Barking.—At the last meeting of the Town Council the Works Committee reported that the Borough Surveyor had sent four notices to builders since the last meeting of the Committee, calling attention to the use of inferior building materials. Councillor Johnson said it had come under his notice that the foundations of some houses had crumbled away on account of bad material being used. It seemed very disconcerting to owners to be called upon to underpin their houses through that sort of thing, and that, in his opinion, the time had arrived when the Council should stamp out this kind of business. He expressed the intention of attending the next meeting of the Works Committee and to make a few suggestions regarding their by-laws.

Baker and Dittons.—£500, is to be spent on the improvement of various footpaths in the district.

Barnet.—Plans have been lodged by Messrs. Root & Sons for rebuilding brush works in Roman-road.

Bendon.—The following plans have been passed:—Mr. A. W. Elkington, for Mr. T. Elkington, eight houses, Cannon's-lane, Pinner; Messrs. Clark & Co., for Mr. C. Carrington, six houses, Pinner View; Mr. H. G. Assister, for Mr. J. S. Anthony, shop and house, Harrow Weald.

Holborn.—The Council have decided to make objections to the proposed building scheme of the Pearl Life Insurance Company, Ltd., on the site of Nos. 248-250, High Holborn, plans of which are now before the London County Council, on the ground that with regard to the block of buildings which extend from the Holborn Empire to Holborn-place, the proposed re-erection of the building line would be at the expense of the public way, which, in their opinion, was not justified.

Marylebone.—Instructions have been issued to the Assistant Surveyor to recast the roadway of Upper Gloucester-place. Repairs are to be carried out to the macadam roadways of New-street, Brynston-street, New Cavendish-street, Upper Marylebone-street, and Paddington-street.

Richmond.—Plans have been lodged by Mr. W. A. Lewis, on behalf of Mr. W. R. Waters, for alterations to the Star and Garter Hotel, Richmond.

Richmond.—Plans have been passed by the Urban District Council for Messrs. Salter & Co., Ltd., for extensions to the Bottling Works at the Rickmansworth Brewery.

Southwark.—The tender of the Patent Victoria Stone Company, Ltd., has been accepted at 14s. 14s. for providing and fixing new drains to the steps of the underground convenience at St. George's-road, Elephant and Castle. Plans submitted by the Borough Engineer have been approved for the alteration and decoration of the Blackfriars-road

District Library, and tenders are to be obtained for carrying out the work.

Stepney.—Electricity mains are to be extended in New Gravel-lane, Shadwell, and St. Anne's-street, Limehouse.

Tottenham.—The following plans have been passed:—Messrs. J. H. Clark & Co., additions at factory, Fountayne-road, for the Mills Equipment Company; Messrs. Lavington Bros., Atheneum-road, Whetstone, eight houses and shops, High-road; Mr. G. L. Wilson, care of Mr. H. S. Couchman, 520, High-road, Tottenham, six houses, Antill-road.

Tring.—An offer of £422 from the Road Board for converting certain flint roads into granite roads is to be accepted.

Wandsworth.—The following plans have been passed:—Messrs. C. W. Boris & Co., Ltd., on behalf of the Cunard Motor and Carriage Company, Ltd., alterations and additions to White Lodge, Lower Richmond-road, Putney; Messrs. Holloway Bros., four houses, Burntwood-lane; Mr. J. H. Harvey, additions to Cedarcroft, corner of Portsmouth-road and Heathfield-gardens, Putney Heath; Messrs. Yeoman, Spriggs, & Co., motor garage, Heathfield, North Drive, Streatham Park.

Watford.—Plans have been passed by the Rural District Council for Mrs. Ackerman for three houses at the Swillett.

West Ham.—The Education Committee have instructed the architect to prepare draft plans providing for a school for about 1,500 children, and alternative plans for a school for about 1,600 children in four departments, on the Sophia-road site. The Committee have accepted the tender of Mr. A. E. Symes, at £5,200, for extensions to the Education Offices.

OBITUARY.

Sir W. J. Crossley, Bart.

Sir William John Crossley, of Glenfield, Altrincham, and Pull Woods, Ambleside, who died on October 12, aged 67 years, was head of the engineering firm of Crossley Brothers, of Openshaw, Manchester, motor and gas-engine makers. He was the son of Major Francis Crossley, of Dunmurry, Co. Antrim, and was educated at the Royal School, Dungannon, and at Bonn. He then entered Sir W. G. Armstrong's works at Elswick, and in 1867 started in business with his brother, the late F. W. Crossley, in Manchester. Sir William Crossley was elected M.P. in 1906 for the Altrincham Division, Cheshire. The baronetcy conferred upon him in 1909 descends to his eldest son, Kenneth, Chairman of Crossley Bros., Ltd.

Mr. H. Broadhurst.

Mr. Henry Broadhurst, M.P. in 1880-96, was born in Littlemore, near Oxford, in 1844. On quitting school at the age of twelve he found employment in a blacksmith's forge for two years; he then worked at his father's trade as a stonemason, and as a journeyman, laboured several years in and around Oxford, chiefly upon collegiate and ecclesiastical buildings. Coming to London in 1865, he worked as a mason upon the clock tower of Westminster Palace, the Abbey, Royal Albert Hall, Burlington House, Guildhall, and the Government offices, including the Home Office, where, in 1866, he held the position of Under-Secretary of State. In 1872 he relinquished his trade upon becoming a member of the Parliamentary Committee of the Trades Union Congress; in the next year he was appointed Secretary of the Labour Representation League, and in 1875 Parliamentary Secretary to the Trades Union Congress, which post he retained for an aggregate of fifteen years. He sat as M.P. for Stoke, 1880-5; Bordesley, 1885-6; West Nottingham, 1886-92; and Leicester, 1894-6. Mr. Broadhurst served upon the Royal Commissions on the Housing of the Working Classes and the Condition of the Aged Poor.

SCHOOL, ABERBARGOED.

A new elementary school for boys was opened at Aberbargoed recently. The school is situated near the main road from Aberbargoed to Pengam, and has accommodation for 400 boys. It has a central hall and eight classrooms. A manual instruction room has been built in the playground. The external walls are of local stone. The building is heated by open fireplaces and a low-pressure heating apparatus, installed by Mr. E. Porman, Newport. The building was erected by Messrs. Williams & Sons, contractors, Bargoed and New Tredegar, at a cost of £1,149, from designs by Mr. J. Bain, F.R.I.B.A., architect to the Monmouthshire Education Committee. The clerk of the works was Mr. G. E. Pettit, Fleur-de-Lis.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, —; Contracts, iv. vii. x.; Public Appointment, xvii.; Auction Sales, xxvi. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary. The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* * It must be understood that the following paragraphs are printed as news, and not as advertisement; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

OCTOBER 28. — **Salford**. — Extension of office accommodation on workhouse site at Eccles New-road. Premiums 200, and 100. Particulars from the Board of Guardians, Salford, Limited to architects practising in Salford and district only.

FOREIGN AND COLONIAL.

New Foundling Hospital, Vienna.

Occupying a site of nearly 58,000 square metres, the new Foundling Hospital of Lower Austria, in Vienna, provides accommodation for 450 children, 285 nurses, and a staff of about 70 persons in addition. There are seven buildings, including two administration blocks, three large blocks for children and nurses, one devoted to kitchens and other offices, and one to the power installation. All the buildings occupied by inmates have well-ventilated basements, ground floor, and two upper stories, and contain, in addition to the wards and apartments reserved for the children, nurses, and attendants, an infirmary, operation theatres, clinical department, and an incubator-room. Steam heating is adopted throughout. The kitchens, laundry, and the disinfection and sterilisation departments occupy one building, also warmed by steam where necessary.

Works in Russia.

The following information is from the report by the British Vice-Consul at Liban (Mr. C. J. Hill) on the trade of that district in 1910, which will shortly be issued:—

Plans for the building of a new theatre have been submitted to a committee, the locality having been decided upon—A new cathedral in memory of the late Emperor Alexander III. is to be built and the site has been chosen. A narrow-gauge railway to a place called Bernaten, some fifteen versts (9 miles) from Liban, is in contemplation. It is proposed to erect villas there, the scenery, pine woods, and beach being the attractions.

Works in Spain.

The *Gaceta* of September 28 notifies that tenders will be received up to October 23 at the offices of the "Junta de Aragon, calle de Don Jaime I, No. 61," Saragossa, for the supply of 2,800 tons of Portland cement required for the reservoir works at La Peña. Although the call for tenders is reserved to Spanish firms, it is stated that, in the event of no award being made, foreign firms may then compete; but preference will still be given to Spanish firms, providing their prices are not more than ten per cent. higher than the lowest foreign tender. The same issue of the *Gaceta* notifies that tenders will be received up to November 27 at the "Secretaría del Ayuntamiento de Barcelona," Barcelona, for the construction of a large city slaughter house and cattle market. A deposit of 100,000 pesetas (about 3,700*l.*) will be required to qualify any tender, to be increased to 500,000 pesetas (about 18,500*l.*) by the successful tenderer. The *Gaceta* of September 29 notifies that tenders will be opened on November 16 at the offices of the "Junta del Común de Regantes," Liria, for the construction of a hydraulic cement water main, 2 metres wide, 1 metre high, and 2,861 metres long, designed to carry water from the San Vicente spring to Arriba. The upset price is put at 55,905 pesetas (about 2,000*l.*), and a deposit of 5 per cent. of this amount will be required to qualify any tender.

Although the two foregoing contracts will doubtless be awarded to Spanish firms, nevertheless the carrying out of the works may involve the purchase of some materials out of Spain.

Hotel and Theatre, Debreczin, Hungary.

The *Zentral-Anzeiger*, Vienna, of October 8, states that a company has been formed in Debreczin, with a capital of 1,000,000 kronen (41,500*l.*), for the erection of an hotel and theatre at Debreczin (Hungary); also that a company, presided over by Dr. Friedrich Parkány, of Budapest, has been formed with a capital of 800,000 kronen (33,500*l.*), for the purpose of building an hotel at Sídók (Hungary).

Labour in Capetown.

We have received the following particulars from the Government Labour Bureau of the state of the labour market in the Cape during August:—

The conditions of employment in the stone-dressing trade are still very good, and employment is readily obtainable for all qualified men belonging to the masons' society who make application. Upwards of eighty granite masons are employed at the New Law Courts, and seven or eight freestone dressers at the channelling building. Cutters of kerb and monumental masons were also fairly busy, and masonry is only fair, very little new work being in hand. Competition is keen for work such as repairs and alterations, but the general prospect for the trade are considered to be good on account of the numerous tenders recently invited.—Painting and decorating is in a very dull condition; work continues to be intermittent and wages low. Many painters are

at present employed as casual labourers.—Fibro-plaster and cement working continues in a dull condition, with no demand for additional hands. A few plasterers are unable to secure employment.—Bricklaying is moderately busy. Regular employment is not, however, readily obtainable, although the present outlook is good in view of the considerable number of plans for new buildings now in preparation.—Shop fitting is fair to good.—As to joinery, with the exception of the box-making section, in which a number of men were working on short time, all branches of this trade were moderately busy. Carpenters in the building trade appeared to be more fully employed than during July, generally in connexion with the execution of minor works and contracts.

PATENTS.

APPLICATIONS PUBLISHED.*

17,067 of 1910.—Henry Harris: Portable stove, also applicable for use as a freighter.
19,315 of 1910.—Sydney Edwin Follett and Albert Arthur Fritchard: Combined door checks and springs, also door checks.
22,161 of 1910.—Edwin Malley and James Robinson: Construction of fire-doors for boilers, ovens, and the like.

JAMES RANSOME, F.R.I.B.A. ARCHITECT.

CHURCH OF ST. JOHN THE BAPTIST, KENSINGTON.
MESSRS. JAMES BROOKS, SON, & ADKINS, ARCHITECTS.

DISCUSSION now in progress in the columns of the *Times* cannot fail to be of interest to all who in any way concerned with the design arrangement of a museum. For the time past it has been only too clear that our great collections fail lamentably in exercising the educational influence that they should.

general public who visit these collections with a vague notion that they will find them amusing and interesting, and make it obvious to the observer, by their listless and aimless air, that their desires in this direction are not being fulfilled.

The system of informal lectures and the somewhat similar one of official guides have been devised to meet this drawback, and are undoubtedly of value. All the same, there is more to be done than this, and it has been widely realised that the objects housed in a museum

should, as far as possible, be made to tell their own story.

We must remember that for the purpose of the student, who, as the real worker, has the best right to consideration, it may be desirable to adopt an arrangement quite different from that suited to the general public. The three bases for possible arrangements are geographical, chronological, and technical, and while these can be combined the whole question resolves itself into which of them is to predominate.

For the student the technical grouping on the basis of craft is unquestionably the one most desirable, while for the untrained public it is quite the least instructive. For them the combination of works of one period and locality, so as to enable them to resuscitate the mode of life in such a place at such a date, conveys much more than the same objects to be viewed separately in a dozen different sections. This aspect of the case has been recognised in Germany as governing the design and arrangement of the museum to a much greater extent than it has with us, and in the German museums it is usual to give a large proportion of the space available to a number of rooms, completely fitted up, made to illustrate in every detail the typical room of a specified district and period.

Nearly all our leading museums have here and there made an attempt to realise something of such a system, but the claims of other methods have limited these efforts.

As a realisation, within one definite period, exceptionally complete in its character and highly provocative of public interest, we may cite the exhibition prepared this year in the Castle of St. Angelo, Rome, in which the rooms were restored as far as possible to the condition in which they existed in the XVIth century.

There can be no question that, if the public only are to be considered, the aim should be to reconstruct all that has survived into a complete picture of the life of the past, using all the components of this picture in their normal relationship to each other, even including wax models for the display of action and costume, such as are to be seen in the groups representing the Indian Tribes in the Museum at Washington.

While the case of Natural History is not exactly on parallel lines, it presents sufficient points of similarity to make the same principles applicable; the chronological element is only present in some branches, the geographical is of definite importance, but we find genus and species replacing the crafts. With these modifications in our initial definitions, much of what has been claimed in regard to the Technical and Ethnological collections applies also to those of the various branches of Natural History.

The conclusion to which we are brought, by examination of the entirely different demands made on a museum by the student and the general public, is that it is surely best to recognise the impossibility of reconciling these demands. If instruction is to be conveyed in a popular form the arrangement employed will not be a convenient one for the student, while if the student alone is to be consulted the public will not be much edified. Now neither claim may be denied, so that we are forced to the conclusion that we should provide what would be in effect two museums.

This view was held by those responsible for the conditions laid down in the recent competition for the National Museum of Wales, though no definite opinion was expressed as to differences of character in the public and students' sections, and the general schedule did not suggest any variation from the type of arrangement usual in this country.

It might be thought that this duplication would materially increase the demand for space, and such an increase would undoubtedly be necessary in the public section if the presentment is to be in the form suggested here. On the other hand, collections for the use of students can take up less room than if they had to be fixed in position and properly seen without the possibility of removal from one place to another.

Again, the general public do not require to see a full and complete collection exhibiting every shade of variation; for them the general impression is the important factor, and a few typical examples of each kind utilised in the groups before referred to are quite adequate. These can even be supplemented with good reproductions, if necessary, more on the lines of the architectural courts at the Crystal Palace, though, of course, not in the rather crude and slap-dash manner there adopted.

The recent enthusiasm for pageantry gives us a hint as to what might be done in popularising the museum; but numerous refinements of arrangement and detail would suggest themselves to anyone making a serious study of this question, and the linking up of the popular and students' departments would give further fruitful sources of interest to the planner. For instance, the students' collections may be arranged over, or under, or around the public collections belonging to the corresponding race and period, while the work of a particular craft, such as the smith, the weaver, or the woodworker (or, in the case of Natural History collections, the genus with its subdivisions), could follow out a line taken horizontally in one direction or another, linking up the various sectional groups.

All these problems are before us, and so far it does not appear as if any really logical attempt has been made to evolve an organic form of museum. Even the possibility or otherwise of such a form is not yet a settled question, and there is ample scope for the architect and the curator of the future to devote their attention to the means we should adopt in obtaining the utmost possible educational value for all classes from our important public collections.

EMPLOYMENT IN THE BUILDING TRADE.

According to the Board of Trade *Labour Gazette*, employment during September was fair on the whole, though not so good as a month ago. It was better than a year ago. Returns received from 1,137 firms employing 59,247 people at the end of September showed that as compared with a month ago there was a decrease in the total number employed by them of 7.2 per cent. in the London district, and of 1.4 per cent. in other districts. Compared with a year ago, there is an increase of 18 per cent. in London, and of 0.7 per cent. in other districts. Bricklayers, masons, painters, plasterers, and labourers showed a decline in employment, compared with a month ago, while carpenters, joiners, and plumbers showed an improvement. The increase common to all branches. The percentage of trade union carpenters and joiners unemployed at the end of September was 22, as compared with 31 a month ago, and 72 a year ago. For plumbers, at the same dates, the percentages were 5, 7.8, and 10.1 respectively. For London, the trade union returns show that the percentage of carpenters and joiners unemployed was 3.3, as compared with 3.6 a month ago and 5.7 a year ago; the corresponding figures for plumbers were 7.9, 10.1, and 8.

NEW METHOD OF MEASURING THE VITIATION OF AIR.

HITHERTO the customary method of gauging the vitiating power of confined air has been to ascertain the proportion of carbon dioxide contained therein, and to express the relative purity of the air in terms of carbon dioxide, pure air being considered to contain four parts of that gas in 10,000 parts of air. This method lacks precision, because the quantity of carbon dioxide indicates the degree of ventilation rather than the degree of vitiating, and it in no way reveals organic impurities which are deleterious constituents.

Granting that pure air is always oxidised and that emanations from the lungs, through the skin of human beings, and animals are all reductent, the measure of the reducing properties of the air should be furnished by numbers directly proportional to the vitiating due to the proportion of foreign substances contained in the air. These being chiefly of organic nature are condensable by means of water vapour.

Based upon these considerations is a new method of measuring the vitiating of air proposed by MM. Henriët and Bouyssi at a recent meeting of Académie des Sciences.

The method comprises three operations:—(1) To collect by condensation a given volume of water vapour from the air to be examined; (2) to measure the corresponding volume of air; (3) to determine the reducing properties of the substance in the water of condensation collected.

For the purpose of condensation the authors employ a cylindro-conical receiver, with the capacity of 3 litres inside which is introduced a similar vessel containing ice and salt. The vapour condensed forms in the outer vessel, and is removed in liquid form, the quantity collected by the authors being always 5 grammes by weight.

The corresponding volume of air is readily computed by the usual rule after the pressure of the mixture of air and vapour and the tension of vapour have been ascertained by the use of an hygrometer and thermometer.

In testing the reducing substance collected the following is the procedure. In a flask of 50 cm³ capacity introduce 5 cm³ of the condensed water, and 10 cm³ of a solution containing per litre 316 mg of potassium permanganate and 425 mg of chromic acid (pure and free from sulphuric acid). Boil for 10 minutes and, after cooling, add 10 cm³ of a solution containing per litre 10 g of ammonium ferrous sulphate, and 10 cm³ of pure sulphuric acid at 66 deg., the liquid then taking a greenish tint. Into it is added by means of a burette a weak solution of potassium permanganate (of 0.05 per cent. concentration of the normal solution containing 158 g per litre) until the appearance of a rose tint. The difference between the reading and the standard reading obtained by repeating the operation without the condensed water gives the quantity of permanganate reduced by the substances occurring in the air under examination. The corresponding weight of oxygen is then deduced, and the results are stated in milligrammes per 100 cubic metres of air.

The following are some results obtained by the authors:—

Source of Air Examined.	Degree of Vitiolion.
Parc Montsouris	1
Quartier de l'Hôtel de Ville	10
Room occupied by guinea-pigs, rabbits, and monkeys	13
Printing works	13
Office, badly ventilated	14
Dark passage, badly ventilated	17
Dressmaker's workroom	21

In the last example the workroom, measuring 104 cubic metres, was occupied by twenty women, and the windows had been kept closed for twenty-four hours exceeding the collection of vapour.

Although the method described cannot be applied so readily as tests for carbon dioxide, it possesses the advantage of indicating directly the influence of noxious constituents in the atmosphere, which can only be guessed at from the results of carbon dioxide tests, and it could be found of considerable value to those engaged in the study of hygienic workshops and other places where healthfulness is a matter of supreme importance.

NOTES.

Indian Art and Archaeology. "East is East, and West is West," especially in art and kindred matters. Mr.

B. Havell, late Principal of the Government School of Art, Calcutta, and the author of several important works on Indian art, is convinced that the Public Works and Educational Departments as now maintained for propagating European architectural ideas and methods of art teaching have been slipping for the last fifty years the foundations of Indian art and architecture." He suggests, therefore, that India would be in it this Department were reduced, and he agrees, of course, with Lord Curzon, to whose reproaches we referred two weeks ago (p. 410), that the termination of the appointment of Mr. J. H. Marshall, Director-General of Archaeology, is greatly to be deplored. The fact is, the importation of European ideas into India has been no more successful in relation to artistic matters here than the similar influence has been in Japanese art. A Western mind is not able to grasp the symbolism of native art, and academic conventions cannot be applied with advantage to the art of the hereditary craftsmen of India. Part of the usefulness of the Archaeological Department lies in the help it gives in directing native talent, the outcome of special traditions; and to minimise its power is to defeat the ends of true progress.

The Crystal Palace. We have considerable sympathy with the object of the representative and influential Conference of public bodies held at the Mansion House on Monday to consider the question of the acquisition of the Crystal Palace and its grounds for the use of the public. The Palace is in itself a structure of considerable interest, which is endeared to countless thousands of people by memories of happy days spent under its glittering roof and within its beautiful precincts; and to know that it was to be pulled down and the

site built upon would cause no little regret to many of us. One of the difficulties, after that of raising the money for the purchase, is to know which of several schemes to adopt for its future management and control, and we hope that the Committee which has been appointed to consider the most practical scheme will be able to prepare one which will be generally acceptable. It is interesting to know that Sir Douglas Fox & Partners have made a careful examination of the Palace building, and they find that, as far as the main structure is concerned—the columns, foundations, and everything—it is good for another sixty, eighty, or 100 years, if put into proper condition.

Changes at the Admiralty. THE shuffling of seats in the Cabinet does not usually possess any special interest for the architect, but the appointment of a new First Lord of the Admiralty opens up an interesting question. We understand that when the new processional arch on the Mall was designed it was the original intention that the buildings on either side should form residences for the First Lord and for the First Sea Lord, respectively. As the building neared completion the First Lord is reported to have expressed his intention of continuing to occupy his present house in Whitehall. Someone, who evidently did not realise that First Lords, being political, are here to-day and gone to-morrow, appears to have given orders that the house should be turned into offices. This apparently was done at some considerable expense, presumably not to the advantage of the building. The interesting question now arises: Will the new First Lord desire to live in the new house provided by an appreciative nation for the custodian of its first line of defence, and, if so, what will be done? Will the alterations be again altered? And will this process be gone through at every change of Ministry or general post in the Cabinet if the new incumbent happens to have different ideas from those of his predecessor as to what constitutes a desirable town residence?

The Architect as "Decorator." MR. FARROW's letter to the *Journal of the Institute* with reference to the lack of any recognition in the Institute examinations of the necessity for adequate knowledge of interior decoration calls attention to a matter of some importance. That architects occasionally lose commissions from ignorance of this subject is no doubt true, but we cannot say that we think it would be to the advantage of architecture if they were all to endeavour to be experts in the Louis XVI., the Adams, the old English, L'Art Nouveau, and the rest of the different styles which make up the stock-in-trade of the "decorator." The decoration of a house should be the outcome, the logical conclusion, of its structure and general character. There are, we think, plenty of architects competent to deal with it in this way, although they could not, and would not if they could, produce such a finished effect in any particular style foreign to their structure as their client might wish and obtain from a firm of decorators. If the Institute took the

matter in hand it would, we believe, strengthen the tendency to treat decoration architecturally. This, however, might not help the architect financially so long as clients look upon decoration as "applied ornament," and prefer to have it in a different style in each separate room of the house.

Wimbledon Common Extension. We feel sure that the appeal issued by the Lord Mayor of London, Dr. Longstaff, and Sir Kenneth Anderson, on behalf of the fund for the extension of Wimbledon Common, will meet with the approval and support of the public. Their appeal makes the point that Wimbledon Common concerns London as a whole; that London benefits by it, but has paid nothing for it; that the Common has been secured and kept up by local residents; and that it is time now that London came to their assistance to help them to secure the land of Kingston Vale before it is too late. We have already dealt with this question in our Monthly Review of Civic Design, in which we pointed out that buildings were rapidly spreading along the new tram route from Wimbledon to Kingston, so enclosing this district in the town area. There is no doubt of the urgency of the question, and that it is one which should receive immediate support. As an old building is often best preserved by finding a use for it, so this district may possibly be most easily secured by making some practical use of it which does not destroy its character. Such a project as a sports centre might enlist the support and the subscriptions of people who are not particularly interested in open spaces, as such, or who think—as the Wandsworth Councillor thought about Streatham Common—that Richmond Park and Wimbledon Common are already large enough.

The Railway Commission. THE findings and recommendations embodied in the Report of the Railway Commission are too voluminous to be discussed here, but it may be remarked that the existing machinery for the settlement of disputes is regarded as inadequate. Various amendments are suggested, procedure modified (in the direction of "speeding up"), and concessions made which should tend to improve an admittedly unsatisfactory state of affairs. In view of the nature of the evidence given at the inquiry, and the tone of the speeches at meetings already held to consider it, it is to be feared that the Report will not be accepted as entirely satisfactory to either side; but if it leads to a better understanding and to more amicable relations between the companies and their employees it will be all to the good. It is noticeable that the remarks in this column at the outset of the strike (as to the futility of industrial bargains in the absence of loyal observance by each side) are fully endorsed by the Commissioners in their Report:—"It is clear that, however satisfactory the machinery may be, however reasonable the settlement, all goes for nothing if a contract once entered into be not loyally observed." We can, with equal readiness, endorse the

Commissioners' conviction that "if railway men will only place the call of duty above and before every other consideration they may confidently rely upon the British public to support them in any fair claim fairly put." The crucial point will be whether or not the new scheme incorporated in the Report will admit of claims being "fairly put" from the point of view of both parties; and it may be regarded as the most hopeful feature of the Report that it has been unanimously agreed to by men thoroughly representative of each side. At the same time, it is already evident that there is a widespread hostility to the Report; and although this attitude may be somewhat modified when its terms are better understood, the outlook is, at present, very disquieting.

LORD ROSEBERY, with a disturbing gift which is his own among our public men, has upset the general and absurd equanimity with which we are apt to regard the accumulation of books both in our national and general libraries. Speaking broadly, we should say that the preservation of books published prior to 1830 (to fix a perfectly arbitrary date) should be maintained, and that those published subsequently should be subjected to a rigorous revision. The respect with which printed matter in book form is usually regarded is altogether out of proportion to its importance. Out of the enormous number of books now published every year the vast majority have no permanent value whatever; indeed, it is scarcely too much to say that a large number of them have no value of any kind. Works of fiction, facile works of travel, biographies, or memoirs published merely for family purposes, might all very well be excluded from collections which aim at any kind of permanence. We do not agree with Mr. Edmund Gosse, whose regard is mainly for belles-lettres, that all possible requirements in the way of a library might be contained "within the drawing-room of a small house in London." Far from it. But we have no hesitation in saying that books of the type which we have indicated are a useless burden to the shelves of any library, whether public or private.

THE NINTH INTERNATIONAL CONGRESS OF ARCHITECTS, ROME.

At the twenty-seventh annual general meeting of the Society of Architects on the 19th inst. the Report of the Society's official delegate at the Congress of Architects in Rome, i.e., Mr. R. G. Lovell, a member of Council of the Society, was presented and adopted. In the course of his Report Mr. Lovell says:—

"I was able to attend the five sessions of the Congress in the Congress Hall and offices adjoining the Castle of S. Angelo. A translation of the subjects discussed and the resolutions carried is appended."

Subject VI.—The desirability of a dictionary of comparative architectural terminology.—This was made clear, and the comprehensive nature of the proposed international dictionary will be realised by referring to the trial sheet herewith. The Congress resolved that the Permanent Committee should undertake this work, and that the text should be supplemented by illustrations.

Subject IV.—Considerations as to modern architecture.—Several papers were read of

widely divergent views; but the expressed and unexpressed opinions of the members were so varied and antagonistic that it was found impossible to formulate any resolution.

Subject III.—The technical and artistic education of the architect and the architect's diploma. The exercise of his profession beyond the limits of his own country.—Considerable interest and excitement was created during the discussion following the paper read by M. Albert Louvet (author of the *Grand Palais des Beaux-Arts*). M. Louvet's views were embodied in five resolutions, the first one being to the effect "that the right to practise architecture should be free in all countries." This appeared to be entirely opposed to all ideas of registration. Neither the paper nor the resolutions had been printed or translated, and the necessity of following the discussion in four languages made it very difficult for the bulk of the members to properly appreciate the importance of this proposal. Your delegate was supported by Mr. W. B. Riley, the delegate of the London County Council, and strenuously opposed any voting being taken that day until members had had an opportunity of properly understanding the resolutions. Although M. Louvet was willing to delete this first resolution, there was a considerable number of members who insisted upon a vote being taken. Fortunately, however, we were able to maintain our objection by a small majority, and the contentious clause was struck out. It will be noted that this resolution did admit of another construction, namely, that an architect should be free to practise his profession beyond the limits of his own country; but the discussion was so involved and the wording so ambiguous, that the British and American contingents considered that it was more prudent to adopt the course we did. During the whole of this very important discussion, which referred principally to the education of an architect, I heard no reference whatever made to the necessity of any form of commercial training!

Extra Subject: Copyright.—The resolutions were passed practically without any discussion. They had been carefully formulated by M. Doumet, the honoured President of the Permanent Committee, M. J. M. Poupinel, the Secretary-General, and M. Georges Harmand, Advocate and member of the Permanent Committee. The work already done in England appears to entirely cover these resolutions.

Subject I.—Reinforced concrete.—Several interesting papers were read, including one by Mr. W. E. Riley, F.R.I.B.A., which was very well received, but it was felt that the study and development of this material from an æsthetic standpoint had not made sufficient progress, and it was decided that the Congress should record no vote on the subject.

Several papers were read on:—**Subject II.—The duties of the architect with regard to his employer.**—A very heated discussion arose when it was urged that under certain conditions an architect should be permitted to accept payments from the builder. Mr. John Slater, B.A., F.R.I.B.A., made it quite clear to the Congress the strong views existing in our country upon this point. There appeared in other countries to be a certain justification for this custom. For instance, it was shown that in Spain the responsibility for the stability of a building was fixed by law upon the builder, consequently it was usual in big buildings for him to employ an architect to protect his interests, while the property owner employed another architect, who was usually responsible for the design and also for the foundations. The discussion brought to light so many varied views that the Congress only voted upon the main issue, namely:—"That the architect should under no pretext receive fees except from his employer." The further study of this important question was referred to the Permanent Committee.

Subject VII.—Foreign academies in Rome.—Although the American, Spanish, and French delegates shortly described the work which their academies were doing (principally that of research), no announcement was made as to the great work for the establishment of a British Academy in Rome. This scheme Mr. J. W. Simpson has been working at for some time, and, although his efforts appear to be on the point of realisation, he considered it more prudent not to imperil the ultimate success of the enterprise by any premature disclosure.

Subject V.—The carrying out of architectural work for the State or other public bodies.—This proved possibly more contentious than any of

the other subjects. The matter had been exhaustively discussed and a decision arrived at at the last International Congress in London. The London resolution was attacked, on the one hand, by those members who desired to have a distinction drawn between the architect and the engineer, and, on the other hand, by those who wished to have a distinction drawn between the official architect and the private architect. The bulk of the British members had considered it wiser to support the resolution of the London Congress, and to ask that a fresh vote should be taken, but, upon it being decided to take a vote, they felt free to follow their individual opinions, and most of them considered that "All public works of a monumental character should be open to public competition, and not be designed by the official architects." A great deal of confusion arose in framing the various resolutions and amendments and in properly translating into the four languages; consequently, in recording the various votes the resulting resolutions are somewhat involved, although they represent what your delegate and the bulk of the British and Americans voted for. The official architects were naturally opposed to the last resolution, and, in the confusion, a protest was lodged with the President, objecting to this resolution on behalf of the British members. I am quite satisfied, however, that the bulk of them did vote and approve, and do now approve, the resolution as it stands at present, namely:—

"That with the object of obtaining monumental buildings embodying all the essentials of art the schemes in all cases must be prepared by qualified architects, and before the work is put in hand the schemes must be submitted to the approbation of an institution such as the Academy des Beaux-Arts, or to Committees, the majority of whose members are architects."

Earthquake Commission.—The resolution asking the Government of Italy to take the initiative in this matter was passed without any discussion.

Next International Conference.—It had been exhaustively discussed by the Permanent Committee and decided that the next Conference should take place at St. Petersburg in 1914. A cordial welcome was promised by the Count de Suzor, the delegate from the Russian Government, to all those who would go. It is suggested that the Conference should take place in the winter during the period of the high season at St. Petersburg. The general meeting of the Congress unanimously confirmed the decision of the Permanent Committee.

We were given to understand that only about 500 members and Associates had inscribed no official list was forthcoming before we left Rome. The British numbered about seventy, and we believe they were the most numerous being closely followed in numbers by the Germans. It is said that many absentees were occasioned by the exaggerated reports of the seriousness of the plague in Italy, and in addition many Roman Catholics declined to attend a Congress held as part of a festival to celebrate the fiftieth anniversary of United Italy and the abolition of the Papal temporal power.

It was evident on all sides that our hosts and *confères*, the Italian architects, did everything in their power to render our stay agreeable and entertaining. Possibly we Britishers were too exacting in requiring the Congress meetings to be of a more formal character. It was repeatedly stated that the London International Congress and the Town Planning Congress were so excellently organised that it made it almost impossible for any other city to approach them. On the other hand, we found that the generous hospitality of our hosts filled up every moment of our time to overflowing, and certainly there appeared to be more to be learnt outside than inside the Congress Hall. I therefore refer to some of the functions that your delegate was privileged to attend.

In his subsequent remarks Mr. Lovell said:—**Commandatore Boni**, who is the curator, and is in charge of the excavations of the Forum, gave an interesting lecture, with slides, on the "Forum of Trajan—the highest development of Roman art." He described his discovery of the grave of Trajan at the base of the column, and the method he had adopted for determining the exact length of the Roman foot, 100 of which represent the height of the column, including the pedestal. This also represented the depth of earth removed from between the Quirinal and Capitoline Hills. Professor Boni has found that 27.702 metres represent the

not length of 100 Roman ft., roughly, 91 English ft., instead of about 97 English ft., previously supposed. Professor Stübben also gave a lecture, with slides, on "Town Planning" similar to the one he gave at the London Town Planning Conference. He described the garden cities of England as the apogee of domestic life, but claimed that in Germany they were doing great advances in the planning of towns.

The Ethnographical Exhibition is a most comprehensive collection of typical buildings from each Italian province, correct in every detail, both inside and out. To an architectural student there is gathered together in the Piazza Armi samples of all the motifs and details of Italy to discover. It is generally admitted that where has better reproductive work been done.

The following is a translation of the resolutions passed and referred to by Mr. Lovell:—
First Meeting, October 4: Subject VI.—The irrefragability of a dictionary of comparative architectural terminology.—The following resolution was passed:—The Congress recognised the desirability of a dictionary of comparative architectural terminology, and resolved that the Permanent International Committee of Architects should organise an international Commission, on whom all continue the work commenced and present work at the next International Congress.

The Congress is of opinion that drawings and sketches should accompany the text in order to make the definitions clear.

Subject IV.—Considerations as to modern architecture.—On this subject the Congress was of opinion that no resolution should be voted.

Second Meeting, October 5: Subject III.—Physical and artistic education of the architect and the architect's diploma. The exercise of his function beyond the limits of his own country.—The Congress carried these resolutions:—

1. That the right to use the title of architect should be reserved to those who have obtained as a result of a proper examination passed by an artistic technical and scientific education.

2. That the title of architect should be held in the same rank as the title Master of Science, Doctor of Medicine, etc.

3. That the schools of architecture may be varied in different countries, while adhering to the same general rules.

4. That students should not be able to enter schools of architecture until after having gained in previous schools the same general culture, or a similar culture, to that which is required in the other professions.

Extra Subject.—Copyright.—The Congress was of opinion, on the one hand, that the provisions on copyright made during the last thirty-four years at the International Congresses of Architects and also at the International Congresses of Literature and Art, notably at Madrid in 1904, at London in 1906, and at Vienna in 1908.

The Congress draws attention, on the other hand, to the progress accomplished during the last thirty-four years in European legislation for the protection of architectural works, notably the Spanish law of 1879, the French law of 1902, the German law of 1907, and the Convention of Bern, 1886, and by the Convention of Berlin of 1908; and the Congress draws attention to the resolution made at the International Art Congress held in Rome April, 1911, when uniform protection was considered legitimate for all works of art, including architecture, during the life of the author at least for fifty years after his death.

The Congress resolved:—

1. That architectural work should be protected in all its artistic aspects.

2. That architectural designs, including the designs of exterior and interior façades, the plans, sections, and elevations, and the decorative details, constitute the first evidence of the thought of the architect and of the architectural work.

3. That the building is only a reproduction, on the ground, of the architectural design.

The Congress confirms the resolution that architectural work and all the designs which compose it, together or separately, also that the construction and all other reproductions, should be in all international laws and conventions be protected during the life of the author and during a minimum period of at least fifty years after his death, in the same manner as all artistic works of painters, sculptors, and others.

Third Meeting, October 7: Subject I.—Reinforced concrete, the mode of using it in different countries, and how it may be applied to great buildings as regards the technical and the decorative point of view.—On this subject the Congress determined to pass no resolution.

Fourth Meeting, October 9: Subject II.—Duties and rights of the architect with regard to his employer.—First resolution: The Congress decided that the architect should under no pretext receive fees except from his employer—State, town, administration or individual.

(2) The Congress decided to refer the further study on this subject to the Permanent Committee.

Subject VII.—Foreign Academies in Rome: Their history, the studies and works of the pupils, their influence in their respective countries.—No resolution was passed.

Fifth Meeting, October 10: Subject V.—The carrying-out of architectural works for the State or other public bodies.—The Congress repeated and confirmed the resolution made in London in 1906. The Congress considered that it was necessary to carefully observe in principle a very clear division between the practice of the art of the architect and that of the engineer, and consequently the following resolutions were passed:—

1. That architectural works intended for the State, municipalities, or other public bodies should only be entrusted to qualified architects after competitions or otherwise.

2. That with the object of obtaining monumental buildings embodying all the essentials of art, the schemes, in all cases, must be prepared by qualified architects, and before the work is put in hand the schemes must be submitted to the approbation of an institution such as the Académie des Beaux-Arts, or to Committees the majority of whose members are architects.

Extra Proposition:—The Congress begs the Government of Italy to take the initiative in the formation of an International Commission of representatives of countries subjected to earthquakes in the following manner:—

(a) To unite all the studies and the works which have been made and are being made in all that concerns earthquakes, and also the stability of buildings in earthquake countries.

(b) To elaborate general regulations and local regulations for constructions to be built in these countries. And to require the representatives of the foreign countries present at the ninth Congress of Architects to ask their respective Governments to create seismic stations where they do not yet exist.

And to ask that the Earthquake Commissions should be composed not only of learned geologists, but of architects and engineers, in order that these Commissions may, by their work, contribute to the technical and artistic solution of the question of stability of the constructions in earthquake countries.

THE MICROSCOPICAL EXAMINATION OF ARCHITECTURAL MATERIAL.

At the second meeting of the Glasgow Architectural Craftsmen's Society, which was held on October 13, the President, Mr. Jas. S. Boyd, being in the chair, a lecture on "The Microscopical Examination of Architectural Material" was delivered by Mr. John S. Glen Primrose, A.G.T.C., A.Inst.M.M., Lecturer on Metallurgy at the Glasgow Technical College.

The speaker said that, during the past decade, perhaps more than in any other, there had been developed the science of examining and paying minute attention to "little things," and in the doing of this a very widespread interest had been taken in practical microscopy. We are beginning to realise how very true it is that things "are not what they seem," and although it is highly problematical if we shall ever be enabled, by even the highest development of ultra-microscopy, to contemplate "the mighty atom," or to watch the migration of "ions," still we get sufficiently near to the proximate composition and structure of things with the high powers now attainable with the microscope and modern lenses that new and vast fields have been opened up to us in a way which was not deemed possible a very short time ago.

For a long time past microscopy has been regarded rather in the light of an agreeable pastime than as a subject capable of yielding any information of practical value, but the science of microscopy had steadily emerged from the systematic examination of almost all material coming under the practical man's purview, until now we find it regarded as almost the last word to be said in the scientific investigation of "something gone wrong," which cannot be elucidated satisfactorily in any other way. This is true, not only of structural and engineering materials from the metallographic point of view, but also of many other substances too numerous to name. Like most other methods of analysis, however, it is not capable of universal application, but, even recognising the limitations which must still be set, its worth is very great in many directions which are not commonly recognised.

The author explained that he did not wish to be understood as desiring to teach the architect or the builder how to set about their business, or insist that they must go through life with a microscope at their elbow, but hoped to demonstrate how often it would help to solve some of their difficulties, not necessarily by their own use of it, but by their understanding the report of a specialist trained in its use. It is perhaps just a little unfortunate that these experts are inclined to follow the lead of most very technical individuals, and use terms and a phraseology which is very like Greek to the person untrained in their particular branch, and thus much which is of real practical service is either lost or overlooked from want of proper comprehension.

Analysis of Stone.

The branch of microscopy with which he was most familiar, had to do with the structures of metals and their alloys, but, before considering this important section now called metallography, he showed some interesting photo-micrographs made at comparatively low magnifications of different varieties of stone and sands, such as are commonly used in building construction.

Fig. 1. Polmaise Sandstone. Normal dressed surface. Magnified 30 diameters.

Fig. 2. Polmaise Sandstone. Decayed edge. Magnified 30 diameters.

Fig. 3. Polmaise Sandstone. Acid treated. No. 1. Magnified 30 diameters.

Fig. 4. Portland Stone. Normal dressed surface. Magnified 30 diameters.

Fig. 5. Portland Stone.

stone. Normal surface.
Magnified 30 diameters.

Fig. 7. Closeburn Red Sand-
stone. Acid treated.
Magnified 30 diameters.

Fig. 8. "Black Pasture" White
Sandstone. Normal surface.
Magnified 30 diameters.

The first investigation was undertaken in conjunction with Mr. Samuel Smith, formerly clerk of works to the College, and dealt with experiments connected with the important point as to the durability of various sand and artificial stones when exposed to town atmosphere, particularly a distinctly acid one, such as obtains in Glasgow and most large manufacturing centres. Fig. 1 shows the surface of a dressed portion of Polmaise sandstone, which is of fairly close texture, and shows clearly the sand particles or aggregate held together in their matrix of binding material, which is of a yellowish shade. Fig. 2 illustrates the appearance of the fractured edge of a piece of this stone, taken from the Glasgow Municipal Buildings, and which has been exposed to the air of the city for a comparative short time. It is evident that the matrix containing over 10 per cent. of carbonates has to a very considerable extent been dissolved or eaten away, leaving the sand grains almost unsupported, and in such a condition that rapid wearing away or surface erosion may take place. This effect is said by some authorities to be due to a large extent to the action of bacteria; but, whilst that may be so in certain cases, it would appear much more probable in this instance to attribute the result to the action of acid from the atmosphere. Proof of this may be drawn from Fig. 3, showing a portion of the freshly-dressed stone after being treated with only a few drops of dilute sulphuric acid, when the same pitting effect due to the dissolving away of the matrix is observable.

Fig. 4 gives the surface micrograph of a piece of Portland stone, which has been polished as well as possible to produce a smooth face, in which there are still cavities large enough to show as black patches under the side or oblique illumination used, the small holes being really out of focus of the microscope objective. Keeping the specimen in position on the stage a few drops of acid were dripped on to the stone, when in a few seconds it was found necessary to refocus the instrument, and the very much altered structure shown in Fig. 5 was observed, evincing what might almost be called the absurdity of using such material in Glasgow, where it is not much used. Both the aggregate and binding matrix in this stone are composed of carbonate of lime, which is readily soluble in dilute acid.

Figs. 6 and 7 show the normal and acid treated surface of the same piece of Closeburn red sandstone, such as was used in the building of the Technical College, and it is remarkable how very closely these resemble

one another. Not only were several drippings of dilute acid placed on the stone, but finally a little warmed acid was tried, and even then no appreciable difference was noticeable. The only other example worth quoting is that of a similar test applied to a sample of a white sandstone, known as the "Black Pasture," from Northumberland, which has recently been used in the construction of two large buildings in Glasgow, viz., the Wellington-street Post Office and the Mitchell Library. This stone also, like the Closeburn, possesses a very high acid resisting power, as shown by the comparison of Figs. 8 and 9. These show very slight difference between the normal smoothed surface in Fig. 8, and the same spot acid treated, as seen in Fig. 9.

Although sands which are used for mortar and other purposes are not commonly examined under the microscope, it is frequently a very useful adjunct to other physical or chemical tests. The chemical analysis would actually in this case seem to be for most practical purposes subordinate to the merely mechanical one of grading, since the less uniform the size and shape of the particles the better they seem to bind and set with the admixed material. Figs. 10 to 13 show interesting comparisons of different types of sand in common use. The sea

sand, Loch sand, such as the Belfast red, usually quite sharp enough, but rather fine and often too clayey. Crushed sandstone shiv is quite a good substitute if the grinding has not been too thorough, in which case the particles are too small and uniform to be much use. The figure giving the average degree of fineness is a very useful thing to know, and is easily ascertained by weighing the portions of a definite quantity of sand left after shaking on a set of sieves. (Multiplying the weight of the particles passing by the number of meshes per linear inch, and dividing the total by the weight of material taken, the average of the grades is expressed as a percentage. Extremely fine sands show a value from 100 to eighty-five, good medium sands from eighty-five to seventy, coarse sands from seventy to fifty-five, and extra coarse material from thirty to fifty-five.)

The following table shows an interesting comparison of the four types of sands mentioned above, and it will be seen that the weight of any particles large enough to remain in the twenty-mesh sieve is added in direct proportion to the weight of sand lost in sieving is added to the weight of sand passed through the sixty-mesh sieve. It is of value to note the proportions of the total weight left on each sieve:—

Grade of Sand.	Sea.	Clyde River.	Silver.	Belfast Lough.
Not through 20 mesh	10 = 1	14.2 = 14	0.4 = 1	1.6 = 2
Through 20 mesh	10.5 = 210	40.5 = 810	9.7 = 194	0.5 = 130
Through 40 mesh	35.2 = 1,168	29.0 = 1,180	25.0 = 1,000	3.5 = 140
Through 60 mesh	40.0 = 2,160	8.1 = 504	29.2 = 1,732	4.0 = 240
Through 80 mesh	9.3 = 744	2.1 = 168	9.2 = 736	2.6 = 208
Through 100 mesh	5.0 = 500	4.3 = 490	25.5 = 2,550	81.0 = 8,100
Lost (<60)	1.0 = 60	1.5 = 90	1.0 = 60	0.8 = 48
	100	5,323	100.0	8,868
Average degree of fineness	= 53	32	= 63	= 80

sand, even when perfectly clean, which is not often the case, does not show the needed "sharpness" to give it strong binding powers, as most of the particles are water-worn and more or less rounded at the edges and corners. Silica sand is better in this respect, and is especially free from clayey particles, whilst most of the grains are extremely angular; it is sold as silver sand, but ordinarily it is too expensive. River sand, as shown in the sample taken from the Clyde, does not contain much mud or clay, and the grains are only moderately rounded, but, as a rule, the average fineness got on grading is low, indicating that it is an extra coarse

Now that cements are so largely used in various types of building, the ordinary testing is judged incomplete without a microscopic analysis of the material at various stages of its setting, and some of the recent books on the subject of testing cements have published photomicrographs for guidance of those interested in the matter practically. The microscope has been valuable in bearing out the latest chemical conclusions that the setting and hardening involve changes, the principal products of which are not due to a crystallising reaction, but to colloidal action brought about by the formation of various "sols" and "gels,"

are termed, and which can be recognised by the microscope. From the foregoing evidence it will be clear that, although the microscope cannot replace chemical analysis of a substance, it is of great service in showing up how the substances present are arranged in the mass, and is of great service where the structure is in any way patchy or not uniform, which is often the case.

The Structure of Metals and Alloys.

It is, however, when we come to examine the internal structure of metals and alloys that the microscope gives us most valuable evidence, since not only can it be made to show the arrangement of the constituents, as they occur in the solidified condition, but in practice it can also furnish a fairly accurate idea of the life history and heat treatment of the metal, also to a great extent its fitness or unfitness for any specific purpose. Correct thermal treatment like wrong or too early mechanical treatment is quite simple to detect, and even in some cases the structure reveals wrong chemical composition, particularly if some of the compounds formed are such that they segregate badly into patches, which thus cause weakness. Cast iron and steel, like most other alloys, are of a comparatively complex structure, since, the solidification goes on, one constituent (usually a solid solution) separates or freezes out gradually into crystallites, leaving the still molten portion enriched in a second constituent, which solidifies in the interstices and the first in the form of a "eutectic" solidified mother liquor, which has the lowest melting point of the series. This "eutectic" is not a chemical compound, though it may have a definite composition, it is itself a mixture of two constituents, which by chemical compounds, very intimately mixed and usually arranged more or less alternately in alternate layers, which are readily recognised under the microscope. Several lantern slides were shown to illustrate the occurrence and structure of different eutectics.

The lecturer briefly detailed the methods of cutting and preparing a metal section for microscopic examination, pointing out that must be free from scratches and then etched for a few seconds in a very dilute (1 per cent.) solution of nitric acid in alcohol. The illumination most frequently employed is oblique, a small reflector being used to direct light vertically on to the specimen on the stage of the microscope. The chief micro-physical constituents were shown to be ferrite, shown in Fig. 14, which is the ground mass of Swedish charcoal iron, wrought-iron, and most of the very mild steels used in structural and structural work. Pearlite was shown as the portions containing the combined carbon, and the modes of its occurrence were illustrated to account for the varying strength of the material. Figs. 15 and 16 show it in mild steel as cast, and also as rolled. The carbon in cast iron is often to a large extent uncombined, having separated out in thin flakes of graphite.

Significance to Architects.

It is not often that an architect is called on to make an investigation of a serious failure occurring in structural material, but, as must often be interested in the result, some slight familiarity with the appearance of

various types of micro structures is serviceable in enabling him to follow with a fuller degree of comprehension the specialised reports often submitted along with the results of a complete investigation. Several examples coming under the author's notice were described and illustrated by lantern slides, amongst others being the case of a wrought-iron angle bar which, through failure, was the cause of a fatal accident a few years ago. The fractured edge of the metal showed a portion not far from the bend in which the crystal formation was noticeably different from the rest, even to the naked eye. Under the microscope the cross section of the metal at this point showed a distinct streak of a highly phosphoric portion. The quality of the metal was not called into question in the inquiry, but apart from the analysis showing too high a percentage of phosphorus, the micro-structure clearly indicated that it was a piece of metal quite unsuited for the purpose to which it had been put. Another instance of the failure of wrought-iron was shown to be due to a considerable proportion of combined carbon having been left in an elongated layer through the metal, thus causing it to be brittle at the point.

Mild steel, such as that used for constructional purposes, is chiefly faulty in respect of either blowholes left from the casting and not completely welded up in the process of rolling, or in having impurities left on account of an insufficient amount of metal having been removed from the top end of the ingot by cropping. These inclusions become considerably elongated in the direction of the rolling, thus weakening the structure very much and giving the metal a tendency to tear or split along such cracks.

A recent case of a roof girder which gave way with serious results was blamed on a defective portion of the metal, but the microscopic examination clearly showed the metal to be sound enough originally, but very badly corroded at the point of failure, due to insufficient care in applying protective coatings. It is not at all frequent to find mild steel in an "overheated" brittle state, but excessive cold working, such as hammering in riveting, occasionally sets up a serious form of brittleness due to the deformation and partial destruction of the crystalline formation. The microscope readily reveals this, and is also able to show how even a slight annealing removes this dangerous state of strain.

Metal which has been subjected to a large number of alternations of stress frequently fails in an alarming manner, and as the fracture shows large facets, the fault is usually put down to the metal having become crystalline. As a matter of fact, it is really the breaking down of the internal crystalline structure which has caused the destruction of the piece of metal due to fatigue, which is brought about by the development of a large number of "slip-bands" usually starting at the outside and working their way in through the metal by the minute quantity of debris formed setting up a grinding action. The cure for this disease in the metal is to allow periods of rest for recovery by renewed growth of the crystals, which effect can be got much more quickly by a short annealing to the correct temperature, but this is only of use if the slip-bands have not got to the stage of forming debris, after which nothing short of remelting puts the metal right again.

As phosphorus is very frequently present

in foundry irons, its influence must be watched in instances where cast-iron is employed for columns or supports. It may enable the iron to withstand a considerable amount of steady pressure, and yet fail utterly if it receives the slightest rough usage. The size and arrangement of the separated flakes of graphite is very important in this same connexion, and instances have been known where too slowly-cooled cast-iron has failed through the flakes being larger than was compatible with the strength requisite for the position in which it was used.

The heat treatment of cast-iron is not often resorted to, except in the case of white iron, which has to be annealed in order to make it malleable for certain purposes. One remarkable instance of the failure of some brackets was investigated by the author, showing that they had been incompletely annealed, thus leaving a considerable portion of the original structure of white iron which was distinctly brittle.

The examination of failures is not the chief use of a microscopical investigation, since in many instances it is capable of being used as a check against the employing of faulty material. This mode of examination is coming to be largely used, not so much in the way of applying more stringent specifications, as in detecting where causes of failure are due to unfair duty having been put upon the metal, which is unfortunately very often the case, or to the use of material which is unsuited to the purpose for which it is introduced. It is only in quite a small proportion of cases that investigations have shown defects arising from inherent weakness or bad manufacture.

In the discussion which followed it was asked if the lecturer could give a decided opinion on the bacteria theory for the decay of stone, or account for the fact that Portland stone stood well in London, especially in old buildings. He was asked to account for the large amount of sulphuric acid occurring in the air of manufacturing cities.

Mr. Primrose, in reply, stated that, although not a bacteriologist, he deemed it highly improbable that any form of microbe could be found to exist in a stone which was exposed to the atmosphere of cities on account of the acid solution which was formed on the surface and permeated the mass. The strength of the solution might at first be very weak, but as it dried, the acid would become stronger, eventually dissolving out the matrix or binding material if it contained much carbonate. The Portland stone which seemed to stand best in the London buildings was that which had been employed in a seasoned condition, or had been erected long enough ago to get a surface skin before the air became even occasionally acid enough to attack it. It was a well-known fact that the amount of acid in the London atmosphere was much less than that usually found in the Glasgow air. The formation of the sulphuric acid was due to the fact that all coal contains a small quantity of sulphur, and when burned this produces the gas known as sulphur dioxide. On coming in contact with moisture in the atmosphere this dissolves readily, forming the unstable sulphurous acid, which in presence of the oxygen in the atmosphere was soon converted into the strongly corrosive sulphuric acid form. The effect of fuming was to form a surface protective, but those

Houses, Blyth: Entrances.
Mr. Edward Cratney, Architect.

stones which contained only small proportions of carbonates, and held, in addition, a small amount of natural alkalies, would perhaps be found best able to withstand the action of city atmospheres.

NOTE.—With reference to the accompanying illustrations, the sandstones are photographed under oblique illumination, the sands by transmitted light, and the metal surfaces by vertical illumination.

HOUSES, BLYTH.

IN our issue of January 6 last, p. 26, we illustrated Mr. Edward Cratney's designs for a pair of semidetached villas in brick and rough-cast. On this page are shown views of the houses in their finished state.

LANDSCAPE ARCHITECTURE.

A LECTURE ON "Landscape Architecture" was recently delivered by Mr. Thos. H. Mawson, Hon. A.R.I.B.A., before the Gloucestershire Architectural Association.

In the course of his lecture Mr. Mawson said—

"That we have lost that fine sense of spacious planning which has given to us modern Edinburgh and so many London squares few will deny. Nor will the travelled man or woman deny also that, whilst we are becoming less spacious in our ways and more trivial in our planning, more individualistic and less communistic in our architecture, other countries are learning the restraint which ever characterises the highest art.

It may be well to offer an explanation for this disparity between our own conditions and those which obtain abroad. It is simply this: that in England when a man acquires wealth he seeks the country and the distractions of sport.

Abroad, as a man acquires education he draws nearer the heart of the city, where he finds art, music, literature, and those other refreshments of the mind which are necessary to his intellectual life. The student of landscape architecture finds that the wealthy Englishman and the educated foreigner both demand beautiful surroundings. The Englishman has his country seat, fine gardens, and expansive domain wherein to take his pleasure. Abroad, the man seeks the city and combines with others in providing beautiful parks and gardens for the use of all and free to all.

As usually understood, landscape architecture conjures up to the mind a slight and partial infusion of colour, neatness, and prettiness into the domain of nature or the surroundings of our homes. Whether these scenes are romantic or commonplace, it conveys no more to the mind than dressed-up improvements. Others, again, think of it as a happy field of *laissez-faire* in which there is no constructive beauty. To them landscape architecture is not an art, but something to play with, which may be taken up or dropped at will. How wrong this is we will seek to show.

The successful landscape architect must not only be able to build up in his mind's eye the whole of the buildings, roads, parks, garden ornaments, and utilitaria into one harmonious comprehensive scheme of which he is able to pre-judge the effect, but must have that intimate practical knowledge which will ensure giving full effect to his dream.

To do this successfully the landscape architect has not only to study architecture in the round, but he must also have a keen appreciation of natural objects and features, and possess the power to weave the natural and the artificial together without discord. This generally conceded to the art in its relation to domestic architecture, and very few architects would nowadays undertake the design of country domain without consulting the man who has schooled himself in these large problems of landscape and garden composition. To this extent we may say the art is recognised in England. How does it stand in relation to town development? Surely, if anything, it is where the landscape architect is absolutely essential.

In both America and Canada the profession of landscape architecture is gaining, and must continue to gain, in public appreciation. The reason for the greater advance made in the profession in America than here is threefold. First, we have the fact that it is a comparatively new country, which is not only less hidebound by tradition and precedent, but one which, by its rapid growth, provides many more opportunities for the effective application of co-ordinated architecture; and, secondly, the absurd pretensions of persons in England, totally unqualified to fulfil its duties, in whose hands many splendid opportunities have been thrown away, thus the minds of those who are capable of estimating the worth of the occasion are filled with a disgust of the whole profession. Lastly, and by no means least, we have in the most unfortunate etymological significance of the term "landscape architecture," which suggests to many persons in this country with unwarranted interference in the realm of nature or a childish attempt to introduce into our towns by little patches of futile gardening. If it were not that the modern significance of the expression is clearly understood both in America and on the continent, and that its use has become general and more or less unalterable, one would be tempted to advise the adoption of some other term which would, by its construction as well as its application, describe and designate the "architect co-ordinator" who

Houses, Blyth: South Front.
Mr. Edward Cratney, Architect.

vince it is to arrange on an effective plan
attached and detached architectural units.
To avoid a misunderstanding, a line of dis-
cussion should be drawn between garden
design, whether called "garden architecture"
or "landscape gardening," on the one hand,
and "landscape architecture" as the term is
understood in America. The first relates, for
the most part, to the creation of those private
gardens of which Englishmen have every-
where been so proud; while the latter, though
it includes the architecture of gardens, has
yet to do with works of a public nature,
including the planning of cities.
It is characteristic of the attitude of the
profession generally to the profession in this country
that in America that, while here few people
wadays venture to lay out a private garden
without professional advice, the municipality
prefers the amateur to the professional
for its undertakings. Abroad, so great is the
importance attached to the art that schools
are not only splendidly equipped, but are
increasing in number. So determined are
Americans to extract the best that the work
can show that they send their professors on
expeditions to Europe to study classic examples
of landscape architecture at first hand, and to
collect whatever literature, ancient and modern,
is to be got together for the use of the students.
Here, however, we are differently placed, for,
withstanding the excellent curriculum pro-
vided by the Liverpool School of Civic Design,
which in many respects is unique, it may yet
truly be said that we are still without a school
where the essentials of the art of landscape
architecture as applied to civic betterment may
be studied.
This brings us to the question, What are the
essentials of the art? And what is the equip-
ment, theoretical and practical, necessary for
practice? First, it may be emphatically
stated that the pupil must start with a liberal
education so that he may be able to exercise
tact, catholicity of tastes, power of association,
and a love of orderly progression and logical
sequence which can only be gained by imbibing
the spirit at least of the classics. On this
foundation must be built a knowledge in the
ground, and sympathetic interest in all the
various branches of architecture, so that he
may be able to meet and sympathise with the
specialist in each branch of the profession,
whether domestic, ecclesiastical, commercial,
municipal, or otherwise.
He is to befit himself to design parks,
residential, and control natural reserves and park-
lands in a way that accords perfectly with the
surroundings—that is, his design is not to be
any sense of the word disjointed, as most of
our English civic parks seem to be. To this
end must be added, or it must be projected upon, a
study of sociology, engineering and architecture,
horticulture and arboriculture, which
kinds, broadly speaking, the full subject of
urban planning, which is in the American mind
incorporated in the term, landscape architect.
He must previously have had an expert
training in surveying in all its branches,
including the modern rapid methods of tach-
ymetric contouring, and must understand the
geologic and other influences which go to make
the different local conditions and the formation
of the various soils to be encountered.
There are other minor affiliated branches
incorporated with these in the Liverpool School
of Civic Design; such as the legal aspects of
urban planning (seeing that we are more bound
by precedent than the newer country), but,
broadly speaking, apart from these national or
local differences, we are at last following the
ways of our countries, although we prefer to
let the art by another name.
For the practice of landscape architecture,
however, much more than this is needed, for,
like other practitioners, the work of the land-
scape architect in city development is not so
much the design and erection of units as the
control and composition of extended areas, and
the harmonising of a multiplicity of features,
natural and artificial; the first differing in scale
and bulk from year to year, and the second
constant and abiding. These features must be
manipulated, with a sound practical knowl-
edge of probabilities in the case of the less stable
factors, so as to make at all periods in their
development a stately or picturesque whole.
Again, while in other branches of architecture
study of linear perspective so far as it relates to
the portrayal of individual buildings or groups
of buildings is necessary in landscape architec-
ture, the fully-equipped practitioner must be

able to make bird's-eye views of the whole city,
not, indeed, with the architect's close attention
to detail, but in order to show a masterly group
of broad areas in mass. Even this does not
exhaust the list of the more obvious essentials of
this branch of the profession of architecture, for
the student must also attain an educated "sense
of locality" which will enable him to grasp the
practical and aesthetic possibilities of the site,
to build up in his mind's eye a picture of the
city to be, and, above all, to present his con-
ceptions to others graphically and pictorially in
such a manner that they, too, may participate in
his vision and become fired with this enthusiasm.
This is a standard of attainment which cannot
be reached either by way of the American School
of Civic Design, even if the student shows a
natural aptitude in these departments, for it
needs the best teaching of each, supplemented
by outdoor studies. This combined course of
study and preparation may not be necessary for
the architect in general practice, on the one hand,
or the landscape gardener on the other; it is, how-
ever, necessary for the practice of city planning.
Drawing a comparison between the profes-
sional standpoint in England and America
on this subject, it may be said, while the English
architect too often imagines that what really
matters is a knowledge of architecture, such as
is demanded under the examination scheme
of the Royal Institute of British Architects
as a sufficient training for the man who designs
both cities and gardens, the professors of land-
scape architecture in America, with equal
sincerity, hold that an expert knowledge of
scientific surveying and contouring, botany,
arboriculture, traffic problems, and a proficiency
in draughtsmanship are sufficient for successful
city planning, and therefore neglect the study
of architecture. In both cases the outlook is too
restricted.
This brief and very incomplete examination
of the necessary equipment of the landscape
architect will show that there is pressing need
for the formation of some association, not
necessarily composed entirely of professional
men, for the study and promotion of landscape
architecture. Assuming for the moment that
we are agreed that a special training is necessary
and the profession an important one, can we find
a sufficient number of men willing to give up
at least six years to academic studies, and have
we the means of imparting the necessary
training? The answer is emphatically, Yes!
But the lack of organisation and co-ordination
so characteristic of our British methods do not
make for the effective collaboration so necessary
if we are to frame any project on the lines
sketched out, and if we are to utilise what at
present exists.
In a country where the practical instruction
counts for so much it may be asked, What are
the prospects? Of course, all admit that the
profession is a delightful one, but what are the
material prospects? We do not know; but
never was a call of service stronger or the need
for missionary zeal more pressing. Our hearthens
are at our doors. Nay, in this cathedral city
of Gloucester, with its rookeries and sordid
squallor, you need awakening to civic con-
sciousness, to the value of your glorious posses-
sions, and equally to the range of your oppor-
tunities to the need of pleasant boulevards,
green spaces, of the restoration of your river
banks, so that your citizens may take the
leisure uninterrupted by those constant
reminders of industrialism from which we all
seek to flee.
Civic art is so utilitarian in its purpose to be
civic first and art afterwards, and yet to love
our city we must make it lovely. This can
only be done by awakening in the soul of the
citizen that high desire for civic art which has
so long lain dormant. This dormant pride can
only be aroused by setting before the people a
tangible vision of what their city is capable of
becoming. The dream of what one's city should
be, and may be, and even some day must be,
will be a special inspiration to those professions
of the fine art upon which the beauty of the
city ultimately depends. It is the work of the
landscape architect to present this dream in its
most alluring form.
Mr. Mawson then showed a number of
extremely interesting lantern slides, among
which were a fine series illustrating his scheme
for the improvement of Bolton; and a charming
set of photographs showing the laying-out of
large private gardens carried out by the lecturer.
A short discussion followed, and a hearty
vote of thanks was accorded Mr. Mawson for his
scholarly and fascinating lecture.

NOS. 81 TO 95, KING'S-ROAD,
CHELSEA.

THESE shops, of which an illustration
appears on our front page this week,
have been built for the freeholder, Mr.
Charles Pettitward, to replace eight old
shops, which were worn out and have
been pulled down. The old irregular line
of frontage has been straightened up, and
a strip of land 5 ft. wide has been thrown
into the road to widen it at this point by
arrangement with the London County Council.
The buildings comprise seven shops, with
living accommodation over for the tenants,
and a motor garage, with workshops, lock-ups,
and office accommodation over. An attempt
has been made to combine the eight shops
into an individual block instead of treating
them as separate buildings.
The fronts are constructed with brown
salt-glazed facings and cream and brown
vitreous salt-glazed terra-cotta supplied by
the Burnmantoffs Company. The contractors
for the work are Messrs. L. H. & R. Roberts,
of Islington, and the architect is Mr. J. Pain-
Clark, of Gray's Inn.

ARCHITECTURAL SOCIETIES.

Nottingham Architectural Society.

The opening meeting of the winter session
of this Society was held at the Society's
Room in St. James's-street on Tuesday.
A letter was read from the Nottingham
Building Trade Employers relative to
"specialists" in contracts, which was
deferred to a future meeting for full
discussion.
Messrs. A. Hendy and W. Shepherd were
elected members and Messrs. C. F. W. Hasle-
dine, T. H. Waumsley, N. H. Pratt, and J.
Warburton were elected Associates of the
Society.
After light refreshments had been served,
the members adjourned to the lecture-room,
where Mr. Harry Gill, M.S.A., a member of
the Council, gave an interesting lecture
entitled "Holiday Rambles in Norfolk."
The lecture was illustrated by a number
of his own lantern views of the buildings
and churches in Norwich, King's Lynn,
Cromer, and the small villages in "Poppy
Land." The lecturer pointed out the special
architectural features of each view, and gave
much useful and interesting information.
The President and Vice-President expressed
the thanks of those present to Mr. Gill.

ARCHAEOLOGICAL SOCIETIES.

Royal Archeological Institute: Art and
History in Westminster Abbey.

An autumn meeting of the Royal Archaeo-
logical Institute of Great Britain and Ireland
was held at Westminster Abbey on the
20 inst., by permission of the Dean of West-
minster. The gathering was under the direc-
tion of Mr. W. H. St. John Hope, and its
purpose was to complete the examination of
the mediæval monuments and furniture.
Sir Henry Howarth said that those awful
fellows, the architects at the beginning of the
Gothic period, thought that everything should
be swept away with the exception of what
was Gothic, but in the Abbey they had a
place where the whole history of sculpture
right down to the latest times could be traced,
a great museum of English art and history
combined, such as was not to be seen any-
where else.
Mr. St. John Hope, by the aid of a plan,
described the mediæval arrangement and use
of the Abbey Church down to 1540. Many
of the mediæval monuments, he said, had
been stowed away into corners to make way
for tasteless piles of marble sculpture. The
Abbey Church was attached more or less to
the Palace; no one had any parochial rights
in it, and when the Abbot claimed the body
of Henry V., who had died at Windsor, it was
because the King was their sole parishioner.
In the middle of the church was the chapel
of the monks, perfectly self-contained, where
they sang the services. At the west end was
a substantial screen, and beyond that, in the
nave, a number of altars. A platform called
the Lower Pavement occupied the whole of
the crossing in the choir between the four

great piers, on which stood another altar, and at times an enormous seven-branched candlestick of bronze, the result of the Judaizing movement of the XIIth century, by which many church ornaments were based on those of the temple. The beautiful mosaic pavement in front of the altar was the work of Abbot Ware, who secured many of the pieces of stone from Italy. The history of the pavement was told in letters of brass, but every one of these had now disappeared. Near by was the Royal pew in which the King sat when he was minded to come from the Palace to hear a service. Mr. Hope also spoke of the extraordinary merit of the early monuments. There was more mosaic work to be seen there than in any other church north of the Alps. The Abbey also contained several examples of heraldic art from 1250 to about 1500, when heraldry fell into decay.

The company then passed into the Abbey. In the nave Mr. St. John Hope explained the heraldry of the carved shields in the spandrels, dating from the XIIIth century, but he regretted that everything was mouldering on account of the London atmosphere.

The party then divided into three groups, and under the several guidance of Mr. Hope, Mr. Peers and Mr. Prior visited the various chapels in the Abbey. Mr. Prior described the Chapel of Henry V. as the apotheosis of chivalry, exhibiting the pride of place, of one who lived his life in a pageant that was not at an end on his death. The Chapel of Henry VII. was described by Mr. Hope, who said that he would argue that the beautiful screen was part of the work of a tomb intended for Windsor, on which considerable sums were spent. Within the screen was a tomb, which had been broken up and replaced by the present one. Although the latter was of Italian workmanship, there were certain English features about it.

The afternoon meeting was held in the Jerusalem Chamber, where Professor W. R. Lethaby, Architect Superintendent of the Abbey, read a paper on "The Confessor's Shrine." The shrine consisted, he said, of a gable-roofed coffin, covered with plates, arcades, and figures, all of gold, set with precious stones. Matthew Paris recorded in 1241 that Henry III. caused a shrine of pure gold and precious stones to be set up; probably it was begun at this time, but it was not completed for full thirty years. The King's favourite man of affairs was Odo, the goldsmith, and from the Abbey documents they might conclude that the shrine was the work of Odo and his son Edward, of Westminster. The marble and mosaic basement on which the coffin rested still remained, one of a number of examples of the Roman mosaic worker. An inscription on the presbytery pavement showed that it was laid down in the year 1268 by Odericus from Rome, and a similar inscription on the shrine basement recorded that it was the work of Peter, citizen of Rome, in 1279. He compared the tomb with that of Pope Clement IV. at Viterbo, and said that the best reading of the facts would be that Oderic and his sons were the most famous mosaic workers in Rome, that Henry III., advised by the Pope, attracted the father to Westminster, that the Pope himself died in the year that the presbytery pavement was finished by Oderic, and his son Pietro Oderic made the Papal tomb. Possibly he had been with his father, and was called back to Rome. Later, when the Pope's tomb was done, Peter came to Westminster to execute the Confessor's Shrine. He had compared the shrine base at Westminster with photographs of the Viterbo tomb, and the similarity between them proved, in his opinion, that they were by the same master. They might accept it as proved that the shrine case and Henry III.'s tomb were the work of Peter, son of Oderic, who made the tomb of Clement IV. at Viterbo.

Mr. E. S. Prior delivered a lecture on "The London Style." London throughout the Middle Ages, he said, led the way in matters of art, and at the background of all provincial styles lay the workmanship, and particularly the art, of the capital. The spread of London's style meant the spread of the "shop" style. Medieval art was peculiarly ecclesiastical, concerned largely with the building of churches and monuments. The bishops were constantly in London, and their monuments and the work ordered by them were sent away to the various

cathedrals. London was also the gate for the entrance of Continental influences. It had no building stone of its own, and had to use imported material, unlike the cities of Durham, Lichfield, and Wells. Stone from Reigate and Caen and marble from Purbeck were used, and London was ready to take any materials that it could get. London also brought in masons from the country who returned home with the ideas that they had gathered in the capital. He discussed various monuments in the Abbey, and said that they contained many details showing that they were "shopwrought," made of separate materials from different parts of England.

The meeting concluded with a vote of thanks to Mr. Hardinge-Tyler, the Secretary, for his work in arranging the gathering.—*Morning Post.*

Surrey Archaeological Society: Visit to Charterhouse.

On Saturday, the 14th inst., a number of the members of the Surrey Archaeological Society visited the Charterhouse. The Master, the Rev. G. S. Davies, explained that, owing to the fact that the Monastery was largely rebuilt during the opening years of the XVIth century, it is often very difficult to tell what is part of the monastic buildings and what Howard House. The gateway and doors are of the XVIth century, but the house above was rebuilt about 1700. The Lay Brothers' Observances were first visited. They were later the servants' quarters of Howard House, and are now known as Wash-house Court, a most interesting red brick Tudor structure.

The Master's Court is mainly post-Dissolution. Three sides have been spoilt by a casing of brick put up by a former Master, but the great hall fortunately escaped. This fine Tudor hall contains a magnificent oak screen, with a fine overhanging gallery along one side, and much beautiful panelling. At first the Guests' Refectory, it was slightly enlarged, the roof raised, and a clearstory inserted to make it the banqueting-hall of Howard House. Later it became the dining-room of Sutton's Hospital.

The great staircase put in by Norfolk was much admired. Up these stairs Ridolphi was led to meet the Duke, and here, later, Norfolk was arrested for complicity in the plot.

The Great Chamber was next visited. It is believed that the upper part of the great fireplace was brought from Italy by Norfolk, and the lower part made to match it in England. There is also some fine tapestry of the same date. The chapel was originally built as a church in which relatives of those who had perished in the Plague might pray for the repose of the souls of the dead. In 1571 it became the chapel of the Monastery. The south side of the building is of this date. A new bay with columns was thrown out to the north by Sutton's trustees, and contains his magnificent tomb. Most of the stalls and pews are of the same date. The pulpit is a fine piece of Jacobean work, and the Communion table is famous as one of the best of its date, c. 1611, still extant.

GENERAL NEWS.

The Society of Architects.

The twenty-seventh annual meeting of the members of the Society of Architects was held on the 19th inst. at the Society's offices at Bedford-square. Mr. G. E. Bond, President, presided. The annual report, part of which was given in our last issue, p. 459, was adopted. Mr. R. G. Lovell read his report as delegate of the Society at the International Congress in Rome, and was accorded a hearty vote of thanks. We print the substance of Mr. Lovell's report on p. 470.

Town Planning at Liverpool School of Architecture.

The syllabus (certificate course) of town planning lectures for the Department of Civic Design at the University of Liverpool School of Architecture has been issued. The following courses have been arranged:—(A) "Outlines of Town Planning"; lecturers, Professor Adshhead and Mr. Atercrombie. (B) "Civic Engineering and Hygiene"; lecturers in engineering, Professor Brodie and Mr. Aman; lecturer in hygiene, Professor Hope. (C)

"Civic Law"; lecturer, Mr. Chaloner Dowdall. (D) "Civic Architecture"; lecturer, Professor Adshhead. (E) "Civic Devotion"; lecturer, Professor Adshhead. (F) "Parks and Gardens"; lecturer, Mr. Thomas H. Mawson.

Repairs at the Houses of Parliament.

During the recess the frescoes in the corridors leading to the lobbies of the House of Lords and House of Commons have been restored under the direction of Professor Sir Arthur Church. The six historical pictures behind the Strangers' Gallery and at the back of the Throne in the House of Lords have been cleaned. The work carried out by the Office of Works since August includes thorough cleansing of the House of Commons. The brasswork and carving has also been repaired. In Westminster Hall, at the south end, the three principals of the roof have been renovated, parts of the wood which had decayed having been removed and fresh pieces of oak bolted in.

Royal Academy of Arts.

The winter exhibition at Burlington House will be devoted to works of Old Masters and deceased British artists, with paintings by the late Josef Israels, Corresponding Member R.A., and of the late E. A. Abbey, R.A. On November 8 election will be made of an Associate to the vacancy occasioned by the death of Mr. Abbey. Unless the King's signature can be appended to the diploma before his Majesty sails for India, Associates can be officially elected during the autumn to fill the places of Mr. W. Bramley and Mr. A. Parsons, recently elected full Academicians.

Tattershall Castle, Lincs.

The Governors of the Manchester Whitechapel Institute have lent for exhibition by the Walpole Society in the Grafton Galleries a large water-colour view of the Castle painted by Thomas Cortin, and first shown by him in the Royal Academy Rooms in 1799.

Preservation of Stone Masonry and Frescoes.

Sir Arthur Church has just retired after more than thirty years' service from the Chair of Chemistry, Royal Academy. He has signalled his term of office by manifold research, and the steps he took for resisting the evil effects of sulphuric acid upon many of our public buildings and paintings. He applied the Baryta process to the walls of Westminster Abbey, Chapter House, and Palace, the Bodleian Library, the Chapel at Holyrood, and Greenwich Hospital, where he restored a decorative painting by Gentileleschi, besides the wall paintings in Westminster Palace. The process is applicable to statuary of bronze and marble placed in exposed situations.

"Nab Wood," Windermere, Westmorland.

The freehold estate known as "Nab Wood," formerly occupied by the owner, the late Geo. A. Pritt, and comprising a modern residence with extensive gardens and grounds on the eastern shore of lake Windermere, has been sold by private treaty by Messrs. Trubshaw & Gibson to Major G. Armitage. Alterations and additions to the house and grounds are now in progress, and are being carried out to the designs of Messrs. Trubshaw & Gibson, who have designed an extensive terrace and garden scheme.

Incandescent Glow Lamps.

The first of the special series of twelve lectures on "Illumination" arranged to take place at Battersea Polytechnic was delivered by Professor J. T. Morris on October 17. On this occasion the lecturer dealt with incandescent glow lamps, laying stress on the enormous progress of the last few years, and the extraordinary difficulties that had been successfully overcome in making metallic filament lamps. The gradual evolution of the carbon filament. Ernest Tungsten, and Tantalum lamps, the method of attaching the filaments, and making allowance for the "sag" were illustrated by a series of lantern slides. The actual filaments used in various types of carbon and metallic filament lamps were mounted intact on one of these slides, and thrown upon the screen in order to show their comparative thinness, and the lecturer subsequently showed that even these fine wires could

support a tension of a 2-lb. weight without snapping. A great variety of the latest types of lamps was also shown, including the test 200 v. 15-c.p. Osram lamp, and the new drawn-wire Mazda lamps. A series of the curves on metallic filament lamps (the test tests of the National Physical Laboratory) also attracted much attention.

Subways in the City.

At a meeting of the City Corporation on the 19th inst. the Streets Committee asked for parliamentary powers to construct a subway for pedestrians across Cannon-street, near the Mansion House Station, at an estimated cost of £16,000. Mr. A. C. Morton, M.P., said it was true that the Mansion House subways are only used by from 12 to 14 per cent. of persons wishing to cross, but even that percentage represented more than 20,000 persons daily, besides those who used the stations. The report was carried. On the recommendation of the Streets Committee the Court sanctioned a subway between the Moorgate-street station of the Metropolitan Railway and the adjacent station in Finsbury-pavement of the Great Northern and City Railway. The Court gave its consent to the introduction of a Bill in Parliament by the London County Council authorising the construction of a tramway in Bishopsgate from the City boundary to Aldersgate-street.

C. S. Rolls Memorial.

The statue erected to the memory of the late Hon. Charles Stewart Rolls, M.A., R.G.S., A.M.I.Mech.E., in Agincourt-square, Monmouth, facing the Shire Hall, unveiled on October 19, was sculptured by Sir W. Goscombe John, R.A. The monument of bronze, 16 ft. high, represents Mr. Rolls habited as in his flight across the channel, and holding in his hands a model of an aeroplane; on the pedestal are bronze reliefs symbolical of aviation, ballooning, and motoring.

MacLagan Memorial Window, Newington Butts.

The Bishop of London will dedicate on October 31 the memorial window to the late Archbishop MacLagan in St. Gabriel's Church, Newington Butts, the church of which the Archbishop was the founder. At the conclusion of his ministrations at St. Gabriel's, his plan for filling the east window was completed only so far as the centre light was executed; in this was depicted, in ascending order, "The Annunciation," "The Crucifixion," and "The Ascension"; exactly what was designed to fill the two side-lights has now been completed. Dr. MacLagan's conception of St. Gabriel took cognisance of the saint's appearance to Daniel and to Zacharias, and these appearances furnish the themes for the lower panel pictures, in the left and right and lights respectively. The upper panels being devoted to the "Agony" and the "Women at the Tomb," occasion has also been taken to fill the two quatrefoils, with angels, which are superimposed, above the two side-lights, and nearly level with the top panel of the centre light, in which is depicted "The Ascension." Messrs. Morris & Sons, Ltd., of 239, Kennington-road, have executed the work.

Art Publications.

The *Connoisseur* announced for publication the 23rd inst. the life and works of Sir Henry Raeburn, R.A., by Mr. James Greig. The volume contains more than fifty illustrations and a catalogue of Raeburn's works. The Christmas Number of the *Art Journal* is devoted to the art of Mr. tanhope A. Forbes, R.A., whose son, by the way, has just entered the schools of the Architectural Association.

Royal Military College, Sandhurst.

The new buildings on the eastern terrace are nearly completed. Six companies of cadets will be accommodated in the two wings of the buildings, which cover an area of almost 1,000 ft. by 200 ft. in extent. The general design is classic in manner; the central block has a Doric portico, with an ionic columnar Order above, and a copper-covered octagonal dome. Covered corridors run the wings to the main block, faced with a granite stone to the first-floor level, and of red brick with stone dressings on the upper two floors; in lieu of the old cubicles the cadets' rooms, thirty-five on each floor, are 1 ft. 6 in. by 9 ft. 9 in., and from 10 ft. to

11 ft. high. The dinner-hall is 156 ft. long, 48 ft. wide, and 24 ft. high to the apex of the domed ceiling. In a vault are four 20-ft. boilers, whose shafts draw all smoke from the furnaces, which heat water for the radiators in the halls and corridors, the pipes in the cadets' and officers' quarters, and the bathing and domestic service systems. The buildings have been erected, at a cost of nearly £50,000, by Mr. T. Rowbotham, of Birmingham, to the designs in every detail of Mr. H. B. Measures, M.V.O., F.R.I.B.A., Director of Barrack Construction, War Office; Mr. E. Peers was chief clerk of the works. The whole interior of the older buildings, erected in 1811-2, is to be reconstructed forthwith.

Faculty Pews.

The holding of faculty pews in our churches is somewhat anomalous in these modern times, but in some churches their removal is to be deprecated, as destroying the character of the church and the stamp of its antiquity; the old oak pews, too, often being removed to give place to less cumbersome modern seating. It is not often, however, that the rights of faculty pewholders are shown to constitute an obstacle to securing the safety of the rest of the congregation. The Vicar and Churchwardens of the celebrated Priory Church at Christchurch have recently applied for a faculty for the removal of the galleries from the north and south transepts and for other improvements, but this was opposed by the holders of certain faculty pews. The Diocesan Architect had made a report that the north gallery, with its narrow staircase, was a veritable deathtrap in case of fire, and the Chancellor, in his judgment, said that unless the owners of the faculty pew in that gallery undertook to repair the gallery and to remove this danger a faculty would be issued for the removal of the gallery, a faculty pew being provided for the holders in some other agreed position in the church. This seems a reasonable condition to impose, and in this case the galleries would appear to offer no advantages, as the report made by Mr. T. G. Jackson, R.A., Diocesan Architect, sets forth that the galleries of early 15th century period are ugly and obstructive, and in the case of the north gallery dangerous by reason of its narrow staircase, and that their removal would greatly contribute to restoring its ancient beauty to the interior of the church. The learned Chancellor granted a faculty for the other objects of the petition, comprising the transfer of the organ-blowing chamber from the south gallery to the transept below, the provision of a second communion table outside the choir-screen, and reseating in the transepts and nave. The costs of the hearing and opposition must, he said, devolve upon the applicants.

BOOKS.

The Cathedrals of Central Italy. By T. FRANCIS BUMPUS. With fifty-one illustrations. (London: T. Werner Laurie, Clifford's Inn, Fleet-street. 16s. net.)

MR. FRANCIS BUMPUS is a voluminous writer, with an evident love for architecture and a keen appreciation of the masterpieces of the art. He writes enthusiastically of work he admires, and though his gossipy narrative is sometimes a little too discursive, it must be admitted that his volume is both readable and instructive. It is intended, we presume, principally for the educated layman interested in the works of architecture, but it contains much that will appeal to the architect. Mr. Bumpus has the right perception of the value of architecture to a nation when he says: "Architecture and the arts subsidiary to it not only throw a lustre on the reign of kings, but in the monuments they erect sum up most completely the cultivation and tendencies of the nation, keep its memory green, and where its glory has departed and all else has been swept away, still point to the greatness and intelligence of the people." There is nothing new in the observation, but the point is worth making whenever opportunity occurs, especially in such a work as this. The first chapter is devoted to "The Journey," the author having a great deal to say in these seventy-eight pages—not always about architecture—that is interesting, giving the

result of careful observation and investigation; and this interest and impression are sustained by a perusal of the subsequent chapters. There are two chapters on the arts subsidiary to architecture:—I. "Stained Glass Painting"; II. "Sculpture"; followed by a chapter on "The Romanesque" and three chapters on "The Gothic." The work includes an index and over fifty illustrations, two or three of which are coloured plates from paintings by Stafford Leake. This is one of the best works which, in our opinion, the author has written, and we are glad to call attention to it.

Practical Mathematics and Geometry. By EDWARD L. BATES and FREDERICK CHARLES-WORTH. Part III. Advanced Course. (London: B. T. Batsford. 1911. Pp. 776. 5s. net.)

THIS book, with Parts I. and II., forms a progressive course of instruction so arranged that students can acquire by easy stages the knowledge necessary for passing the technical examinations of the Board of Education and for assisting them afterwards in practical work. The present volume has been written to cover the extended course resulting from the recent decision of the Board of Education to discontinue Stage I. Examinations in practical mathematics and geometry. The book is very clearly written, well illustrated with diagrams, and excellently produced. It will be found a valuable guide for advanced students.

Mill and Factory Wiring. By R. G. DEVEY, A.M.Inst.E.E. (London: Constable & Co., Ltd. 1911. Pp. 197. 2s. net.)

A very handy little book, written from the practical standpoint and free from all complicated technical matter. The installation of wires and cables by various methods is dealt with clearly, and the numerous diagrams of connexions for all types of electrical machines in general use should enable the wireman to wire and connect to any generator or motor with the necessary auxiliaries.

Practical Advice on Gasfitting. By R. HALKETT. (London: Walter King, Office of the *Journal of Gaslighting*, 11, Bolt-court, E.C. Price 2s. 6d.)

THIS little work is by a man who understands his subject, for Mr. Halkett is Assistant Superintendent of the City of Leeds Gas Mains and Distribution Department. It is a practical little book, the information in which is clearly stated, and the facts, as the author claims, can readily be grasped. The work contains several diagrams, etc., in order to make the author's meaning clear.

Electrical Mining Installations. By P. W. FRENDENACHER, A.M.Inst.E.E. (London: Constable & Co., Ltd., Orange-street, Leicester-square, W.C. 2s. net.)

THIS volume is intended specially for colliery engineers and contractors engaged in the installation of electrical plant for mining purposes. The book includes chapters on generating plant, generating-station switch gear, electric haulage, electric pumping, and electric ventilating. The work contains several explanatory diagrams.

Guide to Patents, Trade Marks, and Designs. (London: J. S. Withers & Spooner, Chartered Patent Agents, 323, High Holborn.)

THIS is the fifth edition of a useful little guide the object of which is to explain to inventors the elementary steps necessary in connexion with the protection of inventions and the registration of trade marks and designs. It is not exhaustive, but deals with points on which inventors often require information.

BOOKS RECEIVED.

ALL SAINTS' CHURCH, HORSEBATH. By Catherine E. Parsons. (London: Cambridge University Press. 5s. net.)

PYROMETRY. By Chas. R. Darling. (London: E. & F. N. Spon, Ltd.)

REINFORCED CONCRETE CONSTRUCTION. By M. T. Cantell, Lic.R.I.B.A. (London: E. & F. N. Spon, Ltd. 4s. 6d. net.)

CHURCH STUDY. By M. M. Penrose. (London: The National Society. 4s. net.)

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. E. White (Chairman) presiding.

LOANS.—A loan of 15,000*l.* is to be made to the Hampstead Borough Council for the purpose of street lighting by electricity in use.

The Kensington Royal Borough Council is to receive a loan of 550*l.* for acquisition of certain property, and a loan to the Guardians of Holborn Union of 4,700*l.* for Poor Law purposes.

SCHOOL, STEPNEY.—It was reported by the Education Committee that the Senrab-street School, Stepney, is to be enlarged to provide accommodation for 1,162 children, and that plans had been approved for that purpose.

SCHOOLS.—The York-road School, Islington, is to be enlarged at a cost of about 1,190*l.* Heating apparatus and electric lighting are to be installed at the Great College-street School, St. Pancras. Various alterations are to be carried out at George Green's School, Poplar.

NEW SCHOOL.—The same Committee also reported that revised plans have been approved for the erection of a new Rural Council School at Dockhead, Bermondsey.

RECONSTRUCTION OF OFFICES.—The girls' offices of the St. Barnabas School, Hanover-square, are to be reconstructed, and the Committee have approved plans for that purpose.

CLOAKROOM.—A new cloakroom is to be erected at the St. Joseph's Roman Catholic School, plans having already been passed for the work.

CHIEF FIRE-STATION.—In a report by the Fire Brigade Committee it was stated that the extension of the chief fire-station has now been completed. The testing ground at this station is being lighted by electricity at a cost of about 55*l.* Electric lighting is also to be installed at the east and north-east blocks of this station at a cost of about 235*l.*

WHITEFRIARS FIRE STATION. Alterations are to be carried out at this station at a cost of 1,555*l.*

DRILL TOWER.—A drill tower is to be erected at the Bethnal Green Fire Station at a cost of about 100*l.*

OLD OAK ESTATE.—In a report of the Housing of the Working Classes Committee it was stated that good progress had been made with the erection of houses on this estate, and that it was proposed to erect eighteen more cottages and three shops on the estate.

LIBRARY, EDUCATION OFFICES.—The Establishment Committee reported that it was necessary to provide additional accommodation for the books in the library at the Education Offices, and that the estimated cost was 113*l.* 10*s.*

ST. PAUL'S BRIDGE.—In a joint report of the Highways Committee and Improvements Committee it was recommended that Parliamentary powers should be sought for the construction of tramways from Southwark-street over the proposed new bridge. It was stated by the Finance Committee that this proposal would require the expenditure of 350,000*l.* towards the cost of widening St. Paul's Churchyard and the construction of tramways and subways.

An amendment was put forward by Mr. J. D. Gilbert asking that a scheme should be submitted for the provision, on the basis of the Home Office suggestion, of a new road in continuation of the proposed southern approach to the bridge.

This amendment was opposed by Lord Alex. Thorne, who contended that it was not wise to construct such a new road until they knew the character and volume of the traffic which would pass over the bridge.

It was also pointed out by Mr. Hayes Fisher that it would probably be six or seven years before the bridge was finished, and experience showed that it was not always an economical policy to buy land in advance of the time when it would be wanted.

Further consideration of the matter was then adjourned.

ADMINISTRATIVE ARCH IMPROVEMENT.—It was reported by the Improvement Committee that terms had been arranged for the acquisition of all interests in the property needed for the Mall and Charing Cross improvement.

CORRESPONDENCE.

The R.I.B.A. and the Society of Architects.

SIR,—In the Report of the twenty-seventh annual meeting of the Society of Architects, published in your last issue, I find the following:—

"The meeting was consequently adjourned, and in due course your Council received an intimation from the Council of the Royal Institute that they proposed to make an application to the Privy Council for a supplemental Charter, which would give the necessary powers to enter into the agreement."

This I believe to be the first information that any ordinary member of the R.I.B.A. has received that such an intimation had been given by the Council of the Royal Institute to the Council of the Society of Architects, and I am astonished that such an arrangement should have been made without consulting the general body, and that it should have been left to the Society of Architects to declare the manner by which they hope to be absorbed. W. H. BURR, A.R.I.B.A.

* * * The report quoted by our correspondent does not exactly cover the state of affairs. We understand that the R.I.B.A. agreed to take steps towards securing a Charter, and the first of these steps would be to obtain the authority of the general body, which has not yet been done.—[Ed.]

The Breaking-up of Landed Estates.

SIR,—The breaking-up of so many landed estates throughout the country will remove an influence which for centuries has been identified with our great landowners in the preservation of natural scenery. This may be seen on all sides in town and country; in London it gave us the 400 garden squares of which we may well be proud, and in the country that influence has preserved the landscape in innumerable places.

As this influence wanes, can we look for another conserving force without the intervention of a public authority? This question appears to me to be answered in the affirmative by a landowner who, in submitting to auction lands in Eynsford and Farningham, bars the erection of objectionable buildings by a condition of sale that each building shall be subject to the approval of the Royal Institute of British Architects. All purchasers being under like restrictions, all are alike benefited, and the community gains.

Those who know the valley of the Darent, with Lullingstone Park, the seat of Sir William Hart-Dyke, and the Elizabethan mansion of Frank's Hall, recently purchased and restored by Earl Bathurst (whose ancestors occupied it in Tudor times), will appreciate this effort to preserve the old-world setting of a valley which owes so much to the celebration of Arbor Day by the annual planting of shade trees in the thoroughfares and fruit-trees in the cottage gardens of Eynsford and Farningham.

This proposal to substitute the influence of the Institute of British Architects for that of the great landowner will, I trust, be cordially supported. MARK H. JUDGE.

White-Lead.

SIR,—You have a "Note" in your issue of the 20 inst. condemning the use of white-lead as a pigment on the ground of its being necessarily injurious to the health of the painter. During forty-five years I employed many thousands of painters, and can say that in point of health and healthy appearance they compared quite favourably with any other class of operative. Some of these men I have known for thirty, forty, and fifty years. During this time there have been a few cases of what is called "painter's colic," which have mostly responded to treatment in a few days; I can remember but one case causing death, and in this case the victim was a zealous, good workman, but personally untidy and careless of himself.

Undoubtedly there are some constitutions "predisposed" to being affected by lead, and these persons should never become painters.

There are certain conditions of work, well understood and for the last sixty years acted on by all good painters and employers, indispensable to the safe use of white-lead; these are personal cleanliness and the invariable washing of hands before meals and before leaving work. It becomes a fixed

habit with the men, and facilities for it are a recognised part of the employer's provision of materials and plant on a painting job, as it is one of the foreman's duties to see that the practice is observed. If it be true that there is lately an increase in the number of cases of lead-poisoning reported, I think this may be explained in two ways:—Firstly, that for cheap contract work many casual hands are taken on who are not trained painters; secondly, that since compensation claims for lead-poisoning can be made on the employer, even after a few days' engagement, "lead symptoms" have become more frequent. Great efforts are made by those interested in "white zinc" manufacture to make the most of the faults of "white-lead," but the latter has qualities for which, in our climate, zinc is no substitute.

It is many years since I have employed any painter, nor have I the remotest interest in lead manufacture, but my own long experience does not confirm this determined outcry against a valuable material. J. D. CRACE.

Architects and Shop Designs.

SIR,—Your correspondent, Mr. Vale, who writes in your issue of September 1, finds shopkeeper clients more difficult to deal with than they are here. The large drapers, etc., who have had considerable experience of London shops say that they gain by setting back the showcase, and form an arcade along the front, as the area of glass can be greater by designing the divisions with recessed bays, and this, they consider, compensates them for the loss of area. Their customers are also able to shop in comfort in all weathers, as they are protected from rain and sun. We experience no trouble from shadows. SINGAPORE. ARCHITECT.

INTERCOMMUNICATION COLUMN.

Church of St. John the Evangelist, Horselydown.

SIR,—Will you oblige by informing me if St. John's Church, Southwark, county of Surrey, is in existence now? I am anxious to know if a monument erected to Benjamin Kidney now exists. It was erected in accordance with his will in the year 1787 or 1788 in the old church. I find that the monument erected to John Gower, who died in 1402, has been removed from the Chantry of St. John, where he had been buried in accordance with his will, and was re-erected in St. Mary's Overies, now St. Saviour's, Southwark.

I find on one map of London St. Olave's Union and a church at the back of the Union, from High-street, Borough, down St. Thomas-street, Crux-street, to Artillery-street; this last street should be in front of this old church, marked on my map. On examining the list of churches I fail to find a St. John, Southwark. You have given us many particulars on churches; can you kindly oblige me? W. INNS BROWN.

* * * Our correspondent's letter relates clearly to the existing Church of St. John the Evangelist, Horselydown, in Bermondsey, built in 1731-2 as one of the "Fifty New Churches." There is no connexion, so far as we know, between that church and the St. John's Chapel, or Chantry, that stood formerly in the north aisle of St. Mary Overies (St. Saviour's), wherein John Gower founded a chantry and was buried, 1408. His monument was removed from St. John's Chapel into the south transept, and repaired and recoloured *ex impensis* the Duke of Sutherland, in 1832; it was returned to its original position fifteen years ago, in the north aisle of the nave, as restored, of Southwark Cathedral. A reply concerning the Kidney monument could doubtless be obtained from the Curate-in-Charge, St. John's Rectory House, Fair street, Horselydown, S.E.—[Ed.]

MORTAR INSPECTION AT FLYMOUTH.

The Borough Surveyor reports that he had examined during the past month four samples of mortar taken from builders. Three of these samples were in conformity with the by-laws, but the fourth was found to be deficient in lime, due to the use of slaked lime instead of unslaked.

EDITORIAL SUMMARY.

The Arrangement of Our Museums" is the title of the leading article, which deals with the question now in progress in the columns of *Times*.

A second leading article dealing with new methods of measuring the vitiation of air appears on p. 468.

In Notes (p. 469) will be found observations: "The Railway Commission"; "The cumulation of Books"; "The Crystal Palace"; "Indian Art and Archaeology"; "Vimbleton Common Extension"; "Changes in the Admiralty"; "The Architect as Decorator."

A report, by Mr. R. G. Lovell, on the Ninth International Congress of Architects, held in Rome at the beginning of the month, was read at the last meeting of the Society of Architects. Mr. Lovell, who was the Society's official delegate at the Congress. An abstract of the report appears on p. 470.

An abstract of a paper on "The Microscopical Examination of Architectural Material," recently read before the Glasgow Architectural Craftsmen's Society by Mr. John S. Glen Imrose, lecturer on metallurgy at the college, given in this issue, p. 471. Some illustrations accompany the report.

An abstract of a lecture on "Landscape Architecture," recently read by Mr. Thos. H. Watson, Hon. A.R.I.B.A., before the Gloucestershire Architectural Association, appears on p. 474.

Archaeological Societies (p. 475) include brief notices of meetings of the Surrey Archaeological Society (Visit to Charterhouse) and the Royal Archaeological Institute ("Art and History in Westminster Abbey").

Book notices (p. 477) include: "The Cathedrals of Central Italy"; "Practical Mathematics and Geometry"; "Mill and Factory Lighting"; "Practical Advice on Gasfitting," etc.

In our Correspondence Column (p. 478) will be found letters on: "Architects and Shop Signs"; "White-Lead"; "The Breaking-up of Landed Estates"; "The R.I.B.A. and the Society of Architects."

The Monthly Review of Civic Design, illustrated (p. 481), consists of: "A Notable Paris Improvement"; "Schöneberg Electric Railway"; and Notes.

The Building Trade Section (p. 485) includes: "The Railway Commission Report"; "Duties and Land Values"; "The Employers' Parliamentary Council"; "Reinforced Concrete in Underpinning"; "London Master Builders' Association"; "Government Contracts"; "Projected New Buildings in the Provinces"; "Applications under London Building Acts, 1904 to 1909," etc.

Some awards accorded to British exhibitors at the Turin Exhibition are given on p. 489.

Law Reports (p. 489) include brief reports of the following cases: "Schworer v. Bethnal Green Borough Council"; "Minter v. Waldstein."

In Legal Column (p. 489) some observations will be found on "Deposits on Contracts for Sale," and "Oil on Roads."

MEETINGS.

FRIDAY, OCTOBER 27.

Glasgow Technical College Architectural Craftsmen's Society.—Professor Gourlay on "The College Diploma and Certificate Courses in Building." 7.45 p.m.

ILLUSTRATIONS.

No. 93, Mortimer-street, W.

THE accompanying drawing of this building, photographs of which appeared in the *Builder* of October 15, 1910, shows a treatment for premises planned to contain shops and show-

rooms in the front on either side of a corridor leading to a hall in the rear, while a staircase connects a second hall in the basement and office rooms in the upper part of the building.

The elevation is carried out in Portland stone, with bronze wreaths in the frieze, the shield and attendant ornaments and the fanlight over the entrance doorway being also in bronze. The windows are of wrought-iron glazed internally.

Messrs. William & Edward Hunt were the architects, and Messrs. H. & E. Lea the general contractors.

Business Premises, Gray's Inn-road.

THIS building, recently erected by Messrs. Hart & Waterhouse, comprises offices and a board-room, occupying the whole width of the building on the first floor. Lawrence's 2-in. red bricks and Portland stone are employed

Mercury. By Mr. A. Stanley Young.

MONTHLY REVIEW · of · CIVIC DESIGN.

La Chapelle du Val de Grâce, Paris.

[Photo. by Kuhn.]

A NOTABLE PARIS IMPROVEMENT.

UCH measure of poetic justice as circumstances permit is at last being paid to the memory of the greatest artist of the Renaissance in France, the church of the Benedictine Monastery of the Val de Grâce, in Paris, should have been the crowning achievement of the matured genius of François Mansart. Its history is one of the tragedies of architecture. Founded by the Emperor of Austria, the wife of Louis XIII., in fulfillment of a vow to build a noble church on the birth of the Dauphin, the foundation was laid by Louis XIV., when a child of seven years old, in 1645. François Mansart was the architect, but he had been in charge of the works for some time and had raised the walls

some 9 ft. above the floor level he was discharged and superseded by Lemercier, who, in turn, was followed by Le Muet and Le Duc.

Shortly after this crushing blow Mansart was, for political reasons, deprived of all his employment by the Court, and finally died in 1666.

Judging from the plan and general idea of the building, and also from the distinguished character of the interior work as begun by Mansart, this church should have been one of the masterpieces of the Renaissance, and even now the liberties taken with Mansart's design by his inferior successors cannot prevent it from remaining one of the most interesting. As it stands to-day its

chief interest consists rather in its lay-out and approach, and the manner in which the central dominant feature is supported by the lower buildings of the forecourt, than in the actual features and details of the exterior, which fall only too short of what might have been had Mansart been permitted to finish it.

But, although it is impossible now for a more appreciative generation to restore Mansart's conception to its original artistic completeness, it has been found possible to deal with its surroundings on the lines he suggested.

The plan of the church is a Latin cross with a dome on the intersection. This is generally acknowledged to be a fundamental mistake, as the nave or narthex of the

Val de Grâce, Paris: Sketch Plan of Recent Improvement.

long arm of the cross must always cut off the view of the central dome, as at St. Paul's, or as at the Panthéon in Paris, where the Latin cross is said to have been adopted instead of the more natural Greek cross, in deference to ecclesiastical convention.

It is to be presumed, in the absence of any definite record to the contrary, that in this case also it was forced upon Mansart against his better judgment. Be that as it may, he appears to have intended this treatment and to have foreseen its consequences, as he designed a semicircular place, with a fountain and pyramid in the centre, on the opposite side of the Rue Faubourg St. Jacques, to enable the spectator to get far enough away from the building to see the dome to advantage. Had the dome been built on a Greek cross, thus bringing it farther forward, this special arrangement would not have been necessary, as the depth of the forecourt, some 200 ft., would have been sufficient to have given a proper view from the Rue Faubourg St. Jacques; although, of course, such a semicircular place would, in any event, have added considerably to the general effect.

It is here that the enlightened and sympathetic administration of the city of

Paris has found an object worthy of its solicitude. No one of the many admirable improvements which it has in hand or contemplates for the future will give keener pleasure to the lover of art than this homage paid to the memory of the supreme genius of the Renaissance.

After 250 years François Mansart still lives, and his ideas fructify. The Municipality of Paris had already laid out the Rue Val de Grâce, giving a vista of the dome from the Boulevard St. Michel, and it is now engaged in forming the semicircular open place opposite the Court of Honour, as indicated in the sketch plan.

We cannot help contrasting the attitude of the City of Paris towards this historic monument with that adopted by the City of London towards the approaches and environment of St. Paul's, a building of far greater relative importance in the life of the city. But after such an encouraging instance of the immortality of a true idea as is afforded by the improvement at the Val de Grâce we feel justified in believing that Wren's idea will, in the fulness of time, come to fruition also.

A further interesting connexion between these two buildings is to be found in the unusual similarity between the general treatment and the detail of the internal order in both buildings. That at the Val de Grâce should be the personal work of Mansart, and as such, and as one of the latest examples of the work of the great artist of the day, it would naturally have excited the attention of Wren when studying the buildings of Paris. To those interested in such questions it may throw some light on the methods of Wren and on the debatable question of the amount of French work in St. Paul's.

SCHÖNEBERG ELECTRIC RAILWAY.

Zeitschrift für Bauwesen contains a lengthy article, with many interesting detailed illustrations, of an underground electric railway in the neighbourhood of Schöneberg, one of the suburbs of Berlin. We publish a view, with plan and section, of the Stadtpark Station, where the railway crosses at the lower ground level with the high level road taken over it.

Advantage has been taken of this rather unusual arrangement to obtain an interesting architectural composition, which should, we think, be very effective. There is evidently no

reason why these engineering schemes should not prove an added charm to the neighbourhood if only they are rightly handled.

CIVIC DESIGN NOTES.

The Housing of Naples.

DIFFICULTIES in regard to dwellings are alluded to in an annual report of the British Consul at Naples, Mr. Churchill, who says it seems impossible to arrive at a criterion as to the real extent of commercial development of that city. Streets with handsome up-to-date piles of flats the rents of which are in advance of anything hitherto heard of there—are occupied as well as they are licensed for letting; and yet rents are continually rising, showing unmistakably that there is a demand for more housing space. In the more densely-populated quarters of the town there are no tenement houses with vast rooms. Tramway lines are being extended in order to bring the outer suburbs into closer relation with the town, so that the labouring classes may be able to find lodgings there, and cheap workmen's services have been instituted at certain hours of the day in order to enable workpeople to avail themselves of housing at a larger radius from the city proper. In order further to find a solution for the burning question of housing an ever-growing population the Government is projecting a law to encourage the building of cheap dwellings which shall be exempted from property tax for a period of ten years, whilst houses for the better classes are to be exempted from taxes for the period mentioned. These remedies are being general all over Italy.

The Civic Council of Naples, in order to cope with its own local problem, has granted the sum of 12,000*l.* a year for the space of fifty years free of interest and reimbursement, to an institution created for the construction of popular dwellings, the first payment to begin with 1912. The objects of the municipality is to enable the construction company to borrow money cheaply in order that the work may be prosecuted expeditiously. The Civic Council requires the popular dwellings not to exceed a stipulated rent. The neighbouring town of Castellammare has been authorised to hold a lottery not to exceed 40,000*l.*, free of taxes, for the benefit of the company which is to construct workmen's dwellings there.

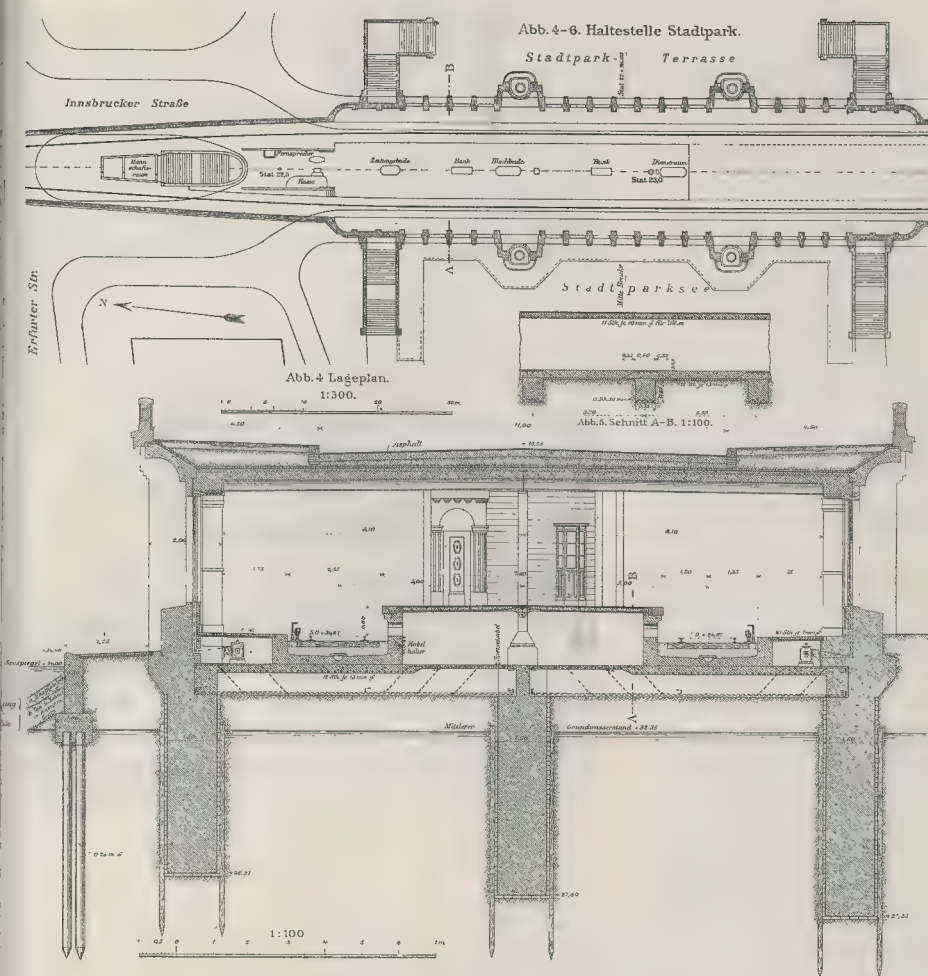

A Forgotten Embankment Scheme.

A SCHEME for a quay at the north side of the river from Charing Cross to Blackfriars appears to have been suggested in 1825 by a Lieutenant Colonel Trench, and to have been taken up and promoted as a financial enterprise by certain more or less important people of the

Electric Railway Station, Schöneberg.

(From *Zeitschrift für Bauwesen*.)

Electric Railway Station, Schöneberg.

(From Zeitschrift für Bauwesen.)

ved in the light of a commercial specula-
t is difficult to imagine it successful, and
be owing to this fact that nothing seems
ve come of it. This perhaps is not

altogether to be regretted, for, considering the
standard of work of that day, it is doubtful
whether it would have proved to be an artistic
success either. Such an undertaking is only

excusable if done supremely well, and for that it
was 150 years too late or too early.

The view we illustrate shows the treatment
of the bank from Charing Cross to Waterloo

Part of an Improvement Scheme for the Embankment proposed in 1825 by Lieut.-Colonel Trench.

Bridge. The idea seems to have been to carry on the basement treatment of Somerset House with water-gates giving access to streets or wharfs behind the screen. This treatment has more than once been proposed for the south bank of the river as producing a fine monumental effect, while providing facilities for the warehouses and docks of a busy commercial quarter.

Whatever may be said against such an arbitrary treatment of the river frontage, its general effect, however tame and uninteresting it might have been in detail, would at least have been more dignified than the present jumble of uninteresting buildings on the western side of Waterloo Bridge. Save for the Embankment, which forms a fine base-line, this part of the river bank is as much in need of comprehensive treatment to-day as it was in 1825.

Rochester and Town Planning. A SCHEME formulated by Rochester Corporation has failed to secure the sanction of the Local Government Board upon the ground that Crown lands are exempted from town planning schemes.

Workmen's Dwellings in Greenock. MANY houses in the poorer part of Greenock having been found undesirable for habitation they have been closed, and the Corporation has appointed a Committee to report on the possibility of rebuilding under the Housing and Town Planning Act, 1909.

Street Widening at Bristol. ON September 22 a Local Government Board inquiry was held in respect to various proposals of the Bristol City Council for street improvements. These included the widening of Victoria-street, St. Philip's Marsh; West-street, St. Philip's; Victoria-road, Bedminster; Hotwell-road; Rupert-street; and Cheltenham-road. The total sum proposed to be borrowed for these purposes was 2,000*l*.

Dublin Citizen's Association and Town Planning. THE Executive Committee of the Association noted with satisfaction that as an outcome of the suggestion made in the paper read on the subject at the UI Breasail Exhibition and Congress of the Royal Institute of Public Health, under the auspices of the Association, by Mr. James Vincent Brady, C.E., steps are being taken for the formation of an Irish Housing and Town Planning Association of a permanent character. The Committee were further gratified to perceive that the Public Health Authorities of the city were taking active steps to give effect to the suggestions contained in the pamphlet issued by the Association dealing with the powers vested in the Corporation under the Housing of the Working Classes Acts.—*Freeman's Journal*.

Twickenham Town-Planning Scheme. A STATUTORY meeting of owners and lessees of property in Twickenham was held at the Town Hall recently to consider the town-planning scheme promoted by the District Council. The Surveyor (Mr. Pearce), in describing the scheme, said that the area scheduled comprised 1,880 acres, of which 1,520 acres were within the parish of Twickenham. On the Surrey side of the Thames a strip of land, varying in width from 100 ft. to 300 ft., and extending from Richmond to Kingston, had been secured and vested in the Surrey County Council, but there was nothing to prevent the adjoining land from being disfigured by the erection of factories and other unsightly buildings. Important new means of communication could also be opened up, including a bridge from Eel Pie Island.

Mr. Cole, who represented the War Office, asked for Kneiler Hall and Hounslow Heath to be excluded from the scheduled area, stating that the Local Government Board had no power to sanction the inclusion in the scheme of any Crown property.

This exclusion of Crown property from the

Bruxelles-aux-Champs.

Plan d'ensemble et Profil en Long de la jonction des Boulevards de 2^e ceinture avec ceux de 1^{re} ceinture.

scope of the Act is a point that may cause trouble in the future unless those responsible for the administration of the Crown lands show an equal amount of discretion and good taste when carrying out works within the area of a scheme. Considerable annoyance was caused in Edinburgh by the way in which the Government officials ignored the amenities of the neighbourhood in one of the residential streets. In the case of Hounslow Heath and Kneller Hall we presume the main idea of the War Office would be to preserve them as they are now, and not to promote building schemes which might clash with the general town planning scheme.

Extension of Streatham Common.

It is proposed to extend Streatham Common by the acquisition of the Rookery Estate of about 3 acres at a cost of 3,000*l*. The London County Council, having inquired whether the Wandsworth Borough Council would be prepared to subscribe towards the expense, a sum of 300*l*. was voted by the Wandsworth Council, in spite of the opposition of one of the Councillors, who thought that the Common was big enough, "taking into consideration the dog-in-the-manger attitude of the London County Council in refusing to give up a small corner of the Common for a public improvement." If the London County Council had not taken up this dog-in-the-manger attitude we presume the Common would not be big enough.

This scheme, by E. S. Brassey, architect, for dealing with the whole problems of the outskirts of Brussels, and for taking advantage of the open spaces and pleasant rural aspects still remaining in close proximity to the city, is, in the authors' words, an attempt to transform the circular expansion of the town into a star-shaped figure, between the points which would be preserved for ever light and breezy intervals promising better things beyond.

It was recently submitted to the Société Centrale d'Architecture, and formed the subject of a paper at the Town Planning Conference at the Royal Institute of British Architects, by whose courtesy we are enabled to publish this plan.

A Possible Garden Suburb.

A RESIDENT in Beulah writes to express surprise that at a time when so much has been heard of a high standard of living, and beautiful surroundings as necessities for a place of residence, the fine wooded slopes of Norway should have escaped the notice of those who look out for the nucleus of a garden suburb. Within easy reach of town, and adjoining main roads already paved, drained, and lighted, are acres of meadows and timbered slopes as high as the dome of St. Paul's, commanding extensive views of the Surrey Hills, and with a statistical death-rate of only 8 per cent.

THE BUILDING TRADE.

RAILWAY COMMISSION REPORT.

THE Royal Commission appointed to inquire into the working of the conciliation scheme in connexion with railways is to be congratulated upon having ended its labours, and issued a unanimous report in a remarkably short space of time, and any of the delay too often associated with the appointment of Royal Commissions. As far as the general public is concerned, by the most important finding of the Commission is that which relates to the recognition of trade unions. On this point the Commissioners report:—"We think that, with great responsibilities, the companies, and should not, be expected to permit intervention between them and their men subjects of discipline and management. Companies, it will be remembered, control that any intervention between them and the men on questions of discipline management would render it impossible for companies to carry out their statutory duties, and would endanger the public safety. Conciliation Boards, according to the recommendations of the Commissioners, as heretofore, deal with questions relating to rates of wages, hours of labour, or conditions of service than matters of discipline and management, and, as regards the Conciliation Boards, are proposed to be given to the men to act as a secretary, whether an employee or a outsider, who shall act as their advocate, shall not have power to vote unless he be elected member. Under the scheme of such a power was not conferred until the stage of conciliation an arbitration—had reached, but under the new scheme the fact that the men's advocate should have no voice in the proceedings in the earlier

comprehensive scheme of conciliation is proposed by the members of the Commission into the details of which we do not intend to enter here; the provisions of the scheme include the abolition of the Central Board, which, it will be remembered, was a body which obtained support from witnesses on both sides, and they, as far as possible, are directed to securing finality for the decisions of Conciliation Boards. Thus Art. 46 lays down that "All settlements arrived at, whether by agreement of the two sides or by decision of the Chairman, shall be final and binding for the periods of operation on both the company and the employees, the ratification of any of these parties being required." In connexion, however, the Commissioners point out that they have not considered it duty to prescribe how contracts are to be enforced nor how the breach of them should be penalised; but they make an appeal to railwaymen to maintain the high standard and tradition of the service. Existing agreements and contracts, it is recommended, should remain in force until July, 1912, and thereafter, unless altered or nullified, the new scheme is to be in force until November, 1914.

As far as can be seen on first inspection, the Commissioners have not only worked expeditiously, but thoroughly, and have produced a report deserving, at any rate, of careful consideration by all those who have any interest in the building trade.

During the sittings of the Royal Commission have abstained from making any comment on the English railway strike and the evidence given before the Commissioners, but now the question is no longer *sub judice* we remark on the extraordinary absence of grievances disclosed in the evidence which justify the men in the action taken by them in dislocating the whole carrying trade of the country. The Commissioners do not find the companies guilty of any obstructive policy to prevent the full fruition of the scheme of 1907. On the contrary, they find both sides considered arbitration as the best method of settling disputes, and that the earlier channels were in consequence somewhat neglected. The Report appears to have been received with much dissatisfaction by a

considerable body of railway workers—probably, as we hope, the result of not knowing what the Report really recommends.

That some grievances may exist in the railway service as in other industries no one would deny for a moment, but in the interests of the men we would urge them never again to be led into inflicting such grievous loss on the community and alienating the public sympathy by the ill-considered actions which have characterised the recent strikes, and for causes so little apparent.

DUTIES ON LAND VALUES: REPORT OF COMMISSIONERS.

THE Report of the Commissioners of Inland Revenue, dealing, as it does, for the first time with the duties on land values under the Finance Act, 1909-10, contains some information of interest, especially to those who, like builders, have an interest in dealings with land.

The Commissioners state that the number of hereditaments to be valued in the three kingdoms approximates some 11,000,000, and that some years must elapse before the provisional valuations can be completed; they also refer to the parallel of the Domesday Book, and mention the fact that in one case at least property has been found to remain in the same family since the original Domesday Book record—a fact historically interesting.

The Commissioners observe that "the increment value duty in the nature of things cannot be expected to yield much during the early years of its existence," and the truth of this observation is apparent; they also observe that, pending the setting up of the machinery of valuation, the collection of the reversion duty and the undeveloped land duty has been retarded, but it surely must be a matter for surprise that the duties on land values have but yielded 520,800l. In this sum is apparently included the mineral rights duty, which is stated to have realised the full amount expected, and from the total have to be deducted the heavy expenses incidental to the valuation, including the salaries of a very large staff.

Having regard to the observations of the Commissioners as to the difficulties to be encountered, and the feeling of general uncertainty engendered among landowners by this Act, the question may well be asked whether any other form of taxation more equitable in its incidence, less cumbersome in its machinery, and less liable to injure already depressed industries could not have been devised.

Under the heading "Reversion Duty" the Commissioners comment on the unexpectedly small number of returns, but 559 accounts having been received, and the duty paid in respect of undeveloped land duty appears to have been 1,189l. in 1909-10 and 1,162l. in 1910-11.

There is much other matter in the Report worthy of study, but we must refer our readers to the Report itself for further information.

THE EMPLOYERS' PARLIAMENTARY COUNCIL: THE TRADE DISPUTES ACT (1906).

THE following is a copy of a Memorial sent by the Employers' Parliamentary Council to the Prime Minister on October 20:—

"The undersigned Central Employers' Associations connected with the various industries in the United Kingdom beg leave most humbly to call your attention, and the attention of His Majesty's Government, to the grave evils which have arisen in consequence of the Trade Disputes Act, 1906, and to the present combination of labour unions for the purpose of promoting national strikes fraught with incalculable loss and immense suffering to the community.

It is submitted, that recent events have demonstrated that picketing during trade disputes and strikes results in intimidation, frequently accompanied by outrage, violence,

and destruction of property; and that the "peaceful persuasion" of a mob of unlimited numbers, who may "attend at or near a house or place where a person resides or works or carries on business or happens to be," is a form of tyranny so gross and monstrous as to completely negative the rights of every law-abiding citizen who declines to subject himself to labour-union domination.

It is also submitted that, the law having relieved labour unions of responsibility for their actions during trade disputes, these bodies are thus specially privileged to do wrong to others, and that such immunity has resulted in great injury to the trade and commerce of the country.

It is further submitted that the federation of the labour unions of the United Kingdom into one gigantic body having for its object the organisation of strikes on a national scale is a conspiracy against private freedom, industrial peace, and national well-being, with which no country governed by just laws should be menaced.

It is therefore most respectfully urged:—

I. That picketing should either be rigorously suppressed or the number of pickets should be limited to two, and such pickets should be required to wear a distinguishing badge, and to attend only where a person works or carries on business.

II. That unions, whether of workmen or masters, should be subjected to the ordinary law of the land, and made responsible, like all other classes of the community, for their actions.

III. That a federation of unions for the purpose of "paralysing the country" by means of a general strike or lock-out, throwing all industries and communications into disorder, and stopping the food supplies of the nation, should be suppressed as an unlawful combination and immediately so proclaimed."

The memorial is followed by the names of a number of employers' associations, including the Employers' Parliamentary Council; the National Federation of Building Trades Employers of Great Britain and Ireland; London Master Builders' Association; Scottish Building Trades Federation; the Glasgow and West of Scotland Building Trades Employers' Council; Glasgow Building Trades Exchange; National Federation of Slate Merchants, Slaters, and Tilers; the National Association of Master Monumental Masons and Sculptors; the National Association of Master Heating and Domestic Engineers; National Association of Master Plasterers; Scottish Master Plasterers' Association; the Confederated National Association of Master Plasterers, Plumbers, and Slaters; the Institute of Plumbers; the National Association of Master Plumbers; United Kingdom Granite and Whinstone Quarry Masters' Association; the London Association of Master Decorators; the Central Association of the Lime and Limestone Industry of Great Britain.

LONDON MASTER BUILDERS' ASSOCIATION.

A COUNCIL meeting of the London Master Builders' Association was held at Koh-i-Noor House, Kingsway, W.C., on Thursday, the 19th inst.

The Finance Committee's report was read and approved, and the report of the Carpenters' and Joiners' Conciliation Board meeting was reported.

The Council gave its consideration to matters relating to the Industrial Council appointed by the Board of Trade, to a petition that had been lodged against the Trade Disputes Act (1906), and to various other trade matters, to the erroneous report in the Press of the annual meeting of the London Association of Slate Merchants and Master Slaters, and to the next issue of the handbook.

The following were elected as Associate members of the Association:—The Metropolitan Asphalt Company, Messrs. C. Loosley & Sons, and Messrs. F. A. Clark & Son.

The following were nominated for membership:—As ordinary member, Mr. A. E. Symes; Associates, Messrs. J. Russell & Co., Ltd.

REINFORCING CONCRETE IN UNDERPINNING.

OUR attention has been called to an exceedingly ingenious and very simple method of reinforcing concrete in underpinning. Mr. C. R. Price, of 87, Bishopsgate, E.C., the originator of the idea, has explained to us the working of it, and mentioned the names of several well-known architects to whom he has shown the drawings, and who have expressed their warm approval of it.

It has always been a difficulty with those who have had much experience in underpinning how to be sure of getting a proper adhesive setting between the blocks or piers of concrete which of necessity have to be put in in 3-ft. or about 3-ft. lengths, and no matter how particularly the work is supervised, or how good a builder is engaged, an ordinary workman is quite capable of leaving a film of clay or earth on the first piers when filling in the intermediate pieces; then, let the rest of the work be ever so well done, the whole is no better than that one doubtful joint. Concrete is put in to distribute the weight over a large area, and, seeing that the bottom of the concrete is in tension, it is at once apparent how vital such weakness is.

The whole object of Mr. Price's idea is—(1) To make it impossible to get any earth at any time between the meeting faces of concrete, thus ensuring a clean joint; (2) to get a grooved and tongued or joggled joint, thus avoiding the straight joint and its weakness; and (3), by far the most important, to get a continuous length of adequate reinforcing throughout the whole length of the underpinning.

The cost, in any case, is very moderate, and in many cases money can actually be saved, as district and borough surveyors will accept less depth of reinforced concrete than would be required in the ordinary way.

We are able to reproduce a drawing of the scheme, which explains itself, and Mr. Price offers to send to any who are interested details and further particulars if they will apply to him at 87, Bishopsgate, E.C.

GOVERNMENT CONTRACTS.

THE following tenders have been accepted during the past month by the Government departments named:—*War Office*: works services—alterations and additions to York Military Hospital—Mr. W. Bellerby, Eungate Sawmills, York; alterations, etc., at Duke of York's headquarters, left wing of main block—Messrs. Thomas & Edge, Woolwich; alterations, etc., to married quarters, Ashton-under-Lyne—Mr. J. Ridyard, Railway Sawmills, Ashton-under-Lyne; erection of annexes and alterations to married quarters, Canterbury—Messrs. Johnson & Co., 97, Southwark Bridge-road, S.E.; erection of annexes and alterations to married quarters, Beverley—Mr. A. Robin-

son, Woodbine Works, Idlo, Bradford; erection of annexes and alterations to married quarters, Gosport—Mr. J. Hunt, South Wharf, Cleve-land-road, Gosport; erection of barrack blocks, Whittington Heath Barracks, Lichfield—Messrs. T. Lowe & Sons, Curzon-street, Burton-on-Trent; erection of canteen and recreation establishment at Horfield Barracks, Bristol—Messrs. G. Pollard & Co., Taunton; erection of fire-engine shed, etc., Preskon—Mr. R. Holt, 50, Badger-street, Bury; erection of officers' quarters, Netheravon—Messrs. W. E. Chivers & Sons, Devizes; improvements to sergeants' mess, Halifax—Messrs. T. Obank & Sons, Cyprus Works, Thackley, Bradford; installation of heating apparatus, left wing, main block, Duke of York's headquarters—Messrs. E. Deane & Beal, Ltd., 1, Arthur-street East, London Bridge; installation of heating apparatus, Hulsea Hospital—Messrs. J. F. Phillips & Sons, Queen Anne's-chambers, S.W.; miniature rifle range, Wormwood Scrubs—Messrs. T. Wood & Sons, Ltd., Crockerhill, near Swanley, Kent; periodical works services at Norwich and Woolwich (hospital)—Messrs. Skovington Bros., Bateman-street, Derby; provision of brick fireplaces to officers' quarters at Bulford—Mr. J. Crockerell, Bulford Camp; renewing paving and fittings at troop stables, Hounslow—Messrs. Johnson & Co., 97, Southwark Bridge-road, S.E. *India Office*, *Store Department*: bridgework—Messrs. Bruthwaite & Kirk, West Bromwich; Messrs. Brandon Bridge Building Company, Motherwell; Messrs. Dorman, Long, & Co., Middlesbrough; Patent Shaft, etc., Company, Wednesbury; tiles—Messrs. Malkin Tile Works Company, Burslem. *Crown Agents for the Colonies*: steel bridgework—Thames Ironworks Shipbuilding and Engineering Company, Canning Town, E.; bridgework—Messrs. Sir W. Arrol & Co., Ltd., 32, Victoria-street, S.W.; cement—Messrs. Martin Earle & Co., Ltd., 137, Queen Victoria-street, E.C.; Barron's Cement Company, Ltd., 6, Lloyd's-avenue, E.C.; Associated Portland Cement Manufacturers, Ltd., 8, Lloyd's-avenue, E.C. *Office of Works*: builders' work, Eltham Palace restoration—Messrs. J. Thompson & Co., 43, Wood-street, Pease borough; General Post Office, north, extension of dining-room—Messrs. H. F. Webb & Co., Longfellow Works, Walthamstow; Glasgow Head Post Office, reinforced concrete work—Messrs. Perry & Co. (Bow), Ltd., 56, Victoria-street, S.W.; Stoke Newington branch Post Office, alterations—Messrs. J. Groves & Son, Forster-road, Tottenham; drainage, Houses of Parliament, revision of drainage and diversion of rainwater—North British Plumbing Company, Ltd., 15, Cartaret-street, S.W.; residences, Kew Gardens—Messrs. Dunt & Hellyer, Ltd., 35, Red Lion-square, W.C.; urinals and fittings—Messrs. George Howson & Sons, Ltd., Eastwood Sanitary Works; General Post Office, laying pipes and ducts (Park Exchange Area, London)—Messrs. Grief & Matthews, 35, Queen Victoria-street, E.C.; laying pipes (Leeds-Hull)—Messrs. Robson, Eckford & Co., Hawick, N.B.; laying pipes from Chepstow River Bridge to Newport, Mon.—Mr. C. J.

McDermott, Castle Enniscomorthy.

GENERAL BUILDING NEWS.

ST. PETER'S CHURCH, HARROW.

THE foundation-stone of this church was on October 16 by Lord Ashcombe. The church will be built from the designs of G. H. Fellowes Prynn, F.R.I.B.A., of Westminster. The architect has chosen a free treatment of the Decorated style. As both the east and west ends are comparatively hidden from view, little elaboration of detail will be necessary. The western entrance porch will be placed on either side of an apsidal baptistry, other entrances to the church being placed the west end of the north and south transepts. Separate entrances are also arranged for chapel and vestries at the east end. The church consists of a nave, 84 ft. long by 30 ft. wide, divided into five bays, giving accommodation for 450 right in front of the chancel. As has been stated, a baptistry flanked by two porches is placed at the west end. North and south lean-to aisles are placed against three western bays of the nave arcade; transepts are thrown out from the two bays on either side. The north transept forms, as it were, the nave of the side chancel. The chancel, which is 33 ft. long by 27 ft. broad, gives accommodation for forty-four, including clergy and choir, and room for a sanctuary. The altar is raised five steps from the chancel floor, and the nave floor level, considerable space is allowed on the east wall above the altar, for a future roscods or decorations, so that the whole effect may be more spacious. Side passages are placed either side of the chancel for returning communicants, and arches open north and south giving a view of the east and from the chancel into the nave. Over the passage on the north side a partly-hidden gallery will be constructed as a musicians' gallery, the organ chamber being placed on the opposite side of the vestries. A large choir vestry opens into the side chancel passage, which also communicates with the clergy, vestry, and sacristy, and a separate porch and lavatory are arranged. The roof will be of barrel form, which affords an acoustic point of view is found to be the best form of roof. The nave and chancel are carried to one level, the apex being 40 ft. from the nave floor level. The chancel arch will be carried to the whole height of the nave roof, a screen and rood beam be-

Mr. Price's Method of Underpinning.

The diagram shows, for the purpose of convenience, underpinning carried out in 3-ft. lengths (it is quite immaterial for the scheme what lengths are done at a time, either of the concrete or the "dumplings" left in to carry the wall while underpinning). Presuming the concrete is to be 3 ft. deep, 12 in. is put in the bottom, and on to this is placed a length of strong and large mesh-expanded metal curled up at the ends; over these curled ends are placed sheet-iron covers, which can be re-used any number of times, and the remainder of the concrete is filled in. This is done in all the first piers, then when the side towards one another, and another piece laid over the joint to ensure proper strength, and the result is a continuous length of reinforcing. Enormous additional strength over ordinary underpinning is obtained, and in many cases at less cost, because less bulk is required.

within the arch. The builders are Messrs. Webster & Cannon, of Aylesbury, tender for the complete work was 8,188*l*.

ADDITIONS TO COLLEGE, EXETER.

Plans for these new buildings were prepared by Messrs. Tait & Harvey, and the cost of erection has been about 16,400*l*. It is intended later on to erect a college hall and dining for the technical department.

NEW COUNCIL OFFICES, DUNFERMLINE.

The Parish Council have accepted the plans of Messrs. Muirhead & Rutherford, architects, for the new Parish Council offices, estimated cost being 5,860*l*. This selection resulted of a competition among the local architects. Mr. Clifford, of Glasgow, being adjudicator.

NEW PARISH HALL, LIVERPOOL.

Messrs. Morter & Dobie, of Liverpool, are architects of St. Catherine's New Parish Hall, which is being erected at a cost of 1,500*l*. The seating accommodation is for 400, and the hall was carried out by Messrs. G. E. Hall, builders, of Liverpool.

WEST OF SCOTLAND COLLEGE, GLASGOW.

At a recent meeting of the Governors of the West of Scotland Agricultural College, the plan of new College buildings was considered. The Committee reported that there were three alternatives, viz.:—(1) To dispose of the present buildings in Glasgow and Arbroath and to provide a new College all situated on a suitable farm, and (2) to erect in one building or series of buildings all the requirements of the College in agriculture, dairying and cognate subjects, to retain the present buildings at Killock and to supplement these by the erection of additional buildings to meet the requirements of the College, excepting provision to be made in Glasgow for continuing evening classes there. (3) To extend the present buildings in Glasgow, or obtain additional buildings close at hand, with or without a demonstration area adjacent to the land to retain the present farm and dairy at Killock. The matter was decided, so that the question of relative costs be ascertained.

THE COMEDY THEATRE.

The recent alterations and decorations at the Comedy Theatre have been made under the care of Messrs. Frank E. Whiting & Co., of St. Peter, Messrs. Battley, Sons, & Co., of St. Paul, and Messrs. The whole of the entrance has been taken out and fitted with a double row of new swing doors in waxed oak, the exterior reveals, steps, etc., being of waxed with Bastard marble. The old vestibule, with its box office, side entrance, and the whole of this space is a new vestibule, which occupied a space at the side of the vestibule, the passage running along the back of the dress circle, and the room, which was situated in one corner of the bar, have all been swept away, and the whole of this space is a new vestibule and box office. The vestibule is angular on plan, and all the workwork is waxed oak. The floor is laid in small tiles, and the walls panelled to a height of 8 ft. The style adopted is that of Doric Order, the columns and pilasters of grey scagliola marble with antique capitals and bases.

NEW CABINET WORKS, BEDFORD.

New premises, known as the Bedford Cabinet Works, Bedford, have been erected to meet the requirements of Messrs. C. & R. Arding, Ltd., whose chief offices and warehouses are in Curtain-road, London, E.C. New works have been erected on land between the London-road and the Great Northern Railway, Bedford to Hitchin branch, in accordance with the drawings and specifications prepared by the architect, Mr. F. W. Nicholls & Reynolds, Ltd. The new buildings comprise three blocks, covering altogether an area of 45,826 super. ft., which are connected by two enclosed passages; each block has separate sanitary conveniences, and with the timber store, dry kilns, boiler-house, and fumigating oven, cover a further area of 4,312 super. ft. being of one story, with space extensions and workmen's dwellings, etc. The plan of the buildings forms a parallelogram, as being best adapted for the purposes of the private railway siding, which has been constructed and connected to the above branch for the requirements of these works only, which has been made to run parallel to the premises. The walls are of purpose of how concrete building-blocks, the sills and finishings being reinforced with iron and quoins rusticated. The roofs are constructed on the north light principle, every part having had in the spacing, so as to

secure the maximum amount of light. The glazing is the patent system of Messrs. Helliwell & Co., Ltd., and was executed by them with their galvanised "Y" sections steel bars. The joinery was executed by Messrs. Samuel Elliott & Sons, Ltd., Caversham, Reading, the exit doors in corridors being fitted with "Panic" fittings, and glazed with 4-in. Pilkington's wire-work rolled plate-glass, the armoured fire doors being supplied by Messrs. Mather & Platt, Ltd., and fitted with attachments for self-closing in case of fire. The ventilation has been arranged with full allowance for all requirements, the fresh air supply being supplemented by openings in the external walls, with dog-legged flues, fitted with external and internal regulating gratings. The steam heating apparatus is on the vacuum system, the mains being 3-in. and 4-in. flanged cast-iron steam pipes in various sets, each set being provided with a fully automatic valve and a nuvacumette valve on the condense, drop branches being taken from the high level pipes and connected to the heating pipes. The steam heating works were executed by Messrs. Rosser & Russell, Ltd., to maintain a temperature of from 55 to 60 deg. Fahr. with the outside temperature 32 deg. Fahr. The boiler and chimney-shaft and works in connexion therewith were executed by Mr. C. F. Davis. The electric-power installation is supplied by the Bedford Corporation, a great feature being that the shafting for the machinery is in trenches below the floor level, the trenches being constructed of reinforced concrete and hollow concrete blocks, the whole being encased with asphalt executed by Messrs. Lawford & Co. The timber store and drying kilns have a cubical capacity of about 55,000 ft. and 4,600 ft. respectively.

TRADE NEWS.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the Drill Hall, Lauder, N.B.

In reference to the article on Messrs. Arding & Hobbs' new presses, Clapham Junction, which appeared in our last issue, pp. 449-453, we may add that the whole of the Bath stone for the work was supplied by the Yockney and Hartham Park Stone Company, Ltd., from their "Kidge Park" Quarry.

The Church of England School at Holywell, Hunts, has recently been fitted with one of D. O. Boyd's hygienic ventilating school grates, supplied by Messrs. O'Brien, Thomas, & Co., Upper Thames-street, London, and Excelsior Works, South Bermondsey.

The Cumberland Infirmary at Carlisle is being supplied with Shorland's double-fronted patent Manchester stoves with descending smoke flues by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 TO 1909.

Lines of Frontage and Projections.

Clapham.—Addition over No. 144, High-street, Clapham (Mr. J. S. Beard for Mr. S. H. Beard).—Consent.

Clapham.—Projecting clock in front of No. 192, High-street, Clapham (Greenwich Time, Ltd., for Electric Palaces, Ltd.).—Consent.

Dulwich.—Erection of porches in front of two houses on the eastern side of Underhill-road, Dulwich, southward of No. 102 (Mr. R. Johnson).—Consent.

Fulham.—Retention of a building next to No. 255, Stephendale-road, Fulham (Mr. A. J. Fuller).—Consent.

Hampstead.—Balcony over the porch at No. 27, Briardale-gardens, Hampstead (Mr. J. Gibb for Miss Macleod).—Consent.

Hampstead.—Erection of one-story buildings on the eastern side of West End, Hampstead, northward of Tower-mansions (Mr. F. J. Stannard).—Consent.

Hampstead.—Two houses with one-story bay-windows and porches on the northern side of St. Cuthbert's-road, Hampstead, next to Shoot-up-hill (Messrs. Rix & Wilkins).—Refused.

Kensington.—Illuminated sign at No. 189A, Brompton-road, Kensington (Imperial Lighting Company).—Refused.

St. George, Hanover-square.—Additions at No. 36, Belgrave-mews South, next to the south-western side of Upper Belgrave-street, St. George, Hanover-square (Mr. F. W. Foster).—Consent.

St. George, Hanover-square.—Projecting balcony at the second floor level at No. 24, Conduit-street, St. George, Hanover-square (Mr. A. B. Jackson for Mr. G. Boudon).—Consent.

St. George, Hanover-square.—Projecting oriol window in front of No. 65, Brook-street, St. George, Hanover-square (Mr. G. T. Hine).—Consent.

Width of Way.

Bethnal Green, North-East.—Addition to St. Peter's Church, St. Peter's-street, Bethnal Green, next to the southern portion of St. Peter's-square (Mr. E. T. Dunn for Rev. W. H. Maynard).—Consent.

Hoxton.—Addition at the rear of No. 29, New Inn-yard, Hoxton, next to the passage-way leading to Reliance-square (Mr. F. M. Elgood for Mr. L. W. Thomas).—Consent.

Width of Way, Lines of Frontage, and Projections.

Hackney North.—Erection of No. 9, Stamford-grove East, Hackney, with a two-story bay-window and a hood (Mr. F. Bull).—Consent.

Lewisham.—Erection of six coal-shed buildings at the Merchant Taylors' almshouses on the eastern side of Brandram-road, Lee (Mr. R. H. Mew for the Merchant Taylors' Company).—Consent.

Marylebone, West.—Retention of a wood and glass covered way in front of No. 15, Elm Tree-road, St. John's Wood (Mr. H. W. Holman).—Consent.

Lines of Frontage and Construction.

Finsbury, East.—Three external iron gangways at the rear of No. 59, City-road, Finsbury, to abut upon the northern side of Oliver's-yard (Messrs. M. W. King & Sons for Mr. J. Kent).—Consent.

Hackney, South.—Temporary wood and iron building at No. 159, Chatsworth-road, Clapton (Mr. E. White).—Consent.

Holborn.—Erection of two iron and glass shelters, next to Drury-lane, at the Middlesex Music Hall, Drury-lane and Shelton-street, Holborn (Messrs. F. Matcham & Co.).—Consent.

Lewisham.—Temporary wood and glass showcase in front of No. 6, Standon-park, Lewisham (Mr. E. Tompkins).—Consent.

Peckham.—Temporary showcase in front of No. 2, Ryelane, Peckham (Messrs. Windybank, Samuel, & Lawrence).—Consent.

Width of Way and Construction.

Marylebone, West.—Temporary shed at No. 12, Gray's-buildings (Messrs. Steinway & Sons).—Consent.

Rotherhithe.—Temporary pay-box at the Bronze Athletic Ground, Yeoman-street, Rotherhithe (Mr. A. J. Walkley).—Consent.

Width of Way and Height of Buildings.

Finsbury, East.—Erection of a building upon the site of Nos. 15 and 16, Beyer-street, Finsbury (Messrs. Lovegrove & Papworth for Mr. C. Clifford).—Consent.

Line of Frontage, Alteration, and Conversion of Buildings.

Lambeth, North.—Erection of balconies at No. 65 to 79, Stamford-street, Lambeth; projecting architectural features in front of Nos. 75, 76, 77, and 78, Stamford-street, and the formation of openings in the party walls at the basement, ground, first, second, and third floor levels (Mr. G. Bartlett for the Duchy of Cornwall).—Consent.

Omission of Footings.

Westminster.—Omission of footings to the walls and piers of a proposed building on the southern side of Great George-street, Westminster, between Nos. 1 and 8 (Mr. J. Miller for the Institution of Civil Engineers).—Consent.

Cubical Extent.

Westminster.—Additional cubical extent in respect of the proposed erection of an additional (fifth) story at the Army and Navy Stores, Victoria-street, Howick-place, and Francis-street, Westminster (Mr. W. V. Falkiner for the Army and Navy Co-operative Society, Ltd.).—Refused.

Westminster.—Additional cubical extent in respect of the proposed erection of an additional story to Ruskin House, Rochester-row, Westminster (Mr. A. Keen for Mr. W. Morris).—Refused.

Uniting of Buildings.

City of London.—Uniting of No. 70, Old Broad-street, City, with No. 25, Throgmorton-street, by means of an opening at the basement level (Messrs. R. Cross, Harrison & Son for Messrs. C. J. Hambro & Son).—Consent.

City of London.—Openings fitted with doors of special construction in lieu of iron doors in the party wall between the basement, ground floor, and first floor of Nos. 28 and 29, Upper Thames-street, City (Check Fire Door Company for Messrs. Siemens Brothers).—Consent.

City of London.—Uniting of Nos. 25, 28, and 30, Duke-street with No. 24, Duke-street, Aldgate, by means of openings at the ground and first floor levels (Levland and Birmingham Rubber Company, Ltd.).—Consent.

Stepney.—Alterations and the erection of an addition to the bottling store at the premises

of Messrs. Mann, Crossman, & Paulin, Ltd., Russell-street, Mile End (Mr. W. Stewart).—Consent.

Whitechapel.—Armoured doors in lieu of iron doors to openings in a party wall between No. 49, Mansell-street and No. 22, Great Alice-street, Whitechapel (Messrs. Mather & Platt, Ltd., for Mr. F. Selby).—Consent.

Cubical Extent and Uniting of Buildings.
Islington.—Motor omnibus garage approached from the northern side of Holloway-road, Islington, with two divisions exceeding 250,000 cubic ft. in extent, and the use of roller shutters to openings between the two garages (Messrs. A. L. Gibson & Co.).—Consent.

The recommendations marked + are contrary to the views of the Metropolitan Borough Councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Enlargement of school (200 extra places); Mr. T. G. James, Secretary, Education Committee, Monmouthshire County Council, Newport.

Altofts.—School (3,600); Mr. W. V. Dixon, Secretary, Education Committee, West Riding of Yorkshire County Council, Wakefield.

Antrim.—Houses; Mr. W. D. R. Taggart, Antrim.

Arkwold. (County Wicklow).—Six houses (900); Mr. A. McGowan, builders, South Quay, Arkwold.

* See also our list of Competitions, Contracts, etc., on another page.

brought to the attention of the public. A steam car company was summoned under the by-laws of the Camberwell Borough Council, made under sect. 16 of the Public Health (London) Act, 1891, in respect of oil waste deposited on the roads. The by-laws provide

some small items, such as a lightning conductor being erected. He said the original contract price was being exceeded by about 1,800*l.* in connexion with the additional work which was ordered. In September the work was completed, and the defendant moved into the house and made serious complaints about the character of the work. Early in January, 1911, Mr. Stanborough's account was completed and forwarded to the defendant. According to the account delivered, the defendant's liability was about 21,000*l.*, and at that date the defendant had on the certificates of the architect paid the plaintiff about 16,000*l.* The architect gave the builder a further certificate for 1,500*l.*, and he wrote to the builder that the defendant was very dissatisfied with the work. Plaintiff afterwards claimed a further sum of 3,000*l.*, but the defendant declined to make any further payment in connexion with the matter.

The Official Referee then read at considerable length the correspondence in the case detailing the granting by Mr. Foster of the certificate for 2,750*l.*, which was sued upon, and also the certificate for 533*l.*, which the plaintiff also sued for in reply to the defendant's counterclaim, the termination of the defendant's appointment and the appointment by the defendant of Mr. John Murray as his architect. The defence in the action, the learned Referee, continuing, said, was delivered in March, 1911.

There was first the plea of a denial of indebtedness which, under the rules and the Judicature Act, might be disregarded, and defendant also pleaded that the architect had no right to give the certificates that he had given, and he based his counterclaim upon the fact that numerous variations had been made from the contract without his authority; further, that the work done and materials supplied under the contract for extra work were unsuitable and not in accordance with the contract, and also that the prices charged by the plaintiff for extra work were excessive. Those were the really effective matters of the counterclaim, under which the defendant claimed damages for a sum largely exceeding the plaintiff's claim. The trial commenced on July 5, 1911, and was continued without interruption until August 19. The plaintiff, by his Counsel, did not content himself by alone relying upon the architect's certificates, but took upon himself the task of meeting and disproving the charges made by the defendant.

The general effect of the evidence of the plaintiff and of his expert witnesses was that as far as the plaintiff was concerned he had generally fulfilled the conditions of the contract; that he had by the contract to follow the directions of the architect; that some of the alterations and deviations were due to the defendant's own fault, and that the work was done under the direction of the architect or the defendant and his wife. It was also said in effect by the plaintiff and his witnesses that if the matter had not been taken out of the plaintiff's and Mr. Foster's hands, matters could have been put right for a very small expense. Defendant's witnesses gave evidence as to the alleged bad workmanship, bad timber, bad joinery work, the improper spacing of the joists, and other matters due to him in the counterclaim, including the fissures and cracks which had appeared in the ceilings and partitions. He (the Official Referee), before addressing himself to the evidence, had first of all to consider the question of principle and the manner in which he had to apply himself to deal with the contract. He thought the architect's certificate created *prima facie* a debt due from the defendant to the builder. The contract provided that the builder was to be entitled to payment of the sum mentioned in the certificate within the specified period. The main ground on which the defendant denied his liability under the certificates for the sums of 2,750*l.* and 533*l.* was that the architect had no authority to give them, his authority having been revoked before they were given. Under the contract the architect had power to grant certificates. The question was whether the certificates for payment by Mr. Foster could in the circumstances stand, and whether the defendant had power to effectively discharge Mr. Foster's authority to grant the certificates for work done. Upon this point reliance was placed upon Clause 3 of the contract, which provided that in the event of Mr. Foster's death, or his ceasing to be the architect for the purpose of the contract, such other person was to be nominated for that purpose by the employer. That clause, in his opinion, did not give the defendant power to terminate Mr. Foster's authority to grant certificates for work done, and even if he had the power, he further found, that the letters which the defendant relied upon on this point did not operate to terminate Mr. Foster's authority. He thought those letters, so far from terminating the

architect's position, recognised that it was continued. Mr. Foster's power was to issue certificates for work done under the contract. He therefore decided that the defendant's plea of a denial of liability upon that ground failed, and that the certificates which Mr. Foster had granted to the plaintiff for 2,750*l.* and 533*l.* were valid certificates. The next question he had to consider was what sum ought to be deducted from those sums in consequence of the charges which the defendant raised by his counterclaim, and to what extent the plaintiff had committed the breaches of contract alleged as to workmanship and materials, and what sum should be allowed the defendant as damages. On this question much contradictory evidence was given as to whether the plaintiff did commit breaches of the contract and conditions. Having referred to the specification and a great deal of the evidence, the learned Referee found that a great portion of the timber which had been used in the building was not of the quality specified, and he was not satisfied that the timber as specified could not be got, and the result was that some of the conditions of the specification were completely ignored in that regard. Next he found that the dimensions of the timber used were not as specified, and that what had taken place in that respect must be considered as deviations from what was specified. He further found that the spacing of the floor joists was in places 18 in. and in others 20 in. apart, which would result, it was said, in great weakness of the floor. He found that the spacing was not in accordance with the conditions specified. He had to decide whether such deviation and defect in workmanship were breaches of contract. It appeared that the architect saw and allowed the wider spacing of the joists. As far as the clerk of the works was concerned, he decided that he had no power to authorise the contractor to disregard Clause 7 of the contract. This clause ran:—"All materials and workmanship shall be of the respective kinds described in the specification, and the contractor shall, upon the request of the architect, furnish him with vouchers to prove that the materials are such as are specified."

It was said with reference to this question that the architect had power, under Clause 12 of the contract, which provided that the contractor should, when authorised by the architect or as provided by Clause 5, vary by way of extra or omission from the drawings or specification, to order or sanction variation. But such a power did not authorise him to depart from the terms of the contract so as to prejudice the strength and stability of the building. He arrived at the conclusion that the acquiescence of the architect as to the wider spacing of the joists, and as to the quality of the timber, did not absolve the plaintiff from his contract to carry out the specification on those heads. Upon those heads, therefore, he found that the plaintiff did commit breaches of the contract.

The learned Referee then referred to the charges made by the defendant as to the alleged defects in the workmanship and the quality of the timber supplied to the roofs, and he found that the timber in both roofs was inferior to that which the plaintiff contracted to supply, and that the spacing of the rafters was wider than that specified, and the rafters were improperly butted, and that some of the rafters provided were too short. He found that other allegations that the defendant had made as regards to the roof were not proved. With regard to the joinery work, he found that the defendant had not discharged the onus which was upon him of proving that the quality of the wood was not as contracted for; but with regard to the workmanship, in that respect he thought there were some defects. He thought, however, there was no doubt that the great heat which had been experienced this summer was very trying to all new joinery work. Having dealt with the items raised as to the slab with the coal house, and the work done in connexion with the coal house, pump house, gardener's cottage, bullfinch's cottage, and dairy, etc., the Referee said that on his visit to Newton Hall in July last he found that the condition of the house was substantially as described by the defendant's witnesses. The weakness of the floors had produced numerous fissures and cracks, some of which were serious, and he found that it was necessary for the stability of the house that remedies of the kind proposed by some of the defendant's witnesses should be adopted. He had come to the conclusion that the remedies proposed to obviate the defects for the plaintiff were insufficient in evidence of the defects; but on the other hand, he was of opinion that the suggestions advanced on behalf of the defendant covered a good deal more than the plaintiff was entitled to require.

The Referee, having dealt with the evidence in detail the sums involved in both claim and counterclaim, and subject to a revision of the

figures, if necessary, before finally entering judgment, entered judgment as follows:

On the claim and defence for the plaintiff for 2,750*l.* On the counterclaim for the defendant for 2,116*l.* 14*s.* On the plaintiff's counterclaim to the defendant's counterclaim for the plaintiff for 533*l.* Execution on the judgments to be limited to execution for the plaintiff for the balance in his favour, 1,664*l.* 6*s.* 9*d.* The costs of the plaintiff's claim to be to the plaintiff. The defendant to be entitled to the costs of the counterclaim, regards the issues on which either party failed, he was not to have those costs. Upon the application of Mr. Clavell Sal K.C. the learned Official Referee granted defendant a stay of execution upon terms, with a view to an appeal from his decision.

HIGH COURT OF JUSTICE, CHANCERY DIVISION. (Mr. Justice Eve). Ancient Lights Case:

Schworer v. Bethnal Green Borough Council.
The hearing of the case of Schworer v. Bethnal Green Borough Council, which was reported in our last issue, was continued on October 13.

For the defendants Mr. W. H. Eve, F.S.I., 10, Union-court, Broad-street, E.C., gave evidence and proved the sections which had prepared on their behalf. He had given the plaintiff's premises and considered the ground-floor room to be a well-lighted room. He could read small print easily at a distance of ten feet from the window. Referring to the sections he had prepared, Mr. Eve said that he had taken a line through the centre of the ground-floor windows and prolonged it at right angles to the defendants' premises, and it gave an angle of 20 deg. of obstruction light. Taking a line from the same place to the eaves of the Town Hall, the angle of obstruction was 45 deg. He did not think, however, that the sections were the true tests of the quantity of light taken away. There was a large volume of light over the yard of No. 20 coming to the windows of the basement and ground floors. The Town Hall caused an obstruction of light, if anything, and did not interfere with the direct light at all. The total amount of light coming to the windows of the plaintiff was horizontal angle was, before the Town Hall was put up, 140 deg. That was an exceptional for such a district. He had considered very carefully the amount of light taken away by the defendants' building, and was strongly of opinion that it was not so seriously interfered with, and that the ground-floor and basement rooms could still be enjoyed in a way that any reasonable person would expect in such a neighbourhood. He did not think any real injury had been done to either owner or tenant.

In answer to Mr. Jessel, K.C., Mr. Eve said that some reduction in light had been made in the value of the house, but he admitted that there was a diminution of light, but did not think the tenant would have to live up any earlier.

Mr. Jessel suggested that in making his plans witness had taken the heights from the general ground level, and had not allowed for the fact that there was a drop of nearly 2 ft. underneath the windows in question. Mr. Eve pointed out that from the way his plans were prepared the depth below the window did not affect the heights.

Mr. Percy Robinson, F.R.I.B.A., of 1, John-street, Adelphi, was also called. He and his partner, Mr. Jones, were the architects of the new Town Hall at Bethnal Green. The copings of the wall adjoining No. 20, Patriot-square, were on in December last. He first inspected plaintiff's premises in 1910. He agreed generally with the evidence given by Mr. Eve. He thought that when the curtains of the ground-floor windows were drawn aside there was ample light for all ordinary purposes.

There was very little diminution of light. An angle of 45 deg. from the window cut off very little sky area, the only obstruction being the chimney of the Town Hall. The witness, cross-examined by Mr. Jessel, said he had practised in London for the last three years. When he visited the plaintiff's premises with Mr. Eve they were able to write down the particulars of the measurements then taken without the slightest difficulty in any part of the room or the ground floor. He considered the amount of light taken away to be a negligible quantity. Mr. Ernest Edward Finch, A.M.Inst.C.E., from 1903 to 1910 Borough Engineer of Bethnal Green, and now Assistant Engineer to the Corporation of London, described the plaintiff's property as a very old dwelling-house, unsuited for business purposes. In December 1909, when he visited the premises, the eastern wall of the Town Hall was at its full height. He went into the ground-floor room. There was no sunshine, but he could see quite well

notes and read them, although they were written in pencil. The room, in his opinion, was very well lighted. He agreed with the evidence given by Mr. Eve and Mr. Jossell; if more gas was to be used, that, in your opinion, damage the premises from a selling or letting point of view, I do not think it would.

Counsel had addressed the Court, Justice Eve, in giving judgment, said the plaintiff alleged that the erection of the new Hall had interfered with the light to the basement and three floors of premises to an extent to cause a considerable inconvenience to the tenants and that they were carrying on their businesses, as usual, as before. When the case came on for the plaintiff abandoned any claim for damages in respect of the two upper and also intimated that the damage to the plaintiff might turn out not to be very great. The case developed it was seen that the plaintiff's claim was well founded, and the claim was only for damages for interference with light coming to the ground-floor. The evidence had been directed to the fact of that room antecedent to and subsequent to the erection of the Town Hall. The plaintiff had satisfied the Court that the erection of the Town Hall the light which came to the ground-floor room was exceptionally bright. The light for that room was at its very best when the plaintiff purchased the house. In the summer of 1908 the windows of the room which were not of any great extent, and which had existed on the land of 14 and 16, Patriot-square, had been moved, and the land was cleared and the erection of the Town Hall. On the 1st of January, 1909, the plaintiff's claim was caused by the Town Hall was not. It undoubtedly diminished the light to the plaintiff's premises to an appreciable extent on the south side.

Justice Eve applied what was laid down by the Court in the case of *Davey v. Leitch*, which is left to the Court to answer the ordinary requirements of the law for the ordinary purposes of the plaintiff. Counsel for the plaintiff said it was because, in fact, the work carried on in the ground-floor room with ordinary light was now being carried on for the same time of day by day. He did not think it had been established as a fact, although the evidence on behalf of the plaintiff had been given quite honestly. He wished to decide the case on that footing, and the question of light did not arise. The plaintiff's cause of action, the results of the evidence on behalf of the plaintiff, showed from that diminution did not give a cause of action. One was and to measure the immateriality of the evidence by the extent to which it involved the plaintiff in the expense of artificial light. On the other hand, he did not think there could be any doubt as to the present condition of the room in question. Not only from the evidence of the defendants' witnesses, but from the fair evidence given by Mr. Rix, the expert, the room was to be regarded as a very fairly well-lighted room. His Lordship thought it had been established that the room was in fact a well-lighted room. The results of the evidence of what the defendants had done, they had not been such as to bring the present condition of the room under and below that at which they ought to have been. Although he sympathised very much with the occupiers, he did not think any claim could be made out on which the plaintiff could succeed, and the action would, therefore, be dismissed with costs.

LONDON COUNCILS.

City.—Plans were submitted by the City Surveyor at the last meeting of the District Council for twenty-two cottages in Berkeley-lane, when it was decided that the Council should be asked to sanction the Board for the erection thereof. The Board was asked at the same time to dispense with the usual public inquiry, as the application made was only an extension of the Council's scheme, for which a loan had already been sanctioned and obtained. Sanction has been given by the Council. The Council has received from the Local Government the sum of £3,050, for repaving the street.

St. Pancras.—At the last meeting of the Urban Sanitary Authority, a resolution was passed that a town planning scheme should be passed, and a Town Planning Committee was appointed. It was further resolved to approach the Local Government

Board with a view to getting them to receive a deputation on the subject. The following plans have been passed:—Mr. G. Jaggar, five houses, King George's-avenue; Miss Lucy Kemp Welsh, additions to workmen's club, Rudolph-road.

Camberwell.—The Royal Institute of British Architects has sent the following circular letter to all the London Borough Councils with regard to street name-plates:—"The Council of the Royal Institute of British Architects wishes to call the attention of the Borough Councils of London to the importance, both in an aesthetic sense and as a matter of public convenience, of taking steps towards a complete revision of name-plates for the corners of London streets, with well designed lettering, preferably of a uniform style throughout London. As to the matter of public convenience, the Royal Institute wishes to point out that while in Paris every street corner bears the name of the street, in London there are hundreds of corners where no name at all is to be found; so that it is often difficult to discover the name of a street without walking some distance along it, the fixing of name-plates having never been carried out on any complete and comprehensive system. In regard to the aesthetic question, it is desirable that a good type of lettering should be adopted on two scales, the larger or smaller scale to be adopted according to the width and importance of the street and the architectural scale of the buildings flanking it. The Royal Institute is not advocating the employment of any name-tablet more costly than those now in use; a good type of lettering, once designed, costs no more to execute than an inferior one. It has long been the wish of the Council of the Royal Institute to see this matter of complete labelling of the London streets taken in hand and carried out in a systematic manner, so as to remove from our capital a reproach which it certainly lies under in this respect in comparison with Paris, and they hope that the Borough Councils would see their way to act together in securing this much-needed improvement. One of the faults in the present condition of things is that not only are name-tablets wanting in many situations where they ought to be found, but that those which exist are in so many different forms and patterns. It is suggested that if the Borough Councils were willing to consult together on the subject and to take up the matter conjointly, and agree upon a pattern of lettering, a uniform system for the whole of London could be secured, to the great advantage of the appearance of our streets, as well as to the general convenience of the public. We may add, the Royal Institute is always ready to place its services in public matters of this kind at the service of the Borough authorities."

Croydon.—The Rural District Council have accepted the tender of Mr. Isaac Wilson, Gorrington Park-avenue, Mitcham, at 35s. 6d., for making up Oakwood-avenue, Mitcham. **East Ham.**—Plans were submitted by the Engineer for a convenience and lock-up shop at the corner of Station-road and Romford-road, and application is to be made to the Local Government Board to borrow the necessary money. A plan has been received from Messrs. Mark Lill & Sons showing a suggested building line for the development of land at the south-east corner of Bendish-road and High-street North, and asking if the Council will allow them to project beyond the building line of Bendish-road, thus enabling them to build right up to the back of the footpath in Bendish-road for a distance of 101 ft. west of the High-street frontage. The Council are to allow them to do this provided they surrender the whole of the forecourt to the building line of the shops on the north and south sides in High-street North, and sufficient land for rounding off the corner of Bendish-road and High-street North. Plans submitted by the Engineer have been approved for the completion of the sewerage of Sussex-road at an estimated cost of £1,200. The Engineer has been instructed to submit plans and estimates for the erection of slipper and vapour baths in connexion with the new swimming baths. Plans have been passed for Mr. T. Watson for six houses in Lichfield-road. Plans have been lodged by Mr. G. Clark for ten houses in Wallend-road.

Greenwich.—Tenders are to be invited for forming and paving a part of Bramshot-avenue.

Hamstead.—A portion of the footway in Finchley-road is to be improved. In order to meet the requirements of the London County Council, extra works and variations are to be carried out at the new town hall buildings, at an estimated cost of £120. No objection is to be raised to the building of an institute on the south side of Penton-court for the Vicar of the Hamstead Parish Church. The architect is Mr. A. Keen, of Raymond-buildings, Gray's Inn, W.C.

Hemel Hempstead.—The Education Com-

mittee have accepted the tender of Messrs. J. & Son, Leicester, at 18s. 6d., for heating and lighting work at the new school at Tyto Waters.

Hendon.—At a recent meeting of the King Edward Memorial Cottage Hospital Committee at the Council Offices, Hendon, a modified scheme was adopted for the erection of a memorial cottage hospital at an estimated cost of £1,500. The address of the architect is care of Mr. W. J. King, "Lyndhurst," Rosecroft-avenue, Hampstead, N.W.

Islington.—A new 9-in. pipe sewer, surrounded with Portland cement concrete, is to be substituted for the old brick sewer in Thornhill-crescent, at an estimated cost of £180.

Lewisham.—Part of Woolstone-road is to be repaved with artificial stone at an estimated cost of £131. In connexion with the proposed London County Council tramway from Catford to Forest Hill, the Council have decided to pave the carriageways and margins of the roads through which the tramway will run with wood-blocks, at the following estimated costs:—Rushey Green to Brockley Rise, 5,770l.; Park-road to London-road, 1,720l. The County Council are to be requested to pave the whole of the tramway track under their control with the same material, with the exception of the portion on Catford Bridge, the whole of which is to be paved with granite setts. The following plans have been passed:—Mr. A. J. Roddis, six houses, Rushford-road; Messrs. Jarman & Co., additions to Obelisk House, High-street.

Surbiton.—At the last meeting of the District Council the following resolution by Mr. F. B. Ray was carried:—"That the Council instruct the Fire Brigade Committee to retain an architect for the purpose of preparing plans for the erection of a fire-station on Surbiton-hill, adjoining the Council offices."

West Ham.—Plans have been passed for Mr. W. Jacques for an addition at the Council school in Grange-road, Plaistow, and for alterations and additions to the Council school, Prince Regent's-lane, Custom House.

Westminster.—The City Council have decided to enter into an agreement with H. M. Office of Woods for the purchase of sufficient land to widen Argyl place, between Regent-street and Kingsly-street, to 60 ft. The necessary paving, etc., works, exclusive of alterations to mains, etc., is put at 539l. A portion of the area at No. 1, Fimlico-road is to be covered in, and the pavement set back about 5 ft., at a cost not exceeding 100l.

Willesden.—Plans submitted by the Engineer for the following have been approved:—Convenience at Church End, estimated cost, 399l.; underground convenience at Canterbury-road, South Kilburn, 1,621l.; construction of new road from Harlesden-road to High-road, Willesden, involving the widening of Pound-lane, 4,920l. The Engineer has been instructed to report as to the cost of erecting a public convenience at the apex of Kensal Rise plantation. Application is to be made to the Local Government Board for authority to prepare a town-planning scheme. The wood paving in Chamberlayne-road is to be extended along Kilburn-lane to Bannister-road, and from the motor omnibus terminus to the northern flank of Kensal Rise Wesleyan Church. The following plans have been passed:—Messrs. William Moss & Sons for the Dairy Supply Company, factory, Cumberland-avenue, Park Royal; Mr. W. S. Dakers for Messrs. Callow & Wright, four houses, Staverton-road, Brondesbury; Messrs. Nowell Parr & Kates for the Royal Brewery, additions and alterations to the Crown beer-house, High-road, Willesden Green; Mr. John Cash, alterations to the Willesden Radical Club.

Woolwich.—The Works Committee report having received seven tenders for the erection of the combined convenience and shelter at the Eltham tramway terminus. The prices of these tenders ranged from 250l. to 385l., and, after consideration, they decided not to accept any tender, but to carry out the work by direct labour at an approximate cost of 310l. The following plans have been passed:—Messrs. J. James & Co., per Mr. J. R. Viney, 89, Chancery-lane, W.C., additions to warehouse at slat factory, Wood-street; the Trustees, per Messrs. J. Garrett & Son, 83, Balham-hill, S.W., baptist chapel and vestries, corner of West Mount and Glenure roads, Eltham. The London County Council have written to the Borough Council enclosing a plan submitted by Mr. R. M. Allen, 83 and 85, Powis-street, for the erection of a cinematograph theatre in Beresford-square, and asking for the Council's observations thereon. The Committee found no objection thereto other than the fact that the new building would be within 20 ft. of the centre of Beresford-street, which was contrary to the provisions of sect. 13 of the 'London Building Act,' and they have decided to call the attention of the County Council thereto.

TRADE CATALOGUES.

We have received from Messrs. S. W. Francis & Co., of Gray's Inn-road, London, E.C., their latest catalogue of wood, iron, and steel revolving shutters, spring shop sun-blinds, and gun-metal. Among the firm's recently-executed work are shutters for the London County and Westminster Bank, Parr's Bank, the Hippodrome, Leicester-square, and the Law Courts.

We have received from Messrs. Arthur L. Gibson & Co., of Radnor Works, Strawberry Vale, Twickenham, a booklet dealing with Cabot's sheathing and deafening quilt. "Quilt" is an insulator, constructed to give the most perfect results in the non-conduction of both heat and sound, and may be used for external walls, ceilings, and partitions. It consists of a felt matting of eel-grass, held in place between two layers of tough manila paper by quilting. Eel-grass is indestructible by decay, and will not burn, so that "Quilt" is practically fireproof. A series of tests made for the sound-deadening of the dormitories of the New England Conservatory of Music, Boston, United States, proved that the insulating properties of "Quilt" were superior to the other methods of sound-proofing experimented on. Other uses to which the material has been put with admirable results are as a sheathing for framed houses, where it may be placed under the shingles or slates as a roof-lining and as an insulator for cold-storage boxes. We note that the living-bus and observatory built for Capt. Scott's present Antarctic Expedition by Messrs. Boulton & Paul, of Norwich, have been lined throughout with two layers of double-ply "Quilt."

FOREIGN AND COLONIAL.

Industrial Expansion of Canada.

An examination of the conditions underlying the industrial expansion in Canada and of the promise of the future has convinced Mr. J. Norton Griffiths, M.P. for Wednesday, that the moment has arrived for English manufacturers to take practical steps towards establishing independent branches of their works in Canada, or of associating themselves with local concerns. Mr. Griffiths suggests that they should follow the American practice of personally controlling and directing the same with their experience and their money, in order to share in the great prosperity that must inevitably take place from now onwards.

International Organisation and Equipment of Schools Exhibition, Russia.

Copies (in English) of the programme, rules, etc. of the International School Exhibition, St. Petersburg, have been received from Mr. C. H. Mackie, the British Acting Consul at St. Petersburg. The exhibition is to be opened on April 15, 1912, and is to remain open for three months. Foreign exhibits will be admitted into Russia free of duty, on condition of re-exportation within six months. Applications for space should be sent to the Executive Committee of the International Exhibition "Organisation and Equipment of Schools," Panteleimon'skaya No. 2, St. Petersburg, not later than November 1. Copies of the programme, rules, etc. (in English) of the exhibition may be obtained by British manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.

Last Year's Lock-out in the German Building Trade.

Referring to this subject in his annual report, the British Consul at Frankfurt-on-Main recalls the fact, mentioned in his report for 1908, that the employers in the building trade had forced upon the employed throughout Germany scheduled wage agreements, the terms of which were not popular, but were accepted after a series of unsuccessful strikes. The employers provided that all these agreements should come to an end in April 1910, because in case of trouble, which was anticipated, a general cessation of the building work would infinitely strengthen the hands of the employers. As negotiations for a new national agreement, started already in the autumn of 1909, had failed, the workmen were given notice on April 1, 1910, for April 15, and on that day the great struggle began. The workmen's demands were chiefly for shorter hours, for a schedule of wages on a higher scale, and also for a more fairly constituted system of labour bureaux for the building trade, while the employers insisted upon one central bureau of control for the conclusion of labour agreements. Two circumstances were in favour of the workmen—the rise in the cost of living brought them the sympathy of the

public, and the fact that for the first time after a succession of years there had been a revival in the building trade induced some employers anxious to utilise a favourable opportunity, to waver. As a result, the numbers of workmen involved never reached the proportions at one time feared—400,000 in 25,000 concerns—and never exceeded 187,000, while the total number of men employed in the building trade probably exceeds 1,500,000. In some important centres (e.g., Berlin and Hamburg) employers and employed soon arranged terms. In Berlin, where about 35,000 men are engaged in the building trade, the men were granted an immediate rise of 3 pf. per hour, to be increased, as from October, 1911, by a further 2 pf. In other centres the struggle was vehemently carried on. The employers received financial aid from several great employers' organisations, e.g., the *Centralverband Deutscher Industrieller*, is said to have placed 5,000,000 marks at their disposal, and the Rhenish-Westphalian Coal Syndicate is believed to have contributed 500,000 marks. Government intervention proved futile. The lock-out lasted seven weeks in all, and ended on June 15 with a compromise. The employers granted shorter working hours, so that the working day in future will vary, according to locality, between 9½ and 10½ hours, with a further reduction as from 1912 to 10 hours; they also granted an immediate advance of 2 pf. to be increased later by a further advance of 4 pf. and 2 pf. respectively per hour. A certain discretion was left to local bodies for the settlement of further local differences.

PATENTS.

APPLICATIONS PUBLISHED.

18,114 of 1910.—Conrad Dressler: Ovens for use in the manufacture of tiles, pottery, and analogous ware.
22,099 of 1910.—Francis Gascoigne Tynde and Everard Richard Calthrop: Method of and means for the construction of concrete sea-walls, piers, pontoons, floating stages, foundations, and other structures.
22,218 of 1910.—Junzo Kajima: Telescopic masts, lifting appliances, or the like.
27,526 of 1910.—Abraham Henry Wormald: Safety window-guard and fire-escape.
30,191 of 1910.—James Compton Merryweather: Apparatus for emptying cesspools, gullies, holes, and the like.
30,211 of 1910.—Richard Roue, jun.: Boilers for heating water and generating steam.
4,932 of 1911.—William John Lindemeyer: Ventilators.
5,085 of 1911.—Herbert Sumner Owen: Manufacture of products of concrete, cement, and the like.
9,103 of 1911.—William Fry Scott: Reinforcement of concrete beams.
11,102 of 1911.—Herman Koppinger: Manufacture of iron window bars.
11,444 of 1911.—William John Swain: Construction of reinforced floors and beams of concrete or any other fireproof or fire-resisting material.
14,063 of 1911.—Albert Mitani: Metal bars for use in ferro-concrete construction.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom at the prepaid rate of 18s. per annum, with delivery by Friday Morning's Post in London and the suburbs.
To Canada, post-free, 21s. 6s. per annum; and to all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, etc., 25s. per annum.
Remittances (payable to J. MORGAN) should be addressed to The Publisher of "THE BUILDER," 4, Catherine-street, W.C.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

October 2.—By FRANK LLOYD & SONS.
Highton, Flint.—Farm Estate, 283 acres, £5,875.
October 5.—By LEBNARD & LEBNARD.
Newborough, Staffs.—Part of Holly Bush Estate, 1,013 acres, £32,925.
October 7.—By FRANK LLOYD & SONS.
Marlton-cum-Lodge, Cheshire.—Estate, 349 acres, £16,890.
Saltney, Flint.—Mainwaring Farm, etc., 189 acres, £11,075.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments—; Auction Sales, xiv.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisement; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

EDUCATION AND EXAMINATION.

THE Revised Syllabus of the R.I.B.A. Intermediate and Final Examinations (see page 499) shows a marked advance on that now in force in that it gives more opportunity for the raising of ability and less for success by means of an accumulation of facts with or without the aid of the memory.

The candidate is permitted to specialise to a greater extent than has hitherto been the case. Even in the Intermediate stage the inevitable bent of his mind towards the artistic or the scientific side is more fully recognised, while, though these there are no optional subjects, ethical questions only cover the minimum range demanded by the exigencies of architectural practice. In the final stage the candidate's thesis now gives him an opportunity for selecting the branch of architecture towards which he feels his faculties incline him. He may either offer a study of historical development, one in the application of science to building problems, or an exposition of his powers of design; but, as this thesis carries more weight than all the practical subjects put

together, the candidate's special studies appear to receive adequate recognition.

While admitting that the new syllabus is far superior to the present one, and that it is perhaps well suited to the present condition of architectural education, we do not think it should be regarded as a final or permanent standard test for admission to the architectural profession.

Professor Blomfield, in a lucid introductory note, explains that the aim of the Board of Architectural Education has been to "humanise" the examination, and unquestionably the revisions are all in favour of intelligent study as against the accumulation of heterogeneous information usually effected by means of "cramming." When we say that the new tests should not be regarded as permanent in their form we are bearing in mind the fact that education and examination must act and react on each other; this time developments in architectural education have opened the way to these improvements in the form of the examination, but the latter in its turn is carefully kept within the scope of preparation available for the candidate.

Might not the examinations have gone a little beyond this, putting pressure on education to work up to their demands? For example, a design prepared in two days (even in conjunction with the testimonies of study) is a somewhat inadequate test of the skill that should entitle the aspirant to qualify as an architect, but it is enough to enable the candidate to exhibit as much as he has at present an opportunity of acquiring at most of the schools in this country.

It must be admitted, however, that it is useless to carry examining methods very far beyond the means of preparation available, and we must therefore look to our educational authorities to take the leading part in any movement for raising the standard of architecture by inculcating a sounder appreciation of its essential qualities.

These in their turn are hampered by the general indifference and lack of any widespread interest in this art. The less conscientious, fully aware that a high degree of artistic skill is not essential to the attainment of a good professional position, are inclined to shirk a long and arduous course of training unless forced

into it by the severity of the qualifying tests for which they must prepare themselves. Thus the schools would be helped by a well-conceived method of examination, while the examination can be strengthened step by step with improvements in education.

As regards the provision of a suitable incentive to the strenuous cultivation of the faculties to their highest pitch, we have yet much to learn from the French, who in their official recognition of the aims of successful students set an architectural standard impossible by our haphazard methods. Their Government system not only acts as an incentive to the artist, but also educates the layman, and impresses on him the value of the arts as a factor in the national life.

Something more than mere examination and something more than the award of prizes and studentships is needed. The student should be made to feel that his career is being watched by the highest exponents of his art in the interests of the nation, and that if he succeeds his achievements will be regarded as a national asset and the stepping-stones to the utilisation of his faculties in the most suitable fashion.

An examination by itself can do little; and Professor Blomfield seems to us to confuse cause and effect when he deplors the disappearance of the type of "student-scholar-architect" which existed at any rate as late as fifty years ago, and suggests that the effort now made in the reform of the examination would resuscitate him. The type he so rightly admires has been discouraged by causes quite outside the profession, and its educational methods and the revision of these will not bring it back unless accompanied by a successful effort to entirely alter the attitude of the public at large towards architecture and the allied arts. We do not say that architects have been free from blame in the degradation of their profession to "a merely mechanical business"; they are but members of the public, and have fallen under the same malevolent influences. It is quite right for them to try to set their house in order, but they must also seek and obtain the sympathies of those outside the profession if any permanent and far-reaching good is to result.

THE L.C.C. TRAMWAYS AND ST. PAUL'S.

IF we express our gratification at the postponement, by the London County Council, of the tramway scheme in connexion with St. Paul's Bridge it is in no spirit of hostility to the idea of tramway extension. On the contrary, we believe that the linking up of the north and south systems is a pressing traffic necessity. Tramways, like other human contrivances, have their defects; they may not be the final solution of our traffic problems, but in the meanwhile they are universally acknowledged to be an enormous practical convenience to the great body of the general public. As such any proposed scheme for connecting the north and south tramways through the City should be considered from the widest public point of view and not from that of the interests or prejudices of the property owners of the City.

Whatever may be the merits of the St. Paul's Bridge scheme in the eyes of the City authorities, we imagine that even its most ardent supporter would not put it forward as an ideal method of connecting the trams. Grudgingly, and of necessity, the City appears to have consented to the trams being brought within its sacred square mile; but only on condition that they were kept out of sight and out of mind in a tunnel.

It seems to us, however, that it is the duty of the London County Council, as the central authority for Greater London, to approach the question from an entirely different point of view. It is not their business to study the special interests of the City where they clash with those of London, or to look on this tramway scheme as a minor and inconvenient detail of a more important subject.

London, as Captain Swinton pointed out, needs a main through traffic route from the Angel to the Elephant and Castle: not just a narrow street tunnel, but a broad avenue or boulevard with tramways. This, as a general necessity for the convenience of seven millions of human beings, is, we take it, of even more importance to the State than the outraged feelings of the City Fathers. It is inconceivable that any reasonable human being who set out to create such a through traffic route would have deliberately chosen the method proposed by the St. Paul's Bridge scheme. As a local traffic convenience and as an addition to the amenities of the City, it could, no doubt, in competent hands, be made a great success and a useful means of disposing of the surplus funds of the Bridge House Estates; but as a through traffic route it is simply absurd, and we must say that we have always found it difficult to believe that anyone with the slightest knowledge of the subject could ever have seriously put it forward and supported it as such.

We have more than once pointed out that the natural through traffic route for this part of London is by way of Farringdon-street and Blackfriars Bridge, and we are glad to see that this idea receives the support of Captain Swinton. Being convinced that the more this question is discussed and thought over from the point of view of the traffic the more reasonable it will appear, we welcome the delay as giving more time for thought.

We are confident that when once the London County Council has grasped the importance of the question it will insist on a scheme which places the necessities of the general public first, while making such concessions to City interests or prejudices as humanity dictates. Surely it will never agree to the City riding rough-shod over the interests of the general public.

By all means let the City have its bridge, but let London have its through traffic artery also.

CHURCH, BELFAST.

The Archbishop of Armagh laid the foundation-stone on October 7 of the St. Donato Church, which will provide accommodation for 603 worshippers. The estimated cost of the work is 4,533*l.*, including fittings, and provision has been made for future additions to the transept. The contractors are Messrs. McIntyre Brothers, of Belfast, who are carrying out the work from the designs of Mr. E. H. Lingden Barker, architect, of London and Manchester.

NOTES.

Regent's Park and the Zoological Gardens.

It seems to be the general view that almost insurmountable difficulties lie in the way of removing the Zoological Gardens to the Crystal Palace or any other site more remote from the centre of London than the present one. At the same time, the 34 acres occupied by the Society are manifestly inadequate, and another 20 acres of the Park are urgently required. We should feel a difficulty in supporting the alienation of so large a slice from the present area of the Park unless it were possible to give compensation to the public in some other way. Three years back we published an article on the linking up of our public parks, which included, among other suggestions, a boulevard continuing the Broad-walk to Parliament-hill, thus bringing Regent's Park and Hampstead Heath into organic connexion with each other. The adoption of such an improvement is still possible, and the public gain would be so great that it would then be possible to give up the 20 acres at the north edge of the Park, provided this area were judiciously selected in conjunction with a comprehensive improvement scheme. As a resort for recreation the clay levels of Regent's Park are far inferior to the heights of Hampstead and Highgate, and a well-defined link between the two would tend to draw the populace from the lower towards the higher and more exhilarating area. We are firmly convinced that this improvement is both desirable and practicable, and the necessities of the Zoological Gardens only introduce one more argument for its consideration.

The Crystal Palace.

ONE of the latest schemes for the future of the Crystal Palace, promulgated in a letter to the *Times*, is that it should be used as the home of "the Museum of Architecture and Sculpture" that everyone interested in art, whether from the educational or the aesthetic point of view, so greatly desires to see established. We confess that we are not much in sympathy with this scheme. The writer of the letter wishes to see established in this country a museum of casts from architecture and sculpture of the lines of the Musée de Sculpture Comparée at the Trocadéro in Paris. But Sydenham does not bear the same relation to London that the environs of Passy do to Paris. The Trocadéro is reasonably accessible from any quarter in Paris; Sydenham is not reasonably accessible from the quarters in London in which those to whom a museum of the sort would be useful mostly dwell. The British Museum and South Kensington are easily accessible, and that is a matter which cannot be overlooked if we are to take into consideration the artist and student to whom their collections are of first importance. They must not on any account be placed out of the way, not even if to do so were to cause, according to the *Times* correspondent, "great rejoicing to the directors of those institutions." We have the greatest admiration for the casts at the Trocadéro, and we would like to see

an orderly and logical collection in London, but not at the expense of the collections at the British Museum and Kensington, and, in any case, only not gathered together at Bloomsbury. The collections in Bloomsbury and at Kensington have become parcel of the life and thought of those whom they chiefly concern (not occasional excursionist or American "sight-seers"), and they must not be removed without good cause. As for Crystal Palace and its site, there is no solution of the "open space," which requires no argument in our limited capital for its adoption.

Protection of Ancient Monuments. WE are glad to see that H.M. Office of Works, recognising the possibilities of the Acts of 1882 and 1900, is taking steps towards assuming further responsibilities in regard to the preservation of our ancient monuments, and has issued a letter to County Councils, stating that the use involved in guardianship would, in some cases, be more fittingly borne locally than by the County Councils, and inviting the latter to draw attention to any monument worthy of protection, and to view to allocation of the responsibility to the appropriate authority. This, at all events, is a step in the right direction, and, as we may confidently expect further developments in the future, it is gratifying to see that the position is not being neglected.

Balliol Chapel. A PROTEST from Messrs. Norman Shaw and Basil Champneys appears in the *Builder* against the threatened destruction of Butterfield's chapel at Balliol College. Bless the work of this architect; it is not appeal to the sympathies of all, but its virility and originality should justify its preservation, at all events till future period, when time will give a proper standpoint from which to appraise its value. The best work of the XIXth century may possess factors of interest which we are not capable of properly appreciating at the present day, and we should deprecate undue haste in its destruction, even if we think we can substitute something better.

Whitechapel Art Gallery. It was a happy idea on the part of those who are responsible for the Whitechapel Art Gallery to decide upon an exhibition which would bring home to Londoners something of the history of their great city. The West have for some time gone East when Whitechapel holds an art exhibition, and it is safe to say that in the latitude of interest the present exhibition will box the compass. The scale of its collection is extensive; appeals to the historian, to the painter, to the topographer, to men of arts and letters, to the collector of choice and of cheap things, to the mere antiquarian, with equal force. It may be compared in some respects to the collection at the Carnavalet Museum in Paris. The aim of the projectors has been, we may take it, first of all historical, the artistic quality of the particular exhibits

being a secondary matter. It is therefore all the more astonishing that so much artistic delight can be derived from a gregarious collection in which artistic considerations are only incidental. We find, for instance, examples of Jean Tijou's ironwork and Grinling Gibbons's carving; unsuspected drawings of Hollar; a large number of the oil paintings of Samuel Scott, one of the few artists who could combine topographical accuracy with the painter's sentiment; Rowlandson, whose tragic, realistic impression of things was expressed with a certain quality of grim humour. Then there are the De Jonghes and Van de Velde, which offer contrasts in method. We must not omit to mention Varley's "St. Pancras Church," Budd's "Greenwich," and particularly David Cox's "Old Whitehall with the Life Guards," although we should scarcely have expected David Cox to rank among the painters likely to be of topographical interest to London history. Architects will find much of interest in the collection; indeed, building of some phase or other forms the main subject of the mass of work of an illustrative character. And among the work of contemporary artists there are the pleasant water-colour drawings of Sir Ernest George and Mr. Frank Lishman to show the versatility, in other artistic mediums, of men of the drawing-board accustomed to the practice of a more geometric draughtsmanship.

The Oxford "High" and Overhead Tramway Systems.

THE Oxford City Council is to be congratulated on having rejected by forty-six votes to six the proposal to allow the installation of an overhead trolley system for the tramways down the High-street. We well remember the consternation which was caused when in about the year 1882 tramways were first permitted in "the High" at all, but the fact that the public have become habituated to horse tramways in this unique thoroughfare cannot be used as an argument for its desecration by the erection of poles and overhead wires. We understand that the installation of the overhead system over the whole of the tramways would effect a saving over a combined system of some 30,000*l.*, and we are glad to see that public spirit has prevailed over economy in this particular instance. Oxford had better be contented with the existing horse tramways than be guilty of an act of vandalism, and the local patriotism shown by the Council will be appreciated even beyond the confines of the British Isles.

The Railway Unrest.

SINCE our allusion to this subject last week a move has been made by the railway companies which, if not misinterpreted by the men, should go far to establish better relations between the two parties. Secure in the assurance recently given them that they will be permitted, if necessary, to recoup themselves from the trading and travelling public, substantial advances in wages have been promised, which will materially improve the conditions of railway service. It is to be hoped that some of

the wild talk which has been indulged in during the last week will now be modified and the conciliatory attitude of the companies recognised and appreciated. We notice that several bodies of traders have already taken alarm at the threatened increase in rates and fares, and are up in arms against any advance. It may be remarked that there are ample safeguards against undue increases, and that the more such advances are spread over all classes of merchandise the less it will be felt in any particular industry. Indeed, considering the economies that are being effected by the gradual abolition of duplicate services and unnecessary competition, the amount to be raised by increased charges should not very seriously affect either passenger fares or goods rates.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

REVISED SYLLABUS OF THE EXAMINATIONS.

WE take the following particulars of the Revised Syllabus of the R.I.B.A. Examinations, which is to come into operation next year, from the last issue of the *R.I.B.A. Journal*.

The Preliminary Examination will remain unaltered.

INTERMEDIATE EXAMINATION.

Testimonies of Study.

Before being admitted to the Examination the candidate will be required to submit the Testimonies of Study Nos. 1, 2, 7, 8, and 9, enumerated in the present syllabus [see *Kalendar*], also either No. 3 (Details of Classic Ornament) or No. 6 (Medieval Ornament), and, instead of Nos. 4 and 5, sheets of measured drawings of a building, with the plottings and sketches. For these Testimonies marks will be awarded by the Examiners, who will be free to allot a larger number of marks to the drawings than has hitherto been permitted.

In addition to the general subjects of History and Building Construction, students will be required to take a special paper either in some period of History, in Mathematics and Mechanics, or in Elementary Design. An extra day will be apportioned for this additional subject.

One hundred marks will be allotted for the Testimonies of Study.

NOTE.—The existing Testimonies of Study will be an optional alternative until January, 1914.

Intermediate Examination Time Table.

(A) Principal Styles and General History of Architecture, and the Purpose of Architectural Features in relation to the Buildings in which they occur:—

Two papers occupying six and a half hours in all 250 marks.

(B) Construction:—

1. Simple Applied Construction in Elementary Design, and the Properties and Uses of Ordinary Building Materials.

2. Theoretical, including Stresses and Strains.

Two papers occupying six and a half hours in all 250 marks.

(C) In addition the candidate must select one of the following subjects:—

1. Historical Architecture showing knowledge of one of the following periods, to be selected by the candidate:—(a) Greek and Roman; (b) Byzantine and Romanesque; (c) French and English Gothic; (d) Italian, French, and English Renaissance.

2. Mathematics and Mechanics—Algebra, up to and including the Binomial Theorem.—The Use of the Slide Rule.—Plane Trigonometry, including the Solution of Triangles.—Descriptive Geometry, including the Mensuration of Simple Plane and Solid Figures.—Simple Conic Sections treated geometrically.—General Statics and Dynamics, including Graphic Statics.

3. Design—dealing with simple subjects.

Paper (in one only of the above subjects) occupying four hours—200 marks.

Testimonies of Study—100 marks.

Total marks—800.

FINAL EXAMINATION.

Testimonies of Study.

Alternative Problems in Design, set by the Board of Architectural Education, will be published every two months in the *Journal of the Institute*.

Every candidate for the Final Examination will be required to submit as Testimonies of Study Designs in answer to at least four of the Institute Problems. These Designs, when they have been submitted to and approved by either the Council of one of the Allied Societies or by a Committee of the Board of Architectural Education, will be considered as qualifying the Student to enter for the Examination. Designs so submitted and approved will be marked in the Examination by the Examiners appointed by the Board.

Two hundred marks will be allotted for the Testimonies of Study.

NOTE.—The existing Testimonies of Study will be an optional alternative until January, 1914.

Final Examination Time Table.

(A) Design for a Building or Portion of a Building—350 marks.

Two days. At the end of the first day's sitting the candidate will be required to deposit with the Moderator the original draft of his project or a tracing of it.

(B) Construction, including Iron and Steel Construction, Ferro-Concrete, Shoring and Underpinning.

Two papers occupying six and a half hours—150 marks.

(C) Hygiene, including Drainage, Ventilation, Heating, Lighting, and Water Supply.

(D) The Properties and Uses of Building Materials.

(E) The Ordinary Practice of Architecture, including Specifications and the Law of Contracts.

Three papers occupying six and a half hours in all (50 marks each)—150 marks.

(F) The candidate must submit a thesis showing advanced and individual work in one only of the following subjects:

1. Historical Architecture—implying, as far as possible the direct study of actual historical buildings.

2. Science, as applied to Building.—By this is intended a special study of an application of science to definite problems of building.

3. Design including Decoration such as a study in Civic Monumental, Decorative, or other branch of Architectural Design.

The subject selected for the thesis is to be notified for the approval of the Board four months before the date of the Examination, and the thesis itself is to be submitted four weeks before the same date. The thesis, which may be either an illustrated essay or a design with a detailed report, will be assessed by Examiners specially appointed for the purpose, who will also examine the candidate orally in his thesis. It is open to candidates to obtain distinction in the advanced work, such special distinction to appear in the Calendar—350 marks.

Testimonies of Study—200 marks.

Total marks—1,200.

An ordinary general meeting of the Architectural Association was held on Monday at No. 18, Tufton-street, Westminster, S.W., Mr. Gerald Horsley, President, in the chair.

Mr. Hall, Hon. Secretary, read the minutes and some nominations, and announced that the annual conversation will be held on November 23 at 8 p.m.

He also announced that the Athletic Club Dance will be held in the Wharcliffe Rooms on December 8.

Mr. E. N. L. Walker, Stockwell, and Mr. R. C. Horsley, Ensworth, were then elected as members, and Mr. F. C. Eden as a member of the Council.

THE EXCURSION TO THE LOIRE.

Mr. H. H. Hill then read a paper entitled "The A.A. Excursion to the Loire, 1911," which was illustrated by a large number of lantern illustrations.

"Mr. President and Gentlemen.—As there are many minds, so are the points of view numerous from which the arts may be studied and enjoyed. And I think in no art are people's ideas of what is or is not to be admired so varied and so capricious as in our own art of architecture. To some a beautiful building only means one very much enriched in its details, exquisitely finished, and lavishly bedecked with carving and ornamentation. Others imagine that they have a great taste for architecture, because they love to visit old buildings, and try to conjure up visions of the personages and happenings that history associates with their walls. In both these classes professional architects are rare. There are some among us, however, who have

a curious knack of never regarding a building that is much more than a hundred years old as real, living architecture. Rather they treat it merely as an example, more or less important, of architectural development, an illustration to the history book. And they are far more concerned about the dates of its erection, the state and manner of its restoration, than they are about the aesthetic qualities of its design. But this point of view is now old fashioned, and is only a belated extreme phase of the great and valuable movement towards the scientific study of architectural history for which the last century is remarkable. For the majority of us nowadays I am sure I am right in saying that our chief interest in all buildings alike, whether new or old, lies in their actual appearance, whether the result of time and alteration, or of pure design.

Personally, I think it a good thing when one is looking at old work to consider it, for a while, at least, as design only; to study how certain means have brought about certain effects, and the aesthetic value of these effects, detaching altogether, for the moment, the various historical circumstances that also have had their share in determining the form of the architecture. Of course, from this point of view alone one could not make a complete study of any particular building. But we really are not often concerned in the making of such studies. We, as modern designers of buildings, go out to see the world done by our ancestors. We are not so much interested in our ancestors as we are in the architecture.

So this evening, since time did not permit us completely to study any of the buildings that we saw in the Loire Valley last August, nor will it now allow me fully to analyse them, I want to do my best to describe to you the architectural impressions that I have received. These, I fear, being no more than the impressions of a first visit, will have little value as serious criticism. I hope that they will have this merit, at all events, that they will evoke the expression of ripe judgments than my own.

The chief aim of the Excursion this year was to visit the Early Renaissance châteaux of the work of the School of Tours, which are so plentifully scattered about the Loire country, from Orléans downwards. But there was also a considerable amount of interesting church work to be seen. Yet it seems to me that in Touraine we were in kind of ecclesiastical no man's land. To the south of us was the great province of Aquitaine, with its distinctive type of Romanesque church. To the west was Anjou, where the development of vaulting made its own peculiar progress in the XIIIth century. And to the north-east lay the Île de France, where

Gateway, Fontevault.

Château Du Moulin.

th-century Gothic shone with its greatest
an.

Touraine were not in the rut of any
cultural type of work. The most import-
ant seems to have come from the
And the further we travelled down
ver the more we seemed to encounter it,
I finally we reached Fontevault, whose
s are hardly less epoch-making in the
ry of architecture than those of Perigueux

e Abbey of Fontevault has had its
itudes. In 1804 it was turned into a
n, and at that time the church was sadly
ated. I think three of the domes
aken down. Now restoration is in
ess, and the almost classic magnificence
ave can again be seen. The east end
ferently designed. There are no piers,
ntives, and domes. Closely-spaced
ns of unusually long proportions are
and their rising lines, crowned by
arches, have a very vigorous effect. I
ry that I have no views of this remark-
church; for within the prison photo-
y was absolutely forbidden. Our only
was the outside of the gateway, an
isting piece of work of the XVIIIth
ry.

e next most important church of the
al type, but a variant of it that is
ie, was that within the castle precincts,
oches. Begun in the Xth century, the
ay at the west end of the nave is all
remains of the earliest portion. This
rel vaulted, and carries a tower and
added in the XIth century. The next
ays carry extremely curious pyramids,
onal on plan. The interior effect of
is most weird and mysterious. Viollet-
le was enraptured with the romanticism
whole church. We saw it under the
of conditions, when the brilliant August
ent the light right up to the apices of
domes. But in dark weather I should
that the building must appear to be
ed in inscrutable darkness, gloomy and
ying to an extreme degree.

Blois the most interesting church is that
Nicholas, of which the nave is early
and the choir XIth century. Here
fluence of Aquitaine and its domes is
slight. There is an attempt at one over-
crossing, but evidently the plan was
red, and eight ribs, carrying a vault,
g from the rim of the pendentives, upon
also stands a blind arcade, as though
had been an idea when changing the
of converting the dome into a lantern.
capitals of the choir are also interesting,
are full of classic feeling.

quite another type is the church at
es. This dates from the end of the
to the XIVth century, and is one of
hall" type, with the aisles rising to the
height as the nave. The exterior did
strike me as possessing much interest,
es for the porch, but the interior is
very fine, and full of dignity. The piers
clustered, rise to a considerable height,
are very well proportioned. The light-
s principally from long lancet lights in
aisle walls, treated in quite a simple
er, but greatly assisting the sense of
in the building.

Among other churches seen on the Excur-
was a fine Romanesque tower and apse at
es, the latter built in the IXth century.
spire was added in the XVth century,
the remainder of the church, which is
fully, within the last half century.
e parish church at Fontevault, Angou-
me in the vaulting is strongly marked.
e is also a square east end, yet vaulted
ough an apse had been intended. Blois
edral is a XVIth-century attempt at
ic, and naturally is rather dull, except
e tower, where the architect returned to
own Renaissance. Tours Cathedral I will
tempt to describe. I barely saw it, and
add very much like to see it again, for
can be no doubt about the magnificence
west front.

turn now to the châteaux that we
ed to what I take it was the real
of the Excursion—we find that in
class of building there was much more
tectural unity than in the churches.
could see also in them the continuous
opment of the habits and conditions of
rough several centuries, and along with
evolution of the architectural sense. In

the beginning the fortress château, built for
defence, often rose to the dignity of archi-
tecture, because if not "proportioned unto
the rules," it was, at all events, "solid,
masculine, and unaffected."

Sincerity in Design.

At a later period, when defence ceased to
be the first consideration, and architectural
magnificence was eagerly sought, the elusive
fairy sometimes all but escaped, leaving in
her room but a heap of carvers' pranks. Here
certainly architecture was "unaffected," and
in good work there was evidence of an en-
deavour to understand the "rules," though
it did not always look "solid," and often was
anything but "masculine." Finally, with
the rise of the modern architect, trained in
both construction and aesthetics, the four
requisites of Inigo Jones could be well fulfilled,
as, indeed, we saw them, in François
Mansart's fine wing at Blois. Henceforth
the most frequently broken condition in the
quartette was, and is, that architecture should
be "unaffected."

In the original mediæval castle at Loches,
now a ruin, though in its day one of the
most important fortresses in France, at all
events, there was no affectation. Nothing
could be plainer than the walls of the
donjon, relieved only by semicircular
buttresses. Nothing more than solid building
was aimed at, and nothing more attained.
The interior became a prison, I suppose, when
the present château was built, and in it the
art of torturing appears to have been brought
to an unusually high state of perfection. What
is now known as the château was built at the
other end of the site, by the Kings
Charles VIII. and Louis XII., that is to say,
between the years 1422 and 1515. Pic-
turesquely situated well above the town, the
verticality of its fenestration is telling; though
from the level of the terrace, as the view on
the screen shows, the unusually heavy string-
course becomes almost the most important
line in the composition. There was nothing
of exceptional interest in the interior, which
is no longer inhabited, except the tomb of
Agnes Sorel, removed from the church, for
some reason, by order of Louis XVIII.

Rising out of the town in the same way as
the château of Loches, but with the added
advantage of being on the bank of the Loire,
is the royal château of Amboise. Here what one
sees to-day is but a fraction of what formerly
existed; for Napoleon I., in an evil hour,
granted it to one Roger Ducos, who, in order to
save himself the trouble and expense of repairs,
destroyed a large portion of the buildings.
What remains is perhaps of more interest on
account of its fine situation, and its exciting
and lurid history at the time of the Reforma-
tion, than as a masterpiece of architecture.
In a novel that I read recently, an admiring
lady described it as looking as though it were
carved out of ivory. But such damning praise
is totally undeserved. Probably that very
spiky row of dormers, which really detracts
from the fine proportions of the lower parts of
the building, was what evoked the lady's
admiration. The tower is interesting. In-
side it is a sloping way, up which horses
and light vehicles can be brought. It is top-
lighted, and the piers around the light well
in the centre assist in carrying the inclined
vault. The chapel stands isolated from the
other buildings, and is an excellent example
of what was good in late Gothic. The re-
mains of Leonardo da Vinci lie buried here.

Military Engineering and Architecture.

At Chaumont the château is again situated
standing high up over the Loire. But it does
not rise up out of the town like the other two.
From the river it appears part castle, part
country house, standing among trees, well
above the straggling village by the waterside.
At close quarters; however, it becomes much
more like the work of the military engineer
than of the architect, in our sense of the
term. The exterior originally must have been
strongly defended. Even now the inserted
windows are comparatively few. The en-
trance to the courtyard is between the towers
at the south-east angle, and whether
deliberately designed for its effect or not, it
is a fine piece of architecture. The coats of
arms on either side of the drawbridge, an
unusual position, would have been better
omitted; but for them, I suppose, the client
was blame. The slots over the entrance
to take the arms of the drawbridge are

effective features, and we saw a number of
them in various places. Originally the build-
ing entirely surrounded the courtyard; but
in the XVIIth century the north side was
taken down, in order, I suppose, to open up
the fine view across the river. The increased
light and air is probably an advantage to
the comfort of the house, which is still in-
habited; but the general design naturally
suffers from being thus dissevered.

Langeais is another mediæval castle, grim
looking enough from the outside, though re-
stored and inhabited at the present day. The
original donjon was built in the Xth century;
but practically the whole of the building now
to be seen dates from the XVth. In the
Middle Ages this château was of great impor-
tance, but from the XVIth century onwards
it seems to have passed fairly quiet days. I
suppose it was too mediæval to tempt any-
body to covet it and fight for it, and too
solidly built to suffer much from decay and
mutilation. About the year 1840 it was re-
stored, and again about thirty years ago.
The work has been most carefully done, and
the late owner has gathered together within
its walls a most interesting collection of furni-
ture, tapestries, and other domestic accoutre-
ments, mostly work of the XVth century.
Indeed, both here and at Chaumont, the frow-
ning mediæval architecture gains greatly by
being continuously inhabited and furnished,
if not with the original, at all events with
the kind of furniture that it must once have
contained. There are also some very good
chimneypieces in Langeais, by the way.

Not far from here, and also at the north
side of the river, is the little town of Luynes,
the chief glories of whose château are its pic-
turesqueness and its magnificent situation.
Perched at the end of a range of hills, it has
a fine view over the Loire, and looks very
imposing when seen from it. But at closer
quarters it is neither so big nor so powerful-
looking as its neighbour. The buildings are
partly XVth century, and partly early
XVIIth, the latter marking the transition
from the exuberance of the Renaissance to the
Classic school of Louis XIVth's reign. The
smallness of scale still remains; but a much
greater quietness and sobriety of treatment
has arrived.

Brickwork is not common in our part of
the Loire country, and the only example that
we saw of a brick château was Du Moulin.
Built in the latter half of the XVth century,
this château remained certainly until the
middle of the XIXth in the possession of the
descendants of the original builder. But
since then, I fancy, it must have fallen upon
evil days. Victor Petit in 1861 describes it as
being carefully finished in the style of the
time of its building. But an edition of the
Guide Joanne which I have, published twenty
years ago, only mentions the château casually,
remarking that a portion is still standing. Its
luck, however, has again turned. The house
was restored about six or seven years ago, is
inhabited again, and beautifully furnished
with contemporary furniture.

The general plan consists of a square plat-
form surrounded by a moat. The whole of
the east side is occupied by the gatehouse and
adjoining buildings. In the centre of the
north stands the house itself. Its plan is
simple. There are two rooms on each floor.
A projection to the south contains the
entrance and staircase, one to the north the
offices, pantry and basement stairs on the
ground floor, and bathrooms above. A
picturesque chapel juts out at the north-east
corner. The kitchen is in the basement, which
is not sunk low enough to be below the water
level of the moat.

The whole group is very quiet and very
charming. It is historically a step in
advance of the other châteaux that I have
mentioned, for it is no longer the castle of
a feudal lord, but the house of a gentleman,
fortified, as the times still demanded. One
envis the architect who had so interesting a
building to restore, and his skill in restoring
it. I notice he has kept faithfully to the
view in Petit's book. One addition only has
escaped my attention. The fliche over the
gatehouse did not exist in 1860, and as an
improvement it is open to question.

Blois and the Renaissance.

At the château of Blois we reach the Renais-
sance. The building, indeed, really con-
tains work to suit all tastes—late Gothic, the

Renaissance, and Early French Classic (for I always think the term Renaissance is hardly suitable to mature and adult architecture, like that of the Louis XIVth wing here). But the chief glory of Blois, in the mind of the ordinary tourist, at all events, is the François I. wing. And certainly it is brave stuff. Curiously enough, it contradicts the accepted proverb that "distance lends enchantment to the view," for the closer one gets, the more one admires the beauty of the detail, and the more one tries to get back and look at it as a whole, the more one is amazed at the happy-go-lucky way in which the design was set out. Philibert de l'Orme was not born a day too soon. At the time of the Renaissance French masons were past masters of their craft. At Blois, indeed, there was no difficulty that they could not surmount, and the staircase is undoubtedly a very marvel of dexterity and beauty. But beautiful features do not necessarily make beautiful architecture. And what was lacking in the early days of François I.'s reign was the mind of the architect to conceive and to control. The Renaissance meant the rebirth of architecture as intellectual design, and although the old combinations of craftsmen tried hard to master its forms, they only attained to picturesqueness of detail, and never reached with them the nobility that they had attained with their own Gothic. To put what I think of this part of the château into present-day office slang, I should say that it had been very cleverly "half-inched," but on a series of small pieces of paper, and that the eighth scale elevations had never received any consideration. As a result the building is altogether without rhythm. The vertical divisions of the side facing outwards are really exasperating. And it seems such a pity that this great accumulation of fine details (for the overloaded cornice on the courtyard side is the only one that is objectionable) were not combined and unified by some synthetic mind.

The earlier entrance front is a happier piece of work. Here there is no pretence at regular fenestration. Stone shafts make vertical divisions, and windows occur anywhere in the panels between. The effect is quiet, and the only blot on the design as a whole is the doorway, a feature pushed in anyhow, instead of one developed out of the general scheme, and one again showing the need for the modern architect, that was growing even when the Renaissance had hardly begun. The figure on horseback is of Louis XII., and is modern. I cannot help thinking, by the way, from the niche in which he stands, that the doorway was designed by one whose true vocation lay in making tombs and monuments in churches.

This whole front was greatly restored during the latter half of the last century, as, indeed, was the whole château. After the Revolution it was turned into a barrack, mutilated and ill-used, until, in the early forties, after a tussle between the Minister of the Interior and the Minister for War, it was rescued to be preserved as a *monument historique*. The only part now remaining

The Château, Blois.

unrestored is the interior of the latest building designed by François Mansart for Gaston d'Orléans about the year 1637, a building that was accounted a sin by all true romanticists of the XIXth century. Most people nowadays, however, will think less hardly of it. Yet, though well placed in the courtyard, it does not show to the best advantage in its surroundings; for mixed styles in architecture never get on together, any more than would a Turner, a Raphael, and a Sorolla in close proximity in a picture gallery. The ceiling of the vestibule and staircase is the only part of this wing shown to visitors, and it is indeed worth coming to see.

After being somewhat irritated at Blois by the way in which the François I. part, through carelessness of design, just misses the point of being really fine, the visit to Villesavin on the following afternoon was indeed a blessing. Here was a real French gentleman's house, a house that no one could live in without feeling the influence of its ordered refinement. The disposition is eminently architectural, not absolutely symmetrical; for instance, the two end pavilions vary a little both in dimensions and detail, and the blank wall of an orangery comes opposite the west wing shown on the screen; but the balance is perfect. The house seems to have been fortunate in having been built all at one time, and without serious alteration since. I should think that there must have been stone mullions and transoms in the windows originally, but I don't feel their loss much to be regretted. To my mind, French mullioned and transomed windows are often rather heavy looking, and by no means so elegant in their proportions as are the usual English variety. Villesavin was built by Nicholas le Breton, Sieur de Villandry, and Financial Secretary to Francis I. The Le Bretons were a family of masons; and this one managed somehow to improve his own house with materials from Chambord, at the same time in course of erection. Two of the dormer windows on the right-hand side of the courtyard were intended for this great palace, and for some reason not used there. Also the beautiful Italian fountain, being thought not good enough for a royal residence, found its way here. And possibly the exquisitely-refined doorway in the orangery wall may have been another little picking. Whether Francis ever got credit for these when the Chambord accounts were being settled, I have no idea; but the fact that De l'Orme, when appointed Surveyor General to the Royal Buildings, dropped severely upon another member of the Le Breton family, making him refund 18,000 livres overpayment for work at Fontainebleau, is significant.

Restoration at Villandry.

At Villandry we spent a most exhilarating morning. The château, standing on the site of a mediæval predecessor, of which only one tower remains, was built in the second half of the XVth century, altered in the XVIIth and again, for the worse, in the XIXth (I

presume about the thirties) by some English people. It is now in the throes of alterations, but this time undertaken in spirit of architectural zeal, with much taste and judgment, though some of us may think without quite sufficient leaven of discretion. M. Carvallo, the present owner, who describes himself as owner, architect, builder, workman, very kindly devoted a morning to our entertainment. He took us all round his garden, and showed us what the English *bestiaux* had done. There had originally been a very large formal garden; but when the English family arrived, believing themselves no doubt to be people of great taste and followers of the romantic revival, devotees of landscape gardening, they levelled all the terraces, did away with the formal gardens, and planted grass and trees everywhere and anywhere. M. Carvallo bent upon restoring all this. He is at work excavating, and has already found the lines and sometimes the walls of the principal terraces and walks. The garden immediately in front of the house he has already laid out, and very well he has done it, too. But in scorn of grass as an herb for garden effect, I don't think many of us will share. Grass can be kept green and level all the year round—in our countries, at least, if not in his and therefore is surely as suitable anything else in a garden colour scheme.

In the house, too, he is making sweeping alterations. He is restoring it as nearly as possible to what it originally was. Certainly it had been spoilt, as the photographs before and after will show. Many of the old windows were only shams, he assured us. The tower certainly looks better solid than it did when pierced with windows, even that, of course, the newly-built-up portion look very patchy at present. But it is a better foil to the rich Renaissance work. Removal of the terrace and bridge at the end of the house, too, as done no harm.

M. Carvallo is nothing if not an enthusiastic Architect, he freely confesses, has altered his whole outlook upon life. He was a scientist, and Villandry has brought him addition, culture, civilisation. It has humbled him. He even went the length of telling us that we, as architects and artists, should aim at once as better-looking, and more intelligent-looking, than the ordinary man of commerce and affairs!

From Villandry we drove to Azay-le-Rideau to the château that, if I may make bold to choose, was the gem of the Excursion. The river front is altogether delightful. There is a kind of music in it, obtained, I know how, except by a happy combination of excellent qualities. Good proportions, a scale, fine scale, and symmetry, though last is by no means the mathematical as for there are many little irregularities with the eye does not at first detect. But quality which above all others distinguishes it, and makes it so much finer than the work of the same period at Blois, for instance, is its marvellous rhythm. With the bright sun upon it, the whole elevation dazzles one.

The Château, Blois.

Italian Fountain, Villesavin.

shimmering whiteness. It seems hardly

At the other side, too, the approach is really charming. A long, straight, avenue the axis of the entrance doors leads one past a pair of excellent gate piers of XVth or XVIIth century design, upon the side of which, facing the chateau, are picturesque stable buildings, erected about the same period. These piers serve a very useful purpose. They block out the view of the whole of the chateau, allowing one to see only a vista of the entrance. For feature it is, and a good one itself. But I think it must have been a corn in the side of the architect of the building. I should fancy the history of it must have been something like this:—Gilles Perhelot, the owner of the house, and some one Treasurer-General to King Francis I., probably wanted to be in the latest fashion. He wanted to have in the middle of his house a fine feature, containing the entrance and staircase, all done in the new Italian style. Accordingly he did just what many another foolish client would do to-day. He dispensed with his architect's services for this portion of the building, and introduced the sculptor from Italy over his head. The sculptor actually did well, on the whole, though there is a good deal of petty nonsense in his detail. But where he failed was where a great many other people used to fail at the same period. He did not realise that what he had designed was in no way a part of the building to which belonged. It is just as if one design were inserted in a part cut haphazard out of another.

I have left mention of the Chateau of Chenonceaux to the last for this reason. It contains the latest development of architecture at we saw, with the exception of Mansart's wing at Blois. But whereas at Blois the characteristic part—the part that one always, though, may be involuntarily, associates with the name—is the wing containing the staircase, at Chenonceaux the bridge gallery is the picture that flashes to one's mind with the word. This, together with the stables and also, is the work of Philibert de l'Orme.

De l'Orme, having studied his art in Rome, was practically the first French architect to understand what classic architecture really meant. Not only did he see that it was more than an affair of decorative details, such as had marked the Renaissance up to this, but at a building should be a single work of art, the intellectual output of a single individual. The system of producing architecture by collective craftsmanship died with the old Gothic. De l'Orme hated the older of things; and he probably saw enough of the bad work resulting from a combination of French masons of the old school, with alien carvers and painters of the new, each of sympathy with, and failing even to understand, the aims of the others.

In the bridge of Chenonceaux the feeling is different from any of the contemporary work in the neighbourhood. The building is not better than some of the others that we saw. I do not think it is as brilliant a piece of work as the river front at Azay-le-Rideau. It contains certain faults of detail, such as the missing out of some of the modillions in the cornices, in order to bring in the tops of the pediments, and the placing of semi-circular headed windows in the rounded bays over the piers of the bridge—this being rather peculiar of De l'Orme's weakness for contrived feats, for there was a certain difficulty in doing what the surveyor would call circular circular work. But this bridge is a design. I feel that the quality of breadth which it possesses was sought for deliberately and scientifically. Every effect was first considered on the drawing-board. To compare again with Azay-le-Rideau, the one is a statue, the other an impromptu.

The remainder of the chateau, also partly built over the river, makes a good foil to De l'Orme's more serious work. On both sides groups up in a very picturesque manner; at the stunted proportions of the first floor rather spoil the effect of the entrance front. One's sympathies are all with Diane de Poitiers. To be turned out of so beautiful a home as soon as it was hardly completed by the jealous vengeance of Catherine de Medici was a harsh punishment.

I cannot conclude a description of this

year's Excursion without some reference to the towns.

At Blois we spent more time than anywhere else. And a very pleasant little town it is, too. With the chateau one hill, and the cathedral on another, the town itself converges to the river bank and a fine bridge across the Loire. Here is a piece of laying-out that will commend itself to town planning enthusiasts. The axis line of the bridge is continued through a portion of the town, climbs by a flight of steps uphill, past a big tower bed, and terminates in a statue to Denis Papin, a native of the town, and the George Stevenson of France. From here the view looking back is most impressive, for the same line is continued to the horizon in the other direction, in a fine *route nationale*, between forests upon either hand.

In addition to the buildings already described are many others that are worth seeing. There are two interesting XVIIIth century gateways close to the cathedral. I have a side of one of them. They lead to the Bishop's Palace, the gardens of which are open to the public, and from where there is a fine view across the river and over the surrounding country.

Tours is a very different town. In the first place it is very much bigger, and then it is

Chenonceaux.

situated on flat ground at the south side of the Loire. Nominally, we stayed here for a longer time than we did at Blois; but we were so occupied with our excursions into the neighbouring country, that really it is hardly correct to say that we visited Tours at all. This was unfortunate, but it was also unavoidable. The town is interesting from many points of view. It contains many old buildings of all periods. But the general impression that one gains is that of a modern city, not much more than 120 years old, well laid out, and the majority of its buildings belonging to the latter half of the last century. The town glories in a new Hôtel de Ville, a building which suffers from too much sculpture, and a general want of restraint. I prefer the older Greek revival, Palais de Justice, which balances it, and is more in keeping with the general quiet air of the architecture of the place. The building of which, naturally, we saw most was the railway-station, a very fine piece of work, and, unlike almost any station that one can think of in England, a pleasure to the eyes.

When we went to Leches we visited a typically mediæval city, clinging round the base of the feudal castle. Here there is no town planning. The streets are narrow and winding. They have that mediæval trick of never seeming to go straight for anything. The Early Renaissance Hôtel de Ville is unceremoniously poked into a corner, and built up against one of the gateways of the old town. The Tour St. Antoine, all that remains of an old church, is a landmark; but, like so many other Early Renaissance towers,

is not a success. Early Renaissance forms are too small and too refined to be of value in tower design, where bigness of scale and boldness of outline are the chief requirements. If that tower had been built in the old Gothic days, the walls would have been battered, and something would have been made of the buttresses.

Saumur looks a fine town as one approaches it. Our first view took in a strictly orthodox classic theatre, just over the bridge, an imposing building, though rather dull. The Hôtel de Ville, a little farther up the town, has much more life in it. Partly Gothic and partly Renaissance, I think the earlier work, with its plain wall space and quaint roof, was the more interesting.

Mr. President and gentlemen, when I began my paper, I mentioned first the Abbey of Fontevault, visited on the last day of the Excursion. In speaking of the town of Saumur I have now got round to the last day again. I fear that in recording my impressions I have taken up a great deal of your time. I regret, too, that I was not better qualified to perform the task; for as I am, as you will probably by now have discovered, quite without any special knowledge of the history of French architecture. When I try to find the reasons why I should have written this paper at all I can find none, save this—that the President asked me, and I felt so flattered that I could not refuse!

The President's

in inviting discussion, said that, in the last words of his interesting paper Mr. Hill had told them how he came to address them upon the subject. It was a privilege belonging to the President for the time being to ask one of the members present at the Annual Excursion to read a paper on the Excursion to the Association, and he thought they would agree that in asking Mr. Hill to undertake this work he was very fortunate in his choice. It seemed to him that Mr. Hill was altogether too modest, when he disclaimed any special knowledge of the history of French architecture. His paper, on the contrary, which was extremely sympathetic and a just and critical account of much that was seen on the recent delightful Excursion, proved, at any rate, that he had a wide knowledge of the subject and a true and deep insight into the enthusiasms and those irresistible motives which impelled forward the development of French architecture. Certainly, the Association was fortunate in its choice of the *locus* of the Excursion; rich, as they had heard, in works of the greatest architectural interest, it was also rich in the beauties of Nature. They did not see the River Loire in a moment of her special power and magnificence, but they saw her in summer mood and dress, supremely beautiful under the bluest and clearest of skies. Mr. Hill had rightly lamented in his paper the fact that they could not give more time to seeing the city of Tours. There was a large amount of fine old painted glass in the Cathedral, and the bays of the choir and of the nave were fine examples of that splendid treatment in bay design of large clearstory windows the full width of the bays. There was also a remarkable XVIIIth-century organ front in the transept. Tours also was famous for some good town planning, especially where the principal bridge crossed the river. The churches were extraordinarily interesting; particularly the Abbey of Fontevault and Candès. The plans and sections of the former should be familiar to all. Mr. Hill had referred to the fact that some of the chateaux they saw were rich in their possessions in old furniture, and instanced Chaumont and Langeais. This was notably the case, and, besides furniture, the wealth of fine tapestries of different dates was quite remarkable. The painted ornament also in the wooden ceilings formed part of interesting schemes of decoration in the rooms, and in connexion with this one remembered the fine tiled floors. He was glad Mr. Hill spoke of the chimneypieces at Langeais. They all agreed that the two they saw there were among the best they had seen during the tour.

Mr. J. Johnson,

who proposed a hearty vote of thanks to Mr. Hill, said the detail of the work the party saw was most charming; the arabesques on

the pilasters were of the greatest possible refinement and delicacy, and there was a most delightful Italian feeling in the work. There was no doubt that many of the châteaux were, in part, very much alike, but they varied in so many details of turrets, dormers, and chimneys that they were exceedingly picturesque; and after having a surfeit in this country of the Georgian box of bricks period, old and new, with poor cornices and heavy swaggering enrichments, it was interesting to go over and see how the French had treated their residences.

Mr. H. D. Searles-Wood.

In seconding the vote of thanks, said he was not one of the party this year, but he had followed the paper with great interest. Professor Blomfield, in his paper at the R.I.B.A. last December, made the remark that François I. was his own architect to a large extent, and he did not want the professional architect under him; and that might account for some of the little irregularities in design which Mr. Hill had referred to. Mr. Noel Williams' "Henri II." gives an interesting account of the history of the period during which most of the châteaux on the Loire were built. He might mention that at Tours there was a very interesting Cours de Vacances in French for English people in connexion with the University, and he had brought a little pamphlet about it, because he thought that some of their students might take the course. It was carried on during the month of August, the courses in the University for French being in the morning, thus affording the opportunity for visiting places of interest in the afternoon.

Mr. Louis Ambler

said he should have liked to have taken part in the Excursion in order to renew his acquaintance, made twenty-five years ago, with these delightful châteaux and churches. The only two he had not seen of those described by Mr. Hill were Du Moulin and Villandry. The month he spent in the district was taken up in sketching, and he wondered how the excursionists were able to see as much as they did in a week; he did not see much more in a month. Mr. Hill did not say much about Chambord. [Mr. Hill: I did not go there.] It was very picturesque and imposing at a distance, and vast, but a little disappointing when one got close to it. What one expected to find was black marble inlay was found to be only slate stuck on; it was effective, but poor as a material used in that way, and the detail was rather coarse compared with the other châteaux. When in the district he was able to sketch inside Chaumont, but that did not seem to be permitted now; he measured up an interesting fireplace there, in the Astrologer's Room, as it was called. Azay-le-Rideau and Chenonceaux also contained much old furniture. Blois showed the evolution from Gothic to Renaissance. In those days the wing at Blois by Mansart was considered inferior, but views had changed, and now that work was looked upon as superior to the rest.

Mr. Andrew Oliver

said that one important point to take into consideration was that the châteaux they had seen exemplified clearly the gradual transition from the fort and the fortified house, pure and simple to the château or dwelling. At Losches he had a fortress; at Langeais there were battlements and machicolations, and these machicolations, although they were used first of all as defence, at Azay-le-Rideau, the defence idea had gone, and they were used simply as ornament. At Chenonceaux Cathedral they found a château, but in an old portion of the building machicolations. What was very unusual in that part of France was a fortified church tower, to be seen at Candès, that was almost a counterpart of the western front of Beziers Cathedral, as the machicolations and circular windows are similar in both cases.

Mr. A. T. Bolton

said that in 1893 he was in the district, going through and further south to Spain. He did not think that anyone going through the Valley of the Loire could fail to be impressed with the architecture, though the drawback was that the facilities for sketching were not

great. About 15 miles further south there was the château of La Rochefoucauld, which was deserted except for the caretaker; and there it was possible to measure and sketch, but the work was not so fine in detail as that further north. He thought Mr. Hill had been rather hard on François Premier work. After some interesting remarks on the period from 1520-1600 to show the relations between Italy, France, and England, Mr. Bolton said that they could not consider these châteaux as entirely dissociated from the history of the times. How did the châteaux come to be built? Well, François I. was a man who was always building, taking an interest in building châteaux as any other potentate might have taken in building ships, and large sums of money were expended in this way, for no sooner was one building finished than another was started; but François never troubled to repair the buildings when they required it. Some of these châteaux were gifts to ladies of the Court, and if one wanted to know about the relations between the King and the artists of the time they would find it most interestingly given in Benvenuto Cellini's own account of his relations with François I. The picturesqueness of the epoch seemed to be reflected in these beautiful châteaux, and it lent very great interest to them. Other smaller buildings of the period besides the châteaux were of very great interest, and the whole district was very well worth going to and staying in as long as one could.

Mr. E. Gunn

said that Mr. Hill's similes had been admirable, but he had hardly made it clear that what was left at Amboise was but a mere fragment of the original.

Mr. Yates

said the arrangements for the Excursion were well carried out, and great thanks were due to Mr. Hennings and Mr. Talbot Brown for the arrangements they made.

Mr. G. H. Jenkins

said this was the first excursion he had ever been to, and he hoped to continue going. He believed that if a man went once he was likely to continue going, for he would find out what a splendid thing saw a A.A. Excursion is. The party this year saw a lot of interesting work in connexion with gardens and laying out.

The President put the vote of thanks to the meeting, and it was carried heartily.

Mr. Hill,

in reply, said that in passing the vote of thanks to him he thought they ought to include Mr. Greig and Mr. Farrow for photographs and slides which had been shown on the screen. He was sorry to be accused of being severe on the architecture of the François Premier, though perhaps he was wrong to use the words "carelessness of design." But, perhaps, owing to the circumstances of design—to François being his own architect, and to the fact of the buildings growing bit by bit and as needs would require—they did not grow quite as they were intended. That was certainly the case with Blois. The enthusiasm of the age, he fancied, sometimes outran the scholarship of the race of architects that was growing up. As to the observation that he was not very clear about Amboise, he was afraid he did not know how great was the extent of the château before part of it was destroyed. The French Philistines, no doubt, were far worse than the English ones; they destroyed ruthlessly; in fact, a great many of the châteaux were entirely destroyed in the XVIIIth century, because people did not want the trouble of keeping them up.

The President announced that the next meeting will be held on November 13 (combined meeting with the Camera, Sketch, and Debate Club), when a paper by Mr. J. B. Fulton, A.R.I.B.A., entitled "That the True Hope of Architecture Lies in the Study of Good Modern Work," will be read.

The meeting then terminated.

[For the photograph of Du Moulin (p. 500) we are indebted to Mr. Baxter Greig, A.R.I.B.A., and for the others reproduced in this report to Mr. A. W. Hennings, A.R.I.B.A.]

ARCHITECTURAL SOCIETIES.

The Glasgow Technical College Architecture Craftsmen's Society.

At a meeting of this Society held in the Society's Room, in the Technical College, James S. Boyd, President, in the chair, Professor Charles Gourlay, B.Sc., A.R.I.B.A., delivered a lecture entitled "The College Diploma and Certificate Courses in Building." In his introductory remarks the lecturer pointed out that it lies more with the student himself whether or not he succeeds in obtaining a thorough knowledge of his subject than with his teachers or the general course which has been planned out for him. The student requires to exercise such qualities as earnestness and thoroughness, also the faculty of taking pains to understand and learn what he is taught. From the practical point of view the most important quality to be cultivated by a student of building is the habit of accurate observation. Assuming a student to possess these qualities, then the greatest profit, in so far as attendance at classes is concerned, will accrue to him if he takes those classes in the order which experience has proved to be most beneficial. The fundamental idea underlying all courses of instruction is the desire on the part of the educational authorities that the student should receive a good foundation and a thorough equipment for his work in life. They wish him to leave college strong in his subject and able to pursue his labour with as great certainty of being right in their as is possible. The lecturer then detailed the day and evening courses in building, dealing with the Entrance Examinations, the Continuation Schools, and the place they fill in the courses of study which lead ultimately to the Junior and Senior Certificates and to the Diploma of the Technical College, which is the highest point at present attainable by the student of building. In conclusion, the lecturer said that the education of the building student was a serious matter, and much of that genuine happiness to be found in one's work in life depended on the sense in which he pursues his studies, which when completed, should greatly add to his skill and to the pleasure in exercising it, which practical work affords him.

Wolverhampton and District Architectural Association.

At the general meeting of the Wolverhampton and District Architectural Association, held at the Library, Waterloo-road, the following officers for the year 1912 were appointed:—Mr. T. H. Fleming, President; Mr. W. J. Oliver, Vice-President; Mr. A. W. Worrall, Hon. Treasurer; Mr. W. Weller, Hon. Secretary (15, King-street); Messrs. F. T. Beck, W. Edwards, and A. Eaton, Painter, members of the Council.

ENGINEERING SOCIETIES.

Institution of Civil Engineers.

The Council of the Institution of Civil Engineers have made the following awards in respect of papers published in sect. II. of the *Proceedings* for the session 1910-11:—Telford Premiums to Messrs. S. M. Dixon, M.A., B.A.I. (Birmingham); H. J. F. Gourley, B.Eng. (London); J. Holden (London); A. Rogers (Horsell); A. E. Griffiths (Hong-Kong); F. C. Lea, D.Sc. (Birmingham); and a Crampton Prize to Professor W. E. Dalt, M.A., B.Sc. (London). They have also awarded the Indian Premium for 1911 to C. E. Capito (Ahwas, Persia), and the Webb Prize to F. W. Bach (London).

Institution of Municipal Engineers: Annual Meeting, Windsor.

The third annual meeting of the Institution of Municipal Engineers took place recently in the Guildhall, Windsor.

Mr. B. Wyand, Secretary, read the minutes of the last meeting and the annual report.

The President-Elect, Mr. E. A. Stickland, A.M.Inst.C.E.,

Borough Surveyor of Windsor, proposed the adoption of the report and balance-sheet. Considering this was only their third annual meeting, their position was a remarkable one, not the least satisfactory feature being their excess of income over expenditure—after

they had to write off a certain amount recoverable.
Mr. Horace Boot seconded the proposition.
The President, Mr. A. E. Prescott, put the motion for the adoption of the report, and it was carried unanimously.

Stickland

I assumed the chair from which Mr. Prescott had delivered his Presidential Address. In the course of his remarks he said that Windsor, as the town is concerned, has little or no story. "Windlesore," as the ancient town called by the Saxons, was granted to the monks of Westminster by Edward the Confessor. William the Conqueror decided to build a Royal residence there, thus originating the structure which is now so well known all over the world. The history of our native land is closely intertwined with that of Windsor.

Windsor, like every other town, has felt the effect of the motor-car and the consequent injury caused by the dust nuisance, etc. The roads through the borough are being gradually, but surely converted from ordinary re-bound granite roads to tarred flag-stone roads.

During the present year a number of roads have been tar-painted, and, favoured by a very good quality of tar and suitable weather, that work has proved very successful. The cost has been out just under 1d. per square yard.

With regard to the examinations shortly to be held under the authority of this Institution, all know that an entirely new line of ideas has been formulated by the Committee, after a great deal of careful consideration and discussion. The scheme has been prepared for the success or failure of which will be jealously watched and severely criticised by those of the old school.

The subject of road construction and maintenance, although centuries old, is still new. At the present time the question deals with difficulties of an almost unsurmountable character, and the perfect road is yet within the grasp of the surveyors and makers of to-day. The trials now taking place at Sidcup are being watched with an intense interest, for we are all waiting and eager to gain an experience which will be of benefit both to the road-user and the road-maker of the future.

The crux of the whole matter, however, is money, and while the wealthy districts are able to be willing to spend large sums of money on the reconstruction and upkeep of their roads, the poorer districts, by reason of their inability to obtain the necessary funds to meet their ways, must perforce let things remain almost as they were. The dust nuisance of this year being more extensively combated, when we constantly read of the number of deaths of roads in the different counties which have been tarred it goes to prove that both councils and their officials recognise the necessity of some means of dust prevention, not forgetting the same time that the hearts of gas shareholders must be almost bursting with satisfaction that the value of their shares are rising.

You may have—in fact, you must have—heard in almost numberless cases the statement that the construction and maintenance of roads is a highway in this, that, and the other district costs so much to maintain. I intend these figures are most misleading to the ordinary mind, and I will try to explain it to you. First of all, the nearness or remoteness of a district from the site where the metal is quarried or prepared may mean that railway carriage costs more per ton of metal than the material itself. Take my own town, for instance. For some years past I have been using Enderby granite from Narborough, Leicestershire. The granite at the quarry quoted me at 5s. 7d. per ton, the railway freight is 7s. 2d. per ton. Now can I possibly construct a road at anything like the same price as the surveyor in a district or town within twenty miles of the quarry? Again, our roads in some places are much less than in others. Then, in the case of a water-bound road, if the water has to be carted any distance from the unit of difference occurs.

I am of opinion that in cases where costs of construction are given we should know the price of the material on the actual work, and that this can be easily given, for we all know that we pay for road material, and we also pay the cost of cartage.

Another subject which at the present time is

attracting a great deal of attention and much discussion is the Town Planning Act; but here, again, as in the matter of road improvements, the question of £ s. d. is so intimately bound up with the carrying out of the Act, one almost fears it is only in wealthy districts that the elaborate and necessary expenditure required for the working thereof can be considered and adopted. It is too much to expect that an institution similar to the Road Board will ever be constituted to assist local authorities in the matter of town planning, for, after all, had it not been for the advent of the motor-car, would the at present enormous expenditure and activity on road construction and maintenance have been pushed to the extent that it has reached? If the gratification of the pleasure of the minority can work such wonder, is it not much more important that the comfort, healthy and sanitary condition of the immense numbers of working men and their families should have some consideration? Are not the surroundings of the habitations of the poorer classes in scores of smaller towns and villages equally as insanitary as those of our larger cities, such as Liverpool, Birmingham, Manchester, etc.?

As municipal surveyors I am confident we shall view with great gratification the carrying into effect of those sections of the Town Planning Act which will enable the home life of the poorer class to be improved, and I hope our efforts in that direction will be as strenuous as they are in the execution of our other duties.

Mr. A. Ernest Prescott (Eastbourne) moved a vote of thanks to the President for his address, and Mr. H. C. H. Shenton (Westminster) seconded.

The proposition was cordially agreed to, and the President replied.

Mr. Horace Boot (Tunbridge Wells) then proposed a hearty vote of thanks to the retiring President, Mr. A. Ernest Prescott.

Mr. Henry C. Adams (Westminster) seconded the vote, which was supported by the President and passed by acclamation.

Mr. Prescott briefly replied.

In the afternoon a visit was paid to Windsor Castle, and the various works of the Corporation, including the police and fire stations, depot, and refuse destructor, were inspected in turn by the members. In the evening the company reassembled at the Guildhall, where they were entertained to tea by the President.

The following are the newly-elected members of Council:—

President: E. A. Stickland, Windsor.
Vice-Presidents: H. C. Adams, London; H. L. P. Boot, Tunbridge Wells; A. Bowes, Newton-in-Makerfield; W. H. M. Jones, Chester; Frank Latham, Penzance.
Honorary Treasurer: Frank Latham, Penzance.

Ordinary members: J. Bailey, Spalding; C. O. Baines, Paignton; W. Bevan, Haverfordwest; A. R. Bleazard, Clitheroe; J. Bourne, Rammarsh; W. L. Carr, Ruislip-Northwood; A. H. Carrell, Leicester; R. G. Coates, Norfolk; F. Cutler, Deptford, S.E.; A. J. Elson, Penze; C. H. Eyles, London; H. J. Farmer, Christchurch; A. W. Gray, Lambeth; R. W. Jones, Carmarthen; A. J. Meeson, Brentwood; T. Mundy, Woolwich; H. Paterson, Hebburn-on-Tyne; A. A. Pattison, Newcastle-under-Lyme; D. Roberts, Lewes; J. Robinson, Darlington; H. C. H. Shenton, London; G. Symon, Blaydon-on-Tyne; J. Taylor, Uckfield; E. W. Veale, Farnham; E. Whitwell, Abersychan.

Meeting at Brentwood.

A meeting of the members of the Institution of Municipal Engineers was held at Brentwood, on Saturday, October 28, for the purpose of inspecting the sewage disposal works there, which are now nearing completion. There was a large attendance, about sixty being present, including the President, Mr. E. A. Stickland, of Windsor.

A paper fully describing the scheme was given by Mr. J. Edward Willcox, M.Inst.C.E., of the firm of Messrs. Willcox, Raikes, & Reed, Westminster and Birmingham, the engineers, and the party afterwards inspected the sewage farm and works. The scheme comprises the construction of the main outfall sewer and a complete installation of bacteria beds on the most modern lines for dealing with the sewage of the joint drainage area having a population of 12,000, including detritus and screening chambers, sedimentation tanks, colloidal tanks, high and low level filters, humus tanks, sludge lagoons, together with irrigation area for dealing with

the supernatant water and drainage from the sludge lagoons. The members of the Institution were afterwards entertained to tea at the Brentwood Town Hall.

Junior Institution of Engineers.

The Junior Institution of Engineers held a very well-attended meeting on October 30, when a paper on "Notes on Design and Construction in Gas Work" was read by Mr. George Evetts, Assoc. M.Inst.C.E. (member).

The author dealt with considerations which guide the engineer or estimator in choosing the site and laying out the same for all buildings and plant. He dealt in detail with the design of the retort house, coal stores, purifier-house, both as to types of buildings and materials of construction, as well as the main portions of the plant, such as retort settings, purifiers, gas-holders, etc., indicating the practical considerations which the engineer has to keep in mind in designing such works. Details of costs of buildings and portions of plant was a feature of the paper. The meeting, terminated with the usual announcements, among which may be noticed that of the Presidential Address of Commendatore G. Marconi, LL.D., D.Sc., on "Engineering Considerations in Wireless Telegraphy," which is to be delivered on November 28, tickets for the meeting being obtainable from the Secretary, 39, Victoria-street, Westminster, London.

GENERAL NEWS.

Professional Announcements.

The partnership heretofore subsisting between Mr. C. R. Field and Mr. William Glasier, under the style of Field, Sons, & Glasier, surveyors and estate agents, of Borough High street, S.E., and Waterloo-place, S.W., has been dissolved as from September 29 last. Mr. Field will continue the business under the old style of Field & Sons, and Mr. Glasier will practise as a land agent and surveyor at No. 17, Pall Mall East, S.W., under the name and style of Mr. William Glasier.

Mr. Alfred E. Nightingale is carrying on his profession of architect and surveyor at Albert-embankment and Gray's Inn-chambers, having given up his office at 38, High-street, Putney. The Studios, Drawing, and Tracing Offices have removed to Albert-embankment.

Japanese Art.

Professor Josiah Conder, F.R.I.B.A., Emeritus Professor of the Imperial University, Tokio, has written an illustrated and descriptive catalogue of a collection of paintings, studies, and sketches by Kawanahé Kyōsai, one of the most important modern artists of Japan. He died in 1889, and Professor Conder, who worked for some years in the studio of the artist, has compiled a valuable monograph. The illustrations are remarkable, the frontispiece being a beautiful reproduction in colours printed from no fewer than eighty blocks. With its elaborate notes on Japanese technique the book will be specially interesting to students of Oriental art.

Fitzwilliam Museum, Cambridge.

The most recent additions to the permanent collections embrace Rossetti's "Girl at a Lattice"; drawings and designs by Burne-Jones, Lord Leighton, and Sir E. J. Poynter, P.R.A.; a portrait by Sandys; a water-colour by J. F. Lewis, R.A.; landscape by Daubigny; and "The Bench," by Hogarth. Gifts of twelve of their etchings have been made by Mr. Martin Hardie, A.R.E., and the Hon. Walter H. James, A.R.E., and the King has lent some highly interesting drawings by Italian masters, one of them being Leonardo da Vinci's first sketch for his "Last Supper."

Ifley Church, Oxon.

The Rev. O. S. E. Clarendon, Vicar of Ifley, makes an appeal for contributions to a sum of 400l., being the estimated cost of carrying out the urgently-needed repair of the Norman tower, now greatly injured by decay, of the well-known church of St. Mary. The tower rises from between the nave and the chancel, the latter being mainly of the early English style, with a groined roof of stone, the ribs springing from clustered and simple columns; the western doorway has chevron mouldings and other embellishments.

Portinscale Bridge.

Sir Robert Hunter writes to the *Times* that, in order to remove any hesitation on the part of the Cumberland County Council to spend money in grouting Portinscale Bridge, Canon Rawnsley and Mrs. Slack, of Derwent Hill (the property nearest to the bridge), have made an offer to the Council to guarantee the cost of grouting the bridge, if the result should (contrary to every expectation) be found unsatisfactory. This generous offer, he says, should make it easy for the Council to accede to the widely-expressed wish that the bridge should be spared.

Rivington Hall, Lancs.

Sir William Lever has presented Rivington Hall, standing in what is now Lever Park, to Bolton, his native city, in order that it may serve as a house of refreshment and as a permanent art exhibition. Sir William Lever has placed in the old XVIIIth-century building a collection of contemporary pictures and furniture. Rivington was the seat of the Pilkington family in the XIVth-XVth centuries. Eleven years ago Sir William Lever presented to Bolton the Hall & the Wood, the home, in 1774-9, of Samuel Crompton, inventor of the spinning-mule, whereof the older and half-timbered portion is reputedly of the late XVth century period.

Hotel Cecil, Strand.

A conversion is to be effected of the large courtyard into a winter garden of considerable architectural pretensions, to cover an area of about 95 ft. by 45 ft., and to serve as an afternoon and evening lounge, with an orchestra, etc. A smaller courtyard will be made at the entrance from the Strand, and many other structural improvements of the hotel will be made.

Memorial Windows, St. Bede's Church, Liverpool.

Four stained-glass windows have been erected in this church as a memorial to the late Vicar of the parish. The architect for the work was Mr. James Francis Doyle, and the windows were designed by Mr. A. L. Moore. The first window depicts the Venerable Bede dictating part of the Gospel to a scribe. The second shows St. Aidan, Bishop of Lindisfarne, preaching to Oswald, King of Northumbria, and some of his subjects. The third shows Caxton at his press, and the fourth shows John Wycliffe sending out his preachers. The windows are in the south aisle.

King Edward VII. Memorial, York Minster.

Mr. G. W. Milburn has sculptured a statue of the late King, which the Dean will give to the Minster. The statue, in Caen stone, is life-sized, and presents the King in his ecclesiastical Coronation robes—stole, dalmatic, and cope—holding a sceptre with orb and cross in one hand and Edward the Confessor's sceptre with orb and dove in the other. It will be placed in a niche on the north side of the high altar.

Memorial to the late Miss Lloyd George.

The memorial which has been erected in Criccieth graveyard to the late Miss Mair Lloyd George includes a late sculptured in marble by Sir W. Goscombe John, R.A.

Egypt Exploration Fund.

The *Times* is officially informed that the chief work of the Egypt Exploration Fund during the coming season will be the continued excavation of the Osireion at Abydos, a great subterranean building connected with the Temple of Seti. Its excavation was begun in 1902-3 by the Egyptian Research Account, the work being conducted by Miss Margaret Murray and Mrs. Petrie, under the general supervision of Professor Petrie. For various reasons the work was not continued by the Research Account.

Cities and Town Planning Exhibitions.

A meeting of the Executive Committee of the Cities and Town Planning Exhibitions was held at the rooms of the Sociological Society, 21, Buckingham-street, London, W.C., on Wednesday, when a report by the Director on "Exhibitions 1910 and 1911" was received, mentioning the following: The R.I.B.A. Exhibition; the one held in Crosby Hall, which was opened by the Right Hon. John Burns, M.P.; Edinburgh (1,700 visitors); Dublin (Women's Health Association Exhibition); Belfast (in connexion with the Congress and Exhibition of the Royal Sanitary Institute); Dublin (in connexion with the Congress of the Royal Sanitary Institute of Public Health). It is proposed to hold the following Exhibitions in 1912:—Liverpool, Birmingham, and Glasgow. At the meeting the question of proposed co-operation with the town planners of the U.S.A., Germany, and France was considered.

Association of Teachers in Technical Institutions.

The annual meeting of the Association of Teachers in Technical Institutions will be

held at the Borough Polytechnic, Borough-road, S.E., on November 4. The annual report of the Council deals with the large increase in the membership of the Association in the past year, and with active work during that period. Branches have been formed in Ireland and Wales, so that activities of the Association now spread over the whole kingdom. After the consideration of the report a discussion will be initiated on the Board of Education Examinations in Science, by Mr. C. F. Smith, Manchester School of Technology, and Mr. J. Wilson, Battersea Polytechnic. Particulars can be obtained from the Hon. Secretary, Mr. P. Abbott, the Polytechnic, Regent-street, W.

Institute of Architects of N.S.W.

The fourth Architectural Exhibition under the auspices of the Institute of Architects of N.S.W. will be held at the Royal Art Society's Rooms, 76, Pitt street, Sydney, from December 2 to 9.

Ghent Exhibition, 1913.

The Belgian Foreign Office have formally invited our Government to take part in the International Exhibition at Ghent, and M. Cooremans, President of the Belgian House of Commons, and M. de Naeyer, President of the Canal Commission, with other representatives, have come to England to negotiate with the Board of Trade. Large sectional space in the Exhibition have already been allotted to Germany and France.

BRITISH HOSPITAL, MONTEVIDEO.

This building is now being erected in Montevideo, Uruguay, South America, the architect being Mr. John Adams, an English architect resident in that city.

The construction will have reinforced concrete foundations, silica calcareous (sand and lime) brick walls, plastered on outside with cement rendering, and on the inside Keene's cement finish. Fireproof floors will be built throughout the building and covered with monolithic flooring. The roofs will be of hardwood framing covered with French tiles.

A very reduced space compelled the architect to somewhat crowd the ground-floor plan, but the very strong light in Montevideo allows closer planning than in this country.

In designing the building provision had to be

British Hospital, Montevideo.

Mr. John Adams, Architect.

ade against the results of a very exposed
sition and a semi-tropical climate.
This building is estimated to cost 16,000l.
The British Hospital in Montevideo is sup-
ported by voluntary contributions. It is
specially used and appreciated by the British
mercantile Marine, British Railway, and other
bible companies' employees, as well as by all
British residents in Uruguay. It admits all
nationalities, some paying patients and many
e. The Committee have for their Chairman
R. J. Kennedy, C.B., his Britannic
Majesty's Minister resident in Montevideo.

THE LONDON COUNTY
COUNCIL.

The usual weekly meeting of the London
County Council was held in the County Hall,
King's Gardens, S.W., on Tuesday, Mr. E.
Hite (Chairman) presiding.
ST. PAUL'S BRIDGE. The report of the
Highways and Improvements Committee on
this matter was again postponed after a long
discussion. It was recommended in the report
that powers should be sought from Parlia-
ment for the construction of tramways from
Southwark-street over the proposed new
bridge to a point near the St. Paul's end of
Peapside, and also of an underground
bypass.
An amendment was moved by Mr. J. D.
Lhury, for the Improvements Committee, to
omit a scheme for the provision of a new
street in continuation of the proposed southern
approach to the bridge. This was defeated
by fifty-three votes to fifty-two.
MR. L. W. S. ROSTRON then moved that
the question be referred back until the Com-
mittee could report on the merits and cost
of the scheme as a means of obtaining a
rough route between the north and south
railway systems. This motion was accepted
by sixty-five votes to fifty-one.
LOANS.—It was reported by the Finance
Committee and agreed that the following loans
could be made:—9,500l. to the Fulham
Borough Council for electricity undertaking;
500l. to the Poplar Borough Council for
street improvement.
SCHOOL, BATTERSEA.—A workshop for
instruction in handicraft is to be erected on
the roof playground of the premises in Latch-
ford-road used by the Battersea Polytechnic.
NEW SCHOOLS.—The following new schools
are to be erected:—New school for about
200 children on a site in Belgrove-road,
Eckenham; new school in the neighbourhood
of Gibbon's-road, Willesden; new school for
about 1,000 children on a site between Roth-
schild and Weston roads, Acton.
NORRERY ESTATE. It is reported that

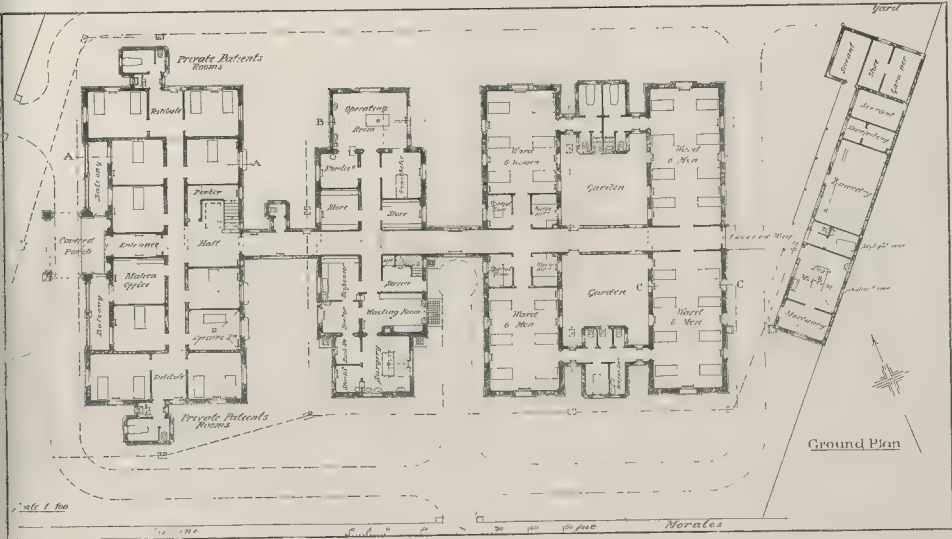

1st floor plan
British Hospital, Montevideo.

fifteen cottages are to be erected on sect. C
of the estate, each cottage to contain four
rooms and a scullery. The Architect's
estimate for the work is 3,531l.
STREATHAM COMMON.—In a report of the
Parks and Open Spaces Committee it was
recommended that the land and buildings
known as "The Rookery" should be pur-
chased for an addition to Streatham Common,
and that an amount of 3,075l. be sanctioned
for that purpose.
CAMBERWELL.—It is proposed to give per-
mission to the Camberwell Borough Council
to erect at Grove Lane-garden three green-
houses and a heating chamber.
THEATRES, ETC.—The following drawings
have been approved by the Theatres and
Music Halls Committee:—
East London Palace, Fieldgate-street,
Stepney—provision of permanent cinemato-
graph enclosure.
Nos. 382, 384, and 386, Edgware-road (cine-
matograph hall)—provision of a motor gener-
ator in the basement.
Hoxton Public Baths—provision of per-
manent cinematograph enclosure.
Nos. 137-141, King-street, Hammersmith
(cinematograph hall)—enlargement of entrance
and covering of exit passageway.
Middlesex Music Hall method of ventila-
tion of the premises.
Shaftesbury-avenue (proposed new theatre)

—additional lavatory accommodation at pit
level.
Victoria Palace, Victoria-street—extension
of the stage and provision of a flymen's room
and an electricians' room.
NEW HOTEL.—It is proposed to erect a new
hotel on a site bounded by Glasshouse-street,
Sherwood-street, Brewer-street, and Air-
street, W., to include a grillroom in the base-
ment and a winter garden on the ground
floor.
PRINCESS HALL, E.—Various alterations
are to be carried out at this hall, at 120,
Commercial-road, E., including considerable
enlargements and new lighting and heating
arrangements.
HANWELL ASYLUM.—In consequence of the
limited extent of the airing court at this
Asylum, the No. 4 male court is to be en-
larged at an estimated cost of 200l.

WAREHOUSE BUILDING MATERIAL AND ACCESSORIES,
ARGENTINA.
The *Boletín Oficial* of September 14 publishes
a notice stating that the "Dirección" has
accepted the estimate submitted by Messrs.
Ways & Freytag for the rebuilding of the
Customs warehouses on wharves Nos. 1 and 2,
in Buenos Aires. These warehouses were
recently destroyed by fire. The cost of the
work is estimated at 955,525 pesos currency
(about 34,000l.).

British Hospital, Montevideo. Mr. John Adams, Architect.

COMPETITION NEWS.

The Australian Federal Capital.

Some correspondence relating to the competition for the Australian Federal Capital appears on this page. A letter from the Secretary of the R.I.B.A. dealing with the same matter will be found on p. 509.

Training College, Glasgow.

The following notice appears in the *Glasgow Herald* of October 27:

"The Glasgow Provincial Committee propose to erect at Jordanhill, Glasgow, a Training College to accommodate 1,200 students, and, to aid them in selecting a limited number of architects to compete for the intended work, they invite architects willing to take part in the competition to send in their names by November 6 to the undersigned, with twenty copies of a statement containing such information as they may think likely to advance their claims."

The site for the proposed buildings was fixed some time ago, as mentioned in our issue of March 17 last (p. 338), and is a good one for the purpose. We understand, however, that there is a strong feeling locally that a public scheme of this importance—the cost will run well up to 100,000—should be made the subject of an "open" competition. If otherwise, the selection should in any case be made by skilled professional advisers.

School at Roman Hill, Lowestoft.

The award of the assessor (Mr. A. Morris Butler, F.R.I.B.A.) has been received by the Lowestoft Education Committee and confirmed as follows:—

First—Messrs. Bryan & Hodges, A.A.R.I.B.A., 60, Solent-road, West Hampstead, London, N.W.

Second—Mr. W. G. Wilson, F.R.I.B.A., and Messrs. Wills & Anderson, A.A.R.I.B.A., 5, Bloomsbury-mansions, Hart-street, W.C.

Third—Mr. Abel Round, M.S.A., 1, Newhall-street, Birmingham.

The premiums offered were 20, 10, and 5 guineas, and fifty-eight designs were received. The accommodation required was for 500 boys.

The whole of the competition designs are on view this week in the Council Chamber, Town Hall, Lowestoft.

Barnsley Public Baths.

The result of the competition for the proposed extension to the Public Baths at Barnsley is as follows:—

1. Mr. E. Burgess, London.

2. Messrs. Bowdler & Wallis, London.

3. Mr. E. W. Dyson, Barnsley.

The premiums offered were 50*l.*, 30*l.*, and 20*l.*

Municipal Buildings, Sofia.

H.M. Minister at Sofia reports that the "Commission Permanente de l'arrondissement de Sofia" invite the submission of designs for a new municipal building which it is proposed to erect at that place. Four premiums, to the value of 7,000 francs (280*l.*), 3,000 francs (120*l.*), 2,000 francs (80*l.*), and 1,000 francs (40*l.*) respectively, will be awarded in connexion with the competition. Architects desirous of competing must submit their designs to the "Commission Permanente de l'arrondissement de Sofia," Sofia, by whom they will be received up to 6 p.m. on December 15. Copies of the programme, etc., may be obtained on application to the "Commission," as above. A copy of the programme, together with a drawing, may be seen by British architects at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.

BOOKS RECEIVED.

THE FIRE BRIGADE HANDBOOK. By James Compton Merryweather, M.Inst.M.E. (London: Merritt & Hatcher, Ltd.)

THE COMPETITION FOR THE AUSTRALIAN FEDERAL CAPITAL.

IN our issue for October 20, p. 446, we mentioned that the Minister for Home Affairs of the Federal Government had refused the suggestion made by the architects' associations of Great Britain and America that they should be represented on the Board to determine the competition for designs for the Federal Capital, and below we print some correspondence on the subject which we have just received from Australia.

The following letter was addressed to members of the Institute of Architects of New South Wales by the Hon. Secretary of the Institute:—

"DEAR SIR,—With reference to the competition for designs for the Federal City, as the Federal Government have refused to amend the conditions of this competition in the matter of the appointment of assessors, and the final decision is in the hands of the Minister alone, in spite of the recommendations made by the institutes throughout the Commonwealth as well as the Royal Institute in London, my Council has decided to ask the members of this Institute not to take part in the competition unless the conditions are made more satisfactory.

I am,

Yours faithfully,

ARTHUR WM. ANDERSON (Hon. Secretary)."

The following letters appeared in the *Sydney Daily Telegraph*:—

"SIR,—Referring to the remarks of the Minister for Home Affairs in connexion with the British and Foreign architects taking exception to the conditions of competition for the designs for the Federal City, the preliminary steps in this matter were taken a considerable time ago. When the Institute of Architects of New South Wales communicated with the other institutes of architects in the Commonwealth and, with their cordial consent, offered to the Minister their assistance in drafting the conditions of this competition, the Minister promised to lay the conditions before the institutes before they were published for any suggestions they might make, but he broke his promise absolutely. When the conditions were published this Institute immediately noticed that they were not in accordance with those laid down in ordinary competitions, and communicated in May last with the Royal Institute of British Architects drawing their attention to the unsatisfactory nature of the clauses relative to the adjudication and the final decision being in the hands of the Minister, and asking that if the opinion of the Royal Institute of British Architects was in accordance with the views of the Australian institutes they would assist us by communicating with the foreign institutes.

The British and foreign institutes have done as requested, so that their action, instead of being an expression of a want of confidence in the honesty and impartiality of Australian professional men, is carrying out the request and confirming the judgment of the Australian institutes, and is an expression of want of confidence in the final decision being left in the hands of the Minister.

We have done all we could to assist the Government in obtaining a satisfactory result, but our assistance was rejected, and the present position was inevitable when the Minister refused to be guided by the professional bodies in the Commonwealth. We are emphatically of the opinion that the laying-out of the Federal City is of such permanent and national importance that the conditions of competition should be drawn up in such a manner that they will attract the attention of the world's most gifted town planners.

JOHN F. HENNESSY,

President, Institute of Architects, N.S.W.

ARTHUR WM. ANDERSON,
Hon. Sec. Institute of Architects, N.S.W.
September 11."

"SIR,—The news contained in your columns of the 9th inst. with regard to the Federal Capital designs and Mr. O'Malley's decision that the conditions of the competition cannot be altered is of grave importance to Australia. By refusing to consider the suggestion of the

Royal Institute of British Architects that three assessors should be appointed, one from each of the American, British, and Australian institutes, instead of the unknown engineer, architect, and surveyor as now decided, Mr. O'Malley is depriving us of the services of the best architectural talent of Great Britain, Europe, America, and Australia. The Royal Institute of British Architects is a powerful body with far-reaching influence, and Mr. O'Malley's antagonism can only result in placing the united architects of the world in direct opposition to the successful issue of the Federal Capital competition. The assessors in all important competitions in Great Britain are appointed by the British Institute, and every condition must be approved before the members of this body are allowed to compete. Its members now include practically all the practising architects in Great Britain, and it is impossible to hold an important competition there without its approval. In the present instance the British Institute does not insist upon appointing even one of the assessors before allowing its members to compete, but merely desires to approve of a British assessor nominated by the Federal Government. This is a concession that would never have been granted had the conditions been issued in Europe.

If the members of the R.I.B.A. in Great Britain are warned not to compete, this warning will be issued in every country in Europe and in America. The architectural institutes in Australia, affiliated with the parent body, will also be advised, and in the circumstances can only refuse to recommend their members to compete. Thus there will be a world-wide boycott of the competition. Mr. O'Malley relies upon unknown "Continental hundreds" to supply designs in face of all opposition. When the premium was restricted to 1,700*l.* for the premiated design, practically all hoped departed of inducing Continental architects to enter into a competition in an unknown far-away land of which they know nothing and care nothing. These providential hundreds are non-existent, since every "young, progressive, and up-to-date" architect is certain to be a member of an architectural institute, and that institute's warning will be quite sufficient to prevent his unlikely desire to compete. Mr. O'Malley's statement that "there are hundreds of young, progressive, and up-to-date professional men who will compete; they have a reputation to make; Australia is a continent, sunny and cheerful, and its city will probably be better planned by men with Continental ideas than those cultivated in a more circumscribed atmosphere," is utter nonsense, and shows astounding ignorance of the position of professional architects all over the world. The British Institute has offered suggestions founded upon a wide experience of the conduct of competitions, and Mr. O'Malley replies with a childish insult. Mr. O'Malley considers that the position taken up by the British Institute shows want of confidence in the probity and impartiality of Australian professional men. It shows nothing of the kind, because architects in Australia are quite in agreement with the British Institute. The advice of the architectural institutes in Australia was ignored by Mr. O'Malley, and it is he who has shown want of confidence in Australian professional men.

If Mr. O'Malley would take his "Continental intellectual" outlook on this competition he would discover that architects in all other countries outside of Australia are the men who plan towns. It is the architect who is trained to design the form of cities as well as of buildings therein, and of necessity he has a knowledge of engineering and surveying sufficient to express his ideas. The help of the engineer and surveyor is invaluable in carrying out the architect's design, but no architect can agree to placing the majority vote in the hands of men untrained to understand the artistic expression of form in the design of a city.

The advice of our architectural bodies has been refused and that of departmental heads accepted. It is but reasonable to conclude that the failure of this competition will result in the appointment of the departments concerned to produce a design. If such a result should come about it will be a discredit to the fair name of Australia, and the Federal City can only be imagined as a town that our descendants will have much trouble, much expense, and much joy in pulling down and reforming.

W. HARDY WILSON.

Sydney, September 11."

CORRESPONDENCE.

Australian Federal City Competition.

MR.—I have just received from the Hon. Secretary of the Institute of Architects of New South Wales a copy of a notice issued by the Council of that body asking their members not to take part in the competition unless the conditions are made more satisfactory. The Competitions Committee of the Royal Institute are considering this notice in a view to recommending the Council to a similar action as soon as possible. I send you with this a copy of the notice I received.
IAN MACALISTER.

* The notice referred to and two letters on the subject appear on p. 508.—ED.]

Cooking Apparatus.

MR.—We have just been very much interested to have our attention called to the summary of Mr. Harold Gray's article, which appeared in your issue of September 22, on the subject of electric cooking apparatus. As figures are given in the summary referred to, direct comparison is practically impossible, the following remarks may prove of interest to your readers.

The second statement appears to make Mr. Gray's statements concerning the electric oven require a little consideration. The first of these is, "That a uniform heat is essential," a statement which, we believe, is incorrect, as the top heat, which Mr. Gray pretends to object to so strongly, is that essential feature of baking which so many do not possess, and are for that reason commercial failures. Further than this, it is a statement that this top heat can be controlled will, for after it has done its work it is necessary to so modify the heat that a steady cooking temperature is maintained, which demands rapid and complete control of the oven temperature, which is, so far, only obtainable in gas-ovens.

The second statement which calls for attention is that in gas-ovens "the food is bathed in the products of combustion of impure gas." This assertion is certainly liable to misinterpretation. Anyone unfamiliar with the chemical considerations of combustion and combustion would be extremely liable to infer from the above remark that the combination of poisonous substances is bound to give rise to a poisonous result, which is, of course, not the case, for if we took hydrogen and oxygen their combustible proportions, we should have a mixture suitable for respiration; but the result of the combination of this mixture with water, a substance the hygienic properties of which need not be enlarged upon.

Again, we might argue that the combination of such substances as sodium and chlorine, though in itself most objectionable and unpalatable, not to say poisonous would produce a substance unfit to eat and of a poisonous nature, but years have proved that common salt, the product of this combination, is a nutritious and extremely necessary. In a similar way experience has proved that the ducts of gas in a properly designed cooker do not affect the food cooked therein, and that these cookers are very good to use.

It would be very interesting to know what improvement Mr. Gray's electric oven represents over and above the best of those we have used, which give the following results:—

With an oven 14 by 12½ by 10 in. the heat of the oven at the start of the test was 61 deg. Fahr. Ten minutes later it had been raised to 260 deg. Fahr., the current used during the ten minutes being 249 of a unit, representing an hourly rate of 1,494 units of electricity consumed. At the end of the ten minutes the temperature of the oven was 550 deg. Fahr., the current used during the further ten minutes being 167 units, representing an hourly rate of 1,002, the total assumption for the twenty minutes being 416 units of electricity. The current was then so adjusted that a temperature of 410 deg. Fahr. was maintained in the oven, and it was found that the current necessary to maintain this temperature was 532 units per hour, these being supervised and checked by a fully trained electrical engineer.

There is one point particularly worthy of note—it was impossible on the particular oven tested to obtain a temperature of less than 410 deg. Fahr., a temperature somewhat in excess of that required for most cooking operations, and a point which clearly demonstrates the want of control over the heat in electrical ovens.

Having dealt with the oven, we should like to give a few comparative figures on the subject of water-heating, this being of such a nature that direct comparison can easily be made.

An ordinary gas-boiling ring used to heat all quantities of water will give, at a low

estimate, 55 per cent. efficient net; or, expressed in another way, it will return in the form of heated water 295 B.T.U. per cubic foot of gas consumed, which, with gas at 2s. 6d. per 1,000 cubic feet, gives a return in heated water of 9,825 British thermal units per penny.

Next, the gas-heated circulating boiler in practice will give an efficiency of 400 B.T.U. per cubic foot of gas used, which, with gas at 2s. 6d. per 1,000 cubic feet, represents 13,320 B.T.U. per penny.

Again, a good geyser as constructed to-day will return in the form of heated water 500 British thermal units of heat for every cubic foot of gas used, which represents (with gas at 2s. 6d. per 1,000 cubic feet) 16,650 B.T.U. per penny. As one Board of Trade unit of electricity represents, if converted wholly into heat, 3,437 British thermal units, it is easy to calculate the number of units of electricity required to give the same amount of heat per penny, as we have shown, can be returned in the form of heated water by the various methods set out above.

The resulting figures are tabulated below:—
NOTE.—In each case the price of gas is assumed to be 2s. 6d. per 1,000 cubic feet.

One pennyworth of gas used in a boiling stove returns 9,825 B.T.U., representing 2,859 units of electricity.

One pennyworth of gas used in a circulator returns 13,320 B.T.U., representing 3,875 units.

One pennyworth of gas used in a geyser returns 16,650 B.T.U., representing 4,831 units.

Assuming a low rate for electrical energy of one penny per unit, the figures given above represent a direct comparison of the cost of gas and electricity, the cost of gas throughout being one penny, the relative cost of electricity being 2.85d. for boiling stoves; 3.87d. for circulators; and 4.84d. for geysers. But it must be remembered that these figures represent cost calculated for gas at 2s. 6d. actually being used to-day, whereas the calculations for electricity allow for 100 per cent. efficiency, which is not the case, to our knowledge.

We trust that these remarks will be of interest to your readers, and that Mr. Gray will see his way clear to give the information sought concerning his improved oven as compared with the test we have set out above.

THE DAVIS GAS STOVE COMPANY, LTD.,
H. A. DAVIS, Managing Director.

New Indian Patent Act.

MR. MAY I through the columns of your paper bring to the notice of such of your readers as are interested in Indian patents the fact that a new Act comes into force in India on January 1, 1912, which will alter the conditions under which valid patents are obtainable? The particular point to which I should like to draw attention is that, under the new Act, valid letters patent cannot be obtained for an invention which has been previously used or published (as by the printed British specification) in India. Under the present Act, however, it is allowable to file an application at any time within one year of the filing of the British application or of the actual sealing of the British letters patent. Therefore, any intending applicants for Indian patents, of which the corresponding British specifications are now published, or will be published by December 31 next, should take care to have their applications filed before that date.

CHAS. B. KETLEY.

Rating of Land Values.

MR. Among many remarkable aspects of recent public affairs, perhaps none is more surprising than the complacency with which middle-class people allow themselves to be despoiled of their hard-earned savings with scarcely a word of protest, and the apathy of powerful trades that are being injuriously affected by recent legislative changes, yet appear voiceless in their own defence, either at meetings or through the journals who undertake to watch over their interests. At the present time, although land valuation has practically added nothing to the revenue, the menacing attitude of the Government towards those who have put their small economies into house property has reduced the capital value of such securities by at least 20 per cent. all round; while, except in very favoured situations, building as a speculation is almost at a standstill. The public are afraid to put their money into what is fast becoming an unprofitable and negotiable security; yet the auctioneering world, which represents the investor, and the trade societies and journals associated with building seem to have no more to say on the subject than if we were suffering from an unusually severe winter, or too great bounty of the sun during the holiday season, or some other matter utterly beyond our control. Friendly societies have not behaved thus in the matter of Mr. George's Insurance

Bill, nor the doctors, and they get some relief. Why, then, should the builder and his customer, the investor, without whom the trade can make no progress, continually "take it lying down"? The question is very serious, and becomes hourly more so, for if this new scheme of making site-values amenable to the rates is put in force the present fall in capital value will be followed by another, which, certainly in the case of mortgaged property, will obliterate all but the secured interests; while in many cases the large advances made by banks, building societies, and insurance companies will be unrecoverable.

It seems, therefore, that some kind of obligation rests on those having the ear of the public, and power and authority in association with these vast interests, to exert themselves with the object of preventing so great an injustice being completed as that involved in the proposed change.

Frequently the victim of these recent enactments is not in a position to endure the strain. House property has long been the favourite investment of elderly men, who, by industry and self-denial, have earned the right to an honourable old age and to make provision for their families. It seems, therefore, a cruel thing suddenly to introduce a change which must seriously diminish and in many cases will destroy their means of subsistence; and this at a time when a fresh start in life is almost impossible.

I think, sir, I have said enough to enlist your sympathy in this matter, and will only add that, although fraught with ruin to hundreds of middle-class families, the change will probably prove as delusive financially as the land legislation of two years ago—the real intention being socialistic and destructive.

HENRY CLORISTON.

INTERCOMMUNICATION COLUMN.

Decaying Floor.

SIR.—About three months ago a small bungalow of five rooms was completed by a local builder. It is now discovered that the flooring, which was to have been laid down directly upon 3 in. of cement concrete, rests upon ½ in. only, under which is nothing but rubbish. The latter appears to be damp, and the result is all the boards show signs of damp rot—which apparently is due also to the fact that they have been partially tarred only—and the joists are in the same condition, i.e., badly tarred; linoleum had been laid down or this would not have been found out.

As it is understood, it is impossible to prevent the boards eventually decaying. Would you kindly advise as to some efficient substitute to replace boards for flooring? I should like to know if some substance could be laid which would not necessitate the expense of removal of the joists and everything else under the boards. I am advised "wood block" flooring might serve, and should like to have some idea of the expense of laying, etc., or whether there is any other patent flooring cheaper and as efficient. S. G. H.

THE BRITISH SCHOOLS AT ATHENS AND ROME.

The annual meeting of the British School at Athens will take place on Tuesday, November 7, at Burlington House, at 5 p.m. The Dean of Westminster will take the chair, and the Director will give an account of the excavations undertaken by the School this year at Phylakopi in Melos. This year the School celebrates its twenty-fifth anniversary, and the occasion will be marked by a festival dinner to be held on the same evening, when Mr. George Macmillan, Chairman of the Managing Committee, will preside. The company will include Lord Morley, and among the speakers will be the Greek Minister (Mr. Gennadius), the Director of the School (Mr. R. M. Dawkins), Professor Ernest Gardner, Dr. Walter Leaf, and Sir Lawrence Guillemard. A short history of the School from its foundation will be produced in honour of the occasion. The annual meeting of the sister School at Rome takes place also at Burlington House on November 21, Professor J. S. Reid, Chairman of the Managing Committee, presiding. In connexion with this meeting there will be an Exhibition of student's work. Mr. J. S. Beaumont, a graduate scholar in architecture of the University of Manchester, has recently been appointed by the Gilchrist Trustees to the Gilchrist Studentship held at the School.

EDITORIAL SUMMARY.

The leading article is entitled "Education and Examination," and deals with the revised syllabus, printed on p. 499, of the Royal Institute of British Architects' Intermediate and Final Examinations.

A second article is given on page 498, commenting on the London County Council Tramways and St. Paul's.

"Notes" (p. 498) include remarks on: "The Oxford 'High' and Overhead Tramway Systems"; "The Crystal Palace"; "White-chapel Art Gallery"; "The Railway Unrest"; "Regent's Park and the Zoological Gardens"; "The Protection of Ancient Monuments"; "Balliol Chapel."

At the meeting of the Architectural Association on Monday Mr. H. H. Hill, B.A., read a paper on "The Architectural Association Excursion to the Loire, 1911," and showed a number of interesting lantern slides of buildings in the district. The paper is printed on p. 500 *et seq.*

Some information in reference to the Australian Federal Capital Competition appears on pp. 508 and 509.

In our Correspondence Column (p. 509) will be found letters on: "Cooking Apparatus"; "New Indian Patent Act"; "Rating of Land Values."

The Monthly Review of Construction, illustrated (p. 511), contains: "Determining Stresses: Collar-Beam Roof Truss"; "American Society for Testing Materials"; "Keeton System of Reinforced Concrete"; and "Notes."

The Building Trade Section (p. 515) contains: "Workmen's Compensation"; "Cement"; "Building Plans and Building Prospects"; "Applications under the London Building Act, 1894-1909"; "Projected New Buildings in the Provinces," etc.

The first of a series of six public lectures on "The Real Nature of the Problems in Heating and Ventilation Awaiting Solution by the Engineer" was delivered at University College, London, on the 17th ult. by Mr. A. H. Barker, a résumé of whose remarks is given on p. 518.

A report of the decision in the case before the Tribunal of Appeal under the London Building Act, *i.e.*, "London and Westminster Bank, Ltd., v. the London County Council," is given on p. 520; also the case of "The London County Council v. Corbett."

Law Report (p. 521) refers to "Alleged Dangerous Premises at Islington."

MEETINGS.

SATURDAY, NOVEMBER 4.

Aberdeen Architectural Association.—Mr. A. E. Payne, A.R.C.A., and Mr. R. W. Gibbon on "A Holiday in Central France." Illustrated. 7.30 p.m.

Junior Institution of Engineers.—Reception by the President, Sir J. J. Thomson, F.R.S., and Lady Thomson at the Caxton Hall, Westminster. 7 p.m.

MONDAY, NOVEMBER 6.

Royal Institute of British Architects.—Opening address by the President, Mr. Leonard Stokes. 8.30 p.m.

Society of Engineers (Incorporated).—Mr. R. W. A. Brewer on "Two-Cycle Engines." 7.30 p.m.

Liverpool Architectural Society (Incorporated).—The first ordinary meeting of the session. Opening address by the President, Mr. Arnold Thornely, F.R.I.B.A. 6 p.m.

The Incorporated Clerks of Works Association (Carpenters' Hall, London-Well).—Paper by Mr. E. N. Craig on "City Working and the Stock Brick Industry." 8 p.m.

University of London (Victoria and Albert Museum).—Mr. Basil Fletcher on "St. Peter's and other Renaissance Churches in Rome." 5 p.m.

TUESDAY, NOVEMBER 7.

Institution of Civil Engineers. (1) Address by Dr. W. C. Uxwin, F.R.S., the President, and presentation of medals and prizes awarded by the Council. (2) Reception by the President in the Library after the meeting. 8 p.m.

University of London (University College).—Mr. A. H. Barker, B.A., B.Sc., on "The Real Nature of the Problems in Heating and Ventilation Awaiting Solution by the Engineer."—IV. 5 p.m.

Bath, see Polytechnic (Lectures on Illuminating Engineering).—Mr. J. G. Clark on "Gas Lighting." 7.30 p.m.

University of London (British Museum).—Mr. Basil Fletcher on "Greek Architecture: The Mycenaean Period." Lantern illustrations. 4.30 p.m.

British School at Athens.—The Festival Dinner, Whitehall Rooms, Hotel Metropole, W.C., to commemorate the twenty-fifth anniversary of the School's foundation. 7.45 p.m.

WEDNESDAY, NOVEMBER 8.

Manchester Society of Architects.—(1) Extraordinary general meeting. (2) An informal discussion to be opened by Mr. J. J. Burnett A.R.S.A., Hon. LL.D. 6.30 p.m.

THURSDAY, NOVEMBER 9.

Sheffield Society of Architects and Surveyors.—Mr. W. S. Parnon on "The Architecture of Oxford." 7.45 p.m.

FRIDAY, NOVEMBER 10.

Glasgow Technical College Architectural Craftsmen's Society. Debate on "The Uses of (1) Stone, (2) Brick, (3) Concrete as Applied to a Country House," by Mr. R. Gilchrist, Mr. W. Orr, and Mr. R. Park. 7.45 p.m.

ILLUSTRATIONS.

Ilkeston Secondary School.

THIS school, about to be erected for the Derbyshire Education Committee, provides accommodation for 204 students. The building has been planned on axial lines, and all classrooms, laboratories, etc., are on the ground floor. The whole of the school is covered with a concrete flat, the Assembly Hall being covered with a dome of the same material. Cross-window ventilation is obtained in all cases by means of dormer windows placed under and over open-corridor roof. The Assembly Hall has been placed in the centre of the quadrangle, being octagonal on plan and having entrances on six sides.

The walls are to be constructed of brick, and the exterior covered with rough-cast. The approximate cost will be under 500, per head, which includes boundary walls, oak fencing, asphalt, and laying out of grounds.

Mr. George H. Widdows, A.R.I.B.A., is the architect.

Hospital and Sanatorium.

This design for the Isolation Hospital at Aberdare was placed first by Sir William Emerson in the competition held some time ago. Mr. Edward C. H. Maidman was successful also in the competition for a Consumptive Sanatorium, Cork, adjudicated by Mr. Albert E. Murray, A.R.H.A. An illustration of this building is given also.

Pugin Studentship Drawings:

Stamford St. Mary's.

THE tower of this church has never been restored, and is consequently one of the most interesting and valuable examples of the period. Iron bands have been placed along the walls and bolted through, but the original stone cutting has been untouched.

The belfry story windows had originally a central shaft with infilling bars to the main arch; traces of the mitres and base moulds are quite visible, and an old XVIIIth-century print hanging in the vestry shows these shafts as existing at that date.

Most of the window openings have been filled in with rough masonry, with the intention of strengthening the tower walls. This infilling has come away and left a fissure all round, showing how this mass only burdens the tower and in no wise helps it.

St. Cuthbert's, Wells.

The Cathedral Church of Wells, by the introduction of long panelled lights to the belfry stage, in the XIVth-century additions to the west towers, established a design which not only in the Diocese of Wells, but throughout the whole West Country, became general in tower building. The Church of St. Cuthbert's is perhaps the finest example of this. The long vertical lines of the mullions and the buttresses, terminating in the pinnacles in which the same vertical idea is expressed, carry away the effect of bulkiness which the plan (being the full breadth of the nave) makes almost inevitable. The church itself has a fine roof, but mostly the remainder is late work of a poor and debased character.

Howden St. Peter's.

St. Peter's tower is the dominating feature for miles around. It has a splendidly dignified effect, sitting at the junction of the four roofs.

The bell story is a late XVth-century addition and is not nearly as good as the rest. A deeply cut casement mould runs up the jamb and the arch of the long lights, and this gives definition to the mouldings and strengthens the vertical feeling of the design.

FIFTY YEARS AGO.

From the *Builder* of November 2, 1861.

The Affinity between Vigour in Architecture and Music.

THERE is something grand and manly in the wild savage vigour of a Romanesque grotesque. There is none of that fiddle-faddle finish we find in modern marble sculpture. When they wanted finish they could give it—it was done chisel in hand; no rasping, filing, Danneker-Ariadne-elegance. When they drew a line it was thick—could be seen at some distance; there was none of your petty German, fine-lined, modern Munich, Dusseldorf, Madonna sentiment. They drew a Madonna that could be seen all over the place—it made the people worship a good way off. They cursed hard and worshipped hard; and what they did they did with vigour. But look at a modern German, who gets religious first and the patriotic, over beer, increasing according to *schoppen* consumed.

It has been reserved for Richard Wagner to found a true school of opera, of dramatic music. His first attempts in this style were "Tannhäuser" and "Lohengrin," the former produced at Dresden, in 1845. Here he began to develop his ideas; but it is in his recent works, not yet performed operas—"Tristan and Isolde," "Rheingold" (Nibelungen)—that the full force of this system may be heard. He speaks of the effect the orchestra should have upon the soul thus: "The great melody, such as I conceive it, which embraces the whole dramatic world, should produce in the soul a feeling similar to that produced by a fine forest at the onset of the traveller just escaped from the noise of the town. He distinguishes (in the silent solitude) tones of infinite variety—he hears what he has never before heard; and he finds in them a sublime melody he forgets not—he cannot repeat it, but he returns to it over and over again." And such is the effect of a grand composition of Wagner's. Trust a lover of Wagner's music may spring up amongst our Goths. A. WARRINGTON.

STATUE OF LORD KITCHENER.

Messrs. Elkington & Co. will cast in bronze the equestrian statue for Calcutta. The stone pedestal, 12 ft. high, will bear four bronze panels depicting episodes of Lord Kitchener's military career; the portrait study of the figure is by Mr. March.

ROTHAMSTED, LEITS.

The late Sir Charles B. Lawes-Widdowson, Bart., affected, under his own directions and superintendence, an extensive enlargement and improvement of his ancestral home at Rothamsted, near Harpenden. There are yet remains of the timber and plaster house to which were made additions of brick, in the XVIIth century. In 1655 the Cressy family sold the property to the Witts, of Flemish descent, from whom it passed to the present family of Lawes. The hall are the oak beams and posts of the original house; subsequent changes are plainly manifest in the exterior brickwork of the walls, gables, and chimneys, varied in the thickness and colour; the south and main front, of the XVIIth century, presents an elevation of four shaped gables having small moulded brick pediments and moulded brick cornices; from above the central porch rises a brick bell-tower capped with a lead-covered clock turret. The dining-room ceiling is a fine specimen of Elizabethan plasterwork; nearly all the apartments are panelled in oak, some in a pleasing version of the linen-fold design; there are handsome oak staircases and richly-carved chimney-pieces, with many examples of contemporary furniture of common designs.

MONTHLY REVIEW of CONSTRUCTION.

DETERMINING STRESSES: COLLAR-BEAM ROOF TRUSS.

WHEN obtaining the stresses in the various members of roof trusses by means of graphic statics it will be found that the simpler wooden more often give rise to difficulties than the complex trusses of larger span in iron or

considering a collar-beam truss of 20 ft. span as shown in Fig. 1, the reactions can be

found to enable the "closing" of the stress diagram properly.

This arises from the fact that one factor has been disregarded—a most important one—the bending at the joints of the collar-beam. It is a well-known fact that the tendency of such a truss is to "spread" at its feet, thrusting the walls out sideways. Such being the case, the reactions will not be parallel as we have so far established, but must be inclined to one another, their direction meeting somewhere in the vicinity of the truss.

It is therefore best to determine first the amounts of the stresses in each of the members, and these can be calculated by taking a section through the member and taking moments about the nearest joint.

Taking moments about the joint o in Fig. 4 the

$$\text{Stress in CH} \dots \frac{14\frac{1}{2} \times 8\frac{1}{2}}{7} = 13.43 \text{ cwt.}$$

$$\text{Stress in GH (Fig. 5)} \frac{21\frac{1}{2} \times 6\frac{1}{2}}{5} = 28.68 \text{ cwt.}$$

$$\text{Stress in DH (Fig. 6)} = \frac{11\frac{1}{2} \times 2.9}{7} = 6.1 \text{ cwt.}$$

$$\text{Stress in BG (Fig. 7)} \frac{9 \times 10 + 14\frac{1}{2} \times 6\frac{1}{2}}{7} = 26.28 \text{ cwt.}$$

$$\text{Stress in EG (Fig. 8)} = \frac{14\frac{1}{2} \times 2.9 + 21\frac{1}{2} \times 2\frac{1}{2}}{7} = 12.7 \text{ cwt.}$$

Thus we know the stress in each member, and they are all compressive stresses. The stress diagram can be constructed from these stresses, and the reactions form the closing sides, as also an extra external force will be found which is necessary to maintain equilibrium.

Take any suitable point G (Fig. 9) and draw GH parallel to HG in the truss, and equal in length (to the force scale) to 28.68 cwt. From G draw the other sides GB and GE parallel to their respective truss members and equal in length to the stress amount. At H draw HC and HD as shown. Join DE, which should be parallel and equal in amount to the external force in the roof at DE, and CD should also correspond to the force on the truss.

From C draw CB₁ vertically equal to CB₁, the external force on the roof of 9 cwt. Draw BA from B in a similar manner equal to 4½ cwt., the amount of the external force AB on the roof. Draw from D force EF (Fig. 9) parallel and equal to EF on the roof. To close the line of loads (Fig. 9) we require a force BB₁ to maintain equilibrium at the joint BCHG. We therefore show this virtual force on the

drawn out without the aid of a polar ray diagram by considering each set of loads separately, i.e., dead load and wind. It will be found that each set is equally distributed on the abutments; therefore, combining the total of each set of loads at each abutment as shown, we get resultants of 29½ cwt. at points inclined as shown. Reversing the directions we have the reactions at the abutments. The same result is obtained by the funicular polygon and polar ray diagram, as shown in Figs. 2 and 3. The point of the funicular polygon is a point through the resultant of all the forces at must

Draw a line through o (a₁f₁) parallel to and equal to it in length, and through the points also draw lines parallel to a₁f₁ horizontal lines a₁x and f₁y to intersect the lines continued as shown. Join which intersects a₁f₁ at g₁. Then a₁g₁ is amount of the reaction at a₁ and f₁g₁ amount at the abutment f₁. These will amount to 29½ cwt. each as before. This is the elementary one of resolving one into two parallel forces. From the information now at hand the stress diagram in most cases could be easily completed, not so in this case, as the point G cannot be

roof as a load, although really it is a bending resistance in the roof truss.

To find the reactions, join GA and GF (Fig. 9) and draw lines parallel and equal in amount to these intersecting their respective abutments. To prove that all the forces balance one another, complete the polar ray diagram (Fig. 9) and draw the funicular polygon (Fig. 10), when, the last sides of polygon closing, the truss is proved to be in equilibrium and the correct stresses found.

As there is no actual force BB_1 acting externally on the roof truss, this must be exerted by the rafters themselves, and is really their resistance to bending. The method just described may be greatly simplified, as there is a direct method to determine the amount and direction of the virtual force available.

The upper portion of the truss being a triangle, it is self-contained so far as stresses are concerned, and requires no extra virtual force to maintain equilibrium therein. Of course, there are the reactions, but these are provided for by the lower portion of the rafters. We therefore have four joints left—the two at the ends of the collar where the collar-beam joins the principal rafters and the two abutments.

Take first the joint CHG and indicate the various forces there to scale, as Fig. 11. Draw a force polygon (Fig. 12), when it will be seen that a force BB_1 is required to complete the polygon. Take any pole o and draw a polar ray diagram, transferring the rays back to their respective fields (Fig. 11). Where BB_1 meets is a point through which this virtual force acts, and its position is as shown dotted at BB_1 at the joint. The amount of the force is the length of BB_1 (Fig. 12) measured to scale.

The right-hand joint can be worked out in the same way as shown in Figs. 13 and 14, and gives the same amount, i.e., 21½ cwt.

The load line can then be drawn and the stress diagram worked out without trouble. Using graphical methods alone, the same results can be obtained by first considering the loading in the upper portion of the truss, as in Fig. 15. The resultants are obtained from the stress diagram (Fig. 16) where $GB = 19\frac{1}{2}$ cwt. and $GE = 25$ cwt., acting at the inclination shown. Next take the lower portion of the truss (Fig. 17) loaded with these loads in addition to the external loads thereon, and by parallelograms of forces resolve these forces as shown.

The $19\frac{1}{2}$ cwt. at B produces a compressive stress in the rafter of 26 cwt., and a tensional stress in the collar-beam of $11\frac{1}{2}$ cwt. The force at E produces a compressive stress in the collar-beam of 32 cwt. and 33 cwt. in the principal rafter at the end.

The resultant stress in the collar-beam is the algebraic sum of the two stresses, or $32 - 11\frac{1}{2} = 20\frac{1}{2}$ cwt. compression. There being no other defined force to resist this, the inertia of the rafters are called upon to perform the duty, which they do by their resistance to bending. Therefore, show this as an external virtual force acting against the collar-beam, as BB_1 (Fig. 10). Combining the loads at the abutments with the lowest loads on the truss gives the amounts and directions of the reactions. The load diagram can now be drawn as before.

The virtual force of 20½ cwt. at BB_1 can be resolved into two parallel forces of 10½ cwt. each acting in the same direction (horizontally) at the abutments. These multiplied into the leverage to the collar-beam give the amounts of the bending moments at the centre of each principal, or $10\frac{1}{2} \times 5 \text{ ft.} = 51\frac{1}{2} \text{ ft. cwt}$

THE AMERICAN SOCIETY FOR TESTING MATERIALS.

THE extremely useful character of this Society is abundantly demonstrated by the subjoined brief summary of the proceedings at the fourteenth annual meeting held in July at Atlantic City. For the convenience of readers who are interested in special subjects, we deal with some of the various reports and papers submitted under classified headings.

Preservative Coatings.

The Committee on Preservative Coatings presented a voluminous report, including the sectional reports of several sub-committees.

The sub-committee undertaking the inspection

of test panels and bridge painting at Havre Grace reported on the condition of numerous qualities of paint which are still undergoing long-time weathering tests. This eminently practical method of procedure has already the effect of proving the unreliable nature of some paints, and when the final report is presented it will be a valuable guide to architects and engineers, as well as to paint manufacturers. A similar investigation is in progress at Atlantic City, under the charge of another sub-committee, the plates having been painted by the Association of American Paint Manufacturers.

The sub-committee on linseed oil reported the results of analyses in seven different laboratories, the average results obtained to the present furnishing reliable constants for raw linseed oil. Their report includes a paper on experiments conducted by the Bureau of Standards to determine the coefficient of expansion of linseed oil from 4 deg. to 40 deg., the data obtained being of value in permitting the specific gravity of such oils to be corrected for variations of temperature.

The sub-committee on white paint tests has formulated the details of a comprehensive exposure investigation. Some 120 mixtures will be examined, the grinding and mixing of the paints having been undertaken by Professor Allen Rogers, of Brooklyn. The Pennsylvania Railroad Company have agreed to prepare the panels, which will be painted by the Baltimore and Ohio Railroad Company and it is believed that the Departments of Agriculture and of Commerce and Labour will arrange for exposure of the panels at an experimental farm near Arlington, Virginia.

The sub-committee on paint vehicles has recently started laboratory tests on the time of drying and the physical character of the films given by various drying, semi-drying, and non-drying oils to which varying amounts of driers have been added. Exposure tests will also be made by the committee.

A paper on "Further Results of Westinghouse, Church, Kerr, & Co. Tests," by Mr. C. M. Chapman, gives results of tests of over 1,000 coatings on 3,000 panels exposed to the weather. The object of the tests was to show the protection afforded against rust. The results show that for short periods a single coat of red-lead, white-lead, or on the chromatic paints is satisfactory. Carbon graphite, and iron oxide paints appear to be equally useful, and a mixture of graphite and iron oxide seems to be better than either material alone. White-lead appears superior to any other pigment except red-lead for coat work after exposure for one or two years. For two-coat work it is best for one year, other materials show up as well after two years. The durability of red-lead priming was established.

Mr. Henry A. Gardner, in a paper on "Practical Testing of Drying and Semi-drying Paint Oils," described exposure tests recently started in the grounds of the Institution of Industrial Research at Washington for the Association of American Paint Manufacturers on forty-eight pine panels, 2 ft. by 3 ft., covered with standard white pigment reduced with different oil for each panel.

Cement and Concrete.

Mr. Russell S. Greenman read a paper "Practical Tests of Sand and Gravel"

ete." The author recommended sand as delivered and testing by the United States Geological Survey. He quoted results showing any sand can be judged by its degree of voids, loam, and grading, as determined in the laboratory and regarded field tests as valuable indicating the proper proportions of sand as delivered. With members who took part in the discussion, the author emphasised the importance of determining the percentage of loam in sand and the reliability of such matter.

"Expansion and Contraction of Concrete while Hardening" was the title of a paper by Mr. Albert T. Beck, who referred to experiments by the United States Office of Roads. Specimens of concrete were dried immediately after moulding and found to commence shrinking directly, but with very wet mixtures perceptible expansion occurred for a few days. At the end of three months the contraction was about 0.05 per cent. Specimens kept wet showed expansion while in that state and began to contract as soon as dried. Mixtures seeming to expand more than made with more water. The behaviour of material appeared to resemble that of timber. Professor Alfred H. White read a paper, "The Destruction of Cement Mortars by Expansion and Contraction." This communication, although of interest and suggesting a field for fruitful work, is one giving laboratory results which practical purposes must be treated with a deal of reserve. One conclusion, however, is in confirmation of what is already known to experts that the use of much cement in mortar used for rendering is apt to cause expansion and contraction, and for the richer the mixture is in cement water is the change of volume as the temperature of temperature variations.

Standard Specification for Steel Reinforcement Bars.

The Committee on Standard Specifications stated their proposals for steel used in reinforced concrete work, most of the clauses similar to those generally adopted in practice. Two classes of metal are contemplated—mild and hard steel; the former the ultimate tensile resistance of 55,000 lb. per square inch and the yield of 33,000 lb. per square inch, and the latter with the minimum tensile strength of 60,000 lb. per square inch and the yield point of 30,000 lb. per square inch. The draft states that hard-grade steel will be used only when specified. Provision is made for smaller elongation in the case of cold and cold-twisted bars, and for cold twist tests suited to both qualities of steel.

Building Brick.

A paper by Dr. D. E. Douty and Mr. L. L. described "Some Further Experiments on the Absorption, Porosity, and Specific Gravity of Building Brick," conducted by the United States Bureau of Standards. The results find that the best test for absorption is the four-hour boiling method, the results more harmonious than those of any other,

Fig. 2.

and eliminating the injustice done to soft bricks by reliance on short-immersion tests. Some of the results obtained by different methods of testing are given below:—

Method of Testing.	Percentage Absorption.	
	Whole Brick	Half Brick.
Immersion for ninety days and boiling for four hours	20.5	20.0
Boiling for four hours	20.2	19.9
Immersion for ninety days	18.8	18.7
Immersion for seven days and boiling for one hour	18.3	19.1
Partial immersion for ninety days	18.2	19.4
Vacuum	17.7	17.8

Sewer and Drain Pipes.

The Committee on Standard Specifications and Tests for Clay and Cement Pipes presented a voluminous progress report. The work of this section is divided into three classes—(1) To determine the requirements to be fulfilled by sewer and drain pipes; (2) to ascertain the inspection and tests necessary in the case of materials; and (3) to draw up specifications for laying pipes under the usual conditions. An elaborate syllabus has been prepared of points coming into the first two classes, and some of them have been relegated to sub-committees for investigation. Some time will necessarily elapse before the final recommendations of the committee can be formulated for presentation.

Professor A. Marston read a paper on "Methods of Testing Sewer Pipe and Drain Pipe," a communication eliciting a good discussion in the course of which the methods

adopted at St. Louis, Brooklyn, and elsewhere were described.

Iron and Steel.

As on previous occasions, a good deal of attention was devoted to these metals, among the chief contributions being a report on the "Corrosion of Iron and Steel"; an important paper by Dr. Allerton S. Cushman on the "Manufacture of Pure Irons in Open-hearth Furnaces"; two papers on "Hardness Tests," one by Messrs. B. Stoughton and J. S. Macgregor; and a report on the "Heat Treatment of Iron and Steel." Four standard specifications for steel were also presented in addition to that for reinforcing bars already mentioned.

THE KEEDON SYSTEM OF REINFORCED CONCRETE.

VARIOUS methods have been introduced from time to time for securing the stirrups or shear members of reinforced concrete beams to the main bars working in tension and compression. The latest device of the kind is that of Messrs. Richard Johnson, Clapham, & Morris, Ltd., of Manchester, the connexion being made by the application of a key, as shown in Fig. 1. Here the stirrup consists of a piece of round steel rod forming a loop through which the main reinforcing-bar is passed and keyed in position, the two ends of the stirrup being bent so as to assume a diagonal position for better resisting tension on diagonal planes in the concrete, and the extremities are bent over at right angles for anchorage.

The same kind of arrangement is adopted for the lateral reinforcement of columns, as represented in Fig. 2.

One manifest advantage of the system is that ordinary merchant bars can be employed as reinforcement, thus obviating the delays that may sometimes occur in cases where specially rolled bars are used, and enabling the builder to obtain material from any steel merchant in the vicinity of the works to be executed.

It is claimed by the patentees that when the web members are keyed in position on the main bars of a beam the series of projections formed at the points of attachment have the effect of constituting an efficient mechanical bond to supplement the natural adhesion between the concrete and the steel. Moreover, it is pointed out that the strength of the material used in the construction of the main bars is not impaired in any way, as the metal retains the original fibre and structure obtained during the process of rolling in the mill. The stirrups are made from high-grade drawn-steel, and, together with suitable keys, are supplied, ready-made, by the patentees, with or without the main bars.

Fig. 3 illustrates the general arrangement of connexions between beams and columns in the "Keeton" system of reinforced concrete, which, in our opinion, possesses the merits of practicability and simplicity.

Fig. 1.

Fig. 3.

CONSTRUCTION NOTES.

Moving a
XIIIth Century
Church Tower.

In order to facilitate enlargement of the church at Bochoit, a German town near the borders of Holland and Belgium, it was decided to move the tower for the distance of 9-30 metres and to place it on new foundations. The tower dates from the XIIIth century, and it will be readily understood that the operation of shifting so ancient a structure was one involving extreme care. The weight was considerable, the walls were hollow and filled with loose material, and the stones were very friable.

Work was commenced by cutting openings through the side walls for the insertion of twenty-six rolled steel beams, in two groups of thirteen, destined to carry the weight of the tower. Then the north and south foundation walls were laid bare to permit supports to be built up under the ends of the beams, the supports being incorporated 256 screw-jacks. At the bottom of each support was a concrete foundation, above this longitudinal timbers with transverse ties, then came the jacks and more longitudinal timbers with ties carrying a row of five longitudinal steel beams providing a runway for rollers, and over the rollers were balks of timber faced on the under side with steel plate. Outside the tower a track was formed on concrete foundations constructed on the new site for the structure.

When all preliminaries had been settled, the tower was lifted bodily from its foundations by raising the jacks 25 millimetres. It was then rolled along the track to the new site and connected with the foundations by courses of brick laid in cement. The rollers employed were 60 centimetres long by 5 centimetres in diameter, and the structure supporting them was proportioned so as to keep the pressure on the concrete foundation slab within 25 kilogrammes per square centimetre, and the pressure on the soil within 1-7 kilogrammes per square centimetre. The whole of the work, including construction of the new foundations, was completed within three months at the cost of 45,000 francs.

Americans
Control
British Timber
Reserves.

How did Yankee syndicates and capitalists acquire such a grip on British Columbian standing timber that, as the Agent-General for British Columbia recently estimated, fully 50 per cent. of this valuable asset of the British Empire has passed into their hands? Simply because about five years ago the province of British Columbia badly needed money, and finding that commodity hard to raise through the taxation of a sparse and poor population, threw open its timber limits to prospectors, just as gold claims are open for staking in new countries. The effect of this was to throw practically all the timber of the province on the market at one dump. In 1906 and 1907 about 35,000 square miles of timber were staked, and this made the stakers responsible to the Government for ground rents aggregating 400,000. per annum. But those who had taken up the claims had for the most part no money. They were forced either to cut and sell their timber or to get rid of their claims. Then the shrewd American speculator saw his chance and seized it. Quietly but steadily American banks began buying British Columbian timber limits, and these deals are still in progress. In fact, some who ought to know hold that to-day 75 per cent. of British Columbian standing timber is held by rich Americans. These men will not sell at present; they are doggedly holding for the inevitable rise which must follow hard on the heels of the urgent demand for timber from the three prairie provinces where no trees grow, and settlers by the hundred thousand are each year calling for timber for their frame-houses, from the railways now being completed along the prairies and right into British Columbia, to say nothing of the outlet which the approaching completion of the Panama Canal must provide for British Columbian timber in the Eastern States of America and in Europe.

A Smoke-
Diffusing
Chimney.

In a paper contributed to the German Society of Engineers the author describes a form of chimney-shaft provided with an arrangement in the upper part intended to dilute and diffuse smoke and noxious fumes in the outer air. The diffuser consists of a continuation of the shaft proper, its walls being pierced by conical openings radial to the centre of the chimney, the wider end of each opening being at the outside. Wind enters freely through these openings, breaking up and diluting the upward stream of smoke or gas and creating strong eddies in it. Owing

Smoke-Diffusing Chimney.

to the conical form of the openings, those on the side away from the wind allow comparatively little of the smoke to escape. It is said that practically all the smoke, diluted and whirling in eddies, passes out at the top of the chimney and diffuses itself very rapidly in the surrounding atmosphere. Chimneys of this type are intended particularly for use in places where sulphurous fumes prove destructive to surrounding vegetation, but it seems probable that the idea might very well be applied to boiler chimneys generally in large centres of population.

FEAR of an approaching Preservation shortage in the world's supply of timber is causing increased attention to be paid to the methods of preserving timber from decay. This is especially noticeable in the United States, where a number of papers on the subject have recently been published. It is generally agreed that impregnation of the timber with creosote is the best method of treatment, but under the name "creosote" a number of liquids varying widely in composition are being sold, and no one is yet able to say which liquid, or mixture of liquids, is the most effective preservative. Creosote is commonly regarded as a coal-tar distillate, but in recent years large quantities of water-gas tar and its distillates have been used as creosote. Water-gas tar is derived from petroleum or petroleum distillates. In a paper recently communicated to the

New York section of the Society of Chemical Industry Mr. Weiss has shown that creosote is a more powerful antiseptic than the so-called creosote oil obtained from coal, but the fact that oil-tar is more abundant in many parts of the United States than coal-tar has induced many to advocate the use of its distillates in admixture with the coal-tar substitutes for coal-tar creosote. It is obvious that the action of creosote is mainly a preservative action, and, therefore, that distillates are equally good for preservation.

Although coal-tar creosote has been used for timber preservation for more than a century, scientific investigations have yet shown which constituent of the creosote is the most valuable, and specification of creosote contracts still reveal a great divergence of opinion as to the constitution of creosote. According to Mr. Charles H. H. this divergence of opinion is based upon the unsupported by scientific facts, and a much trouble to those engaged in the creosoting industry. He complains that descriptions of creosote mentioned in specifications and publications are not available for use in most of the wood-preserving industry erected in America. Some estimate of magnitude of the creosoting industry in the United States may be formed from the fact that the annual consumption of creosote in that country amounts to fifty-six million gallons.

In England coal-tar creosote is more abundant but very large quantities of water-gas tar are also made here, and if oil-tar distillates are as effective as coal-tar distillates for preserving timber the fact should be made known. Evidence hitherto published does not conclusively prove that oil-tar distillates are either superior or inferior to coal-tar creosote for preservation.

New System
of Glazing.

A FORM of glazing bar is on the market by the Société du Vitrage Rationnel, designed not only to hold the sheets of glass, but also to receive and away water of condensation and any which may find its way through the joints. As shown in the accompanying section, the bar is in the form of an inverted T with a transverse flange for carrying the glass. The lower flange is bent up at the sides to form a gutter beneath the joints. The panes of glass are of special construction, having grooves

New System of Glazing.

different width and depth, disposed diagonally to the edges of the pane, and designed to break up moisture condensed on its surface, beads of water being conveyed along the gutter and finally deposited in the gutter of the glass bar.

In roofs where expansion and contraction are anticipated, the panes are placed with mastic, and held in position by a zinc strip moulded to fit the upper part of the glazing bar and fixed by screws. The horizontal part of the strip acting as a spring makes a joint while permitting the iron bar to expand to expand and contract freely. In where expansion is not an important consideration, the panes of glass are bedded on mastic in the usual manner.

THE BUILDING TRADE.

WORKMEN'S COMPENSATION.

THE Home Office has issued the statistics of compensation and of proceedings under the Workmen's Compensation Act, 1906, and the Employers' Liability Act, 1880, during 1910. There have been collected from the seven groups of industries—mines, quarries, glass, factories, harbours and docks, constructional works, and shipping covering 10 employers and more than 7,000,000 employed persons coming within the provisions of the Compensation Act of 1906. In the year 1910 compensation was paid in 3,510 cases of death and in 10,000 cases of disablement. The average amount in cases of death was 153*l.*, and in cases of disablement 5*l.* 14*s.* The annual cost for compensation, taking the seven groups of industries together, averaged 7*l.* 8*d.* per person employed. It was lowest at 4*l.* 5*d.* each person in the case of persons employed in factories, and highest in cases (20*s.* 2*d.*) and in docks (20*s.* 6*d.*). The total amount of compensation paid under the Act in the seven groups of industries was £225,750, as compared with £274,238*l.* in the previous year. Including management other costs the total charge borne by seven industries probably amounts to £4,000,000. These figures include, in addition to accidents, cases of the various industrial diseases (now twenty-four in number) included under the Workmen's Compensation Act. Compensation was paid in 438 cases of death from disease, and 438 cases of disablement. The total number of original claims for compensation under the Workmen's Compensation Act were finally settled within the cognate of the Courts in England and Wales in 1910 was only 3,862; in Scotland, 466; and in Ireland, 658. The decision was in favour of the workman in 786 per cent. of the cases. The returns in the seven grouped industries made compulsory, but, no such returns were required from the building trade, we extract any exact information as to the burden the Act imposes on this trade.

In the heading of factories includes shipbuilding, workers in wood, and the manufacture of machines, appliances, and tools, and constructional work includes the construction of railways, tramways, canals, harbours, docks, bridges, tunnels, waterworks, roads, and engineering works. Thus in persons comprised in the description "Building Trades" may be employed in the above headings, but, as the construction of buildings, except when they form part of an engineering work is excluded, particulars concerning the building trade are relegated to the second part of the report, which gives information as to the claims where the Courts have had jurisdiction of the cases.

Where we find that in England and Wales cases were taken into Court as compared with 637 in 1909, but memoranda were registered in 435 cases, in which lump sums awarded, averaging 40*l.* 10*s.* 3*d.*, and 37 cases where weekly sums averaging 8*l.* 8*d.* were also awarded. It is impossible to find in the report the sums awarded as compensation in the building trade, but in the cases settled the sums totalled 12,273*l.* and the weekly sums 95*l.* 4*s.* 6*d.* The burden placed on employers is, of course, not represented by the actual sums paid as compensation, but, because the costs, etc., were not included in the figures given, nor compensation under contracting-out schemes; and, finally, because the amount paid to insure itself the liability and not the actual compensation paid is the burden placed on the employer. In this latter connexion an illustration contained in the report is of great interest, as from the returns made by insurance companies it is estimated that the total amount of compensation paid, including legal and medical expenses, bears to premiums paid in the proportion two to one; thus the actual amount paid in

compensation must be increased by one-third to show the burden imposed upon the employer.

It would be more satisfactory if better returns could be obtained as to the compensation paid in other industries than those seven grouped undertakings in which returns are now compulsory.

BUILDING PLANS AND BUILDING PROSPECTS.

THE latest returns published in the Board of Trade *Labour Gazette* as to the building plans submitted to the local authorities in the third quarter of the year so far as they afford any indication of building prospects cannot be considered very satisfactory. As compared with the same quarter a year ago, the returns available for the United Kingdom and Ireland, but exclusive of the County of London, indicate a net decrease in expenditure of 310,118*l.*, or 8*l.* 5 per cent. The greatest decrease is shown in dwelling-houses, 401,809*l.*, and shops and other business premises show a decrease of 29,369*l.*, but factories and workshops give an increase of 54,214*l.*, and churches, schools, and public buildings of 112,204*l.*; "other buildings, additions, and alterations" show an increase of 14,644*l.* The statistics as to districts are also interesting, but we only quote those that show an increase and those in which the largest decreases have occurred.

Increases are confined to "other districts in England to those specifically tabulated," 73,528*l.*, or 22*l.* 6 per cent.; Wales and Monmouthshire, 7,210*l.*, or 7*l.* 2 per cent.; Ireland, 4,123*l.*, or 2*l.* 9 per cent., and Lancashire and Cheshire, 3,442*l.*, or 0*l.* 6 per cent. The decreases are headed by the Midlands, with 175,616*l.*, or 24*l.* 7 per cent., next comes Outer London, with 147,752*l.*, or 21*l.* 9 per cent., and then the Northern Counties, with 60,938*l.*, or 36 per cent.

CEMENT.

THE Council of the Institute of Chemistry have inaugurated a series of lectures, the first of which was delivered by Mr. Bertram Blount, F.R.C., at King's College, Strand, on the 26th ult.

In the unavoidable absence of the President, Dr. Beilby, the chair was taken by Professor J. Millar Thomson, LL.D., F.R.S., who opened the proceedings with a reference to the scheme of lectures, which, he said, was an extension of the work of the Institute on lines mainly directed to benefit advanced students of chemistry. Its aim would be to indicate the scope and object of the work actually carried out in various branches of professional chemical practice, as distinct from academic training; while occasionally the lectures would deal with matters of forensic and ethical interest.

Professor Thomson then welcomed the Institute to King's College, and called upon Mr. Blount to deliver his lecture, the first of two, on "Cement," of which the following is a brief abstract.

The lecturer limited his discourse to the consideration of calcareous cements as being of predominant importance, and more particularly to the Portland cement industry, the size of which would be judged by the fact that the world's production is estimated at 25,000,000 tons per annum, valued roughly at 35,000,000*l.* The industry is essentially a chemical one, and in the interests of both manufacturer and consumer is, and should be, controlled by the chemist.

The earliest form of calcareous cement is probably calcium sulphate sufficiently dehydrated to form plaster of Paris. Its disadvantage, lies in its lack of plasticity and its liability to attack by water. On the other hand, calcareous cements, properly so-called, while being plastic, are capable of hardening, and are resistant to water. The common fallacy that the setting of lime mortar is due to the action of lime on the sand with which it is mixed was once more exploded by the lecturer. It has long been known that some siliceous materials have an advantage over others as aggregates for mortar. These are known generally as "pozzolanas," and their usefulness depends on the fact that they contain hydrated silica or attackable

silicates which interact with lime and form compounds more or less resistant to the action of water. Similarly it has been known that some limestones are better than others in providing strong and resistant lime for mortar.

There seems to be no record that limestones were deliberately and intelligently chosen for the hydraulic quality of the lime which they furnished until the time of Smeaton who, in considering with what material he should build the Eddystone Lighthouse, ascertained that Aberthaw limestone was undoubtedly hydraulic, and, desiring to know why, applied to Mr. Cookworthy, a chemist of the period, whose office as consultant was creditably fulfilled. It was found that those limestones which were most hydraulic contained the largest proportion of argillaceous material. But, not content with this, he reasoned that this quality might be improved by the addition of what was then known to be capable of conferring hydraulic properties on ordinary lime, and accordingly used trass, a pozzolanic material.

From the subject of hydraulic limes the lecturer went on to discuss the manufacture of so-called "Roman cement," a crude form of Portland cement made by burning lumps of clayey limestone. The foundations were thus being laid of one of the largest chemical industries in the world. Starting with the notion of imitating Roman cement, the progenitors of the Portland cement industry arrived at the idea that when chalk and clay were mixed and burned an hydraulic material was produced which, when ground, would set and form a strong, sound cement. The function of the chemist who concerns himself with this industry was dealt with at some length. When a new works is to be started there has to be considered the nature and available quantity of the raw materials, the accessibility of a supply of fuel, the suitability of the proposed site, the choice of process and the appropriate plant, and such matters of transport, supply of labour, and probable markets, which go far to determine the commercial success of any undertaking. The function of the chemist continues after the works are started, and on him depends the smooth control of the quality of the cement produced.

In the next lecture, to be given in the latter part of November, the chemist, properly so-called, and testing of cement will be dealt with.

GENERAL BUILDING NEWS.

CATHEDRAL TOWER, BIRMINGHAM.

THE repairs to the tower of Birmingham Cathedral have been carried out under the direction of the architects, Messrs. J. A. Chatwin & Son, and it is stated that not a single piece of new stone has been put into the casing. The tower was erected in 1710 from the design of Mr. Thomas Archer, a pupil of Vanbrugh. The cost of the present repairs is about 1,500*l.*, and the contractors were Messrs. R. Bridgman & Sons, of Lichfield.

NEW CHURCH, BOLTON.

St. Barnabas' Church is to be erected at an estimated cost of 10,000*l.*, on a site at the corner of Thomas Holden-street and Chorley Old-road. The design has been prepared by Mr. Frank R. Freeman, architect, of Bolton, and the contractors are Messrs. J. C. & F. Woods, of Bolton.

NEW CHURCH, FARNHAM.

The new parish church of St. Thomas-on-the-Bourne, Farnham, Surrey, has just been completed by Messrs. Mardon & Mills, of Farnham, from designs of Mr. H. S. Sidebotham, of Guildford, in conjunction with Sir Charles A. Nicholson. The materials are the local Bargate stone for the exterior, with a brick for the interior, which has been plastered and discoloured white, the dressed work for windows and capitals of pillars being of Douling stone. The church consists of the permanent and completed chancel and sanctuary, organ loft, with clergy and choir vestries and lavatories, heating chamber, and the first three bays of the nave, the latter being at present only carried to the stop of the arcade with a temporary roof covering. The space below the organ loft is the invalids' aisle, and is so arranged that they can be wheeled into church on the level. The north

aisle is used as the temporary side chapel, but eventually a portion of the old church will be removed from its present site and rebuilt to the north of the new chancel, for use as the permanent side chapel for day services. This will be the next portion of the building to be undertaken. After that, the nave and aisles will be completed by three more bays, and the clestory continued from the chancel westwards, and finally the west tower will complete the fabric.

PARISH CHURCH ENLARGEMENT, WALTON, LIVERPOOL.

The original Parish Church of St. Mary and vicarage were founded in 1326. The rebuilding of the present church was completed in 1842, and a complete restoration was carried out in 1887. During Archdeacon Spooner's rectorship great progress has been made in church extension in the large parish of Walton, and two new buildings have been erected and opened for service during the past year. Archdeacon Spooner and the wardens applied for permission to remove the pulpit from the north to the south side of the chancel entrance, to make alterations in choir stalls, necessitated by the removal of the organ to the north side of the chancel, and to introduce additional choir stalls; to erect a side chapel on the south side of the church; to construct arches in the south wall between the proposed side chapel and the body of the church, to furnish such chapel with a communion table, communion rails, and seats, and to make other alterations at a total estimated cost of 2,000/. The chapel, which is called the Hornby Chapel, is in memory of the Rev. Thomas Hornby. The architects are Messrs. Nagington & Shennan, of Liverpool.

NEW CHURCH, BRISTOL.

The church of St. John's, Fishponds, has been consecrated by the Bishop of Bristol, and the accommodation is for 525 people. It has been built at a cost of 3,243/., including fittings, by Mr. W. F. Read, builder, from the plans prepared by Mr. E. H. Lingden Barker, architect, of London and Manchester.

SCHOOL, JARROW.

The new secondary school which has been erected at Jarrow by the Durham County Council has just been opened. The new building is situated on a site over five acres in extent on the north side of Field-terrace. The main building is two stories in height. The classrooms will provide accommodation for 300 day students, and, in addition, laboratories and lecture-rooms for scientific and technical subjects have been erected. The accommodation on the ground floor comprises six classrooms, a physical laboratory with preparation room and store, and a chemical laboratory with preparation, store and dark-rooms adjoining. A gymnasium is provided in the west wing; while in the east wing there is the lecture theatre. The further accommodation on the ground floor includes the assembly hall, two stories in height, with gallery at one end, headmaster's room, library and administration-room. On the first floor, in addition to four classrooms, there are the cookery and laundry-rooms, students' dining-room, botanical laboratory, elementary and advanced art-rooms, clay modelling-room, manual instruction workshop, mechanical laboratory, and engineering workshop. Rooms for the assistant mistress and master are also on this floor. The contractor for the school buildings was Mr. T. Lumsden, Jarrow, for the playing field and fencing, Mr. J. W. Henderson, Gosforth; heating, Messrs. R. J. Ward & Co., Newcastle; tar paving, Mr. E. Clarkson, Boldon; while Messrs. Fell & Co., Hexham, have laid out the grounds. The architects were Messrs. Remondson & Newby, South Shields, and Mr. T. Weddell acted as clerk of works. The total cost, including furnishings, etc., is about 25,000/.

PIER FOR PORTHCAWL.

At a meeting held in the Exchange Restaurant, Cardiff, it was proposed to erect a pier and pavilion at Porthcawl. Details of a scheme were submitted by Mr. E. Mellis, A.M.I.C.E., and it was decided to form a syndicate to obtain the provisional order and apply to Parliament for the necessary powers.

NEW BUILDINGS IN LONDON.

Warehouse and factory, Stamford-street, S.E. (5,000/.); Mr. A. Sykes, architect, 45, Finsbury pavement, E.C. Rebuilding of Woolwich Police Court, S.E., and West London Police Court, Vernon-street, West Kensington, W., by Mr. F. Dixon Butler, architect, Metropolitan Police, New Scotland-yard, Westminster, S.W. House, Kidbrooke-grove, Blackheath, S.E. (4,000/.); Messrs. Belcher & Jones, architects, Cliford-street, Bond-street, W. Messrs. William Taylor & Co., builders, Lower Mall, Hammersmith, W. Pulling down of Nos. 6, 7, 8, and 9, Little Turnstile, Holborn, and erecting

blocks of shops and offices over; architects, Messrs. Homer & Lucas, 35, Bucklersbury, E.C.; builders, Messrs. Spiers & Son, St. John's Wood, N.W.

MEMORIAL TO SIR REDVERS BULLER.

The memorial to the late General has been erected in Winchester Cathedral, and takes the form of a black marble tomb on a plinth of polished green marble, surmounted by a recumbent figure in bronze of the late General. The sculptor was Mr. Bertram Mackenno, A.R.A., who has depicted the figure as a soldier in a greatcoat, asleep on the battlefield, a common soldier's blanket beneath him, and a knapsack for a pillow. The memorial was unveiled and dedicated on Saturday last by Lord Grenfell and the Dean of Winchester respectively.

TRADE NEWS.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to Edmond United Free Church and Hall, Kelso, N.B.

The Shipcote Hall, Gateshead, is being ventilated by means of Shorland's patent exhaust roof ventilators, supplied by Messrs. E. H. Shorland & Brother, Ltd., of Failsforth, Manchester.

The Tempersford School, Beds, has recently been fitted with one of D. O. Boyd's hygienic ventilating school grates supplied by Messrs. O'Brien, Thomas, & Co., Upper Thames-street, and Excelsior Works, South Bermondsey.

Mr. John Adams, architect of the British Hospital, Montevideo (see p. 506), who is now in London, would be pleased to confer with any British house that would install a heating system throughout the building at a minimum cost.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London County Council, the following applications under the London Building Acts were dealt with, the names of the applicants being given in parentheses.

Lines of Frontage and Projections.

Battersea.—Retention of wooden hoods at Nos. 9, 10, and 12, Shepperton-lane, Battersea (Mr. H. Buchan).—Consent.

Battersea.—Projecting clock in front of No. 120, Battersea Park-road, Battersea (Mr. W. Watkins).—Consent.

Deptford.—Building on the eastern side of Warwick-street, Deptford (Mr. H. W. Horsley, for Messrs. Herbert & Sons).—Consent.

Greenwich.—Projecting signboard at No. 191, Westcombe-hill, Greenwich (Southern Automobiles, Ltd.).—Consent.

Hampstead.—Addition to greenhouse on the western side of Parkhill-road, Hampstead (Messrs. Duncan Tucker & Co. for Miss Willing).—Consent.

Holborn.—Erection of a building with a forecourt boundary upon the site of Nos. 245 to 260, High Holborn (Mr. H. P. Monckton for the Pearl Life Assurance Company, Ltd.).—Refusal.

Islington, East.—Retention of a signboard in front of No. 151, Englefield-road, Islington (Blaker Engineering Company, Ltd.).—Consent.

Islington, South.—Projecting one-story shop in front of No. 238, Upper-street, Islington (Messrs. Drivers, Jonas, & Co. for Mrs. C. E. Merson, Mr. R. J. Hayward, and others).—Consent.

Paddington, South.—Retention of a wooden staircase in front of No. 2, Forchester place, Paddington (Messrs. Deacon & Allen).—Consent.

Wandsworth.—Erection of buildings on the western side of Ellerton-road, the southern side of Magdalen-road, and the northern side of Burntwood-lane, Wandsworth (Messrs. Holloway Brothers).—Consent.

Woolwich.—Bay windows to four houses on the northern side of Glenlyon-road, Eltham (Mr. J. J. Bassetti).—Consent.

Woolwich.—One-story building on the western side of Griffin-road, Plumstead, northward of No. 2 (Mr. E. H. Wright for Mr. C. G. Lambeth).—Refusal.

Width of Way.

Bow and Bromley.—Building at the rear of No. 132, St. Stephen's-road, Bow, at less than the prescribed distance from the centre of the roadway of Chad-street (Messrs. Andrews & Foxwood for Messrs. Devine & Co.).—Consent.

Deptford.—Addition to a building on the southern side of Mary Ann's-buildings, Deptford (Mr. O. Archer for the Salvation Army).—Consent.

Kensington, North.—Erection of a building on the eastern side of Old Court-place, Kensington (Messrs. J. Barker & Co., Ltd.).—Consent.

St. Pancras, North.—Clubhouse and cottages upon a site on the eastern side of a footway leading from York-rise to Chester-road, St. Pancras, with a forecourt boundary at less than the prescribed distance from the centre of the said footpath (Messrs. Matthews & Son for the Mansfield Bowling Club, Ltd.).—Consent.

Wandsworth.—Erection of a building on the south-western side of a way leading from Mitcham-lane to Eardley-road, Streatham (Mr. W. Bartholomew for Mr. Parker).—Refusal.

Woolwich.—Erection of a building upon the site of No. 1, Beresford-square, and Nos. 1, 1B, 1, and 2, Beresford-street, Woolwich, abutting also upon Salutation-alley (Mr. R. M. Allen for Mr. G. St. John).—Refusal.

Width of Way and Lines of Frontage.

Kensington, South.—Retention of a permanent wooden staircase at No. 4, Thurloe-mews, South Kensington (Messrs. W. Hodges & Co., Ltd.).—Consent.

Lines of Frontage and Construction.

Islington, North.—Erection of a cathedral crane at No. 6, Hercules-place, Holloway (British Ever Ready Electrical Company, Ltd.).—Refusal.

Lewisham.—Temporary wood and glass shed at No. 2, Brockley-road, Lewisham (Messrs. Thompson Brothers).—Consent.

Width of Way, Lines of Frontage, and Construction.

City of London.—Iron and glass gantry over George-yard, Bouverie-street, City, at premises of the Daily News, Ltd. (Messrs. Treadwell & Martin).—Consent.

Greenwich.—Steel and iron barge building sheds and a sawmill upon a site on the northern side of Rope-walk, Greenwich, between Anchor and Hope-lane and Angstein's Wharf, and erection of a steel and iron gantry at the said premises (Messrs. W. C. & Sons, Ltd.).—Consent.

St. George, Hanover-square.—Erection of a steel, iron, and concrete gantry to connect two blocks of premises of Messrs. Keen, Robinson, & Co. Ltd., over the public way of Denmark-street, Stepney (Messrs. Keen, Robinson, & Co. Ltd.).—Consent.

Width of Way, Deviation from Certified Plan, and Cubical Extent.

St. George, Hanover-square.—Re-erection of a garage building in Pembroke-mews, Halkin-street, Westminster (Mr. E. Wimpsey for Messrs. Rawlings Brothers, Ltd.).—Consent.

Width of Way and Buildings for the Supply of Electricity.

Hoxton.—Erection of a fixed girder a movable runway across Bath-place, Hoxton, at the Shoreditch Borough Council's electricity power station (Mr. C. N. Russell for the Shoreditch Metropolitan Borough Council).—Consent.

Space at Rear.

Kensington, North.—Erection of a building upon the site of No. 14A, Pembridge-place, Kensington, with an irregular open space at the rear (Mr. J. S. Beard for Sir W. Cooper).—Refusal.

Construction and Alteration of Buildings.

St. George, Hanover-square.—Iron, glass and concrete staircase enclosures in an open court at the rear of No. 9, Berkeley-square, St. George, Hanover-square (Mr. F. Foster).—Consent.

Space at Rear and Alteration of Buildings. Marylebone, West.—Water-closet addition to the rear of the Wallace Head public house, Blandford-street, St. Marylebone (Mr. W. Ingram for the New London Brewery Company, Ltd.).—Consent.

Buildings for the Supply of Electricity.

Hampstead.—Wooden cooling tower at the Hampstead Metropolitan Borough Council's electricity generating station, Lithos-road, Hampstead (Mr. A. P. Johnson).—Consent.

Alteration of Buildings.

City of London.—Additions and alterations at the premises of the Daily News, Ltd., the eastern side of Bouverie-street, City (Messrs. Treadwell & Martin for the Daily News, Ltd.).—Consent.

Formation of Streets.

Wandsworth.—Barriers across Broad-water and Klamata-street, Garratt-lane, Tottenham (Messrs. Grundy, Ltd. & Co.).—Consent.

Wandsworth.—Adaptation as a street of way or part of a way leading from Mitcham-lane to Eardley-road, Wandsworth (Mr. Bartholomew for Mr. Parker).—Refusal.

Uniting of Buildings.

City of London.—Uniting of Nos. 4 and Wood-street, City, by an opening at the ground-floor level, so far as relates to formation of an additional opening at basement level (Mr. S. Mart).—Consent.

London.—Doors of special construction in iron doors to open openings at the offices of Messrs. Peek Brothers & Winch. Trundleys-road, Deptford (Fireproof Ltd., for Messrs. Heath & Sons).—**London, West.**—Formation of three open a party-wall at a proposed garage of London General Omnibus Company, Ltd., street, Newington (Messrs. A. L. Gibson for the London General Omnibus Company, Ltd.).—**Consent.**
Leitch.—Erection of additional stories to L. N. and O at the premises of the Electric Company, Henley-road, Northwich (Mr. B. Dawson).—**Consent.**
Recommendation marked + is confined to the views of the Metropolitan Borough Council concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

Aden.—House, near Bridge of Dee (Mr. W. E. Gauld, 11a, Dee-street, Leam).
Albion.—Proposed extensions to Alma (3,000), for Messrs. Francis Webster & Sons, sailcloth, etc., manufacturers. Addition to Iron Works (2,500), for Messrs. A. & Son, Ltd.
Amman.—Bank, near the church, for the City and Midland Banking Company, Ltd. (School (1,140); Messrs. Smith & Sons, builders, 18, Lancaster-road, Kettering).
Blackburn.—School (5,000); Mr. J. T. Black, architect, Market-place, Kettering.
Birmingham.—Rebuilding Mossend-street Works, Messrs. W. Beadmore, Ltd.
Birmingham, City.—Hospital (1,000); Mr. J. E. Litchman, Derwent-street, Birmingham.
Birmingham, Offices.—Offices for the Blyth Harbour Commissioners; Messrs. Cackett & Burns Dick, 24, Grainger-street West, Newcastle.
Birmingham, Children's home.—Beacon-road (Mr. C. F. Hain, builder, care of Mr. Thynbridge, clerk, Board of Guardians, in).
Birmingham, Proposed school.—near Wesleyan, 1, Nottingham-road (1,000); Trustees, John Chapel, Nottingham-road, Birmingham.
Birmingham, School.—School (5,000); Mr. D. Pugh, architect, Charles-street, Cardiff.
Birmingham, Extensions.—to Grammar School; P. Elford, Secretary, Education Committee, Oxfordshire County Council, Oxford.
Birmingham, Alterations.—to school, Abels-street; Mr. E. Jones, Secretary, Education Committee, Burnley Town Council.
Birmingham, Lloyds Bank.—Lloyds Bank (7,000); J. Slater, Wedgwood-place, Burslem.
Birmingham, Dispensary.—Dispensary (500); Clerk, Alfred Guardians, Radford.
Birmingham, School.—School (3,600); Mr. C. W. County Architect, Brecon.
Birmingham, School.—School (6,000); Mr. J. Julian, hall, Cambridge.
Birmingham, Extensions.—to school (Mr. J. King, Russell-street, Wihaw, Gwyndyn—Chapel; Mr. J. Teinson, architect, Cardigan; Jas. Morgans, 1, Llyweddafydd, New Quay).
Birmingham, Enlargement of Whitwood Mere School.—School (100 extra places); the Messrs.
Birmingham, Residence.—Curzon Park (1,700); Messrs. Dickens, Lewis, & Haynes, architects, Shrewsbury; Messrs. Treasure & Son, builders, Shrewsbury.
Birmingham, Victoria-road.—for the Messrs. and Liverpool District Banking Agency.
Birmingham, Additions.—to St. Oswald's Roman Catholic Schools (ninety extra places); the Messrs.
Birmingham, New water scheme.—S. F. C. Howard, Surveyor, Dawlish Urban District Council.
Birmingham, Artisans' dwellings.—Trinity (3,430); Mr. F. Cottle, Surveyor, Tas Town Council.
Birmingham, Proposed enlargement of St. Martin's Schools.—Schools (1,200); Mr. R. Knockner, Secretary, Education Committee, Dover Town Council.
Birmingham, Lodging house.—School (3,000); Mr. Bell, architect, Merry street, Motherwell.
Birmingham, Jute warehouse.—Mid street, for Messrs. Don & Duncan.
Birmingham, Buildings.—Nicholson-square (Mr. T. P. Marwick, 43, York-place, Birmingham).
Birmingham, Twenty-three houses and lay-out of land.—Avenue-road; Mr. W. Eger, architect, 12, Queen's-road, Erith.

* See also our list of Competitions, Contracts, in another page

Exeter.—Business premises, Sidwell-street; Mr. J. A. Lucas, architect, Guildhall-chambers, High-street, Exeter. Extensions, Sanatorium (5,000); Mr. T. Moulding, Surveyor, Exeter Town Council.
Featherstone (near Pontefract).—Homes for aged miners; Mr. W. Hamilton, Fearnley, Featherstone.
Folkestone.—The following plans have been passed:—Motor garage, rear of Marine-terrace, for Mr. A. H. Holbein; Messrs. Bromley & Dahl, architects. Alterations and additions to "Seaholme," The Riviera, Sandgate, for Dr. Wesley Smith; Mr. A. R. Bowles, architect.
Fox Platt.—School; Mr. J. Hyde, Secretary, Education Committee, Mossley Town Council.
Galway.—School (2,000); Messrs. Cooper & Dickinson, 12, South Frederick-street, Dublin.
Glasgow.—Factory; Mr. T. A. Miller, 12, Randolph-street, Glasgow. Extensions to engine works, Canal-street (2,500); Messrs. J. Monro & Sons, architects, 28, Bath-street, Glasgow. Extensions to works (3,000), for the Harvey Engineering Company, 224, West-street, Glasgow.
Glasgow, St. Peter's Church.—Church (10,000); Messrs. Webster & Cannon, builders, 42, Cambridge-street, Aylesbury.
Hebburn-on-Tyne.—Picture hall and theatre; Mr. H. E. Kelvey, 79, Rushmore road, Manchester.
Hilarywood and Winton.—Schools (5,000 each); Mr. R. Littler, architect, 16, Ribblesdale-place, Preston.
Holyake.—High school for girls (9,000); Messrs. John Lee & Son, builders, Higher Behington.
Joppa.—Terrace villas, Brunstone-gardens (3,000); Mr. G. S. Carrara, 1, Eskine-place, Edinburgh.
Kenley.—Adaptation of Commemoration Hall into boys' secondary school (5,500); County Architects, Surrey County Council, Kingston-on-Thames.
Kinglassie.—School (7,800); Mr. G. C. Campbell, Methil, Fifeshire.
Kinning Park (Glasgow).—Rebuilding saw-mills (10,000); Messrs. H. & D. Barclay, architects, 245, St. Vincent-street, Glasgow.
Kirkby Woodhouse.—Church institute and Sunday-school (2,500); Mr. Louis Ambler, architect, 201, Temple-chambers, E.C.; Messrs. Coulson & Lofts, builders, 37, St. Andrew's-street, Cambridge.
Kirkstall.—Chapel and school; Trustees, Zion United Methodist Church.
Leith.—Extensions to works, Leith-walk (2,500), for Messrs. Jas. Bertram & Son, Ltd. Lemington.—Institute; Franklin Brothers, builders, Newcastle.
Leven (Fifeshire).—Proposed additions to Davis Foundry (10,000), for Messrs. Harry Balfour & Co.
Lisburn.—School (3,000); Mr. Jas. Hunter, Lisburn.
Long Four (near Londonderry).—School (5,000); Mr. D. R. Wray, architect, 21, Ship Quay-street, Londonderry.
Lower Bebbington.—School (1,000 places); Mr. R. P. Ward, Secretary, Education Committee, Cheshire County Council, Chester.
Luton.—Infirmary (6,000); Messrs. Gotch & Saunders, architects, Market-place, Kettering.
Manchester.—Alterations and additions to Summer House (1,500); Mr. J. H. Reynolds and Mr. C. H. Wyatt, Joint Secretaries, Education Committee, Manchester City Council.
Middlebrough.—Six cottages on asylum ground (220, per house); Mr. S. E. Burgess, Surveyor, Middlebrough Town Council.
Morley.—Additions to Grove Mills for Messrs. David Bradley, Ltd.
Muirhead.—School, Coumar Angus-road (2,000); Liff School Board.
Newcastle.—School (5,000); Mr. Harrison Ash, Newcastle.
Newport (N.B.).—Post-office buildings (2,100); Messrs. McCulloch & Jamieson, architects, 20, Whitehall-street, Dundee.
Nifferton (East Riding Yorks).—Proposed school, Westgate; J. J. Bickersteth, Secretary, Education Committee, East Riding of Yorks County Council, Beverley.
Nuneaton.—Additions to factory, Seymour-road, for Messrs. H. Singaby & Son.
Padiham Green.—Additions to school (2,100); Mr. R. Littler, architect, Ribblesdale-place, Preston.
Paisley.—Extensions to Messrs. Eadie Brothers' works, Violet-street (2,200); Mr. J. C. Bennett, 12, High-street, Paisley.
Alterations and extensions.—nurses' home buildings, West Mount; Surveyor, Paisley Parish Council, Church-halls, North Croft; Mr. Peter Coates, Garthland-place, Paisley.
Petersfield.—New block of infirmary; Mr. A. J. Mackenness, Clerk, Petersfield Board of Guardians, High-street, Petersfield.
Pontsarn.—Sanatorium (7,177); Messrs.

John Morgan & Son, builders, Monk-street, Pontsarn.
Portobello.—Extensions to Harbour Green Pottery; Messrs. Carlyle & Buchan, 42, Brighton-place, Portobello.
Retford.—Schools (6,000); Mr. L. Maggs, architect, Shire Hall, Nottingham.
Richmond.—Rearrangement of St. Mary's Schools; architect, care of the Managers.
Rock Ferry (Birkenhead).—School, Lees-avenue; Messrs. W. Tomkinson & Sons, builders, 21, Dansie-street, Liverpool.
Rosemount (near Londonderry).—School (3,500); Mr. E. J. Foyl, Strand, Londonderry.
St. Austell.—Cottage hospital; Mr. A. Clarke, builder, Penventon, Redruth.
Shaw (near Oldham).—Picture hall (2,700). Mr. Herbert Laugman, 120, Lord-street, Southport.
Sheffield.—United Methodist Church, Chantry-road (2,500); Trustees, Woodstock Church, Sheffield.
Sherburn (Co. Durham).—School (5,000); Mr. W. Rushworth, architect, Shire Hall, Durham.
Somerton.—School; Mr. A. A. Newman, Secretary, Education Committee, Newport (Mon.) Town Council.
Southampton.—The following plans have been passed:—Ten houses, Newcombe-road, for Mr. W. B. Hill; twenty houses, Newton, Ash Tree, and St. Catherine's roads, for Mr. J. Smith. Plans have been lodged for six houses, Newton-road, for Mr. F. Lowe; also for the development of Athorley Estate, Hill-lane, for Messrs. Jurd & Sanders.
Southend.—Tramway shelter, pierhead (700); Mr. R. Birkett, Electrical Engineer, Southend Town Council.
Southwick.—Presbytery, adjoining St. Hilda's Roman Catholic Church; Messrs. Jos. Potts & Son, builders, 57, John-street, Sunderland.
Springfield.—Extensions, asylum (3,700); Messrs. Gillespie & Scott, architects, 4, Queen's-gardens, St. Andrews, Branch store, Arbour-lane, for the Chelmsford Star Co-operative Society.
Station Town.—School; Mr. J. A. L. Robson and Mr. A. J. Dawson, Joint Secretaries, Education Committee, Durham County Council, Durham.
Twickenham.—The following plans have been passed:—Alterations and additions to Brandon's Brewery, London road, for Mr. W. Simmons; alterations to pavilion, Island Hotel, Eel Pie Island, for Mr. H. G. G. Walker Gate, School; Messrs. Mars & Tweedy, architects, 17, Eldon-square, Newcastle-on-Tyne.
Ware.—Alterations to factory for Messrs. Allen & Hanbury.
West Hyde (Herts).—School (200 places); Mr. U. A. Smith, Surveyor, Herts County Council, Hertford.
Wheel Harmony (Redruth).—Housing scheme; Mr. Sampson Hill, architect, Green-lane, Redruth.
Whitby.—Rebuilding of Custom House Hotel for Messrs. Forster's Bishop Middleham Breweries, Ltd.
Wigan.—A plan has been passed for four houses in Platt-lane for Mr. John Knowles.
Yarmouth.—Maltings, Laughing Image Corner, for Messrs. E. Lacon & Co.

BUSINESS PREMISES, GRAY'S INN-ROAD, LONDON.

In reference to our notice on page 479 and illustration in last week's *Builder* relating to this building, the general contractors for the building were Messrs. Patman & Fotheringham, Ltd., London, W.C.

MANCHESTER BUILDING TRADE EXHIBITION.

The Seventh Manchester Building Trades Exhibition, organised by Mr. Walter Cawood, of the City Hall, Deansgate, Manchester, will be held in March next, for a period of eleven or twelve days. The Exhibition is supported, we are informed, by the trade organisations in the North of England, prominent amongst whom are the Manchester, Salford, and District Building Trade Employers' Association, Manchester and District Branch National Registration of Plumbers, and the Institute of Plumbers, Ltd.

BUILDERS' LABOURERS' WAGES.

An adjourned meeting of the National Builders' Labourers' Union was held on the 27th ult. at the Co-operative Hall, Downing-street, Manchester, to consider a letter received from employers in the trade in reply to a communication sent by the officials of the union asking for an increase of wages which would mean a minimum of 6d. per hour. Mr. T. O'Garra, President of the Building Trades Federation, presided. A resolution was passed asking the employers to submit the whole question of wages, rules of employment, etc., to the Board of Arbitration in the building trade, or to an independent arbitrator, with a view to avoiding a cessation of work.

HEATING AND VENTILATION.

THE first of a series of six public lectures on "The Real Nature of the Problems in Heating and Ventilation Awaiting Solution by the Engineer" was delivered in University College on the 17th ult. by Mr. Arthur H. Barker. Sir Aston Webb presided, and said that the lectures were the result of a communication between the Institute of Heating and Ventilating Engineers and the University of London. They were to provide teaching for regular engineering students who might wish to specialise, and for engineers and architects engaged in practice. Architects were supposed to take no trouble in securing the best form of heating and ventilation for their buildings, but that was not the case. It was an extremely difficult thing to ventilate and heat a building used by people of different ages and requirements.

Mr. A. H. Barker then read his paper, the title of which was "On the Real Nature of the Problems in Heating and Ventilation Awaiting Solution by the Engineer." In the course of his remarks the author said:—

"In proposing to discuss the nature of the unsolved problems in heating and ventilation I am fully aware that I am committing myself to a review of the entire field of heating and ventilation. There is perhaps no part of this field which is not replete with problems which have not been fully solved, many of which can in the nature of things never be fully solved.

A considerable part of the science of heating and ventilating may be perhaps described as a science of leakages. Many of the problems which the heating engineer is called upon to solve are similar to one which often confronts the gas engineer—to determine how much of the gas put into a main will leak away before it gets to the customer's burner, or shall I say before it gets past the customer's meter? The solution, of course, depends entirely on the skill and care with which the mains are put in, and perhaps on the skill and care with which the customer's meter is adjusted, on the quality of the ground, and the traffic which passes over it, the temperature, and the number and extent of the minor earthquakes experienced. It is impossible to determine the quantities with precision unless a great many things are known which never can be known exactly.

The function of the heating and ventilating engineer is the application and utilisation of heat and air. In the broadest sense, all these applications may be said to be within his sphere. But this is the age of the specialist, and the applications of heat and air are so numerous that no one branch of engineering can sufficiently deal with them all.

The application of heat and air, as in the case of every other branch of engineering, has been subdivided into a large number of special branches. There is the boiler engineer, who deals with their application at high temperatures for special purposes; the power engineer, the metallurgical engineer, and many others.

At the other end of the scale we have the refrigerating engineer, whose special function is the removal of heat and the expansion of air and other gases, the consequent attainment of low temperatures.

The profession of the heating engineer lies somewhere between these limits, within a region bound by undefined limits of temperature. As regards heat, the greater bulk of his work lies between the limits of 30 deg. and the boiling-point of water. Of course, there are many instances in which he is concerned with the maintenance of lower or higher temperature than these—up to, say, 600 deg. for special industrial purposes—and he is sometimes, though rarely, concerned with very low temperatures.

He has sometimes to deal with high-pressure steam, but rarely above 100 lb. per square inch. His functions, however, in practice, go considerably beyond these bare limits.

As for air, he treats it chiefly at atmospheric pressure in regard to its temperature, composition, cleanliness, humidity. He sometimes has to do with air at low and high pressures. He is concerned to some extent with air compression.

He has to do with laundrywork, cooking apparatus; he has close connexion with the building trades, including that part of the structural design which is out of sight—

plumbing, drainage. He has to do with electricity, as far as this form of energy is used for development of heat and for the generation of power in small quantities, especially for such purposes as the driving of fans and laundry machinery. He is also concerned with constructional work, furnace work, refrigeration, and, to some extent, the generation of power.

It will be seen that the sphere of the heating engineer cuts into a large number of other trades, with all of which he is more or less concerned. The special branch with which he is more directly concerned than any other is the maintenance of the temperature in, and the delivery of air into, inhabited buildings. This is the branch with which I shall deal in the first place.

In relation to his *clients* the heating engineer occupies a position which is in some respects different from that occupied by other engineers.

There are few private persons wishing to light their houses by electricity, for instance, who would endeavour to carry the work out without the assistance of a specialist. Few persons would venture to put in an engine or boiler or even an acetylene gas plant without trained assistance.

On the other hand, the man who wishes his house to be heated and ventilated can do the work himself after a fashion. He can put large fires in his grate and open his windows. He can buy gas radiators, and connect them to gas pipes which the gas company puts in for him. His domestic staff can dry his clothes by hanging them out on a line or putting them in front of the fire. He can even hire a local plumber to put him in boilers and radiators, or if he is of a mechanical turn of mind he can even do this work with his own hands.

It does not at first sight appear to be a problem of any considerable complexity merely to provide a certain amount of heat and a certain quantity of air to a building.

If, therefore, the heating engineer is to justify his existence, he must be able to show that he can do this work so much better and more cheaply than the unskilled man that it is worth the while of the latter to call in his help.

A considerable part of the real science of heating and ventilation consists in the knowledge of how far the laws of mechanics, physics, and chemistry are not applicable. The study of the negative side of the science is, in practice, at least as important as that of the positive side. It is, for instance, easy enough to determine what would be the heat lost from an air-tight window if there were no wind, no rain, and an even temperature on each side. One of the essential investigations applicable to questions of this kind is how far the ordinary rules of heat transmission are not applicable to such cases. This is the kind of negative science in which heating engineering largely consists.

In this restricted sphere of warming and ventilating buildings the fundamental and comprehensive problem which the heating engineer has to solve is how to provide the most healthy possible conditions within a building at the lowest possible cost. This is the parent problem of the whole subject, and I shall have to ask you to bear with me while I consider it in some detail.

It is necessary for the fully-equipped practitioner to appreciate fully every condition that bears on the solution of this problem. That solution is essentially divided into three parts:—

Firstly, to discover what those conditions are, and, secondly, the means by which they can be provided; and, thirdly, how they can be provided in the easiest and cheapest way.

The third section is an essential part of the problem. It may perhaps be granted provisionally that if a certain temperature is maintained on a thermometer, and if a certain large regular and liberal supply of clean fresh air is thoroughly mixed with the air in a room, this does, with certain limits, constitute healthy conditions.

The production even of these simple conditions in a large number of rooms simultaneously in itself involves the application of a large and complicated set of natural laws, but the study of these is a comparatively simple matter.

The heating engineer will in future have more and more to inquire what is the cheap way in which equally satisfactory conditions can be secured. It would even at present be of little use to lay down that, in order to secure healthy conditions, certain results must be obtained, if the obtention of those results is so expensive that an ordinary citizen could not hope to attain them. The effect of increasing the stringency of the requirements is that the ordinary citizen or even the ordinary committee of public body endeavours to do without them and takes the risk of the results, or endeavours to get what he considers tolerable conditions for himself by means cheaper in first cost. It is for the heating engineer to know not only what are the most desirable conditions, but also how they can now be secured, and the factors which bear on the relative cost of the various methods at present known, and also what the lowest conceivable cost at which such conditions can possibly be obtained.

There are two distinct elements in the technical success of an installation of heating and ventilation, apart from the question of cost. The perfectly-successful plant is one which secures conditions within a building which are as healthy as living in the open air, and produces a feeling of perfect comfort in the persons using the building. Under these two conditions are both satisfied there is always room for improvement in the results obtained. No conditions can be considered satisfactory, even for a time, however healthy they may be, unless a person subjected to those conditions is maintained in a state of reasonable bodily comfort. If he is actually conscious of his bodily comfort, he ought at least to be unconscious of any comfort.

This element, therefore, though important is certainly secondary in real importance; the commercial engineer it is more important than the other element. A heating engineer who produces conditions which are uncomfortable is brought to book at once. If he produces conditions which are unhealthy though comfortable, he may never be brought to book till the day of judgment, and he has not then if he pleads ignorance or throws the responsibility, as I think I should be able to show, in present conditions has a perfect right to do, on the medical authorities, and on the persons responsible for the control of finance.

It would perhaps be satisfactory from a point of view of comfort that a person should be conscious that any system of heating and ventilation exists or is absent when suitably engaged in any ordinary occupation—is, that he should be conscious of neither heat nor cold, stuffiness nor draughtiness.

It has latterly been the custom to treat pulmonary diseases, such as phthisis, by ventilation known as the open air treatment. The lowness of temperature to which sufferers are often subjected in carrying out this treatment is not infrequently, indeed, usually said to produce, especially at first, more or less acute discomfort. Such conditions have nevertheless been proved to be of great advantage.

The patient experiences a positive feeling of comfort when he allows himself to be closed in a room that is warm. Such conditions, though extremely comfortable for a time, have a most prejudicial effect on the health of the recovering patient. It is, indeed, quite easy to conceive that perfectly comfortable conditions might be attained in a room which were nevertheless extremely dangerous.

It is thus clear that there is no essential connexion between feelings of bodily comfort and the prevalence of healthy conditions, though it is probable that a constant valence of conditions which are necessarily uncomfortable does tend to be prejudicial to health. It is not easy to define either constitutes comfortable conditions, or healthy conditions. Individuals differ greatly in their estimate of bodily comfort. Conditions which to one person are perfectly comfortable, may to differently-constituted persons represent the acme of discomfort.

In this latter connexion one of the difficulties arises from the fact that Nature has made the human body singularly adaptable to whatever conditions it may be placed in. Indeed, it is held by some of the

need medical thinkers that one of the things essential to bodily well-being is constant change of condition, and that there is to maintain a suitable standard of a constant change of atmospheric condition of some kind is essential.

order to be able even to commence his on accurate lines the engineer requires now in minute detail what is the condition of the atmosphere as regards chemical composition, temperature, humidity, and ment, which must be maintained in a in order to secure not only comfort, also healthy conditions. The nature of investigation which must be undertaken under that this information may be obtained, as I have said, of the most difficult order known to modern science. For reason, no scientific instruments have or possibly can be devised which will the information directly, and even if an instrument were in existence produced observations of such a difficult order would be necessary that is almost and possibility that the information be of been obtained.

chief function of ventilation is held by of the most eminent authorities to adapt condition of the air so that it will be able for helping to maintain the proper temperature.

most of the theories as to the function of ventilation which have done duty for the hundreds of years, or since mankind thought on the subject at all, have been altered by recent experiments to be wholly wrong. It is not very long since that carbon dioxide was regarded as an active respiratory agent, and the quantity of this poison in the air determined its value or healthiness. It is now known to be not in the deleterious, even in quantities vastly in excess of that contained in the worst breathing air.

According to Dr. Leonard Hill, up to 300 to parts per 10,000 it has no considerable effect on the organism. By another of those yellow automatic regulating mechanisms, excess of CO₂ simply stimulates the thing, the effect of which is that a man immersed in such an atmosphere comes to breathe very deeply. It does not lead to the least increase of the amount of CO₂ in the blood. Small percentages of 100 to 200 parts per 10,000 are of no account. Six hundred parts per 10,000 produce headache, irritation of the heart, sweating, and the thing becomes distressing. Higher percentages, 1,100 to 1,200 parts per 10,000 produce coma, but do not quickly destroy life.

An extraordinary fact is that the quantity of CO₂ in the blood is kept constant whatever the nature of the atmosphere breathed, the automatic regulatory effect of the thing in the blood on the respiratory centres. Then it is considered that the rough rule thumb hitherto used by the ventilating engineer that the proportion of CO₂ in the breathing air must not exceed ten parts per 10,000, and that this rule was originally arrived at by assuming the theory that CO₂ is an active poison, it will be seen that a small change in practice may possibly be sight, although even now the greatest authorities on hygiene adopt this or a similar rule based on a microscopic percentage of CO₂. Another similar theory which has also been only exploded is that an excess of oxygen in the breathing air produces more rapid combustion and so endangers life by burning the body too quickly. It is now known that the body cannot be made to burn faster, like a fire, by a greater supply of oxygen. A very large excess, however, is poisonous, and arrests the metabolism of the body.

A defect in the quantity of oxygen, which as from 21 to 15 per cent. of the quantity normally present in breathing air, is known to have very little effect on a healthy subject. A candle will not burn in containing less oxygen than 17 per cent. in an atmosphere, but the percentage can be altered to about fourteen without notably affecting the bodily functions. The proportion normally present in the air is about 21 per cent. With 12 per cent. only the breathing becomes altered. With 10 per cent. the colour of the face takes on a leaden hue, the heart palpitates, and bodily and mental activity become difficult. At about 6 per cent. consciousness is lost, and death takes

place when the oxygen sinks to 3 to 4 per cent., or about one-sixth part of the quantity normally present in breathing air.

Another theory largely held, but now proved wholly erroneous, is that the presence of ozone destroys the organic germs in the air, and has a stimulating effect on the organism. The extremely minute quantities of ozone, however, present in ordinary air is now known to have no such effect. It is true that concentrated ozone will destroy or oxidise germs, but if ozone existed in the air in sufficient quantity to do any damage to the bacteria it would produce inflammation in the lungs of persons breathing it. What has been supposed to be the odour of ozone in seaside air is now known to be the slight smell of decaying seaweed, and it is certain that there is no greater proportion of ozone in seaside air than there is in any other air.

On the authority of Haldane, there is no evidence whatever of the existence of any poisonous organic impurity in the air of crowded rooms. Expired air is certainly entirely void of particulate matter; it is, in fact, much freer from germs than is the ordinary air of the street.

The smell which is noticeable in crowded rooms, especially in an assembly of uncleanly persons is now known to consist of the products of putrefaction of particles of dirt on the skin and on the clothes. It has no detrimental effect whatever except that it produces a feeling of nausea in persons of æsthetic temperament.

It will be thus seen that all the explanations that have done duty in the past of the undoubted evil effects of breathing bad air are definitely disproved, and it has not even yet been definitely settled what is the feature of vitiated air which does, in fact, or which appears to produce results prejudicial to health or of fresh air, which has a contrary effect.

The smell, temperature, degree of humidity, and absence of movement of breathed air, as well as the presence of disease germs are causes which so far as is at present known produce evil results, but what degree of absence of these features is necessary that there may be no evil results whatever is not known, and perhaps cannot be exactly known for the reasons previously stated.

It is probable that the best opinion on the point is fairly unanimous that the chief evil effects are due to the temperature and the moisture in bad air, which exercise a bad effect on the working of the automatic temperature mechanism of the body.

The presence of these features in bad air make it more difficult for the surplus heat to be abstracted from the body, and produce results which are a direct consequence of that effect. Very little consideration, therefore, will show us what the radical alteration in the theories of ventilation these facts, assuming them to be well established, must produce, and it is difficult to say what changes in practice we are on the eve of witnessing on account of these discoveries.

It is only within comparatively recent years that much attention has been devoted to the humidity of the air as an element in efficient ventilation. If the air is too dry, say, below 50 deg., it has certain evil results. It takes up moisture from every object that will yield it, causes a shrinkage of wood, produces cracks in floors and fissures in beams, and damages furniture. Its effect on the human organism is that it absorbs moisture from the skin, from the nasal passages, mouth, the throat, and the lungs. It makes the skin dry and rough, and aggravates throat and catarrhal troubles, and is in some cases the developing cause of such disorders.

Persons are, as a rule, constantly passing into and out of rooms, which may be very dry, into the outside air, which may be very moist owing to its lower temperature. This is probably the cause of colds and inflammation of the throat and bronchial passages. It produces in some persons a feeling of lassitude. It has a tendency to lower the temperature of the skin too rapidly, owing to a rapid absorption of moisture. On the other hand, air that is too damp interferes with the normal loss of heat from persons, and again causes a feeling of oppression. Now, it is difficult to conceive that variations in the humidity alone can be very serious, because Nature provides an atmosphere which is extremely variable in humidity.

There is one feature in vitiated air which is not directly connected with its chemical composition, but is of very great importance in connexion with healthiness of living inside four walls, that is the amount and character of the dust in the air. Any person who has watched closely the course of a beam of sunlight through the air of a room cannot fail to have observed the innumerable multitudes of dust particles which appear to fill every cubic inch of space. The very smallest movement sets in motion uncountable millions of dust particles, and, if a close watch be kept on the air passing into the nose or mouth of the persons breathing, these particles can be actually seen entering these passages. As expired air is practically free of all particulate matter, it is clear that the dust entering the body through the nose and mouth remains there. Since among these millions dust particles there must be a large number of disease germs, it is obvious that every human being is exposed every breath he takes to the attacks of diseases.

The particular feature of ventilation which helps in removing the dust is that the exhaust or foul air should be taken from the very lowest possible level—if possible from a horizontal grating in the floor—but in any case through an aperture right at the floor level, such that there is no sill or unperforated ledge between the actual floor level and the hole through which the air passes. The reason is that it is found on analysis that there is a much greater concentration of dust particles close to the floor than anywhere else, and the number of particles always increases the nearer the floor.

When air is warmed by contact with hot surfaces there is, to my mind, a great deal of evidence to show that it undergoes some change, the nature of which, so far as I know, has never been properly defined, and I am not sure that even the existence of a change is generally recognised. I can only define the effect of the change as a devitalisation. In my own mind I am satisfied that this change does take place, apart from the change of temperature, the change in the quantity of CO₂, or in humidity. I have no doubt it has much to do with the prevalent unpopularity of central heating for private houses and other buildings as now practised in this country and elsewhere, and particularly with the unpopularity of the Plenum system. The investigation is difficult because at least half of the necessary observations relate to matters which are purely subjective. It has to do with the variable sensations of individuals. So far as my experience goes, air is not affected in this sense by a surface below a temperature of 130 deg. Fahr. Above this temperature it is always noticeable by people who are affected by it, and the hotter the surface the more it is noticeable. It is something, I believe, quite different from the burnt smell which emanates from very hot radiators, and which indefinitely resembles the smell of wet paint. The latter smell is said to be due to the charring of organic particles, but I am certain that the feeling of lassitude to which I have alluded is some thing different from the presence of this smell.

May I now review the position in which the above discussion leaves us, as seen from the point of view of the ventilating engineer? Please observe that I have not yet said anything whatever in regard to heating, nor in regard to cost; I have only considered the outlines of the root problem of the ventilating engineer, that fundamental problem which meets him at the very outset—what is good air and what bad?

The object is to attain healthy and comfortable conditions by regulating the composition of the air in a room in the broadest sense. We know from experience that untreated vitiated air is injurious to breathe; of that there can be no possible doubt. Neither is there any possible doubt that the air which Nature provides is generally good to breathe as regards chemical composition.

It is, however, within the region of doubt whether and to what extent natural air can be improved for breathing purposes by altering its temperature and humidity and by extracting some of its dust. Nature provides elaborate automatic regulating mechanisms in the human body which counteract the effect of variable temperatures, humidity, and excessive CO₂, and to some unknowable extent provides for the elimination of dust entering

the mouth and nose. It is more than a probability that it is conducive to health to give these automatic mechanisms plenty to do in order to keep them alive. In other words, it is not healthy to make the air so uniform, draughtless, and generally perfect that the automatic mechanisms are allowed to perish or deteriorate by atrophy.

It appears to me to be doubtful whether heating air by means of hot surface does not destroy its vitality. If it is so, the reason for it is entirely unknown. Now we know, or think we know, what is the chemical composition of atmospheric air, although it is more than a little disconcerting to reflect that it is only within the past few years that some hitherto entirely unknown elements have been discovered in atmospheric air in comparatively large quantity. I do not know that any attempt has been made to ascertain what effect, if any, these newly-discovered elements have on the human body.

We also know, in the same doubtful and expectant fashion, what is the composition of expired air, but we do not know, and apparently no man can tell us with certainty, which are the features of expired air, which are deleterious.

We are told that it is not the excess of carbon dioxide, since vastly greater quantities of this gas can be endured without the slightest effect. It is not the deficiency in the quantity of oxygen, nor the absence of ozone. There is no poisonous organic impurity in expired air. There is, however, a smell in a crowded room which, though easily perceptible to the senses, appears to baffle all attempts at chemical analysis. Again, the dangerous ingredient in air is said not to be dust. Dust is not generally dangerous if of an inorganic character, or even if organic and free from certain bacteria or micro-organisms, which are the exciting cause of certain diseases. What, then, is the trouble with vitiated air? The only answer that it is possible to give to this inquiry at present is that it is, probably the temperature and humidity (I ask you to mark that word "probably"); it has possibly something to do with the smell, and possibly something to do with the germs, if and when unhealthy persons are present. It may be the lack of movement. It needs no explanation to show from this analysis that if a ventilating engineer wishes to tackle this root problem on sound lines this analysis affords him no assistance whatever.

It is clear that, at least one solution consists of making the air in a room good to breathe by sweeping such vast quantities of atmospheric air through it that the difference between the composition of the inside and the outside air is microscopic. This is a kind of counsel of despair. A man normally takes into his lungs $\frac{1}{2}$ cubic ft. or 25 cubic ft. of air per hour. He completely consumes the oxygen in 5 cubic ft.

All our medical authorities, after explaining to us that this or that or the other is not the dangerous ingredient in vitiated air, are careful to safeguard themselves by stating that all they have said does not operate as an argument in favour of diminishing the maximum degree of carbonic impurity to be allowed in breathing air.

I hope I shall not be taken to be committing the absurdity of depreciating the achievements of physiology, that is far from my intention. I yield no man in my profound admiration for what has been done in this direction. I wish merely to emphasise the extraordinary difficulty I had almost said the impossibility of obtaining any reliable results on a matter of such difficulty as this.

Our scientific solution of this root problem is to provide him with 200 times as much at least, or, for good ventilation, with 1,000 times as much. If in any other branch of engineering your authorities demanded a factor of safety of from 200-1,000, what conclusion would you draw as to the state of knowledge in that branch?

But we may be told that fresh air is cheap enough; we can get any amount of it for nothing, and we at least know with a sort of wavering uncertainty that if we do use plenty of it the result is good. But is fresh air so cheap?

It must not be forgotten that whether it is good for them or not people will not have plenty of fresh air unless it is warmed, and

unless it is introduced without draught, and that to warm in the most economical way 16,000 cubic ft. of fresh air costs roughly 1 lb. of coal.

If every person in this country, where the climate is mild, were supplied even with 2,000 cubic ft. of fresh air per hour, duly warmed according to the latest Board of Guardians' notions of health and comfort for paupers, it would cost some ten or twenty million tons of coal every ordinary winter, even in a mild climate like this. Every human being gives off per hour a quantity of heat which may be set down as roughly 400 450 B.T.U. This heat is carried away along with the other heat in the ventilating air. We are told even that one of the objects of ventilation is to carry this heat away when all the time we are flinging into the air additional heat, which is also enormously expensive in the mass, and which is also wasted.

Observe the extreme want of logic in the whole proceeding. The heat in the air as such serves no useful purpose; the vast proportion of it which is blown through the room serves no useful purpose beyond that of diluting to a certain arbitrary degree certain products which medical authorities tell us are not in the least deleterious, and all this in order to mask the operation of certain products which appear to be unrecognised, but which certainly are deleterious, for there can be no question that expired air is deleterious to breathe.

What the engineer wants to know is precisely this: If a thousand persons are enclosed in an air-tight room, which is maintained at, say, 60 deg. by some means; if we remove 900 cubic ft. of CO₂ per hour from the air of the room, and 70 lb. of moisture, and restore 1,000 cubic ft. of oxygen to it, and remove 400,000 thermal units; and if some means can be found to remove the organic smells and the dust, "will the air be kept in a perfectly fit state to breathe? Will it, in fact, be as good as the outside air? If not, why not? And what else is necessary?"

It is in order to avoid—I will not say shirk—the solution of this and similar problems that we are compelled at present to adopt the device of flooding the interior of a building with vast quantities of fresh air. At any rate, this is the best solution that has been hitherto devised, expensive though it is. At present, the problem is not really acute, because the world's coal supplies are still adequate, but the problem will assume another shape when this is not the case."

Professor Cormack proposed a vote of thanks to Sir Aston Webb for presiding.

Sir James Crichton-Brown,

in seconding, said that Dr. Leonard Hill had been making certain experiments on human beings, and his conclusions seemed to point to the fact that we attached too much importance to the carbon dioxide in the air, and that larger quantities can be inhaled without any detriment whatever. Temperature and humidity brought sickness, nausea, and fatigue; what we wanted was a cool, dry atmosphere. If, as the lecturer had shown, microbes increased according to the age of houses, cathedrals and mansions would need to be pulled down and rebuilt every twenty years. The problem had been complicated by past Budgets. But under previous Budgets there had been a window tax, yielding two millions per annum, under which every skylight and every zinc plate for ventilation was liable to taxation. Architects built houses with as few windows as possible, and in Edinburgh a number of buildings were erected without windows at all, lighted entirely by artificial light.

The resolution was carried, and Sir Aston Webb, in responding, said that before architects could do much they must have some definite data from scientific men on which to found a scheme of ventilation. The engineer wanted to lay down his scheme and get the architect to put his buildings round it, but that was not always possible.

NEW COAL EXCHANGE, SWANSEA.

This building is to be erected at a cost of 20,000*l.*, from the designs of Mr. C. T. Rother, architect, of Swansea. The designs were selected by means of a competition.

TRIBUNAL OF APPEAL UNDER THE LONDON BUILDING ACT.

London and Westminster Bank, Ltd., v. London County Council.

The Tribunal of Appeal under the London Building Act (Mr. A. A. Hudson, Chairman) sat at Caxton Hall, Westminster, last Friday to give their decision in the appeal of London and Westminster Bank against the decision of the Superintending Architect regarding the building lines of Wimbledon Park-road and Augustus-road. Mr. Courtham represented the appellants, and Mr. Duddy the respondents.

The facts of the case, which occupied greater part of two days, and was reported in the *Builder* of October 20, were as follows: The bank bought a piece of land some years ago at the corner of Wimbledon Park-road and Augustus-road, Southfields, in view of future development of the district, there being at that time no buildings in the road between Southfields Station and the County boundary. The Bank Company heard that some villas were going to be erected in Augustus-road, and to prevent any building line being established to their detriment they commenced the building of their bank premises, and proceeded very slowly, got as far as the first story, then stopped work, owing to the action of the Superintending Architect, who fixed a building line for both Wimbledon Park-road and Augustus-road. The Superintending Architect took existing buildings at Seymour-road as a basis for determining the building line, which was nearly a mile away, as determining the building line of Wimbledon Park-road, and he took the villas nearly erected in the Augustus-road at the time of his visit as the building line of Augustus-road. Further, it was alleged that in determining the building line of Wimbledon Park-road, he took account of a bend in the road, where the bank premises were situated, and the result of the fixing of the two lines was to practically destroy the bank site. The contention of the appellants was that the whole of Wimbledon Park-road ought not to have been taken into consideration in fixing the line, and, further, that the bank was erected first in Augustus-road, and thus a building line was set up. The Council held that the Superintending Architect was right in taking the whole road into account, and that there was no reason why that part from Augustus-road to the County boundary should be deemed to be a different part of the road. With regard to Augustus-road, the contention was that the Superintending Architect was bound to take into account the buildings already there when he visited the place, and these buildings were the villas erected at the same time that the bank was being erected. There was no conflict of evidence as to whether the bank or the villas were erected first.

The Chairman said the Tribunal found there was no general line of buildings existing between points A and B on the architect's certificate plan. These points really were between Augustus-road and the beginning of the property of the railway company. With regard to Augustus-road, they found there was no general building line except between points marked A and B, which was between Albee-road and the beginning of the bank premises. The effect of the decision was that there was no building line where the bank premises were erected.

Mr. Munroe asked that, as the bank had succeeded in both particulars, they should be awarded costs.

The Tribunal decided that, taking all the circumstances into account, no order should be made as to costs.

London County Council v. Corbett (now Lord Rowallan).

On Friday last the Tribunal of Appeal sat at Caxton Hall, Westminster, to hear the parties in the matter of an application to the London County Council with reference to the order of the Tribunal, dated August 1906, and the undertaking given by Mr. Cameron Corbett (now Lord Rowallan) respect to the formation of streets on the St. German's Estate, leading out of the southern site of Downhill-road. Mr. Corbett represented the London County Council, and Mr. Macmin the owner of the St. German's Estate.

Mr. Walsh explained that on August 1905, the Tribunal made an order preventing the owner of the St. German's Estate from erecting any buildings on the estate for a period of five years from building on certain portions of their estate so as to enable, if it was thought proper, for roads to be made giving communication with the Forster Estate, which adjoined St. German's Estate. Mr. Macmin took the preliminary objection that the covenant which Lord Rowallan entered into was dead. The order of the

al said that the County Council should liberty at any time before September 29, to apply to the Tribunal for an extension of order, whilst Lord Rowallan entered covenant not to build on the portions estate mentioned before September 29. That date was passed, and he contended the covenant was dead and could not be enforced.

Chairman said notice was given by the Council on September 13, and he over the objection.

Walsh, by means of plans, explained to the Tribunal how the two estates were laid out and asked that the order restricting building on the points shown on the St. German's map should be extended for a period.

Alfred Milwood, from the department Superintending Architect of the London County Council, said he visited the estate on September 6. He explained the condition of with regard to the roads on the Forster

overing the Chairman, witness said that had been sanctioned on the Forster and agreed upon by the parties, and was a legal obligation to make it, which gave communication between the estates. Chairman said that being so they did not want to go into the state of the road, was plenty of power under the London County Act to deal with roads.

Macmin said that all the roads witness dealing with were on the Forster Estate or on his.

Walsh said that was his difficulty. It had been so slow on the Forster that they had no guarantee that the would be made. Hence they asked for extension of the order for a time.

Walsh expressed the opinion that the on the St. German's Estate should be made for the present until the roads on the Forster Estate were made.

Stewart (a member of the Tribunal) seemed as if the County Council wanted to put pressure on one estate, to get to bring pressure on the other estate to make it.

Macmin: Yes, and over whom we have control.

Chairman said the idea of holding this open seemed to be to make the Forster go quicker.

Macmin said that the County Council sanctioned a group of roads on the Forster Estate made no provision or agreement as to construction of the roads to take in the of land reserved under the order of

Walsh said that there was an appeal the Forster Estate to the Tribunal in 1907, the case was adjourned for the express of negotiations taking place between the parties, the joining up of these

The case had never been resumed. or considerable discussion with regard to the appeal of the Forster Estate in had reference to dealing with the land

ed by the order. Chairman said they had better leave matter out and confine themselves solely question of whether the roads sanctioned the Forster Estate did afford such comation between the estates as would make strictions on the land on the St. German's unnecessary.

Ernest Van Putten, Engineer and Surveyor to the Lewisham Borough Council, said his view was that the residents in Birkwood and Balloch roads, and other roads on St. German's Estate, would suffer great inconvenience in getting to Bellingham and Key Stations unless they got a further unication.

J. Slater (a member of the Tribunal) had even if they retained the restriction, power had either the Council or the Tribunal to say that a road should be made? Macmin said he thought by negotiation with Forster Estate they might get over the difficulty.

Slater said that was what they tried to do years ago. Macmin said at that time the Forster Estate absolutely against making any communication with the Council or the Tribunal at all. Now, however, they were making roads, and they might be induced to a third to communicate with Muir Kirk-

Macmin said he had the Surveyor of Forster Estate present, who would say his had absolutely no intention of making a third road. They did not want communication with the Council or the Tribunal, as they feared their property was superior to that of St. German's Estate. After five years ought they ought to be able to wind up estate. He submitted that the communication which were wanted five years ago had made on the Forster Estate.

or further discussion between the parties, chairman said the Tribunal felt that the

St. German's Estate owners ought to have the opportunity of winding up their estate, and they suggested that the parties should try to arrive at a settlement.

Ultimately the case was adjourned for the following suggestions to be considered:—The St. German's Estate to be at liberty to make a road in continuation of Muir Kirk-road up to the estate boundary, although such road would be a *cul de sac*. The St. German's Estate to be at liberty to build houses fronting such road, and the restriction on the continuation of Ardock-road to be not extended; these suggestions to be the subject of agreement between the Council to the estate, or to be made the order of the Tribunal.

Mr. Macmin said if they agreed they would come before the Tribunal with the minutes of an order.

No order was made as to costs.

WESTMINSTER CITY COUNCIL.

At the fortnightly sitting of the Westminster City Council, on October 26, the following, amongst other matters, were done with:—

Widening of Argyl-place.—The Improvements Committee reported having considered communications from H.M. Commissioners of Woods and Forests to the effect that it will shortly be necessary to settle definitely designs for the rebuilding of Crown property in various parts of Regent-street, and as a result the Committee considered that the widening of Argyl-street at its junction with Regent-street should be now decided upon, as such a widening is likely in the future to lead to the development of Great Marlborough-street into an alternative thoroughfare to Oxford-street, between Bond-street and Soho. They therefore recommended that the Council should purchase from the Crown 1,107 sq. ft. of land for 16,500l., which will allow the widening of Argyl-place, between Regent-street and

King's-street, to 60 ft. Mr. G. W. Lawrence pointed out that the matter wanted careful consideration, because great as would be the boon in making the alternative thoroughfare, still it must be realised that the rent of the roadway would probably remain narrow for several generations. Mr. H. Simm pointed out that the price asked was an enormous one, and practically represented 800l. per foot for 20 ft. of Regent-street. After further discussion the recommendation was agreed to.

Widening of Pimlico-road.—The same Committee stated that the Highways Committee had asked them to consider the question of improving the junction of Commercial-road and Ebury Bridge by the removal of No. 1, Pimlico-road. At the present time the Committee did not feel justified in materially altering the property, which is occupied by the Council. They are of opinion, however, that the site should be dealt with by a comprehensive rebuilding scheme, and that in the event of such a scheme being formulated, consideration should be given to the carrying out of a suitable improvement of the site. In the meantime they agreed that the pavement should be set back 3 ft.

LAW REPORT.

KING'S BENCH DIVISION.

(Before Mr. Justice COLLIERIDGE.)

Alleged Dangerous Premises at Islington.

Sugden v. City of London Brewery Company.

THIS case was heard last week, an action by the plaintiff to recover possession of the Island Queen public-house, Hanover-square, Islington, together with the outbuildings and offices. It raised the question whether the tenants of public-house premises with outbuildings and stables were liable to rebuild a portion of the premises pulled down in conformity with a breach by the tenants of the covenants to repair. In May, 1910, the stables had fallen into such a state of disrepair that a notice was served upon the tenants, under the Conveyancing Act, requiring them to do the necessary repairs. They refused, and the question was whether upon the facts, which were really undisputed, the landlord was right in seeking to recover possession. The indenture was dated September 20, 1894, and the covenant provided for proper repair of the premises. The defendant pleaded that the stables were originally of defective construction, and that it was due to that fact that they had fallen into a dangerous condition. They further pleaded that the continuance of the covenant

became impossible in consequence of the notice of the County Council.

The defence (went on Counsel) was evidently based upon the application of the case to that of *Lister v. Lane*. By *Lister v. Lane*, if one leased to a man a house which at the time of the demise was so faultily constructed that it was bound to tumble to pieces before the expiration of the term under the covenant to repair, then the man was not obliged to rebuild. He (Counsel) submitted that *Lister v. Lane* only applied when the whole of the subject-matter at the time of the demise was in the condition which brought about the state of things complained of. Where only a subsidiary portion of that which was demised had fallen into disrepair, *Lister v. Lane* could have no sort of application. The stables in this case were a subsidiary part of the whole property demised. The plaintiff did not accept the defendant's view that the dangerous condition of the stables was due to the settling of the foundation. He attributed the dangerous condition to a weight being placed on the floor of the loft greater than the floor was calculated to bear, thus causing the walls to be thrust out of the perpendicular. Undue weight had been placed upon the rafters. This defect might have been repaired if they had been attended to in time.

Evidence was called for the plaintiff in support of the contention that the dangerous condition of the stables was attributable to undue weight having been placed on the floor of the loft.

On behalf of the defendants evidence was called to prove that the ground on which the stables were erected was made up, and that the foundation of the building was bad.

Without hearing Mr. Fox on the law, his Lordship gave judgment for the defendants. He came to the conclusion that the walls were erected on a bad foundation, and that the roof was of defective and faulty construction. If he was right in the view that these were the causes which produced the mischief, then they did not come within the provisions of the covenants of the lease, and it did not lie on the tenants to make good the mischief caused by those two defects.

Judgment was accordingly entered for the defendants, with costs.

LONDON COUNCILS.

Acton.—The Works Committee have decided that the work of erecting a school for 860 children should be proceeded with.

Bethnal Green.—With regard to the alterations to be carried out at the Public Baths and Washhouses, where the committee-room and superintendent's office is to be converted into eleven men's first-class baths, the following tenders have been accepted:—Messrs. Measures Brothers, Ltd., steel girder and two steel stanchions, 12l. 1s. 7d.; Messrs. Doulton & Co., Ltd., eleven porcelain baths and fittings, 155l. 7s. 6d.; Messrs. Ellis, Geary, & Co., terrazzo work, partitions, and flooring, 75l. 19s. 3d.; Messrs. J. Wouter Smith, Gray, & Co., calorifier, 71l. 10s.

Croydon.—An offer of 4,200l. has been received from Dr. Carnegie for the erection of a public library at Thornton Heath. The following plans have been passed:—Messrs. Drake Bros., Shirley, near Croydon, ten houses, Silverleigh-road; Mr. R. C. Palmer, Sherwood-road, five houses, Elm Grove road.

East Barnet Valley.—The Surveyor has been instructed to report as to sites for public conveniences at the top of Station-road and near the Arch, East Barnet-road. Paving works are to be carried out in Bulwer-road, Leicester-road, Station-road, Lytton-avenue, and Victoria-avenue.

Hammermith.—The Council have decided to raise no objection to the proposal of the managers of the St. Stephen's Roman Catholic Schools, Rylett-road, Hammermith, to enlarge such buildings. The tender of Plascom, Ltd., Wolverhampton, has been accepted for paving the carriageway of Wells-road with 2-in. old macadam mixed with Plascom for first layer, and 2-in. of new granite gouted with Plascom for the second layer, at 5s. 6d. per yard super. A plan has been passed for the erection of a billiard hall on the site of Nos. 150, 152, and 152A, King-street, for the Temperance Billiard Halls, Ltd.

Henwell.—The Surveyor has been instructed to prepare estimates for the wood-paving of the margins of Uxbridge-road, from Boston-road to Church-road. Instructions have been given to the Surveyor to prepare plans and estimates for making-up Cowper-road.

Hendon.—Tenders are to be invited by the Rural District Council for the construction of an observation ward at the Isolation Hospital. The following plans have been passed:—Mr. W. Chems Grove, fifteen houses, Bolton-road, Pinner; Mr. A. W. Marshall, five houses, West End-lane; Mr. H. R. Matthews, garage,

The Broadway, Harrow Weald; Mr. R. Murray, offices and transformers, 30, Manor road, Edgware, for the North Metropolitan Electric Light Company. Plans have been lodged by Messrs. C. & E. Steele for five houses, Longley-road, Pinner.

Heston and Isleworth.—The following plans have been passed: Messrs. Fuller, Smith, & Turner, alterations to Cross Lances, Hounslow, and to the Swan, Isleworth; Mr. W. H. Ansell, additions to Wavertree, St. Peter's-road, St. Margaret's; Messrs. Nowell Parr & Kates, alterations to Lord Clyde and Duke of Cambridge, Hounslow, the Victoria Tavern and Red Lion, Isleworth, and the Jolly Farmer, Hounslow. Messrs. Smee & Houchin have lodged a plan for a chapel in Staines-road, Hounslow.

Holborn.—The Council have agreed to the application of Mr. J. Sawyer, on behalf of Messrs. A. W. Gamage, Ltd., for permission to extend the existing subway under Robin Hood-yard. The Borough Surveyor has been instructed, owing to a subsidence of the roadway in Denmark street, to report as to the necessity of relaying the whole of the roadway.

Hilford.—Workshops are to be erected at the electric station at a cost of 375*l*. The following plans have been passed: Messrs. J. D. & S. J. Mould, hall, Richmond-road; Mr. E. T. Dunn for Mrs. Stroud, twenty-four houses, Farnham-road; Mr. A. T. Haines, for Mr. C. G. Rooke, four houses, Bradford-road; Mr. G. Smith, five houses, Brook-road; Mr. J. Derrett, four houses, Abbey-road.

Midlesex.—Land situated in the Edgware-road adjacent to the Silk Bridge over the Silk Stream arm of the Brent reservoir is to be purchased from the Ecclesiastical Commissioners by the County Council for 600*l*, as the site for the new court-house, Hendon. A site in Mayfield road, Stroud Green, is also to be purchased from the Hornsey Town Council for 8,222*l*, for the erection of the Stroud Green High School for Girls.

Poplar.—Improvements are to be made to the public electric lighting of the Borough, and all gas lamps are to be replaced with incandescent electric lamps as soon as practicable after mains have been extended to those thoroughfares where only gas is now available. In connexion with the extension of the generating-station buildings, the Surveyor is to carry out excavations for, and the construction of, foundations in connexion therewith, at an estimated cost of 2,726*l*. Tenders are to be invited for the erection of the superstructure, the Borough Surveyor being allowed to compete.

St. Pancras.—The tender of the London Asphalt Company, Ltd., has been accepted for relaying part of the west side of Brunswick-square with 2-in. asphalt at 8*s*. per yard super, and free maintenance for two years, and thereafter at 6*d*. per yard super, per annum for maintenance for ten years.

Southwark.—In connexion with the widening of Hain-pole, 1,200 ft. of super. ft. of land had been given up to the public, and the Council have decided to pave this, including the resetting of the kerb, laying new footway paving and completing the asphalt of the street throughout, at an estimated cost of 1,371*l*. A deputation has been appointed to wait upon the Public Control Committee of the London County Council to put before them the question as to the necessity of erecting a new mortuary and coroner's court to replace the one situated at Collier's-rows, which is of faulty construction and too small for present requirements.

Stepney.—Electricity mains are to be extended to Parnham-street, Limehouse; Skidmore-street, Mile End Old Town; and Pennington-street, St. George-in-the-East. The Borough Engineer has been instructed to carry out the work of reconstructing the existing sewer in Diggon street, Mile End Old Town, at an estimated cost of 140*l*.

Wandsworth.—Tenders are to be invited for paving the following new streets: Cotford-street, Tooting, between Okeburn-road and Church-lane; Valley-road, Streatham, between Sunnyside road and entrance to Messrs. Curtis Brothers' dairy. Plans have been passed for Mr. M. W. Hudson for additions to Price's Bakery, Garratt-lane, Springfield; also for Mr. F. J. Meech for four houses in Chilterton-road.

Watford.—The Rural District Council has accepted the tender of Messrs. King & Son, at 120*l*, for sewer construction work.

OBITUARY.

Mr. J. L. Clemence, J.P.

It is with regret that we record the death of Mr. John Louth Clemence, J.P., F.R.I.B.A., who has just passed away at his residence, 14, Marine-parade, Lowestoft. Mr. Clemence, who was eighty-nine on August 29 last, commenced his work very early in life—at fourteen years of age. He

was first with Professor C. R. Cockerell, and worked with him in his office at the Bank of England. Later on he joined Sir Morton Peto, and had a large share in his schemes for laying out and developing Lowestoft. He planned practically the whole of that part of Lowestoft, says the *Lowestoft Journal*, which comprehends the Esplanade, Wellington-esplanade, and Marine-parade, and later on he was responsible for the most important buildings that were erected. Chief amongst these is St. John's Church, the Wesleyan Chapel in High-street, and the Town Hall as it stood before being improved and enlarged some years ago. He superintended the restoration of St. Margaret's Church in 1871. He was also architect for Lowestoft Hospital. Some of the pupils of the deceased were Sir J. Wolfe Barry, K.C.B. (engineer of the Tower Bridge), Edward Barry, the late Mr. Boardman, architect, of Norwich, and Mr. S. P. Pells. Mr. Clemence was a captain in the 11th Suffolk Volunteers. He took a lively interest in the public affairs of Lowestoft. He was a member of the old Improvement Commission, and later on he became an Alderman of the Town Council, a position he held till 1894. He served the office of Mayor in 1886-1887. During the time Mr. Clemence was on the Town Council he did valuable work for the borough, and he was a keen critic of all that went on around him. When he retired from the Council in 1894 he continued to still act the part of critic, with a ready wit, and an aptitude for verse-making. Mr. Clemence married, but his wife predeceased him some years ago. The funeral was attended by the Mayor (Mr. T. E. Thistle), members of the Corporation and of the magistracy.

Mr. George Wise.

We regret to announce the death of Mr. George Wise, who was found dead in his office-chair at Billingsgate Market on the evening of October 25. At the subsequent inquest held by Dr. Waldo, the City Coroner, it was found that death was due to heart failure. Mr. Wise was recently engaged as Clerk of Works for the Corporation of the City of London upon works at the Guildhall, Billingsgate Market, and Leadenhall Market, under Mr. Sydney Perks, the City Surveyor. He supervised the erection of the Leicestershire and Rutland County Asylum, under Messrs. Eyraud & Pick; the Kent County Asylum, Chatham, for Messrs. John Giles & Gough; and, under Mr. George T. Hine, the Claybury and Bexley Asylums, for the London County Council, and the East Sussex Asylum. He was one of the oldest members of the Incorporated Society of Clerks of Works, and throughout a long career was much esteemed and respected by his employers and by all who had business relations with him.

TRADE CATALOGUE.

Messrs. Teuten & Co., Ltd., iron founders, of 221, Upper Thames-street, London, E.C., forward us their latest illustrated supplementary catalogue and price list of new designs in metal registers, ranges, bath-sinks, etc. The "Ideal" portable copper and the "Popular" washhouse boiler (for gas) are useful specialties which should find a ready market. Messrs. Teuten also supply ornamental cast and wrought work for verandahs, external stairs, and builders' ironmongery of every kind.

PATENTS.

DEPARTMENTAL METHODS AND THE R.I.B.A.

THE President of the Royal Institute of British Architects in his opening address of the session dealt in a straightforward and spoken manner with questions of vital importance both to the profession and the general public.

Of all the subjects to which he referred it seems to us to be of more importance both than that usually described as "official architecture," and we welcome the President's remarks as expressing support with all the authority of his position ideas and opinions which years past have been held by all those who have given much thought to the interests and the future of the public

architecture of this country. We place this question first in importance as we are of opinion that, so far as our public buildings are concerned, it involves nothing less than the very existence of architecture as a fine art.

As Sir Robert Hunter pointed out in his sympathetic speech, there is an obvious reason why architects object to the existence of such huge official factories as are controlled by the First Commissioner of Works, the Admiralty, the War Office, or the London County Council. There are, however, other reasons not so obvious perhaps to the layman, but far weightier and more worthy of the serious consideration of the

public. Anyone who takes Sir Robert Hunter's remark as discounting or as being intended to discount the observations of the President is liable, we imagine, to make a grave mistake. On the contrary, if it happens, as it does seem to happen in this particular instance, that the interests of architects coincide with the best interests of the public and of architecture as a fine art, the argument would appear to be strengthened, not weakened.

But, after all, the main question is the value to the public of these vast official establishments. Architects object to them for the good and sufficient reason that the best architecture cannot be

obtained by any such methods. As they consider that the public is entitled to the best that can be produced, as they know that the public pays as much, or more, for an inferior article as it need pay for the best, they naturally conclude that the interests of the public suffer in consequence.

The President gave some interesting figures, which suggested that much of this official work is done at a cost of 7 per cent. for salaries alone. We are not disposed to quarrel with the Government for paying this extraordinary price provided it can be shown that they get extraordinary value for it. The trouble is that this cannot be shown, while we have a shrewd suspicion that in this matter the public is deceived, and takes it for granted that these large Departments are producing work which is as good as or better than the best that can be produced by independent practitioners. The public hardly realises that the most gifted designers of the day are not to be found in these Departments, or that their services could be obtained at a smaller cost.

We venture to say that if this question is to be satisfactorily dealt with it must be discussed and settled on the broadest grounds of public policy and from the point of view of the interests of the whole community, and not merely the interests of any one profession.

Architecture, when all is said, is the servant of life, its *raison d'être* is the service of humanity. No profession can justify its existence on any other grounds.

It would appear, then, to be useless, and therefore foolish, for the independent architect to plead the necessity to live. This necessity is apt to be apparent to no one but himself. Neither does it seem advisable to discuss this question from any political standpoint. The only safe ground is the broad and, we believe, incontrovertible fact that the existence of these Departments is not in the highest interests of the State or of the art of architecture.

Mr. Irving K. Pond, President of the American Institute of Architects, whom everyone was glad to see present, informed the meeting that the American architects had succeeded in obtaining a law whereby all important Government work is given to independent architects, and that the standard of work had been raised thereby.

With such an encouraging example before them, and after so definite a pronouncement of their own opinion, we presume that those who control the Institute policy will not let the matter drop, but will use all their influence to obtain similar results in this country.

Considering the rapid growth of these Departments during the last few years, and the enormous size to which they have attained, few matters with which the Institute has to deal are of more immediate importance to the future of architecture in this country, and we think that, whether or not any advantages accrue to the profession from the President's action, he discharged a public duty in calling attention to the question.

LONDON STREET ARCHITECTURE.

MESSRS. RICHARDSON AND GILL* are fully justified in their contention that, despite the public interest taken in our

country houses of the Georgian period, the minor town house, and more especially the later developments from the time of the Adam brothers onward, has been comparatively neglected. In America the buildings of this era under the designation of the Colonial style have formed a fertile source of inspiration to architects in recent years. This, of course, was only natural, as they represented the only type of vernacular work, while here in England our domestic architecture represented by buildings dating back for many centuries prior to this period in London, however, possesses so little in the way of domestic buildings of a date earlier than the XVIIth century that the introduction of modern work based on mediæval or Jacobean traditions is apt to be destructive to the harmony of the ensemble, and architects will be well advised to keep their work in harmony with the really characteristic effect of London exhibited in the early years of the XIXth century. As a useful reminder of what this effect was the work of Messrs. Richardson and Gill is of undoubted value; the illustrations are well chosen, and give a good general impression of the periods covered by the book. Many will be recognised by the architect who has his eyes open as he passes through familiar streets, but we can hazard a guess that he will find some that draw his attention to delightful conceived bits of composition which must have passed unnoticed in the turmoil and traffic of London; such, for instance, as the façade in Brook-street, the illustration of which we reproduce, and other works of the early XIXth century, which we have been too apt to regard as negligible. Probably but few who have passed No. 1, Bedford-square on their way to Euston, and have not the interesting design of the unusual central doorway, are aware of the delightful interior that lies behind it, the work of Thomas Leverton in 1771. While the better-known work of the brothers Adam in Fitzroy-square is less frequently studied than its merits as a composition demand.

The work of Nash and his contemporaries has been so frequently undervalued, owing to the clamorous detraction of stucco which emanated from Pugin, Ruskin, and their followers, that we feel indebted to those who are not helping to bring us back to a better balanced frame of mind, and to make it clear that architecture is a more plastic art and less dependent on the actual material employed than has sometimes been imagined. A statue in bronze or marble may make a special appeal, but we do not withhold our admiration for the work because the presentment happens to be in plaster. The same reasoning applies to our buildings; our authors, indeed, go farther, and point out the advantages of painted stucco.

* "London Houses from 1660 to 1820," By A. Richardson and C. Lovett Gill. Octavo. 1911. net. (B. T. Batsford.)

Nos. 57 & 58, Lincoln's Inn-fields (about 1735). (Influence of Inigo Jones.)
From Messrs. Richardson & Gill's "London Houses from 1660 to 1820." (B. T. Batsford.)

g the impression of cleanliness so
ctive in the business street. Apart
this we have often noticed effects
ur painted fronts, more especially
the sun is dropping towards the
on, that could not be paralleled in
lon in any other material. The
ces glisten with vivid reflections,
g a brilliancy to the light and shade
might be commended to our pictorial
ts.

whether we decide to revive the
ted front or not is, however, of
r interest to the great question as to
form our street architecture is to
in the future. At the present time
building is regarded as entitled
s individual expression, and conse-
ntly our street picture is mainly
ndent on accidental effects. Are we
g to return to the conception of each
k as a single design balanced in itself
in conjunction with its neighbours,
ill the influences demanding freedom
each separate owner continue to
ail? Messrs. Richardson and Gill
luct us through the period during
h the idea of the group design
veloped. We should welcome a further
tribution to the study of London
itecture dealing with the conception
the street as a comprehensive design,
trated by the numerous examples of
type that we seem to be in danger of
g, as, step by step, the demands of a
e complex social organisation render
c internal arrangements obsolete.

connexion with some question of architectural
politics affecting perhaps rather the status of
the architect than the advancement of the art
of architecture. Moreover, church building
forms but a small part of the total architectural
output or practice, and it is not always strongly
represented on the Council."

Now, without claiming that the
P.R.I.B.A. is in his official capacity
necessarily infallible in his selection of
an assessor, or even that he has a pre-
scriptive right to such a duty, we must
express our opinion that this paragraph
is calculated to convey quite a false
impression, in that it suggests that these
appointments go to an undue extent to
members of the R.I.B.A. Council. The
fact that many assessors are or have
been members of Council obviously does
not justify the inference that this fact has
ever influenced any President in his
selection of any other than the man he
considers most suitable.

Anomalies in Ecclesiastical Law.

In designing and furnish-
ing churches many
problems of local origin
must be faced, and
because parishioners in one district will
accept without question features which
elsewhere will be condemned architects
must be prepared to adjust their ideas
accordingly. Moreover, the inconsis-
tency of the law is notorious, a fact
indicated by two recent decisions. In
the Diocese of Carlisle application was
made for the erection of a rood in a
parish church, and permission was
refused on the ground that, in the words

of previous judgments, there was a
danger of "superstitious reverence."
"People now looked to the East-end
and the Holy Table for sacred emblems."
Further south, however, at Cranham, in
Gloucestershire, the Consistory Court
permitted the erection of a rood on the
chancel screen. In the first case it was
intended to place the Crucifix on a
beam not then in position; in the second
case the emblem was destined for the
existing screen. Such subtle distinc-
tions are common in ecclesiastical
practice, and architects are bound to
keep in mind the possibilities of altera-
tion in their designs from causes other
than structural or artistic.

Mr. Pond and the Time Spirit.

MR. IRVING K. POND, the
President of the American
Institute of Architects,
who was present at the
Institute meeting on Monday, has
expressed opinions about the present
condition of American architecture which
are as frank as they are interesting. We
have not before us a complete copy of
the address which he delivered to the
American Federation of Arts, but the
extracts indicate a refreshing point of
view and a terseness of statement which
are characteristically American. He
believes that architecture should before
everything express the spirit of the time
and country in which it is produced, and
he does not find in the work of his own
country any expression of the salient
characters of its higher civilisation, of

NOTES.

In an article in the
Church Builder, giving
suggestions as to the best
course of procedure for
one desiring to build a new church, Mr.
D. Caröe deals at some length with
competition methods. While in the
n his opinions are in accord with the
gnised ideals of the architectural
profession, we feel bound to take excep-
t to his views in two instances. Mr.
öe advises that the name of the
essor should not be known to com-
petitors, repeating the oft-heard con-
tention that the latter will play up to the
essors' prejudices. Even if this were
sible, we think that it is a lesser evil
n that competitors should be asked
go blindfold into a competition with-
knowing whether the assessor is one
whose judgment they can place any
ance or not. There are many eminent
hitects who are by temperament quite
suited for the position of assessor, and
perienced competitors know quite well
se to whom they would, or would not,
prepared to submit designs. The
er point to which we must refer is
way in which Mr. Caröe deprecates
application to the R.I.B.A. in the
agraph we quote:—

"It is not unusual to apply to the President
the Royal Institute of British Architects
appoint the assessor; certainly a way out
a difficulty if a committee is unable other-
e to agree. But the advantage of the
cedure is open to some doubt. More often
n not the President—quite naturally—
points one of his colleagues on the Council,
it seems reasonable if such appointments
regarded as among the distinctions of
ce. But the Institute Council is an annually
cted body, and, although always comprising
n of distinction, is not infrequently chosen in

No. 1, Bedford-square (1771). Thomas Leverton, Architect.

From Messrs. Richardson & Gill's "London Houses from 1660 to 1880." (B. T. Batsford.)

its idealism, its altruism, and many other fine qualities. And as the conditions of contemporary civilisation very remotely correspond with those of ancient Egypt, Greece, or Rome, "this age," he says, "holds no place for the extraneous application of the borrowed finery of art, but must insist on an expression of the vital principles of structure and the rational development of ornament which shall not obscure the vital thought, but which shall be of intrinsic worth in defining the character of the mass, and in conferring charm upon the structure." And then, with extreme candour, he proceeds to illustrate instances of "brutal utterances of architectural untruth" from contemporary American work. In referring to buildings designed for banks, theatres, churches, schools, factories, and the like, he holds that we have "no record of such prostitution of art even in the most debased Roman period." They seem to be, he says, "cut off by the rod from some interminable Roman colonnade." Mr. Pond will find few to disagree with his statement of general principles with regard to the purpose of architecture, although they may find his application open to argument. A national style is not evolved in a day; and, rightly or wrongly, it has been thought that classic work provides the rules of the architectural syntax. Work after the character of Robert Louis

Stevenson's "sedulous ape" may perhaps too frequently be the result of a student's enthusiasm; but we do not think that it would be difficult to prove that contemporary work most likely to endure as representative of the *Zeitgeist*, even including some of the German and Austrian phases of the type known as *l'art nouveau*, has been founded on a knowledge of the structure of classic art.

Architecture and the Press.

AS AN indication of the average view of the Press where architecture is concerned a recent note in the *Globe* is illuminating. The writer, or the local person with his eye on the rates who has inspired him, discovers certain qualities in a school building which has just been erected at Bromley more appropriate to the dignity and taste of a country mansion than an educational establishment subsidised by the taxes of the municipality and the State. An admirably designed wrought-iron gateway serves as a particular illustration of the *Globe's* point of view. The gateway is altogether too good. We do not happen to know the locality in which the architect, Mr. Burke Downing, has built his school or its position in regard to traffic, but we may safely say, we think, that his gateway (which was illustrated in the *Builder* of October 20) is in a position which makes it a matter of more public

importance than the gateways of most private mansions. But there are larger matters at issue than that concerning equally the educationalist and the taxpayer, which may be readily summed up. With regard to the first, for instance, a scheme of education can be considered complete which does not take into consideration the educational influence of the scholar or student's environment, of the things with which his eye (through which his mind operates) comes into daily contact; and as to the second, which concerns the taxpayer, we doubt that consideration design which involves the better application of materials to their purpose is usually more expensive at first cost than the work of inferior artistic quality, while the advantages in the long run cannot be questioned.

Balliol Chapel.

WE commented in our last issue (p. 499) upon the protest of Mr. Norman Shaw and Mr. Basil Champneys against the threatened destruction of Butterfield's Chapel at Balliol College, expressing our agreement with the protest. As we pointed out, the work of Butterfield does not appeal to the sympathies of all, and may be too early to attempt an estimation of his position among the architects who made their mark in the XIXth century, or to say with conviction that his work will have a permanent or any influence at all upon the architecture of the future; but there can be no doubt of the individuality and interest of his buildings, and of the fact that he was an artist whose unquestioned love for his work; and those of our readers who hold similar opinions will be glad to read the following paragraphs from a letter, over the signature "H. C. Sotheran," in the *Saturday Review* for the 4th inst. :—

"Butterfield made his mistakes. He was unbending, wilful man, perhaps, and certain in Winchester College Chapel he came woefully to grief; as did, alas, the chapel! He saw one thing at a time, and had his way. But are we always going to do the same?"

He was a very great artist; with him architecture was alive; it bore his mark; its smallest detail had his personal touch. Not least his Balliol Chapel. Its slender spirelet, its thorn-tracery, its banded walls, all tell of Butterfield, as they do of Ruskin and the "Stones of Venice." We are all now sneering at Victorian taste. It had its faults, and we need not fear to smile, if only we do not forget to acknowledge what we owe. To those who remember, to defend seems absurd. Its mistakes were made to give us our inheritance; and if we have forgotten those who follow us will record our debt to it. They will not overlook that it was decided to destroy Balliol Chapel in the week in which *Life of Ruskin* was published! As to Oxford, architectural history is the history of English thought for eight hundred years. They will not fool who try to wipe out the history of the XIXth century."

This is well put, and we hope it and other protests may lead to the abandonment of the proposed destruction.

The Railway Outlook.

THE forecast at the present moment may be described as "stormy and uncertain, with occasional bright intervals, possibly clearing later." It would be rash to prophesy more definitely. The firm attitude of the companies—whether it does or does not make for peace—cannot be characterised as other than consistent. They undertook to abide by the decision of the Commission and simply reiterate their promise

No. 35, Brook-street, W. (Greek Revival.)

From Messrs. Richardson & Gill's "London Houses from 1660 to 1830." (B. T. Batsford.)

ing that the Report might quite con-
nably have been as unpalatable to
n as it has proved to be to the men,
latter should have consented as
lly, if reluctantly, to accept it.
uld they fail to do so, even though
companies are, at the same time,
ing the most far-reaching concessions
have been proposed in the history
our railways, their attitude would
oubtedly alienate public sympathy in
event of another general strike. There
however, ample time before the date
for the return of the ballot-papers
h are being issued for the purpose
esting the feeling of the men on this
it for a calm and dispassionate view
the situation; and we may express
ope that another costly and bitter
gle may be averted. With winter
ad, and the coal-mining industry very
etled and disturbed, the effects of
her railway stoppage would be more
strous than before.

PICTURE EXHIBITIONS: SPAIN AND TANGIER.

is rare to find a grasp of pictorial effect
bowed so keen a sense of architect-
l form as is displayed in the work of
Henry C. Brewer, now on exhibition
the galleries of the Fine Art Society.
artist who possesses the faculty of utilis-
mass and balance in his work more
uently expresses himself mainly by
e and not to any great extent by the
nate study of detail. This, however,
of the case with Mr. Brewer's delightful
er-colours of Spain and Tangier, which
e giving a sympathetic rendering of
itectural detail, are no less admirable
he qualities of colour and composition.
an exhibition as this cannot fail to
rest the architect, who will see buildings
h he probably already knows and
ures presented to him in a fresh light,
to the skilful selection of point of view
of effect that distinguishes these works.
We were particularly struck with the
ities displayed in the range of colour
mes, which, while always harmonious,
er intensely the characteristics of the
e as it impressed the artist. So many
sts seem to have conventions in colour
pages that persistently dominate their
k, but Mr. Brewer is fortunately able
eep his imagination open to the influences
his subject, and thus to transmit the im-
pression it has given him, free from any alloy
conventional method.

Thus the bright costumes and sunlit walls
the market place of Leon and that of
ovia almost dazzle us with their sparkle
e brilliancy, while in the evening light
e Bridge of Alcántara, Toledo, conveys
eeling of mystery and repose. Equally
ful, but in a warmer key, is the evening
ly of the Alcazaba, Tangier, while the
ys and warm browns of the Bridge of
Martin, Toledo, convey a feeling in sharp
trast to the soft reds and blues of ships
water set against the glowing walls
Seville on a sunny afternoon. But,
we have indicated, composition and colour
not the only qualities claiming our
ention; the architect, often irritated
the slipshod way in which the painter
frequently treats the beautiful detail of
buildings he depicts, will delight in the
ing attention that Mr. Brewer lavishes
them.

As examples of this, we publish this week
reproductions of his drawings, "The
Ansepts, Orense," and "The Portico at
antiago." These are typical of numerous
derings of Gothic work in Spain; among
ers we may mention views of the cathedrals
Toledo, Seville, Leon, and Cuenca.
The studies of Moorish work at Granada,
rdoba, and Tangier display no less

sympathy with its essential qualities, and,
indeed, there are very few works in the
whole exhibition that do not make a strong
appeal to all those who are interested in the
architectural developments they portray.

MODERN PICTURES.

The Goupil Gallery Salon has for the past
six years or so provided a representative
exhibition of certain phases of modern
British art. The present exhibition is
animated and interesting as a whole, while
there are individual works which are among
the best of the particular artists represented.
It is not a little curious to find at this time
of day a picture of Mr. Walter Greaves
appearing in a collection of works of ultra-
modern tendency. But to say, in conse-
quence, that the lack of appreciation with
which this artist has hitherto been rewarded
is due to the fact that his work has been in
advance of its time would be absurd. There
is much, for instance, that is characteristic
of the classic painters of the Netherlands in
the atmosphere, detail, and general working
out of his "Chelsea Regatta," placed at the
entrance of the first gallery. As the Goupil
Salon contains over 300 works, including
drawings and water-colours, the majority of
which have qualities of individual interest, we
are unable to do more than casually refer to
one or two of the more prominent pictures.
Among these, there is the "Souvenir de
Noël" of Mr. G. W. Lambert: a girl, with
black hair, dressed in pink, wearing a red-
paper cap from a Christmas cracker, in
which the treatment suggests that this
artist is transferring his allegiance from the
classic Spanish school to certain modern
masters who have been inspired by it. The
work of Mr. Glyn Philpot indicates that he
has developed from the precocious mastery
which was characteristic of his pictures a
year or two ago into a transition stage, in
which we discover a certain hesitancy of
method and of outlook. He remains as yet
an artist who has to fathom his own
depths. The picture of the artist and his
model entitled "The Rest Time" by Mr.
William Strang, is as powerful as any of his
recent works. The six pictures of Mr. Augustus
John suggest a post-Impressionist mood, of
which it is a little difficult to grasp the
import at a first seeing. Various phases,
indeed, of the same movement are to be
found upon the walls, and obviously, with
one exception, they are works of serious
intention. Mr. Wilson Steer, Mr. Tom
Robertson, and Mr. Von Glehn all revel in
the play of sunlight upon the multitudinous
and crowded leafage of trees and their
intervening spaces. In the small seascio
plage studies of Mr. Walter Bayes there is a
charming balance of composition and colour;
Mr. Van Anrooy's "The Green Court,
Canterbury" is interesting, and there are
the landscapes of Mr. Peppercorn and many
other pictures of distinguished merit.

EAST LONDON MEMORIAL TO KING EDWARD VII.

The bronze bust of the late King, which has
just been erected in the garden of Mile End
waste, was executed by Messrs. Henry Harris &
Son, and stands upon a pedestal of polished
marble, 8 ft. high.

PADDINGTON TERMINUS, GREAT WESTERN RAILWAY.

Extensive improvements are being made of
the terminus and its approaches, built by Brunel
nearly sixty years ago. On the northern side
three additional arrival platforms will be
added, making the total up to twelve, with a
roadway between Nos. 10 and 11. No. 1
platform is being lengthened upon the site of
houses in Westbourne Park, and of the
company's workshops and sheds, for which new
provision is made upon 60 acres at Old Oak
Common, Wormwood Scrubs, with separate
shunting lines into the terminus. Westbourne
Park Station and junction is to be reconstructed,
and six of the nine bridges between that station
and Paddington have been rebuilt. The
departure platforms will be greatly increased in
length, as well as No. 1, and a new glazed roof
will cover the whole.

OPENING MEETING OF SESSION AND PRESIDENT'S ADDRESS.

THE first of the sessional meetings, 1911-1912,
of the Royal Institute of British Architects was
held on Monday at No. 9, Conduit-street,
Regent-street, W., when the President, Mr.
Leonard Stokes, occupied the chair and
delivered the opening address.

The minutes having been taken as read, and
members attending for the first time since their
election welcomed by the President, it was
announced that the nominations included five
Fellows, fifty-six Associates, two Hon. Asso-
ciates, and forty-nine Licentiates.

The President then read the following

"Since I had the honour of addressing you
last year we have passed through all the glories
of a Coronation, and long may our beloved
patron George V. live to wear the crown, placed
upon his head amidst so much rejoicing and
surrounded by so much pomp and splendour!
Such an occasion naturally gives great oppor-
tunities to the architect and decorator, and I
think we may congratulate ourselves upon the
fine results achieved in many cases. It is, no
doubt, to be regretted that more use was not
made of our services; and that, when they were
called in, our schemes were not more com-
pletely carried out. Nevertheless, the best
results along the great processional route, and
elsewhere, were produced undoubtedly—as
might have been expected—by our noble selves
and not by the commercial firms too often in
evidence. It would be invidious to mention
individual cases, but I should like to place it on
record that the most effective, pleasing, and
characteristic of the many great efforts to adorn
our streets and buildings were those produced by
architects. The only case of misplaced archi-
tectural genius that I noticed was the annex to
Westminster Abbey, erected "in the Gothic
style" at large expense. Surely the culmin-
ating point of the great procession along an
otherwise gaily-decorated route should have
been something better than a mere plaster
sham?—supposed, no doubt, to be in harmony
with the Abbey, but really a very poor com-
plement to it. One would have thought a fine
marquee in gold and gorgeous colours sur-
rounded by Venetian masts carrying flags,
banners, and pennants much more suitable to
the occasion than an impertinent imitation
Gothic building.

Closely bound up with this same subject is the
unfortunate *impasse* connected with the com-
pletion of the great processional road through
St. James's Park. This road is in itself a fine
thing, but how it came about that it has no
proper opening into Trafalgar-square is quite
incomprehensible, and, I fear, is another illustra-
tion of the hopeless manner in which our public
improvements are invariably mismanaged. In
this case a processional road starts from a
palace, and leaves off, if you please, with a
flourish of trumpets behind a row of houses
which practically block its further progress.
And when the houses have been dodged, further
progress is effectually barred by an underground
convenience! I should have thought that the
possibility of getting properly and effectively
into Trafalgar-square would have been the first
thing to consider by those responsible for the
scheme, instead of the last, and it now looks, I
fear, practically impossible ever to make a really
good finish towards the Square without spending
a further huge sum of money, which might have
been avoided if the scheme had been properly
thought out from the first, by all three of the
large public bodies really interested in the
scheme, instead of by one alone, which one went
to work apparently without any regard to the

other two until the last moment, when, alas, it was too late! Architects are unfortunately too often forced, by the near-sighted policy of their employers, into designing incomplete schemes of this sort, and get all the blame for so doing, whereas they, of course, can only do as they are bid, on the land at their disposal.

London Improvements.

This brings us once more face to face with the fact that there really should be one authority responsible for the whole of London, and not several as at present. London with its seven millions of people is as important and probably as difficult to govern as many a European country; and instead of its City Corporation, its London County Council, and its two dozen or so of Borough Councils, with the Office of Works and the Woods and Forests thrown in, one would have thought that at least one Minister of the Crown—aided perhaps by a committee of experts—would have found work enough to engage his time in looking after London and seeing that its affairs were properly managed.

Mr. Waterhouse last session read us a most interesting paper on this subject, but I fear his suggestion of a chief architect acting with the architect from each Borough Council would probably cause friction and confusion, and I would much prefer to take, say, H.M. First Commissioner of Works, and—after divesting him of many of the duties he now performs—make him responsible for the proper domestic government of London. He should, of course, have a good deal of power and some knowledge and taste. There are, I assure you, grave reasons for some change even from an architectural standpoint; take, for example, our street improvements. Most of us can remember when Piccadilly-circus was improved—into a hopeless muddle—and it is now proposed again to alter it, and make it very much what some of us in this Institute suggested at the time! But this, of course, now can only be done at a very much greater cost. Shaftesbury-avenue and Charing Cross-road are each wide thoroughfares, but both hopelessly laid out from a town-planning point of view. Kingsway is quite out of scale with its neighbourhood, and has, as I told you once before, two ends at one end, and no proper end at all at the other! The alterations at the Marble Arch have perhaps relieved the traffic but spoilt the appearance of the place, and the slice of Green Park that was thrown into the road by Hyde Park-corner has done no good whatever—though I believe it was done to please the police—and the ordinary use of the road are not in force now at this spot, which will lead, I feel sure, to some horrible accident.

If we go a little further back still, what a great opportunity was missed when the land behind the Albert Hall was dealt with! This is now covered largely by public buildings, and yet none of them look well placed, neither do they tell as a group, as might have been the case had the land been properly laid out, as it certainly would have been in any other country but ours. This all shows that such work should not be left to amateur Committees or Corporations, driven this way and that, first by one consideration and then by another, but should be in the hands, as I have suggested, of, say, a Minister of the Crown, who should advise, control, and direct the various authorities now responsible for the government of London, and see that they worked together and for the good of London as a whole, and that their various schemes and plans formed part of a comprehensive whole, arranged with due regard to the future.

Surely some general scheme for the improvement and development of London in the future should be at once got out, and might be taken in hand by the suggested Minister? In Rome we were recently shown a plan which is to be carried out during the next twenty years, and all the property so required has been scheduled and the price fixed, and any improvements on it can only be made at the owner's risk, knowing that it may be wanted at any time during the next twenty years. We, however, do not appear to realise the importance of a comprehensive scheme, and the only people who do know, to some extent, that the public really likes well-laid-out and well-designed buildings are those who run exhibitions, such as the White City. When will our Corporations learn the same lesson, and realise the fact that there is money in it too?

Take a concrete example which has been exercising some of us a good deal lately, viz., the Corporation of London Bridges Bill. This Bill was promoted by the Corporation of

London, and has now become an Act of Parliament, and provides for rebuilding Southwark Bridge, and for building a new bridge to be called St. Paul's Bridge close to it. Now we all know that the traffic in the City is already about as congested as it will can be, so what it will be like when fresh streams of traffic are created flowing to and from these two great new bridges heaven only knows! It would seem a wiser policy to try rather to coax traffic away from the heart of the City instead of into it, particularly as the enormous cost of land tends very much to prevent improvements there being carried out on any very comprehensive scale. But the City has money to spend on bridges, so spend it it must, and in the City precincts, too, quite regardless of whether it might not be far better to go to work either higher up or even lower down the river. A Minister of the Crown might help us here.

One last word on St. Paul's Bridge. This Institute has for years been agitating, as you know, for proper architectural consideration for this bridge from the outset, and the Corporation turned a deaf ear to us. Parliament, however, came to our help, and at the eleventh hour three well-known architects were called in to advise the Corporation. This was what we had been working for all along, and I think we should congratulate ourselves on having got it. I am asked for in the end. That some of us may have been disappointed at the form the advice took is not the point. The lay-out received architectural consideration before the Corporation got its Bill; and now we can only devoutly hope that if both bridges are gone on with the Corporation will take such steps as will ensure the designs of these two great bridges being as fine as it is possible to make them.

I should like to explain, however, the reason why we architects seem to be somewhat divided on the subject of St. Paul's Bridge. The reason is that there are two very different ways of looking at the subject; the first may be said to be the aspect of the bridge itself, and the second the aspect from the bridge. Unfortunately it is not easy to combine the two, and hence some of us took the view that the first thing to consider apart from the great traffic problem—was what we saw from the bridge, and others what we saw when we looked at the bridge itself. Doctors are allowed to differ, so I must claim for our profession the same privilege. If not too late, however, I should like even now to suggest that Southwark Bridge might be rebuilt first so that we may see what effect it has upon the traffic. This course would have the further advantage of preventing the river and its vast floating traffic from being obstructed by works to two bridges so close together at the same time.

Architectural Departments.

I have already suggested that my proposed new authority might be the First Commissioner of Works after his present duties had been lightened. These I would lighten by very largely reducing the size and output of the huge architectural mill now running under his control. This mill turns out work just now of the annual value of 1,195,410*l.*, which large sum is spent on Palaces, Law Courts, Government Offices, Schools, Labour Exchanges, Museums, Post-offices, and Telephone Exchanges, etc., and on the maintenance of similar buildings over which the Office of Works has control.

Now it will be seen that the work turned out is very varied in its nature, but unfortunately very uniform in its architectural character. I want to be strictly fair in what I say, but I honestly think that the bulk of the work produced by the Office of Works is poor from an architectural standpoint. Some of it has been better of late, I admit, but let us take post-offices as a particular speciality. These may be seen in our towns all over the land, and are generally, as far as I have seen, pretentious and costly and devoid of those good qualities essential in really fine work, and their outer buildings are very much the same.

So much for the quality of the work; now for the cost of production. The architectural staff which produces this work receives 71,849*l.* per annum, or just about 6½ per cent. on the outlay for salaries alone, without any allowance for rent, rates, taxes, pensions, fees to specialists, cleaning, lighting, heating, porters, messengers, and various other sundries. Five or six years ago the salaries amounted to only about 3½ per cent. on the amount expended, which was then about 400,000*l.*, or one-third of what it is now! Fifteen or sixteen years ago only about 250,000*l.* was spent per annum, and the cost of

architectural administration was only about 2 per cent.! These figures seem to show that the larger the office is the more expensive becomes per cent. to administer.

I maintain, therefore, that, as the work now produced by the Office of Works is not very good and not very cheap, the bulk of it might with advantage be put out to independent architects to be better done at a smaller cost, and to relieve the First Commissioner of Works considerably. This you will see has the advantage of killing two birds with one stone, for thus enable the First Commissioner to do work which we want him to do, and free him from work which we would much rather he did not do.

You must not think that I have any particular grudge against the Office of Works, or that I am finding fault with the many good friends I have on the architectural staff there, for my remarks are directed against all large public bodies who attempt to do their own architectural work. The recent Congress at Rome passed a resolution to the effect that "Architectural works intended for the State, municipalities, or other public bodies, should only be entrusted to qualified architects after competition or otherwise." It will thus be seen that the architects all over the world are in accord, and in order to further the case I have looked up the cost—quality against cost—of the architectural work produced by the Admiralty and the War Office. Both of these authorities run large architectural departments spending in the figures about a million and a half per annum each, the former at a cost of about 7 per cent. and the latter about 10 per cent. in salaries alone, and in neither case, of course, included the cost of rent, rates, pensions, cleaning, lighting, heating, etc., which would probably raise the cost by another 1 or 1½ per cent.

I should like to have been able to include the London County Council in my list, but I find no published figures on the subject. I told, however, on good authority, that the Architectural Department of this body is very economically at present, greatly to the credit of the very able gentleman at its head. When, however, in the course of time he retires I venture to predict that no one else will be found with the same capacity for work, the power of organisation; consequently confusion will arise, and the cost of production go up something like that in the three other cases have quoted. And the more these departments undertake now the greater will be the fall there. For it stands to reason that one man cannot have time to design all the work produced by a great office of this nature, and if he has not time to do it himself it must be done by others. It is, therefore, at the mercy of his staff, and if the mercy of his staff, why not at the mercy of the outside architect? In the case of the London County Council, their architect is even called the Superintending Architect; his duty should, therefore, clearly be confined to superintending the work, not of a staff, for then becomes his own work, but of those architects who work in London under his jurisdiction. This principle applies equally to the architects of the Office of Works, the Admiralty, the War Office, and other large public or municipal offices, for all these gentlemen, if they attempt to design any work themselves, may neglect their staff, and if they leave it to the staff it must be good, bad, or indifferent according to the staff, for one man even cannot control a staff the salaries of which at the Office of Works, for example, amount to something like 1,400*l.* per week, or perhaps as much as 99 per cent. of our practising architects pay to their staff during a whole year instead of one week.

In these days of free trade and buying in the cheapest market, why should public offices given preferential treatment? If there are a number of professional men of high standing prepared to accept a recognised scale of fees why should these huge cormorants receive about half as much again as the ordinary rate? Here, too, I know, are in demand just now, and venture to suggest that, without robbing any one at all, thousands of pounds might be saved annually from the unnecessary expenditure now involved in running these large architectural mills. The three which I have named together spend annually in round figures about four or a half millions on building work at an average cost of about 9½ per cent., or 4½ per cent. more than the recognised payment for such work. This equals rather over 200,000*l.* a year paid unnecessarily for the privilege of running these departments. It may be contended, however, that

departments are necessary, as there are a few of works, like painting park-railings, ding broken windows, etc., that must be done; but a staff of surveyors could do very well without mixing up architecture in matter at all, as, I imagine, was intended in the Office of Works was established.

Figures may not, of course, be quite correct figures never are—and those who understand a better than I do may be able to put a much more complexion on them. I can only say that we worked on the official published figures, and these, as a rule, are carefully and faithfully worked with a view to their being swallowed by the British taxpayer, and I hope I have not overstated the case.

Again, it must be only too obvious that a large permanent office is not a likely place for the location of various kinds of architectural work either well or cheaply, for the originating generally done by understrappers and sent to the higher grades for approval or otherwise—a sort of Class of Design—and I have heard of as many as nine separate designs being made for one building before such approval was obtained. In other professions one man professes to be able to specialise in all subjects? Are there not landscape painters and portrait painters and some persons who work best in low relief and others in round? Do not some lawyers go in for criminal work and others for the Probate and so on? Are there not doctors who cut at insides and others who cut our throats? I even with us, some architects do church work and others domestic work; but these offices, as far as I know, claim to be able to do everything from a palace to a prison, and doubt they can, and equally well too!

The Future of the Institute.

I have already referred to the Ninth International Congress recently held at Rome, and the resolution respecting architectural work of the State and municipal bodies being entrusted to non-official architects only. Of resolutions passed, perhaps the following are the most interesting, viz.:

(1) That the right to use the title of architect should be reserved to those who have obtained it as a result of a proper examination and after an artistic, technical, and scientific education.

(2) That the title of architect should be held in the same rank as the title Master of Arts, Doctor of Medicine, etc.

These two resolutions are particularly interesting to us just now, for, as you know, this Institution has been before the Institute as long as I can remember, and it may help us to know what other architects think on the same subject. As, as you know, have been working towards the ends for some time past, and as a preliminary step have created a new class of members called Licentiates, nearly two thousand of whom have already joined our ranks. With this object, too, of organising the profession—the sanction of Parliament—into a strong, united, disciplined, and protected body, negotiations have been proceeding between this Institute and the Society of Architects, it being that two Kings in Brentford were hardly necessary, and that together we should be much more powerful than working independently. A number of meetings were held early in the year, as you are aware, and the general principles of a number of the details were satisfactorily worked upon. Unfortunately—perhaps through some fault—we got on rather faster than our advisers approved of, and we were brought to a halt by finding that we had perhaps exceeded the powers we possess under our existing Charter and by-laws.

This was rather a shock to some of us, but as we had gone so far, we felt that in justice to ourselves and to the Society of Architects we could not do otherwise than make good the mistakes made. Your Council is, therefore, been considering a revised Charter and by-laws which will enable the two bodies to unite under terms I think advantageous to both parties. This Charter and by-laws will, I hope, be very shortly laid before you, and I trust you will pass them, not, of course, without due consideration and discussion, but without forgetting what has already been taken care of. For many reasons it seems to me obvious that the two societies should unite, but the reason that will perhaps appeal most to our only too human natures is the fact that by building up and increasing the power and influence of this Institute we are building up and increasing our individual power and

influence. For the fact of belonging to a powerful body strengthens each of us, and makes us more confident when dealing with the many difficulties that abound in our multifarious duties.

If this address should happen to be read in the provinces, I hope those interested in the good of the profession will endeavour to make as many of their *compères* as possible join our ranks and so still further help to build up a really powerful and representative body. Another way in which our internal economy might be strengthened would be by a number of our Associates who have been Associates for years becoming Fellows. They are, in a number of cases, highly qualified in every way to become Fellows, and I hope they will do so.

It is a matter for congratulation, I think, that an architect has been associated with a sculptor in connexion with the King Edward Memorial. The ideal method, no doubt, would be for one man to do the whole thing, but until our sculptors take a little more trouble to ground themselves in architectural matters the only course I can see that will ensure our monuments being satisfactory is to associate an architect with the sculptor: the custom hitherto too prevalent of leaving the sculptor to produce his own so-called architecture, or to get some compliant ghost to do it for him, is most unsatisfactory.

A British School in Rome.

You will be glad to hear that there is now an immediate prospect of something in the nature of a British School being established in Rome, such school to embrace architecture, painting, sculpture, and archaeology. Nothing, however, very definite has been settled, but there are prospects that, aided by private benefactors, helped by the Commissioners of the Exhibition of 1851, and backed up by the Royal Academy, the Royal Society of British Sculptors, and ourselves, a school will be shortly opened in Rome. Scholarships connected with it will be established, I anticipate, by this Institute with funds lately left us under the Jarvis bequest, and I think I am at liberty to say that the Commissioners of the Exhibition of 1851 will probably also give at least one scholarship each year to architecture, painting, and sculpture, so that with students who we hope may be able to attend this school, either privately or encouraged by the universities and schools about the country, a good school should be got together; and in such an appropriate centre for study as Rome, where most of the other nations have schools, we British subjects should be able to offer our students the means of completing their studies at a much higher level than has hitherto been the case. For it must be remembered that if we architects are to hold up our heads with any degree of success we must have something in them, otherwise the public, which is very quick at finding out impostors, will go back to the jerry-builder, leaving us to pine in deserved obscurity."

Sir Robert Hunter, Kt.,

in moving a vote of thanks to the President for his address, said that in regard to one prominent part of it they could hardly expect him to be in agreement, and while the contention that the Government architectural work should be thrown open was naturally very well received by the meeting, for obvious reasons, it could hardly be welcomed by an humble Civil Servant, who might, if the suggestion made by the President were acted upon, see a large number of his colleagues discharged. The figures the President had given, however, were well worth the attention of the Treasury, who perhaps could explain the matter and cause those figures to bear a different appearance. However, he believed that the great bulk of the work of the Office of Works consisted in supplying post-offices, and, while he could say nothing in that meeting as to the architectural appearance of those buildings, he did not think that anyone had suggested that the construction of those buildings was not thoroughly sound and good, and he was sure that they were well adapted for the purpose for which they had been designed. With another part of the address he was in thorough agreement, and they would be all agreed that it would be a very good thing if some controlling authority could control and supervise the execution of new so-called improvements in London. It always struck him that the great difference between London and Paris was that while in London they had many fine buildings, splendid open spaces, etc., there was a great absence of those broad effects which

catch the eye at every turn in Paris, and which gave him so much pleasure. In London, when we did get a broad effect of any kind we did not seem able to keep it. There was one part of London which was constructed as a uniform design, i.e., the whole district of St. James's Park, and the Duke of York's Monument, and up to Regent's Park, and, while opinions might differ as to the treatment, it was all one harmonious whole, which, however, had now become neither one thing nor the other, thanks to the Office of Works. There were difficulties in a city like London of enforcing adequate control: the enormous commercial growth of London and the enormous value which land in the centre of the City obtains afforded a perpetual incentive to put more buildings on a given site and to get more value out of the land in that way, and that tendency must, in some measure, run counter to the desire to carry out a uniform and harmonious plan. And there was also that feeling of individuality which had hitherto characterised this nation, which resented hard-and-fast control by a central authority.

Much consideration must take place before any definite authority is established for such control as the President suggested, but that some control of the sort was wanted they would all agree. The sovereign remedy for all such architectural ills was the growth of public opinion on the subject, and public opinion in favour of anything like architectural beauty on a large scale was a matter of recent growth only. Hitherto, when any scheme for laying out a new part of a city, or any question in which considerations of beauty and symmetry had arisen, the general attitude of the public man had been that, while it would be very nice to have a pretty building and a well-designed street, considerations of beauty must kick the balance as compared with considerations of finance. That feeling was, he believed, gradually being altered, and there had been signs of better things lately, such as in the St. Paul's Bridge question, in which, however opinion might differ as to the final result, Parliament had directed that opinion should be taken from the aesthetic point of view, and that, whatever else might be said, had been done. He desired to congratulate them on the growing importance of their profession. In recent years people took more interest in getting better buildings designed than was the case a few years ago, and not only was there greater interest in the production of better individual buildings, but there was the whole subject of town planning, which was the growth of yesterday, and which had become a question of so much importance, as was shown, for instance, by the recent Town Planning Conference, which was opened by a Cabinet Minister and by the attempts being made on all sides to do something a little better than what we have been accustomed to in recent years in the way of growing cities and suburbs. The scope of the profession, they must all feel, was widening, and they had a great future before them. He had been told by professional friends that there had been comparatively little work amongst architects lately. He was sorry to hear that, and it might be that there was some check to building, but he could not help thinking that the architect would be the right-hand man on every local authority; that he would be called in to design not only beautiful houses and buildings, but to lay out and to plan collections of human dwellings, and, with the engineer and the medical officer of health, to provide healthier and more beautiful towns.

Mr. Irving K. Pond,

President of the Institute of American Architects, said it was a great honour and pleasure to second the vote of thanks on his own behalf and on behalf of the sister Institute. It was a pleasure to be speaking there, where there was a community of interests; in Rome, where they had recently met, they did not know very often whether they were understood or not. In listening to the address he had been forcibly reminded that the mother Institute and the child which he represented had not only community of speech, but community of thought and ideal—that the same problems which the President had reviewed that night confronted them in America also. In a great many of the larger American towns there were interests which made municipal government almost impossible, but that was coming to a solution there, as it would soon come here. What appealed to him very strongly in the address was the establishment of the proposed British School in Rome. In the case of the two St. Paul's Bridges there might be the two points of

view that the President had referred to, i.e., looking at the bridge and from the bridge; so in the case of the School at Rome there were two points of view, and there might be a division of opinion amongst them; there was the point of view of looking at the School and looking from the School. What was the School to bring them? It seemed to him that they had their own traditions, and he could not blame them for following those traditions; but he did blame his own compatriots and *confrères* for being so closely wrapped up in tradition—in the swaddling clothes they had in infancy. Americans were more bound in the traditional style than we are here. What would Rome give us? We had culture, Oxford, Cambridge, the British Museum, the National Gallery, easy access to the Continent, where we could pursue our studies. If we went to Rome and brought back forms and facts and details and applied them it would fail us in practice; but if we let the tradition mellow in our minds it would benefit and help us. The problem had been brought home to them in America. They had their School in Rome, which was conceived by a former President of the American Institute of Architects, who also gave his life and fortune to it, and it did not behove him (the speaker) to criticise it; but his advice to the students was not to use Rome as a studio, but to use it as a ground for the expansion of ideas and ideals. What the student wanted to determine in Rome was not that so many buildings were built in such and such an age with so many blocks of stone, but what was the controlling motives of the builders. When a man understood that and brought back that principle he would give much to his own community. The problems of official architecture affected American architects as much as English architects. The American Institute of Architects was the father of a law as a result of its persistent dealing with the matter, for it caused a law to be enacted which for a number of years had been in operation by which the principal works of the Government were given out to individual architects. Recently that law had been attacked in the interest of economy, so called, the case being made to show beautifully for departmental architecture, but they knew that where the individual architect got 6 per cent. for work, it cost the department something like 7½ per cent. The Government figures did not show that, but that was the fact. The law in America had given, and was giving, a higher type of Government architecture than was produced under departmental control, and he hoped it would not be overturned, and that in England a similar law might be enacted.

The vote of thanks was then put to the meeting and very heartily agreed to.

The President replied, and the meeting terminated.

The next meeting will be held on November 20 when Mr. H. H. Statham will read a paper on "Modern French Sculpture."

WOMAN AS A DOMESTIC ARCHITECT.

A MEETING of the Architectural Association Camera, Sketch, and Debate Club (Ladies' Night) was held on Thursday last week, when Mr. Edwin Gunn read the following paper on "Woman as a Domestic Architect."

"Architecture is a great and difficult art, the mere scope and meaning of which not one in a thousand laymen, or, perhaps, one in a dozen professed architects, fully understands. The broader and truer meanings of the term as relating to dealings with the masses of buildings and their design to excite definite emotions in sensitive beholders are, however, now more readily grasped than they were, owing, perhaps, to the frequent bandying of such phrases as 'grand manner' and 'town planning,' and it is commonly recognised by people sufficiently interested to care that ingenious contrivance of detail is not architecture, though forming a part of it in some of its minor applications.

Ruskin rather unkindly said of Welby Pugin in one of his scathing denunciations of English architecture (which he did not understand): 'Expect no cathedrals of him; but no one, at present, can design a better final.' Continental opinion seems to sum up the typical British architect on somewhat similar lines—'Expect no cities of him; but no one, at present, can design a better cottage.' Even this modest qualification has latterly been questioned more

than once in current journalism. It has been freely stated that all is not well with our domestic architecture, and the claims of woman as the natural saviour of the situation have been again and again advanced. I have not gathered that architecture had much to do with the claims put forward, though the writers concerned seem to have thought so. They attack, really, from another point of view. Briefly the argument is this—and I hope they will soon elaborate or develop their pleas, as continual restatement has somewhat staled their oft-reiterated cry: 'Women alone should design houses, because they live in them and understand their working.' Or, as Mr. Robertson Scott, well known as a writer under the pen name of 'Home Counties,' puts it, even more directly, 'Structures which are to be lived in most of the time by women, and are to be wholly worked by women, are planned by men, chiefly 'single men in barracks' of offices.'

It will not do to push this line of argument too far, or we shall be committed to the principle that the criminal (or should it be the warder?) must always design his own cell. But, seriously, is there anything in this claim? Where does man live? The cheaper class of (alleged) humorous papers is perhaps responsible for an impression that his time is divided between his office and his club, but this can be dismissed as obviously untrue as regards the cottage-dwelling class. And does woman so devotedly attach herself to home? Is her existence divided between the kitchen passage and somewhere in the neighbourhood of the linen closet? Not to anything like the extent she would have us believe; often she is fluttering about the West-end, corrupting her taste and making herself envious and discontented by worshipping the numerous ingeniously misshapen creations in which the fashion of the moment decrees that she should clothe herself. Enough of this, it is a side issue.

The assumption that woman, while preserving and cultivating all the domestic virtues, will yet find time to become a prolific designer of houses is, to say the least of it, amusing. For observe, it is not the mere fact of being a woman which fits her to design houses for people to live in, but the fact of being a domesticated woman; and as her architectural business increases so her fitness to conduct it would automatically diminish—a state of things not unknown with male architects, by the way. But even conceding the claims made, and allowing that woman might make an efficient designer of the domestic machinery of the house (reserving the right to object that this is a very minor part of architecture), what is to prevent man from doing, or to prove that man has not done, the same thing as well as woman can hope to do? Instances to the contrary can no doubt be produced—kitchen ranges badly lighted, draining boards for left-handed washers-up, no draw-off taps on upper floors, insufficient cupboards (I use the word with bated breath). But is anyone bold enough to declare that the intellect of man is incapable of satisfactorily grappling with such very simple problems of arrangement, or that male architects would have a monopoly of carelessness and stupidity? And, after all, is there not something nobler than a cupboard? I don't mean a wardrobe. A sense of proportion is the one absolutely essential quality of the architect—not alone in the sense of geometrical ratio between masses and parts, and subjection of detail in subservience to the whole conception, but in the avoidance of any exaggeration of certain components to the sacrifice of others. For instance, it is desirable to have good drains, but the architect who designed his drain plan and fitted his house to it would not be committing architecture. An extreme instance, no doubt, but we are invited to let woman design our houses on somewhat similar lines around the domestic offices. Design in plan and section as practised by the ablest of our domestic architects is something very much more than the mere fitting together of so much accommodation (including cupboards) to serve the needs of domestic convenience. But, again, is woman always so determined in securing convenience at all costs? The woman who 'lives in the house' craving for cupboards denied by the unpractical male architect—it's quite a touching picture; but what of woman who lives in her dress craving for—not pockets, but a solitary pocket? Why? Fashion forbids! We know something of fashion in architecture, everything at present must be redolent of the days of good King George, to be followed by neo-Greek; but I see fearful visions of

exaggerated fashions in architecture if woman once gets her head! We all know the mushroom room aeroplanes, and other expansive forms of hat—practical, you will observe, in the perfect case which is permitted their wearers who seated, say, in a railway carriage. Pictorial domestic architecture if a fashion for room on a similar lavish scale but started, followed by a reversion to the toque or baby boy style. No, I don't think that woman can maintain the claims to that sweet reasonableness and hard common sense in dealing with the minor conveniences of life which have been put forward on her behalf by interested parties; one feels that she would always be prone to become, to an even greater extent than man, the master-slave to an idea, before which cupboards, sink, water supply, and possibly even roof and windows would have to retire if they did not conform.

Now, taking it as demonstrated that woman would be most likely to fall short of the hopes entertained for her as a contriver of domestic convenience, what of her claims to success as an architect? Unfortunately, the 'lady architects' who from time to time prevail upon journalists short of copy to print their wearisome effusions on the eternal topic of 'cupboards' do not seem anxious to publish their designs, so that I am acquainted with a feminine building to which the test of critical examination can be applied. There was indeed a cottage at one of the early cottage exhibitions, but—we must perforce rely on other evidence.

Woman has been fortunate in receiving the admission to a sort of pretension to 'better taste' than man. Goodness knows how came about—lack of self-confidence on the part of man, I suppose, or possibly a feeling that anything so unseemly and inessential as art was beneath his lordly notice. As far as I can gather it largely depends on woman's displayed preference for the more delicate (i.e., washy) shades of blue and pink in decoration, a fondness for draping, and a passion for nicknacks which converts the drawing-room—woman's sphere—into the most fussy and unsatisfactory room in the average house. William Morris, at least, knew better. 'There are two things,' he said, 'about which women knew absolutely nothing—dress and cookery; their twist isn't the way. They have no sense of colour or grace of drapery, and they never invented a new dish or failed to half spoil an old one.' I do not think that I need labour this point. I am not anxious to prove that the average woman is less likely to make a successful architect than the average man—who makes a precious poor one—but there is no evidence to show that she would be likely to make a better one.

Upon the physical aspects of the case I have not touched. I do not regard woman's obvious difficulties with excavations and scaffolding as really material, or insuperable. Sir Christopher Wren was hoisted to the giddy heights of St. Paul's in a basket, and I am sure that the method of transport would commend itself to any woman, who, I am given to understand, is the chief supporter (both directly and by influence) of such delightful inventions as the wiggler, woggle, joy-wheel, and similar violent pleasures at our educative exhibitions.

I confess that when I rashly undertook the preparation of this paper it did not occur to me that the argument would be so one-sided. It was my intention to array the points for and against the probability of improvement in our domestic architecture resulting from woman's entry into that sphere. But at close quarters with the subject the probabilities have appeared to me to be all in one direction, and I shall be really grateful to any one who will redress the balance.

The proposition which I shall ask to be allowed to submit to the meeting is—'That available evidence does not justify the assumption that woman would improve on the domestic convenience of the average man-planned house. Before leaving this proposition to the animates of the debate which I hope it may provoke I will briefly summarise the points which I consider vital—'

(1) If there is anything to fit woman as better designer of livable homes than man, it is her intimate and constant touch with the working. This I fear is not so intimate as constant as it was, and in the case of a successful professional must become still less so.

(2) In any case the needs are relatively simple, and the man who cannot grasp them will certainly fail to grasp the more complex needs of the larger problems of architecture, and hence be a poor architect—and there must just as well be poor woman architects.

(3) Evidence in the spheres in which woman already holds free sway tends to show that invention is the last consideration entertained by design.

Miss Cohen,

On opening the discussion, said she was convinced that there was at least one direction in which woman could improve on the average man-planned house, and that was in the provision of labour-saving appliances, the need for which man did not apparently recognise. Also inadequate provision was usually made for fires, and in some country cottages it was, as a consequence, impossible to shop economically. She also felt that they had a grievance against male architects for the many houses in which windows would not open, and to this insufficient ventilation attributed many cases of consumption. Bedrooms had no fireplaces, basement stairs were steep, and small-paneled casements made cleaning very difficult. Kitchens were not sufficiently light and airy, and she had seen instances which could not possibly accommodate a fire. She held, however, that there was really no sex in architecture. Mr. Gunn had spoken of the lack of examples of woman's architectural work to which he could refer, but if he turned to America he would have found there a great many woman architects in successful practice. At any rate, whether or not woman was fitted to perform the whole functions of an architect, she thought there would be no doubt that as an adviser to a male architect she could fill a useful place in the design of domestic work.

Mr. H. W. Britton

thought that the architect could not be blamed for the deficiencies in houses pointed out by Miss Cohen. Men might be to blame, but hardly architects, or, at any rate, modern architects, for the craving for cupboards, he felt that this was wrong and unfortunate; things which could be thrown away (particularly old books) were stuffed into cupboards and got musty; there was a sentimental feeling about musty volumes with which he entirely disagreed.

Mr. Hake,

proposing, said that it was not only old things and books which people put in cupboards—men kept many things there which men could be very sorry to do without.

Mr. A. G. R. Mackenzie

said that his sympathies were with woman in his debate. He felt that they naturally knew more than men about domestic conveniences, and confessed that the point as to small panes of hard to clean had never occurred to him. In any rate, he knew many women who would make better architects than many men.

Mr. J. D. Crace

said that he believed it was quite true about the number of American lady architects, but he thought that most of them acted in a consultative or confined themselves to decorative sign and furnishing, and it appeared to him that these fields of action would much better fit women. He strongly advised them to limit their activities to decoration and garden design, which they could follow without physical inconvenience. As to putting old books away in cupboards, it was necessary in large towns, the sulphur-laden air very soon rotted the other binding.

Mr. P. H. Adams

reverted to Miss Cohen's remarks about sufficient ventilation, and pointed out that it was not necessary to bring in lady architects to cure this—it had already come out by man-made by-laws, which made it necessary to have a certain proportion of windows opening in each room. He confirmed Mr. Crace's impression as to American lady architects and their sphere of action.

Miss Snow thought that the ideal state of things was co-operation.

Mr. A. L. Snow

said that as to co-operation it was practically impossible to avoid it. In his brief experience seemed to him that the person who counted as the client's wife, who generally said pretty much what she wanted as to such domestic details as were in question, and saw that her wishes were carried out.

Mr. Jacob

agreed with Miss Cohen that there was a lack of consideration given to labour-saving devices, and suggested as a remedy that the male architect should take on household duties for a month.

Mr. A. H. Belcher

spoke strongly against women competing with men, and thought that woman's place was the home. Miss Cohen, interposing, asked whether every man could be expected to maintain his surplus daughters, and whether it was not often a necessity that woman should find some occupation by which she could support herself. To this Mr. Belcher replied that he thought every man should support his own family.

Mr. Dale

said that from the title of the paper he had expected rather a dissertation to prove that woman was responsible for all architecture. They had nothing to show that Adam, when a bachelor, wanted a house. It was only with the advent of Eve that a drawing-room where she could put sea-shells and such like knick-knacks became a necessity. A certain well-known philosopher had lived in a tub, and he thought that man alone would probably still do so—with half an inch of tobacco dust at the bottom of it.

Mr. Bullock

gave a graphic description of his experience of a lady client who installed herself as clerk of works and followed the workmen about all day long complaining at their slowness. The painters were her pet aversion, and she was not satisfied with their rate of progress until she was given a brush and some good stiff enamel to lay on.

Mr. Alan Potter

went to the heart of the question and gave a very lucid explanation. Given co-education he was sure that man and woman would be equal in fitness for architectural practice, but it must not be forgotten that the claim made was that woman's domestic knowledge gave her special fitness, and with the resulting decrease in domestic knowledge that special claim must vanish.

Mr. Boutcher

was in favour of co-operation, and pointed out to Miss Cohen that her small-paneled windows, though perhaps difficult to clean, were certainly cheap to repair. The simplest way out of the difficulty seemed to be that an architect should train a lady pupil and then marry her. He held that as an architect woman would not improve domestic architecture.

The Chairman, Mr. Stanley Hamp, then called upon Mr. Gunn to reply. In doing so Mr. Gunn first assured the ladies present that his paper must not be taken too seriously; he had purposely stated things rather forcibly to encourage discussion. The first point that occurred to him was, "Why did woman want to be a domestic architect?" It was no enviable lot under ordinary conditions. He felt that his position had not been seriously assailed. Admitting freely that woman might often improve on the man-planned house, the answer remained, "Yes, but not as an architect." He thoroughly agreed with the principle of co-operation, and with Mr. Snow, who had pointed out that it already existed, but he disagreed with Mr. Mackenzie that woman naturally knew more than man about domestic architecture, and felt that Mr. Potter had stated the case in a nutshell. Amid much laughter he read extracts from the daily Press on the well-worn topic, and concluded with a portion of an article on "Cupboards" (especially for the benefit of the lady visitors) from the A.A. Journal.

ARCHITECTURAL SOCIETIES.

Royal Institute of the Architects of Ireland.

An ordinary meeting of the Council of this Institute was held at No. 31, South Frederick-street, Dublin, on Monday last. The President, Mr. A. E. Murray, R.H.A., F.R.I.B.A., was in the chair, and there were also present:—Messrs. J. H. Webb, E. Caulfield Orpen, Lucius O'Callaghan, F. G. Hicks, H. Allberry, A. G. C. Millar, W. Kaye-Parry, P. Sheridan, and C. A. Owen, Hon. Secretary. The minutes of the previous meeting were read and signed. Correspondence was dealt with, including the letter of the Institute of Architects of New South

Wales re the Competition for Designs for the Federal City, which appeared in our last issue, p. 508.

The President was appointed delegate to the Congress of the Royal Sanitary Institute, which is to be held in July next at York.

The house list for the election of Council for next session was prepared in accordance with the by-laws.

Leeds and Yorkshire Architectural Society.

The first general meeting of the session was held at the Society's room, Leeds Institute, on November 2, the President, Mr. Sydney D. Kitson, M.A., F.S.A., F.R.I.B.A., in the chair. Messrs. Harold H. Woodhead and Walter Butler were elected Associates. The following changes in the officers of the Society were then announced owing to Messrs. Ralph W. Thorp, A.R.I.B.A., H. Ascoug Chapman, F.R.I.B.A., and J. H. Farrar having left the vicinity of Leeds.

Mr. Wm. Whitehead, A.R.I.B.A., elected Hon. Secretary; Mr. Peel Schofield, A.R.I.B.A., elected Hon. Librarian; Mr. J. W. Morley, F.R.I.B.A., elected member of Council; Mr. Douglas Bowman, elected Associate member of Council.

An exhibition of the students' work during the year was then held and the following awards made:—

The Society's silver medal and 5l. 5s. awarded to Mr. F. L. Kruckenberg for measured drawings of Hubberholme Church, Yorkshire.

The prize for construction, 3l. 3s. was awarded Mr. W. Voelkel for a design for an entrance hall and staircase to a public building; the winning design being a well-worked-out scheme in reinforced concrete.

The following gentlemen tied in the Design Competition, four subjects having been competed for during the session:—Messrs. E. H. Gibson, L. A. Elsworth, and P. G. Robinson. A prize of 3l. 3s. was awarded to each.

The Halden prize of 4l. 4s. was divided between Messrs. L. A. Elsworth and Walter Butler, whose work was considered of equal merit.

The Sketching Club prize of 2l. 2s. for sketches was awarded to Mr. F. L. Kruckenberg, and 2l. 2s. for detailed studies to Mr. C. B. Chadwick.

The President expressed his appreciation of the excellent work done during the year.

The next meeting will be the annual smoking concert held at the Queen's Hotel on Thursday, November 16.

Nottingham Architectural Society.

There was a good attendance at the first meeting of the Designing Club in connexion with this Society held on Tuesday, November 7.

The subject set for competition was a design for "A Co-operative Stores in a Mining Village." Three designs had been submitted, and were fully criticised by Mr. W. V. Betts, who had set the subject and prepared the conditions.

After he had placed them in the following order:—"Carbon" first, "Capricornus" second, and "Old Friend" third, an interesting discussion took place, and at the close Mr. A. E. Heazell, F.R.I.B.A. (who took the chair in the absence of the President), thanked Mr. Betts for his kindness in criticising the designs and the three competitors for submitting them.

Mr. H. Gill, in supporting this, said that, as the subject set required special treatment, Mr. Betts had not only pointed out the merits and defects, but had also given them a great deal of valuable information, which could not but be useful, not only to the younger, but to the older members present.

The Chairman announced that at the next meeting, on November 21, Mr. Burke, of Manchester, would read a paper on "Reinforced Concrete Construction."

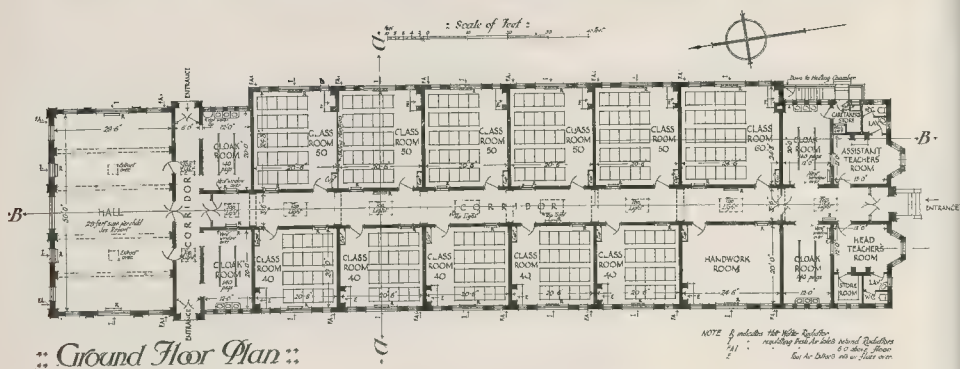

COMPETITION NEWS.

Australian Federal Capital Competition.

Members and Licentiates of the Royal Institute of British Architects are requested not to take part in this competition.

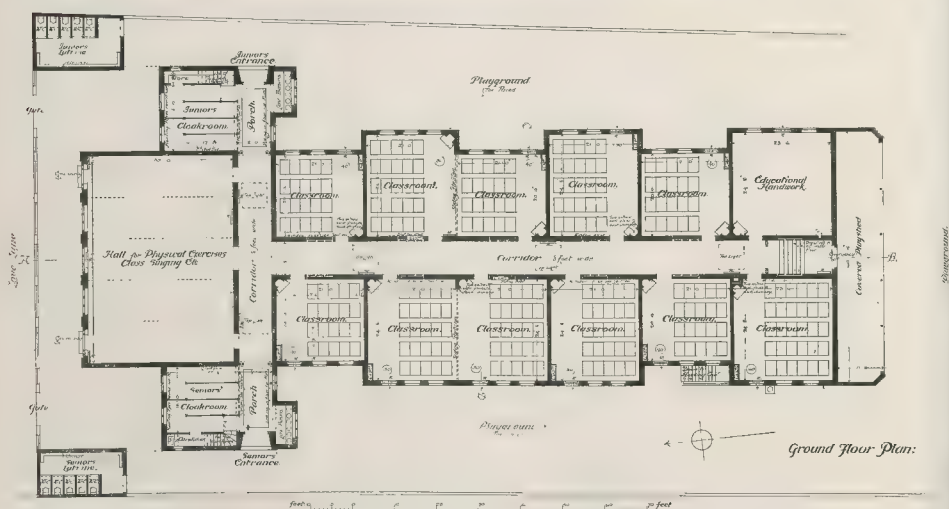

School at Roman Hill, Lowestoft.

We illustrate (pp. 536 and 537) the designs placed first and second in this competition, the result of which we announced last week. We

School at Roman Hill, Lowestoft.

First Premiated Design, by Messrs. Bryan & Hodges, A.A.R.I.B.A.

School at Roman Hill, Lowestoft.

Second Premiated Design, by Mr. W. G. Wilson, A.R.I.B.A., and Messrs. Wills & Anderson, A.A.R.I.B.A.

North elevation

School at Roman Hill, Lowestoft.

Second Prize Design, by Mr. W. G. Wilson, A.R.I.B.A., and Messrs. Wills & Anderson, A.A.R.I.B.A.

stand that these have been superseded, that Mr. Abel Round, whose design was third by the assessor, will carry out the design. If this is so, we feel that an injustice has been done to the architects who won the prize by competition.

Public Library, Stafford.

Mr. Henry T. Hare, F.R.I.B.A., has been appointed assessor in this competition. Designs were sent in by January 6, and any questions should be sent to the Town Clerk, Stafford, by January 25. The author of the design placed first will be appointed architect, subject to the approval of the committee. The second and third prizes are forty guineas and twenty guineas respectively. The total cost of the buildings, exclusive of site, etc., must not exceed £4,000.

Hoarding Competition.

A few months ago Mr. W. H. Lever offered a prize to the extent of 100l. for the best designs constructed from an architectural point of view. Mr. Leonard Stokes was the assessor. The result is as follows:—50l. to Redhill, Reigate, and District Billposting Company; 25l. to the Coventry Billposting Company; 15l. to Messrs. William Booty, Ltd.; and 10l. to the Rochdale Billposting Company.

Miners' Federation Hall, Bolton.

Designs for this building must be sent in by 10 a.m. on January 6, 1912. The competition is open to architects practising within a radius of twenty-five miles of Bolton.

ENGINEERING SOCIETIES.

The Junior Institution of Engineers.

At the recent annual general meeting of this institution the scrutineers reported that the list of officers, etc., had resulted as follows:—President, Mr. Walter T. Dunn; Vice-Chairman, Messrs. S. Bylander and Percy L. Young; Treasurer, Mr. S. V. Cooke; Hon. Auditors, Messrs. H. Norman Gray and W. D. P. Pherson; Members of Council, Messrs. N. Hunt, J. B. Knowles, Reginald Kral, and J. Page; Provincial Members of Council, Messrs. R. Hockley (Newcastle-on-Tyne), Ernest G. (Sheffield), R. H. Parsons (Peterborough), Isaac W. Porter (Southampton), T. P. Regood (Bristol), A. Knight Croad (Glasgow), E. Lilly (Dublin), and H. F. Hunt (Pembroke).

THE BRITISH SCHOOL AT ATHENS: CELEBRATION OF THE TWENTY-FIFTH ANNIVERSARY.

The British School at Athens celebrated the twenty-fifth anniversary of its foundation by a meeting on Tuesday at Burlington House of a dinner in the Whitehall Rooms at the Hotel Metropole, W.C.

The Dean of Westminster presided at the evening, and said that the whole subject of Hellenic archaeology had been elevated into a different atmosphere. It used to be looked upon as the fad of the dilettante, or the gossip of the globe-trotter. It had become an essential department of classical study and in the opinion of the expert Greek scholar. He tried to lay emphasis upon the value of scientific exploration, as distinct from

superficial and amateur digging. The work of the School offered a good example of the strictly inductive methods of patient scientific study.

Mr. George A. Macmillan presided at the dinner, being supported by Viscount Morley of Blackburn, the Dean of Westminster, Dr. and Mrs. Walter Leaf, Sir Laurence Guillemard, Lady Harcourt Smith, Mrs. George Macmillan, Miss Penrose, Miss Jane Harrison, Professor and Mrs. Ernest Gardner, Professor and Mrs. Percy Gardner, Sir Arthur Evans, Sir F. Pollock, Sir Clifford Allbutt, Professor Charles Waldstein, M. Alexander Vouros, Mr. D. G. Hogarth, Dr. F. G. Kenyon, Professor C. F. Lehmann-Haupt, Mr. R. Weir Schultz, Mr. and Mrs. Theodore Fyfe, Professor E. C. and the Misses Bosanquet, Mr. Ian Macalister, Mr. V. W. Yorke, Mr. J. H. Baker-Penoyre, Mr. R. M. Dawkins, Mr. W. Loring, and others.

The toasts of "H.M. King George V." (patron of the School) and "H.M. the Queen and the Royal Family" having been proposed by the Chairman and honoured,

The Chairman, in proposing the next toast, "H.M. the King of the Hellenes," said that His Majesty had always shown himself a good friend of the School, and through his Minister, M. J. Gennadius, he had telegraphed his congratulations and good wishes for the prosperity of the School.

The toast having been honoured, Mr. D. G. Hogarth proposed "The Greek Nation and the Greek Archaeological Society." He said that the Government of Greece showed a real desire to treat the great architectural and archaeological treasures of Greece as a concern, not only of Greece, but of the whole civilised world. It was not too much to say that the antiquities, etc., of Greece were the primary concern of the nation, but they had shown great liberality in distributing some of these treasures to other nations.

M. Gennadius, who was to have responded to the toast, had been called to Paris by his Sovereign, but he had sent a letter to be read to the meeting, and this Mr. Hogarth read. In the course of the letter M. Gennadius said he was glad to think that the British School had amply justified their best hopes. It had added to Athens, the centre of archaeological research, another institution which had already given brilliant results, and which promised even a richer harvest in the future. He referred to the willing aid the Hellenic Government had always given the School, and the encouraging manner in which they had facilitated work. The Government would never act as a dog in the manger in the prosecution of original research.

The Chairman then proposed the toast of the evening, "The British School at Athens." In the course of his remarks he dealt with the origin and history of the School, and mentioned the names of some of its benefactors. He also referred to an interesting "Short History of the British School at Athens, 1826-1911," which he has prepared, and which includes a bibliography of the work of students of the School, compiled by Mr. J. H. Baker-Penoyre, M.A., Secretary, and Miss C. A. Hutton, formerly students. He said that Professor Jebb might justly be called the founder of the School, for, although the idea of forming a school in Athens was not absolutely new at the time, Professor Jebb first formulated a definite scheme, which was the first step in the realisation of the School. From that day until his death Professor Jebb was a member of the

Committee of the School. The first Director was the late F. C. Penrose, and it was a great thing for them to be supported by a man whose name was already known throughout the Continent as well as in his own country as the leading authority on one important branch of Greek study, i.e., Athenian Architecture, and it required some courage on the part of a man of the age of Mr. Penrose to offer his services to go out to Athens and start a new Institution; but he did, and, with the support of devoted students, he met with great success, and to the end of his life he retained an active interest in the School. Mr. Penrose made a good many visits to Athens while connected with the School, and when called away his work was fitly recognised by the creation of the Penrose Memorial Library attached to the School. Another member of the original Committee was the late Sir F., afterwards Lord, Leighton. In the short history of the School he had given a chronological narrative of the foundation of the School, and of its continual progress and work year by year during its twenty-five years of existence, and in that way reference was made to the successive excavations which had formed so important a part of the work of the School. The individual work of the students was shown not only in reference to these excavations, but to the remarkable bibliography writings of the students. Reference was made to the gradual growth of the School Library and to the building of the students' hostel. The School had been equally fortunate in its governing body and in its active members, both directors and students. The relations had always been of the most friendly character. As to the students, it was a most satisfactory thing to find many of them occupying important posts after their stay in Athens. One of their students, Mr. Marshall, was Director of Archaeology in India, and he was glad to say he was not to be removed, in spite of the recommendation of the Indian Government that the post was superfluous. There were four main objects for which the School was founded, and he thought he might claim that these objects had been fulfilled. The first object was to promote the study of Greek archaeology in all branches, and he thought they could say that that had been amply fulfilled. Secondly, besides being a school of archaeology, their object was to make it a school of classical study, and though the object was secondary, it was important, and its importance had been recognised by the Committee throughout, and by those who had taken advantage of the School. He was satisfied that the men who had spent their time at the School had found it of the utmost benefit to them in their after work. Thirdly, the School was also a centre from which information could be obtained, and where books could be consulted by British travellers in Greece; and there, again, he thought they had a very good record to show. Fourthly, the object was to form a library consisting of archaeological and other suitable books, including maps, plans, and photographs, and that object had been continually kept in view, and had been attended with much success. The library was one of which the School might be proud, and which added enormously to its usefulness.

Professor Ernest Gardner responded and referred to the work of the students of the School, and to the comradeship existing between the students, not only of the British school, but also of the French, German, and American schools. These different schools supplied the need of a great international University at Athens. Students felt, moreover, that the life spent in Athens and its School was a dominant influence in the whole of their subsequent careers.

Mr. R. M. Dawkins also briefly replied, and Dr. Walter Leaf proposed "The Guests," coupled with the name of Sir Laurence Guillemard, who briefly replied.

Viscount Morley of Blackburn then proposed the last toast, "The Chairman." He said he could not but think how things had changed since he was a boy at Oxford, when the great event was the publication, one after another, of the new volumes of Grote's "History," and there was no one who had the honour, as he had, of knowing Grote but recognised that his ideas were a great contribution to the thought and intellect of those days. That Society existed to go far

behind all that, to bring the light of archaeological knowledge on generations long before that. But he confessed he thought it was a shame we did not earlier take in hand the kind of work that Society had taken up, and he felt the same thing in regard to Oriental studies. It was to him inconceivable how we, with all our Oriental possessions and institutions, had not in this country—he had done his best to set on foot a movement for remedying that—an independent institution for Oriental studies. He was amazed that, with our enormous wealth and traditions, we were so grudging in contributing to such a Society.

GENERAL NEWS.

The Crystal Palace.

It is stated in the Press that a syndicate, headed by the Earl of Plymouth, has purchased the Crystal Palace for 220,000*l*.

Tattershall Castle.

It is stated that Tattershall Castle has been purchased by Earl Curzon of Kedleston, who has always been warmly interested in the preservation of archaeological remains, and who intervened at the last moment to rescue the Castle from the risks of further vandalism or demolition. It is understood that Lord Curzon contemplates certain works of repair in order to prevent further dilapidations and to preserve the model of a XVth-century fortress mansion.

Trentham Hall, Staffs.

The demolition is begun of Trentham Hall, which the Duke of Sutherland lately offered as a gift to the six federated pottery towns for use as a centre of technical and advanced education. The Duke's offer was declined upon the score of the expense that would be involved by the altering and maintenance of the mansion in that behalf. Holland made alterations of the early XVIIIth-century house, which Barry greatly enlarged and improved, besides adding the central tower; L. Brown laid out most of the grounds, and Barry the gardens.

Quadriga, Constitution Hill Arch.

The colossal group of "Peace" which has just been cast in Mr. A. B. Burton's Thames Ditton foundry for the arch at Constitution Hill will shortly be ready for removal to its place. Nearly 40 tons of bronze were used for the castings, in sections. In our number of October 8, 1910, we published a two-page illustration of Capt. Adrian Jones's design for the group, with one of the Arch, having a much smaller quadriga and figures as originally designed by Decimus Burton.

Alfred Stevens Memorial.

On November 15 will be dedicated in the "Alfred Stevens" Room, National Gallery of British Art, Millbank, the bust which Professor Lanfry has sculptured in bronze and presented to the Memorial Committee, together with a plaster cast of the chimney-pipe in Dorchester House, of which one of the white marble caryatides is illustrated in the *Builder* of April 21, 1894, from a drawing by Professor Lethaby. The Earl of Plymouth will take the chair at the presentation, and an exhibition of works by Alfred Stevens will also be opened, and will remain on view during two months.

A Monument to Bossuet.

A monument to Bossuet has just been unveiled in the Cathedral of St. Etienne, at Meaux, near Paris, where he was Bishop in 1671-91. The design represents Bossuet in a Bishop's ceremonial robes, with an eagle at his feet, in a group of figures of Mdle. de la Vallière in her nun's garb, and the Princess Henriette, Duchess of Orlans, and the Duke of Burgundy, and the Prince de Condé. The sculptor was M. Ernest Dubois.

National Housing and Town Planning Council.

A meeting of the National Advisory Town Planning Committee is to be held on Friday, November 24, at the Westminster Palace Hotel, S.W., when it is hoped that Alderman W. Thompson will take the chair. Details relating to the proposed National Conference, to be held towards the end of March, 1912—Manchester being the town suggested—will be discussed, including the following:—The framing of town planning by-laws in regard to roads; standards of limitation of houses per acre; methods of dealing with the provision of open spaces; the best means to

adopt in order to secure the planning of areas for residential uses; the extent to which an industrial town can, by town planning, stimulate industrial development and secure adequate traffic facilities by rail and water; the question of preserving places of natural beauty. The meeting on November 24 will also consider a memorandum by Mr. Raymond Unwin entitled "Notes on the Effect of Limiting the Number of Houses to the Acre under the Town Planning Clauses of the Housing and Town Planning Act." At the meeting a memorandum on the "Second Stage of a Town Plan," by Mr. Harold Shawcross, will be considered.

International Road Congress.

A meeting of the representative General Committee that has been formed to undertake the organisation of the International Road Congress to be held in London in 1915 was held last week at the offices of the Road Board. Sir George S. Gibb presided. A memorandum submitted by the Chairman dealing with the general question of organisation was considered and generally approved. An Executive Committee was appointed as follows:—Sir George S. Gibb (Chairman), Lord Montagu of Beaulieu, Mr. W. Joynton Hicks, M.P., Mr. F. H. Berryman (County Councils Association) (Vice-Chairman), Sir Charles D. Rose, Bart., M.P. (Treasurer), Messrs. J. A. Brodie, M.Inst.C.E., H. P. Boulnois, M.Inst.C.E., Dugald Clerk, F.R.S., E. Manville, M.Inst.C.E., M. Fitzmaurice, C.M.G., E. Sherrinell Smith, John Kennedy, J.P., D.L., S. Williams, H. P. Maybury, M.Inst.C.E., and Colonel R. E. Crompton, C.B. Mr. W. Rees Jeffreys was elected Hon. General Secretary of the Congress, and Mr. G. Montagu Harris Hon. Deputy-General Secretary. It was decided to prepare and issue at an early date a circular to the bodies and persons interested in the forthcoming Congress.

New Storage Reservoir.

The Metropolitan Water Board's new reservoir at Island Barn was opened on Saturday last by the Lord Mayor of London. The construction of the reservoir was carried out by Messrs. Robert McAlpine & Sons, at a cost of 152,727*l*. The water area is 121 acres, and when filled the reservoir will hold 900 million gallons. The embankment is 1,200 yds. long. The Lord Mayor was presented by the contractors with a silver model of a contractor's tip-vagon.

Sewering of Pencoeed, Glamorganshire.

The Penybont District Council have been considering the matter of sewerage Pencoeed, and have engaged the services of Mr. T. J. Moss-Flower, C.E., of Westminister and Bristol, to prepare a scheme of sewerage and sewage disposal for the district, and the work will include some eight to nine miles of sewers.

The British Fire Prevention Committee.

The winter session of the British Fire Prevention Committee commenced last week with a meeting to conduct a series of fire tests dealing with a small hand extinguisher intended to put out electrical and petrol fires. The meeting was held at the Committee's Testing-Station, Regent's Park, the Earl of Londesborough, K.C.V.O., Mr. Alexander Siemens, M.Inst.C.E., and Mr. Edwin O. Sachs, F.R.S.Ed., members of Council, receiving the visitors. The testing arrangements were under the direction of Mr. Percy Collins, J.P., F.S.S., Mr. Ellis Marsland, Mr. Dyer, Mr. Wylson, F.R.I.E.A., and others comprising a Sub-Committee of ten. There will be another series of tests this month dealing with the flannelette question, and in December some fire-resisting doors and partitions from the United States will be under investigation.

Goodrich House, Hatfield.

Mr. F. W. Speaight, of Morton House, Hatfield, will, it is said, carefully preserve the antiquarian and architectural features of Goodrich House, of early XVIIIth-century period, which he has recently purchased. The property commemorates the fact that King Edgar bestowed Hatfield (Heathfield) upon St. Etheldreda's Monastery at Ely, which Henry I. converted into a bishopric. The Bishops of Ely had a palace, whereof portions yet remain, at Hatfield, which John Morton, who occupied the see in 1478-86, rebuilt. Bishop Goodrich was the last bishop who lived in the palace, which became a royal residence, temp. Henry VIII., and was exchanged for Theobalds to Robert, Lord Salisbury, by

James I., who began the new palace which Lord Salisbury completed in 1611.

City Improvement in Glasgow.

The City Improvements Committee of the Corporation recently acquired a number of old properties at the corner of High-street and Bell-street. These were demolished and new buildings erected on the site. At the time it was considered probable that the Corporation would proceed with further improvement south of these properties and in the Tron-gate. The recent disastrous fire in the last-named thoroughfare, by which the old Tontine House was destroyed, brings these proposals forward again, and the Council are now considering the expediency of reconstructing the remaining portion of the Tron-gate area and the properties in the High-street to the north of the Old Tolbooth Tower, and the desirability of acquiring the buildings at the south-east corner of the scheme. The front of the old Tontine buildings destroyed in the fire has now been pulled down, and with it goes an interesting facade, and one of the few remaining links with Old Glasgow.

Smoke Abatement Exhibition.

The first meeting of the Vice-President and Council of this Exhibition was held at the Holborn Restaurant on Tuesday, Oct. 10. H. A. Des Voeux (Treasurer of the Coal Smoke Abatement Society) presiding. The Chairman having explained the reason which had actuated the Coal Smoke Abatement Society in resolving to take the lead in the organisation of an International Smoke Abatement Exhibition, it was resolved, upon the motion of Mr. A. Ritchie, seconded by Mr. A. J. Martin, that the following Sub-Committee be appointed:—(a) Conference Committee; (b) Domestic Heating (Gas, Electric, Smokeless Fuels, General); (c) Industrial and Motive Power Plants, Boilers, and Accessories; (d) Ventilating and Dust Prevention; (e) Loan Exhibits. An informal dinner followed the holding of the meeting, and at the function Sir William Richmond (President of the Coal Smoke Abatement Society) presided. In proposing the toast, "Success to the Exhibition," the Chairman referred to some of the work which had been accomplished by the Society, and mentioned that this was the proudest moment of his life, inasmuch as the list of societies, institutions, and firms which appeared on the prospectus as giving the support and patronage to the undertaking, they were that evening inaugurating with most satisfactory evidence that their work was being appreciated by those whose opinion was of the highest value. He was delighted at the number of manufacturers who were serving on the Council of the Exhibition, and he regarded it as a happy augury that the scientists and manufacturers were now working unitedly, devising ways and means for suppressing and preventing the smoke nuisance.—In responding to the toast, Mr. F. W. Bridges, the organiser of the Exhibition, mentioned that the exhibit already promised practically assured a most successful Exhibition, and he invited the hearty co-operation of the Sub-Committee towards securing that end.—Sir William Ramsay, in proposing the toast of "The Chairman," made a most interesting and illuminating speech, giving it as his opinion that some sort of legislative measure was necessary in order to preserve the health of the people as regards the smoke evil, and he felt sure that the coming Exhibition would have a most beneficial effect in bringing home to the community at large the benefits which would be derived by the creation of a cleaner, healthier atmosphere and environment.

Lower Thames Valley District Surveyors' Association.

The ordinary monthly meeting of the Association was held at Twickenham Town Hall on Saturday, the 4th inst., the President, Mr. Edward Willis, A.M.Inst.C.E., F.S.I., engineer and surveyor, Chiswick, occupying the chair. Mr. J. A. Webb (Hendon Rural District Council) read a paper entitled "Notes on Drainage and Sewage Disposal in Small Towns and Villages." A vote of thanks to the author was proposed by Mr. A. Gladwell (Eton Rural District Council), seconded by Mr. M. Hainsworth (Teddington Urban District Council), and carried unanimously. The discussion thereon was opened and adjourned to the December meeting.

CORRESPONDENCE.

Royal Institute of British Architects and the Society of Architects.

My attention has been called to Mr. T's letter published in your issue of October from which it would appear that there may be a little misunderstanding among some of the members of the Royal Institute in regard to a portion of the Society's annual report in which it is stated that the Council of the Royal Institute propose to make an application to the City Council for a supplemental Charter, in order to give them the necessary powers to enter into the agreement.

It did not occur to my Council in drafting the annual report that any amplification or explanation of the foregoing statement of fact was necessary, as it was not anticipated that the members of the Royal Institute, or any one else, did not realise the obvious fact that any proposals which may be agreed upon between the Councils of the Royal Institute and the Society must in each case be subject to the consideration and approval of the general body of members before any final settlement can be arrived at.

I have not had an opportunity of consulting the Council on the matter, but I am sure they would be extremely sorry to think that any misunderstanding on this question could possibly arise. Will you, therefore, kindly inform me to make it perfectly clear that proposals for a new Charter and by-laws are being considered by the Council of the Royal Institute from a view to laying them before the general body, and that they will also, in due course, be laid before the general body of the Society? So far as I know, the first public intimation of the question of a new Charter for the Royal Institute appeared in a "Note" in the *Builder* August 4 last, to the effect that the registration movement was temporarily at a standstill, and that a new Charter which must be obtained by the Royal Institute before any amalgamation with the Society of Architects could occur.

It has not been left to the Society of Architects to make any declaration on the matter, but they have referred to it except in the Council's annual report, the publication of which in advance of the annual report of the Council of the Royal Institute is merely a matter of routine and date.

C. McARTHUR BUTLER,
Secretary of the Society.

The R.I.B.A. Examinations.

I regret to notice the lack of emphasis on an important practical issue in the "Revised Labours of the R.I.B.A. Examinations," upon which you comment in last week's leading article. I fully appreciate the great difficulties of the question of architectural education, which undoubtedly have their origin in the general economic atmosphere, as you appear to suggest. We do not desire to see the R.I.B.A. examinations reduced to the level of a mere bait for the professional crammer, his text-books, and his clients; but, at the same time, they should not become a too-easy prey for those welcome parasites. The examinations of the Royal Institute should be generally recognised in their various stages as the attainment of a definite standard of merit and ability, recognition they have certainly not obtained at present. This recognition can only be secured by a consistent "tightening up" on all the technical matters that an assistant or a principal must meet with in daily practice. It will prove beneficial for the assistant in forming a definite basis for his request for a definite remuneration in his principal, and, in a much more comprehensive fashion than hitherto, it will indicate to the principal that the assistant he employs has attained a certain degree of proficiency, and is consequently eligible for a certain definite salary. If the future results of the R.I.B.A. examinations succeed in establishing the competence of the profession as to the relative degree of competency of the probationer, student, and graduate, they will perform a real service and substantially increase the honour accruing thereto. I applaud the breadth of view displayed in Mr. Reginald Blomfield's "Notes," which, I trust, will not mean feebleness in detail, due to the diffusion of the initial force of opinion over a broad area. He speaks of "unlucky persons" and "the probability that in any given subject not more than 2 or 3 per cent. of the candidates know more than the rudiments."

Unlucky questions cause the most trouble in our daily practice, and often involve the ruin of our projects, if not of our buildings. We discover, when it is too late, that time ought to have been found to master the subject. The object of examination being to test the competence of a candidate as well as to gauge his progress in education, the pleadings of "lack of time" and that the "least dislocation puts them out of their stride," at first remove the necessary condition for the acquisition of all knowledge, and, secondly, is a painful admission of the evident loss of the true spirit of education, i.e. adaptability and the unfettered play of thought and imagination on the problem under solution, and should most certainly not be encouraged or even condoned with. The spirit of such a condonation appears to me to figure prominently in Mr. Reginald Blomfield's "Notes," in spite of his evident desire to present his case otherwise.

The small percentage of candidates who "know the rudiments of a given subject" indicates the ground of complaint of the "many competent authorities" that "the standard hitherto reached in the R.I.B.A. examinations has been lower than it should be." It is remarkable to note, in this connection, that the insistence of a "minimum of technical knowledge" is recommended as the only "fair and reasonable course," and four subjects are mentioned, yet in at least two of these the student is twice examined. The term "rudiments" is somewhat elastic, varying in force with the modesty or otherwise of the person who uses it; but one may at least express the hope that a student is slightly removed from the rudimentary stages of these subjects after having been twice examined in them. There should be no doubt that his knowledge of any subject is sufficient to allow him to deal with any problem of current practice on his arrival at the Final Examination, or at least provide him with substantial material for further study to do so.

The endeavour to make the examination palatable to the genuine student, the "probable 2 or 3 per cent.," may easily degenerate into pandering to the faded accomplishments of the remaining 98 or 97 per cent., speedily followed by the installation of a *laissez-faire* policy which, in the future, will be difficult to effect.

I make these criticisms with the object of indicating a point of view essentially practical, and, whilst completely in sympathy with Mr. Reginald Blomfield's views, which, I presume, are those of the Board of Architectural Education, I cannot avoid the conclusion that, unless they are very carefully handled when put into practice, their tendency will be to run into pure dilettantism instead of making the examinations of the Royal Institute a real asset to the profession of architecture.

ERNEST J. DIXON, A.R.I.B.A.

"Microscopical Examination of Architectural Material."

SIR,—I read with very great interest the paper published in your issue of the 27th ult. It is an example of what an excellent thing theory is, but how completely it sometimes fails to square with practice! This, I think, was borne in upon the late Professor Huxley upon a particular occasion which has become notorious.

The school of theory is an excellent one to the student who can hardly get instruction outside of it, but the school of practice, I believe, is generally conceded to be the better tutor. I have been to school in both, and, as a result, I find the conclusions formed in a school laboratory (which, of course, includes the laboratory of a college) is either often contradicted or not substantiated in the school of practice. Take the lecturer's remarks on Portland stone, for instance. He says the results of his laboratory experience of Portland stone evinces "what might almost be called the absurdity of using such a material in Glasgow," and yet, in practice, Portland stone has been found to withstand the atmosphere of Glasgow to an extent, I believe, no other material has successfully stood in that city!

In reply to the discussion which followed the reading of the paper the lecturer said: "The Portland stone which seemed to stand best in the London buildings was that which had been employed in the seasoned condition, or had been erected long enough ago to get surface skin before the air became even occasionally acid enough to attack it."

I will not say here whether I think the lecturer

is right or wrong in talking about using Portland stone "in a seasoned condition." I can only say if he is right he is dead against another school of theory which says the stone should be wrought before it is seasoned, in order that the quarry sap which is in the stone might dry out upon the finished face of the stone and so "case-harden" that face, as it were, whereas if the block is first seasoned before it is wrought the seasoned face upon which the quarry sap has operated is removed in the working, and the wrought face then becomes one which has never been seasoned, and never can be, so far as the quarry sap is concerned. Moreover, I should probably be right if I were to say that, at all events for a considerable number of years, not 10 per cent. of the Portland stone used anywhere has been used in what one may term its "seasoned" state, and yet throughout all the years it has been used its successes are almost invariable and the failures negligible.

If the lecturer's theory is correct, I wonder how he can explain the following facts:—

The quality of Portland stone that most successfully stands the acid test has failed in the acid-laden atmosphere of Birmingham, but stands without being affected in the atmospheres of London and Portsmouth; and why the quality of Portland stone that least stands the acid test in the laboratory is a complete success when used in Birmingham is almost invariably a success when used in London and unsuitable for use in Portsmouth?

The fact is, I have found in an experience of more than a third of a century the only school that I can trust to for education concerning Portland stone is that of experience, and if one is to be influenced by theory only we should over and over again be face to face with contradictions that would make one exclaim with Huxley, "Hang theory!" F. J. BARNES.

INTERCOMMUNICATION COLUMN.

Aluminium for Hot-Water Service.

SIR,—I should be glad to know if any of your readers have had experience with the reputed property of aluminium in affecting hard water, so that the boiler deposit does not harden in the pipes, but remains flocculent for easy removal (probably encysted in a film of alumina).

I understand that the aluminium surface has to have one day off every week and be exposed to sunlight to restore its property to conditions somewhat difficult to ensure in small domestic services. Possibly there are firms who market such appliances. —ALUMINIUM.

Decaying Floor.

SIR,—With reference to the letter signed "S. G. H.," in your Intercommunication Column of November 3, under the heading "Decaying Floor," I have lately had brought to my notice the satisfactory repair to a floor under apparently exactly similar conditions described. The joists were not removed, and the floor was relaid with a composition flooring. The floorboards had rotted away owing to the absence of a damp-course. A.M.I.C.E.

SIR,—With reference to the above, I should strongly advise S. G. H. to take the whole of the floor up, putting a layer of concrete and bedding a dovetailed breeze concrete block which will take ordinary floor-boards. I cannot speak too highly of the results in using them. It is, of course, advisable to have boards tarred. N. G.

SIR,—I am afraid S. G. H. has no other option but to remove the whole of the woodwork. The $\frac{1}{2}$ in. of concrete should be thickened, and, if space is limited, a layer of asphalt, with a thin layer of concrete over would be best. However, as joists are in use, perhaps solid concrete can be used to within about 1 in. of the floor level.

To put wood blocks on a defective floor would be useless; they, in turn, would decay also.

The whole of the woodwork should be removed and destroyed, unless some of it be quite sound, and the walls and concrete washed with carbolic acid, which will prevent spreading. There are several patent jointless floorings on the market. E. S.

* Names of makers of composition floors will be supplied on application to the *Builder*. —Ed.]

EDITORIAL SUMMARY.

The leading article, "Departmental Methods and the R.I.B.A.," is suggested by the important remarks made by Mr. Leonard Stokes in his Presidential Address, given in *extenso* on p. 531, to the Royal Institute of British Architects on Monday.

A second article, on "London Street Architecture," is given on p. 528, being a review of the book on "London Houses from 1660 to 1820," by Messrs. A. E. Richardson and C. Lovett Gill.

"Notes" (p. 523) include comments on: "Balliol Chapel"; "Mr. Pond and the Time Spirit"; "Churches and Competition Methods"; "Anomalies in Ecclesiastical Law"; "Architecture and the Press"; "The Railway Outlook."

"Picture Exhibitions" (p. 531) include: "Spain and Tangier," dealing with Mr. H. C. Brewer's architectural drawings now on view at the galleries of the Fine Art Society, and "Modern Pictures"—the Goupil Gallery Salon.

The opening meeting of Session 1911-12 of the Royal Institute of British Architects was held on Monday, when Mr. Leonard Stokes, President, delivered an address (p. 531).

"Woman as a Domestic Architect" was the title of a paper read at the last meeting of the Camera, Sketch, and Debate Club of the Architectural Association by Mr. Edwin Gunn, formerly Hon. Secretary of the Architectural Association. The paper is given on p. 534. Some notes of the discussion which followed are also given.

Short notices of meetings of the following architectural societies appear on p. 535: "Leeds and Yorkshire Architectural Society"; "The Royal Institute of the Architects of Ireland"; "Nottingham Architectural Society."

The first and second premiated designs in the Roman Hill School Competition, Lowestoft, are also given this week (pp. 536, 537).

A report of the Festival Dinner of the British School at Athens is given on p. 537.

In Correspondence Columns (p. 539) will be found letters on: "The R.I.B.A. Examinations"; "The Royal Institute of British Architects and the Society of Architects"; "Microscopical Examination of Architectural Material."

The Monthly Historical Review, illustrated (p. 541), contains: "Some Worcestershire Churches"; "Mold Parish Church"; and "Notes."

The Building Trade Section (p. 546) contains: "Wages Board System in Australia"; "London Association of Master Decorators"; "Insurance against Unemployment"; "Projected New Buildings in the Provinces"; "Applications under the London Building Acts, 1894-1909," etc.

In our Legal Column (p. 549) will be found some remarks on "Form IV. of the Finance Act."

MEETINGS.

FRIDAY, NOVEMBER 10.

Glasgow Technical College Architectural Craftsmen's Society.—Debate on "The Uses of (1) Stone, (2) Brick, (3) Concrete as Applied to a Country House," to be opened by Mr. R. Gilchrist, Mr. W. Orr, and Mr. R. Park. 7.45 p.m.

MONDAY, NOVEMBER 13.

The Architectural Association (combined meeting with the Camera, Sketch, and Debate Club).—Mr. J. B. Fulton on "That the True Hope of Architecture Lies in the Study of Good Modern Work." 7.30 p.m.

Surveyors' Institution.—Opening address by the President, Mr. W. E. Horne, M.P. 8 p.m. The proceedings will open with the unveiling of the portrait of the Rt. Hon. Lord Alverstone, Lord Chief Justice of England, Associate of Council, recently painted by the Hon. John Collier, and the presentation of the gold medal for the best paper read last session, to Mr. E. H. Blake for his paper entitled "Some Notes on Highway Law as Affecting Property Owners."

University of London (Victoria and Albert Museum).—Mr. Banister Fletcher on "Renaissance Palaces and Churches of Venice." 5 p.m.

TUESDAY, NOVEMBER 14.

London County Council School of Building (Warde-road, Brixton, S.W.).—A special lecture on "Building Stones," by Mr. J. Vincent Eden, D.Sc. (Lond.), F.G.S. 7.30 p.m. Illustrated by lantern slides.

University of London (University College).—Mr. A. H. Parker, B.A., B.Sc., on "The Real Nature of the Problems in Heating and Ventilation Awaiting Solution by the Engineer." 5 p.m.

University of London (British Museum).—Mr. Banister Fletcher on "Greek Architecture: The Hellenic Period." Lantern illustrations. 4.30 p.m.

The Royal Sanitary Institute.—Discussion on "Sewage Farms," to be opened by Mr. H. A. Roehling, M.L.S.C.E., F.G.S. 8 p.m.

Buttress Polytechnic (Lectures on Illuminating Engineering).—Mr. E. Scott-Snell on "Oil, Petrol, Air, Gas, Acetylene, etc." 7.30 p.m.

Institution of Civil Engineers.—(1) Mr. A. H. Roberts on "The Loch Leven Water-Power Works"; (2) Mr. F. B. Soumeashin on "The Hydro-Electric Plant in the British Aluminium Company's Factory at Kinlochleven." 8 p.m.

WEDNESDAY, NOVEMBER 15.

Royal Society of Arts.—The opening address of the one hundred and fifty-eighth session of the Society will be delivered by Lord Sanderson, G.C.B., F.R.S., F.R.S.E., F.R.S.M., Vice-President and Chairman of the Council. 8 p.m.

The Institute of Sanitary Engineers.—Annual dinner, Holborn Restaurant, W.C. 6.30 p.m.

Northern Architectural Association.—Opening meeting of the session, Mr. H. C. Chavivewood, F.R.I.B.A., President, will deliver opening address. 7.30 p.m.

THURSDAY, NOVEMBER 16.

The Society of Architects.—Opening meeting of the session. Presentation of travelling studenthip medal, and address by the President, Mr. G. Bond, J.P. 8.30 p.m.

Builders' Benevolent Institution.—Sixty-fourth annual dinner, Whitehall Rooms, Hotel Metropole, W.C. 6.30 p.m.

FRIDAY, NOVEMBER 17.

Institution of Mechanical Engineers.—8 p.m.

SATURDAY, NOVEMBER 18.

Aberdeen Architectural Association.—Mr. H. MacLennan on "Structural Ironwork and Steelwork for Architects." Illustrated. 7.30 p.m.

ILLUSTRATIONS.

Cathedrals of Spain: Orense Cathedral.

ORENSE was carried out during the Episcopate of Bishop Lorenzo in the early XIIIth century, and is an example of the remarkably fine early transitional work in which Spain is so rich. The transepts are most impressive, and although the lantern at the crossing is of much later date, it adds a picturesque feature, and masses the lighting in the sombre and solid building. At the west end is a rather remarkable copy of the great doorway at Santiago, and the north and south doorways are both rich examples of Romanesque work. The building throughout is constructed of granite, and there are two or three very fine examples of XIIIth-century monuments.

Santiago Cathedral.

The Portico de la Gloria is in the narthex of the cathedral. It was designed and executed by Maestro Mateo, 1168-1188. The carving is perhaps the finest and most important representation of the Last Judgment in existence, and is most remarkable. For, although possessing all the dignity and strength of the Archaic art of the XIIIth century, it is anatomically correct, and as naturalistic as the latter classic art. The figures are full of life and vitality, and are mostly represented as if conversing with one another. The carving is in granite, except for three elaborate shafts of marble. On the column, seated below the figure of the Deity, is carved the effigy of St. James the Apostle, who is supposed to be buried in the cathedral, and to whom the city is dedicated. There are traces of colour left on the carving, and evidently at one time it was all covered with a varied colour scheme. The cathedral is a magnificent example of XIIIth-century work, and, according to Street, an almost exact copy of St. Sernin at Toulouse. These two drawings are now being exhibited at the Galleries of the Fine Art Society. (See page 531.)

Glamorgan County Hall.

This building, which has been erected by Messrs. Vincent, Harris & Moodie, A.A.R.I.B.A., in Cathays Park, Cardiff, will accommodate the whole of the administrative departments of the County of Glamorgan excepting the constabulary. A plan of the building was published in the *Builder*, December 19, 1908, with a report of the result of the competition.

The sub-ground floor is given over to storage strong rooms, caretaker's quarters, heating, and staff dining-room.

The ground floor, containing the whole of the Council suite and County Clerk's department,

and the floors over are subdivided to meet the requirements of the general administrative branches of the county.

Externally the walls are faced with Portland stone, also the interior of the entrance hall, ante-rooms, and the Council Chamber.

The Committee-rooms are panelled in English oak from floor to ceiling.

The floors and roofs are of ferro-concrete construction.

The heating and ventilation to the offices generally is by radiators, with fresh-air inlet behind, and extract being arranged from each room leading to an exhaust fan chamber in the roof. The ventilation to the Council Chamber is the Plenum system. The sculpture work to the main front is by Mr. A. Hodge, of Kensington; that in the rear of building by Mr. A. Broadbent, of Fulham.

Rye Town Hall, Sussex.

The Market Hall is situated on the north side of Market-street, and is approached from the High-street by two steeply rising lanes.

The hall was built in the year 1724, and is brick and stone structure of the typically broad quiet treatment of the Georgian period. The first floor contains at the present time the court, with a painted oak-panelled vestibule approached by an oak staircase from the north-east corner of the large Market Hall below. A series of five stone arches with piers supporting the wall above, containing five sash windows with stone architraves and key blocks, crowns with a stone modillion cornice having a moulded stone-capped brick parapet with a central feature with carved enrichment. The central cartouche containing the arms of Rye (one of the cinque ports) and the two end vases are the only applied ornament the façade possesses.

The tiled-hipped roof is surmounted by a oak, lead-covered cupola, the four angle posts of which are 16 ft. long, so constructed as to secure that the whole of the intermediate framing is carried by them. The rear or north elevation of the hall is of more severe character with plain brick windows. The original sundial from the grammar school is built into the wall at the east end of this front.

J. R. LEATHART.

FIFTY YEARS AGO.

From the *Builder* of November 9, 1861.

Agricultural Hall, Islington.

THE first stone of this building was laid on Tuesday, the 5th, by Lord Berners. The building will be composed chiefly of brick, iron, and glass. The principal front will be in Liverpool-road, and its most striking features will be two towers, one on either side each 95 ft. in height. The body of the building will be fitted up for the exhibition of cattle. A space of 384 ft. in length and 217 ft. in width will be covered by an arched roof of iron and glass, and will be surrounded by a gallery 36 ft. in breadth, supported by iron columns 24 ft. apart. The span of the roof will be 130 ft. Behind the cattle-show there will be a place for the exhibition of pigs. This division will be 100 ft. square and will have a ridge-and-furrow roof of wrought-iron. In addition to the glass in the roof, the walls will be pierced by numerous windows. The plans also include first and second class refreshment-rooms. The entire length of the building will be 500 ft.; breadth, 220 ft.: superficial area, 110,000 ft.

MONTHLY HISTORICAL REVIEW.

Fig. 1. All Saints', Worcester.

SOME WORCESTERSHIRE CHURCHES.

NCE in three years one of the three western cathedral cities rouses itself from its dignified repose and gives up for a few days to the performance study of sweet sound. The quiet hum with motor-cars bringing us from far and near to the Three's Festival. Such of them as have enthusiasm to spare from the musical for the less exciting delights of architecture usually expend it on the local cathedral, seen at such times under the worst conditions, internally at least, it is obscured by staging and chairs and noise. Some perhaps go away with the notion that they have thus exhausted architectural interests of the neighbourhood and miss the rich harvest to be gleaned by lesser churches of the back streets, or such a round as may so easily be made the aid of a bicycle or motor-car among us often far from railway-stations post among the network of narrow lanes intersect the cornfields, the copses, and apple orchards.

Worcester, which was the scene of this celebration, contains besides its much restored cathedral a large number of interesting churches. Of these an unusually proportion are of post-Reformation date, offer fine examples of classical architecture. Among these are All Saints', finely situated the Severn Bridge and possessing an interior which retains some of the

original fittings (Figs. 1 and 2), and St. Nicholas, whose dignified stone front, with its majestic pedimented portal approached

Hard by, too, in a narrow lane, is St. Swithin's, a church of quite unusual interest owing to the fact that up to the present it has escaped

by a double flight of balustraded steps and firmly designed campanile, makes so conspicuous an object in Fore Gate-street.

restoration. An inscription over the west door states that the church was rebuilt in 1786. This, however, does not apply to the XVIIIth-century tower at the west end, which cannot have been then more than slightly modified. The east end is—externally—a charming and unhackneyed classical composition in two stories, forming a most effective termination to a street vista. The body of the church, consisting of a wide nave, is of a simple and pleasantly-proportioned Georgian type (Fig. 3), with plain, round-headed windows and a depressed barrel ceiling designed according to the contemporary idea of a Gothic groined vault. The rib system, which leaves at intervals into circular panels, is by no means unpleasant in effect. The carefully-designed fittings of the sanctuary, the pulpit, the pews, the western gallery, and its organ case, if not so refined as those of Wren's London churches, are yet excellent of their kind. The pulpit especially (Fig. 4), buttressed by its clergy and clerk's desks, and flanked by the fine wrought-iron rest for the mayoral mace, is a fine specimen of carved and panelled oakwork and a complete and almost unique specimen of that race of three-deckers more familiar by repute

[Photo. by Harris.]

Fig. 3. St. Swithin's, Worcester.

than by sight to the present generation of church-goers. Its canopy is especially noteworthy with its carved scrollwork terminating in a gilded group representing the "pelican in her piety." The whole church is, in fact, an archaeological treasure representing down to its smallest details the arrangements of the Georgian era as completely as the sadly neglected little church of Compton Winyates does those of the Elizabethan.

Worcester was recently alarmed by the prospect that misdirected zeal was about to sweep them away, or at least to deprive them of their interest by mutilation on the score of

[Photo. by Harris.]

Fig. 4. Pulpit in St. Swithin's, Worcester.

their falling short of "catholic" standards. Many rightly felt that the present age owed a respect to an earlier one which, if unenlightened according to modern church ideas, yet gave in accordance with its lights and gave of its best, and deemed that a place like St. Swithin's, which has been held appropriate for worship for nigh on two centuries, and has been hallowed by the prayers of seven or eight generations of churchmen, might be considered to have acquired an atmosphere of Christian association which should not be rudely disturbed.

Fortunately these terrors, which were shared by the Society for the Protection of Ancient Monuments, were groundless, and

that body has itself been entrusted with the task of carrying out the necessary repairs and redecoration.

Equally unique of its kind, but of a very different order of interest, is the tiny parish church of Besford, a few miles to the south of the city. It is one of the very few timber churches in existence in the kingdom.

[Photo. by Harris.]

Fig. 5. Besford Church.

Though excessively restored and accompanied with an uninteresting stone chancel, the original XVth-century structure is substantially there to be studied. It is framed of oak timbers in the usual manner of Worcestershire houses, and, if we assume that the mechanical modern plaster fillings are an attempt to copy what were originally, the old plaster work must have been enriched with a variety of patterns and devices, doubtless very pleasant to look upon. The old portion consists of a nave about 60 ft. by 20 ft., entered through southern porch and lit by flat-topped windows with trefoil-headed lights. Internally (Fig. 5) it is lined with Jacobean panelling and possesses one of the most beautiful ro gallery fronts to be seen anywhere, decorated with a frieze of quatre-foils, retaining a rich scheme of original colour, the ground being blue, the tracery of various colours and the central rosettes gilded. The top of the staircase leading to it is still in existence though the entrance to it is now blocked by the vestry fireplace.

The church also contains a treasure even rarer in this country in the form of a treacherous altar-piece, now displaced to make room for a commonplace modern retable and placed in a bad light near the vestry door. Dim as this light is, it is sufficient to disclose a work of a character very rarely to be found in English churches, if indeed

not absolutely unique. The top is to a double curve and cusped, and panels are painted in tempera. The painting is much damaged, but though the central figure at least is indistinguishable, of the subsidiary scenes can be made. Both colour and drawing are very fine, betray the work of an artist of distinction, probably an Italian, or a Fleming under Italian influence. It is much to be desired that this rare piece of church furniture should be carefully cared for and preserved from further

decay. The churchyard at Birlingham, deep and covered in immemorial trees, is an excellent setting for a picturesque village; and the fine XVth-century tower, seen from a distance among the foliage, promises which, alas, owing to the decay of a late-lamented President of the Royal Institute of British Architects, who was named, is far from being fulfilled. The west of the church is as cheerless, as unattractive, as offensive a confection in its textureless masonry as could be found in a mushroom suburb of a Victorian manufacturing town. The old church has been removed bodily, and beyond the tower only wreck it has left behind is its fine Norman chancel arch forlornly left to duty as a churchyard gateway. The tower only too thoroughly matches the ruin, if it does not surpass it in inappropriateness. The pulpit and lectern, which, naturally, cannot be laid at the door of the old P.R.I.B.A., could not be surpassed in absurdity. The former assumes the form of an angel, such as might grace the stone factories in the Euston-road, holding an open book as a rest for the clerk's notes, while the lessons are read the back of an apologetic bird of prey perched on a rockery overgrown with stone.

A delightfully-designed oak reredos, erected by Messrs. Houghton, of Worcester, its best in a poor light to redeem the effect of such surroundings; and another of modern work, a charming churchyard gate, by Mr. Gerald Cogswell, A.R.I.B.A., of Worcester (Fig. 6), forms an effective contrast near the Norman entrance.

Between Birlingham and Eckington the crosses the Avon on one of those fine, arched mediæval bridges with pointed arches and standing places on the peaked piers, which are not uncommon in the district. There is, for instance, another bridge of the type over the river at Bidford, and the very peculiarly arched one over the Teme at Powick, on the hottest engagement in the battle of Worcester was fought. Eckington Church has little unity owing to frequent alterations at various periods, has a fine west doorway, and the string-course of the XVth-century tower cut into battlements is of happy effect.

Worcester, which appears at one time to have been a place of considerable importance, would hardly visit if only for the remarkable series of monuments of all periods in its church and churchyard.

More than one good example of the 14th-century slab, with its floreated cross, can be seen in and around the church, but none is of interest before a beautiful XIVth-century tomb which is figured in Brindley and Kerley's "Ancient Sepulchral Monuments." The slab which now stands in the church, against the south wall, is carved with the figure of Christ on a cross represented as a dove. Two doves (or possibly angels) are shown over His head. From the top of the cross springs a pinnacle and two cusped crocketed niche-heads sheltering the effigies of a lord and lady. Outside the church are of the very few known examples of mediæval churchyard monuments. It is of the type much favoured by the Gothic Revivalists—a slab over a foot thick and cut on steep slopes like the roof of a cruciform tomb with four gables, the roll ridge forming the top. The XVth century contributes a fine, arched canopy tomb about 4 ft. long, with a recess in the south wall of the

Fig. 7. Jacobean Tomb in Bredon Church.

chancel. Within the traceried aperture repose the figures of a father, mother, and child, and above them, in the groined stone tester is a figure of Our Lord in the action of benediction. Against the west wall of the southern chapel is a remarkably splendid Jacobean tomb of alabaster and various marbles (Fig. 7). In the centre a finely-schemed canopied structure of the familiar description shelters the principal personage commemorated and his lady; but it is flanked on each side in an unusual manner by smaller wing canopies to accommodate the kneeling figures of their numerous progeny. The sculpture, as is often the case in such extensive monuments, is of very unequal merit, but nothing could exceed the vigour and decorative effect of the eagle with outspread wings which forms the finial to the whole monument standing some 20 ft. above the floor, and is unfortunately not included in our figure. Georgian tablets are not wanting on the walls of the church to complete the cycle of funerary memorials.

Apart from this, the architecture of the church is full of interest. The nave is principally of the transition from Norman to Early English. The bold square turrets, with inset angle shafts, zigzagged arcing, and pyramidal tops, which flank the west gable of the simply-schemed finely-proportioned western façade are figured as typical of their period in Parker's "Introduction." Another excellent feature is the south chapel, which faces one as one approaches the church. Contemporary probably with Stone Church, in Kent, and resembling it in some respects, as, for instance, in the possession of an inner plane of tracery to the windows, it is far less elaborate, less self-conscious and mathematical, and, therefore, far more human and attractive. Its sole ornament consists in pairs of delightfully-proportioned lancet lights, each about 1 ft. 4 in. wide, with a single splay on the outside and a prettily-trefoiled head. The western group of these is blocked by the great Jacobean tomb above described.

When the need was felt for extension there was added to the east of the nave a central tower with its west wall standing on the old chancel arch and a long "decorated" chancel. A curiosity in this is the occurrence of a "low side window" behind the piscina, but as the stonework has been renewed it is impossible to be certain whether this is an original or modern arrangement. Internally, the floor and the risers of the sanctuary steps are enriched with remarkably fine mediæval encaustic tiles, showing a variety of heraldic and other devices most vigorously drawn.

(To be continued next month.)

THE PARISH CHURCH OF MOLD, FLINTSHIRE.

THE early history of Mold without doubt is connected with the "Mont Brenebylle"—now called the Bailey Hill—at the north end of the town. It has been conjectured that this mound is a relic of the ice age. But whatever its origin, it is not difficult to understand how this mound in the midst of Molesdale, commanding at once the slopes of the Clwydian Hills and the Vale of the Alyn, came to be fortified. After the Norman Conquest it is well known that this part of North Wales became the battleground of conflicting races—the English and the Welsh, alongside of the famous Offa's Dyke, which runs through this part of the country between Mold and Chester. The adoption of the system of Lordship Marchers caused a perpetual warfare of the most savage and destructive character to be carried on between the Dee and the Conway.

Hugh Lupus, Earl of Chester, was granted by William Rufus that north-eastern portion of Wales which is now called the county of Flint; and Eustace de Cruer was given Molesdale and Hopedale. This Baron it was who probably fortified the old earthworks at Mold by building on the highest part of the hill a Norman keep—or castle.

In the reign of Henry I. we find the castle in the hands of Robert, Seneschal of Chester, who took his title from it, and was called Robert, Baron de Mont Alt. By this title his descendants were known till the death of the last of them about 1330, who, dying childless, left Mont Alt, the castles of Hawarden and Rising, to Isabella, Queen of Edward II. But, owing to her conspiracy against her husband, her property was confiscated by her son, Edward III., who granted that portion in North Wales to William Montacute, Earl of Salisbury, in 1337. This nobleman founded Disham Abbey in the following year, and, with a generosity more apparent than real, appropriated the Rectory of Mold, and presented it to this monastery as part of the endowment.

The Church of St. Mary is a very fine example of late Perpendicular work, erected at the end of the XVth century, no doubt on the site of the old church. But of this older edifice there remain only the extraordinarily magnificent niches at the east end of the two aisles, very much mutilated, some ancient glass, and possibly the very thick west wall of the nave. It consists of a nave with north and south aisles and a south porch, a western tower rebuilt in 1775, with the addition in 1856 of an apsidal chancel and a small vestry enclosing the north door. The nave is divided from the aisles by seven arches, whose pillars are much admired for their lightness. Between the springs of every arch is an angel holding a shield, on which are the arms of benefactors or the instruments of the Passion. Among the other sculptures can be

Mold Parish Church.

seen the Veronica. Mention must also be made of the magnificently carved panelled oak ceiling of the north aisle, which is of the same date as the church; the moulding which runs round the building, both within and without, decorated with patera ornaments curiously carved to represent a procession of animals of all kinds, and some extremely fine carving on the east window of the north aisle. The aisle windows are large, with obtuse, four-centred arches, and contain some old glass. At the east end of each aisle were chapels, which must have been very beautiful with the canopied niches richly carved and coloured, within which were statues. Unfortunately, the last relics of the chapels were removed at the restoration of 1856.

The most prominent arms and badges carved are the "three legs of Man," an eagle's claw, and an eagle and a child. These belong to

the Stanley family. The tracery of the window over the north door contains some old glass. In it are to be seen together the crest, arms, and badge of the family; while in the two central lights are:—(1) The arms of Henry VII. on a shield in a wreath or torse, and (2) the arms of Edward, Earl of Derby, and underneath the inscription:—"Orate pro Anima Domini Edwardi, Comitis de Derby, et uxoris ejus qui has fenestras fieri fecerunt." We find that the Lord of the Manor of Mold at this time and owners of the Castle of Mont Alt, together with those of Hawarden and Caergwile, were the Stanley family. This lordship was granted to Sir Thomas Stanley in 1443, and the Earls of Derby possessed it for over 200 years.

Thomas, second Lord Stanley, married Margaret, Countess of Richmond, the mother of Henry VII.

History records the deep interest Lady Margaret took in education and religion. And if her influence and endowments at the older universities bear witness to the former, the churches of Mold, Wrexham, and Gresford testify to her generosity and devotion to the latter in this part of the country.

To her and Lord Derby the people of Mold are mostly indebted for this fine church. But it is evident that the building was not completed all at once; and Edward, Earl of Derby (d. 1572), and his wife appear to have also interested themselves in the church.

In the churchyard there lies buried the celebrated English landscape painter, Richard Wilson, R.A., over whose remains, interred in 1872, is a contemporary altar tomb.

Notwithstanding all that has been done from time to time, the condition of the fabric of the church has of late become so serious

Interior of Mold Parish Church.

reparation became a matter of great importance. Messrs. Prothero, Phillott, & Co., architects, were consulted, and they revealed the extent of the dilapidations and the magnitude of the cost of the repairs. The architects conclude their report as follows:—"The building is urgently in need of repair, and there are others which might be done at any time. The wet soaks into the walls behind the parapet, which places leans very considerably out. On one side the leadwork of the roof is decayed away from the wall, and lets the water into the aisle. Some of the windows of the aisle are ready to fall, the mullions being entirely perished."

Reparation Committee appointed Messrs. Prothero, Phillott, & Barnard (London) as architects, and Messrs.

of the 8,000*l.* which is the estimate for the whole work.

[The above particulars are taken from the *Church Builder*, the quarterly record of the work of the Incorporated Church Building Society. We are indebted to the Rev. Evan Jones, Vicar of Mold, for the loan of the blocks, which also appeared in the *Church Builder*.]

HISTORICAL NOTES.

SIR H. TRUTEMAN WOOD, in a recent issue of the *Journal of the Royal Society of Arts*, has an interesting note on the offices of the Society. Originally established in the Strand in a building adapted by Mr. (afterwards Sir William) Chambers, the need for increased accommodation led to an advertisement being put in the daily papers in 1770, inviting any person who had proposals to make on the subject to communicate with the Secretary. "The result of this advertisement was that the Brothers Adam, who were then occupied with their scheme for the construction of the Adelphi, offered to include in that scheme a suitable house for the Society's purposes."

"The design proposed by the Brothers Adam was duly carried into effect, the requisite height on the river side being obtained by the construction of tiers of superimposed arches. Some of these arches formed public thoroughfares, and later gained an unenviable reputation on account of their nocturnal frequenters. Others were let as storehouses; at one time a number of cows were stabled in some of the arches, and supplied milk to a large part of the West-end. Others again served as cellars for the houses built on the substructure. The Society's house has two stories of cellars below the south-western part of the building, while the foundations of the north-east corner are in the original ground. The whole work has undergone a certain amount of repair, a good deal of strengthening and reconstruction having been carried out about the time of the termination of the original lease, when the Thames Embankment was made; but it seems now as sound as when it was first built."

Tintern Abbey.

SIR E. STAFFORD HOWARD, one of the Commissioners of his Majesty's Woods, Forests, and Land Revenues, reports that the following works have been undertaken during the year ending March 31, 1911, for the preservation of the structure of Tintern Abbey:—North Transept.—The completion of the reparative works to the large north window and the gable and coping; strengthening of the north-west staircase and building up the dangerous openings. North Aisle.—Repairs and protection and pointing to wall. Presbytery Aisle.—Repairs and protection and pointing to south wall. West Front.—Erection of scaffold to great west window of nave and examination and report on same, and walls, gable, and other work adjoining, and estimate of probable cost of repair. Infirmary.—Repairs, protection, and pointing to walls. Northern Arch of Tower.—Provision of timber and other material for shoring this arch on the west side. The number of visitors in the year ending December 31, 1910, was 17,542, as compared with 17,429 in the previous year.

St. Mary's Church, Spital-square.

In December will be offered for sale by order of the Ecclesiastical Commissioners, the freehold site and the fabric of this church, together with the adjoining vicarage, covering a total area of nearly 4,400 square feet. The church was closed some months ago in view of the fact that the population of the district, which embraces the old extra-parochial liberties of Norton Folgate and the Artillery Ground, has become almost entirely Jewish, and of the consequent difficulty of carrying on the work and service of the church. St. Mary's was originally built as the Wheler Chapel in 1693 by Sir George Wheler, rector of Houghton-le-Spring, and Prebendary of Durham, for his tenants, and formed one of the many chapels erected in Spitalfields for the weavers—descendants of the Protestant refugees. The chapel was erected in 1842, and the interior was remodelled for 580 sittings. It stands close to the site of the Spital pulpit cross—rebuilt in 1694 and destroyed in the time of the Civil War—which was used for the preaching in Easter week of the outdoor sermons that were attended by the Corporation of the City, and latterly by the boys of Christ's Hospital. An open-air pulpit

was erected ten years ago in the graveyard of the adjacent Christ Church as a memorial to the late Dr. Billing, Bishop of Bedford, a former rector of the parish. In our issue of January 15, 1910, we published an illustrated article by Mr. G. H. Lovegrove upon the discovery of some worked stones, XIIIth century in date, built into the foundation of No. 38, Spital-square, which it is conjectured were vestiges of the Priory and Hospital of Christ and the Virgin Mary, which Walter Brune, sheriff in 1203, and his wife Roesia founded, 1197, for Augustinian regular canons in what had been the Roman cemetery of Lolesworth. The hospital graveyard, latterly Spital-yard, is the site of the present Spital-square.

The Touchet Shere to John Touchet, Lord Brass, Shere.

We learn that the brass at Shere, Surrey, is to be restored. It was originally on an altar tomb which was destroyed towards the middle of the XVIIIth century. The marginal inscription, which was on a chamfered edge, was stolen, and the slab with the figure was relaid on the floor. Later the lower half of the effigy was stolen. The upper half was illustrated in the *Builder*, October 15, 1910, p. 437. In 1895 a large part of the inscription was discovered in the village after being lost for nearly a century and a half, and was given back to the church, where it was fixed to the sill of a window. The rector, Rev. F. Hill, at Mr. J. S. M. Ward's suggestion, has decided that the whole brass shall be carefully restored under the latter's supervision. The inscription is to be relaid in a fresh matrix, out on the slab, the missing parts replaced, and the lower half of the effigy restored. Fortunately a careful description has been found, which shows there were several peculiarities. Though the restoration will exactly reproduce what is lost, the back of each new piece will be dated 1911; and a rubbing of the brass as it now exists will be hung in the church. Thus the most casual visitor will be able to learn what is old and what new. The original parts will in no way be affected by this restoration, save that they will be much safer from theft. The work has been placed in the hands of Messrs. Gawthorp & Son.

A PROPOSAL to restore the Church of Little Malvern is being inquired into by a Consistory Court at Worcester Cathedral. Formerly a Benedictine priory and cell in connexion with Worcester, the church was founded in 1171 by two brothers, Joceline and Edred, who became successively priors there. The church was dedicated to St. Giles, and maintained a prior and seven monks until the dissolution of the monasteries, when the revenues of the house were worth about 100*l.* John Alocck, a later Bishop of Worcester, who ruled over that see from 1476 to 1486, rebuilt the church. Henry VIII. afterwards granted the property to Richard Andrews and Nicholas Temple.

Only a fragment of the edifice now remains, which is chiefly of the Perpendicular period, although specimens of earlier architecture still exist. The panning of the tower is good, although that portion of the church has a curiously truncated appearance, due to the fact that the battlements have been removed. The arches supporting the Little Malvern tower are the original work of 1171, while the Norman nave, the transepts, and the side chapels can still be traced. A portion of the finely carved rood-screen remains with the ancient stalls; the carvings beneath them, however, have been defaced. In the east windows of the choir were formerly likenesses of Edward IV., his Queen and their children, but these have now disappeared, as well as other monuments of antiquity. The mediæval windlass used for hauling up the bells is still preserved in the apex of the roof.

The XIVth-century church of St. Margaret, Stoke Golding, Leicestershire, is being restored by Mr. Henry F. Traylen, A.R.I.B.A.

The tower, to which attention was turned first, showed a remarkable evidence of decay on the inside owing to the nature of the friable sandstone; it was literally honeycombed, in some instances to a depth of 12 in. The method of restoration throughout the building has been approved by the Society for the Protection of Ancient Buildings. The estimate amounts to 2,500*l.*, and, as the sum of 750*l.* which has been raised practically exhausts the possibilities of local aid, the Committee appeal to the larger public for subscriptions.

View on East Window of North Aisle, Mold Parish Church.

son & Son (Peterborough) as builders. Work was commenced in January last, and it was discovered that the condition of the walls of the south aisle and roof was worse than was anticipated—the masonry was decayed that great cavities were found in the walls, and in some places they were such as 6 in. out of the perpendicular. The woodwork of the roof was found to be in a terrible state. Several of the principals had perished to such an extent at the ends they were only supported in their places by their connexion with the roof. The purlins, were greatly damaged in many cases, and had to be replaced. In the case of all of the windows, the jambs, mullions, and tracery have almost entirely to be replaced—the old stone actually crumbling when touched. The work of reparation is going on, and the Committee have already collected 3,300*l.*, but this is only a small amount

THE BUILDING TRADE.

THE WAGES BOARD SYSTEM IN AUSTRALIA.

UNTIL a few years ago freedom of contract existed between employer and employee in Australia. The position was, broadly speaking, like that which obtains in Great Britain to-day. Rates of wages were ruled, on the one hand, by the quantity or urgency of the work available, and, on the other hand, by the number of men offering their services. Where workmen were in excess of requirements, competition tended to lower wages, and when workmen were scarce and work plentiful, the position was reversed. Now, however, all that has been changed. Rates of wages and conditions of employment are fixed by Wages Boards appointed under special Acts of Parliament. Competition and such-like disturbing factors are supposed to be eliminated and regularity and uniformity secured. The object of Wages Boards is to adjust for a whole industry in a legal way what formerly was left for individual employers and employees to adjust for themselves, or what workmen acting collectively secured by means of strikes.

It may be interesting to outline the procedure adopted by a Wages Board in arriving at its decision. First, as to the Board itself. Each Board consists usually of three persons—a chairman, a representative of employers, and a representative of employees. The chairman is usually a barrister. Its functions are judicial. The Board sits and hears evidence. The employees' union presents "a claim," in which it makes certain definite demands, usually covering a claim for higher wages, shorter hours, preference to unionists, compulsory apprenticeship, limitation of the employment of boys, and the abolition of overtime and the employment of improvers. This "claim" is backed up by evidence of witnesses called in support, which goes usually to show that the particular industry being dealt with is more arduous, dangerous, or skilful than other callings, and those employed in it should consequently work shorter hours, receive higher wages, and enjoy better conditions generally. Each Board has to arrive at its decision purely on the evidence presented. It cannot, for example, take cognisance of evidence given before other Boards. This leads to some interesting situations. The journeymen painters, for instance, swear that they lose more time through bad weather than bricklayers, and that their occupation is more dangerous than that of glaziers, because of their liability to lead poisoning or falls from scaffolds. Before the Bricklayers' and Glaziers' Boards evidence of a diametrically opposite character is given. Before these Boards witnesses show that the painters' work is safe, regular, and pleasant compared with their occupations. All, however, agree that of late years the cost of living has increased and higher wages are necessary for all wage-earners.

When the evidence in support of the employees' case is closed, employers present their side of the matter. This usually goes to show that wages cannot be raised, hours shortened, or conditions improved without injuring the industry; that profits of employers are not sufficient to warrant granting the demands; that if wages are increased such increase must be paid out of the pocket of employers or passed on to the public; that there are limitations to what the public can bear, and that if work is made more costly it will result in work being left undone which would otherwise be undertaken. Between the two sides thus put before the Board is in a fair way to obtain an accurate knowledge of existing conditions. After hearing witnesses it considers the "claims" in the light of the evidence and arrives at its "award." This document, which is in effect a written judgment, sets forth the conditions of employment which are henceforth to be observed. An award is generally made for a period of three years.

The above remarks apply to the Wages Board systems in force in New South Wales and Victoria. They are modelled upon legislation which has been in force in New Zealand for seven or eight years. In other Australian States there is similar legislation though all

differ in detail. Theoretically, the system appears equitable. In practice it is faulty. The weakest point, from the men's point of view, is that the cost resulting from increased wages is added to the price of commodities. As the wage-earner is a consumer as well, he has to pay more for commodities which are made and supplied by employees whose wages have been artificially raised. A source of weakness to employers is the absence of unanimity among themselves. The bulk of employees have aims in common. With employers it is different. Most are competitors; there is also diversity of interests. One employer, for instance, may do a better class of work and can afford to pay higher rates because his employees are above the average. Again, a master builder may be an employer of painters or plumbers. In this way diversity of interests arise, and it sometimes happens that one section of employers sides with the union because by so doing it will injure another section of employer. The master plumbers, for instance, favour the demands of the journeymen plumbers' union because the former harbour a grudge against master builders who employ journeymen plumbers instead of sub-letting plumbing work to master plumbers. In the same way master painters feel aggrieved because master builders undertake painting contracts. It is said that it was in this spirit that master painters at Sydney conceded to the union a forty-four hour week. Painters renovating occupied houses cannot conveniently start as early in the morning as painters working on new buildings, so that master painters would suffer less by such a concession than master builders. This simply illustrates the division of interests among employers.

If Wages Boards really solved labour difficulties the public would be inclined to favour them and put up with the increased cost. Their introduction was intended to do away with strikes and supply a peaceful means for adjusting differences. It cannot be said that they have fulfilled anticipations. Though an award is supposed to bind both parties to it, in reality it binds only one party, viz., employers. If an award does not please employees they resort to their old weapon of the strike. If, on the other hand, an employer fails to observe an award, he is soon brought before the Court, and if found guilty has to submit to a fine or imprisonment.

A master painter, for instance, a short time ago employed half a dozen painters for a few days at about a penny an hour under prescribed rates. He was convicted by the Industrial Court (a Court presided over by a judge, who does nothing else but deal with industrial matters) and fined an amount which, together with costs, totalled about £20.

Similar cases have occurred in which master builders, through negligence or erroneous interpretation of awards, have been heavily fined.

Apart, however, from the interests of either employers or employees, industries do not stand to gain in consequence of the regulations by which they are hampered. Injustice is done to youths who, owing to restrictions, are prevented from learning a trade. The apprenticeship system, which had died a natural death as far as the building trades in Australia were concerned, is made compulsory, and the employment of improvers prohibited. Demands for the revival of the apprenticeship system are alleged to be in the interest of boys themselves, whereas the motive really is to limit their employment. The jealousy with which boys are regarded has had the result of compelling many lads to become unskilled labourers. In New South Wales a youth of twenty-two or twenty-three years of age, who has sufficient knowledge to pass as a mechanic, may earn 11s. per day, while in the unskilled callings his wages are much lower. To show the effect of restrictions, it might be mentioned that an employer recently advertised at Sydney for carpenters and a labourer. Two carpenters applied, and, after accepting employment at 11s. per day, went away for their tools, but did not return. For the position of labourer there were over thirty eager applicants. The same spirit towards boys is shown by claims now being made by members of the brickmakers'

union, who demand that boys shall be paid same rates of wages as men. The explanation of the matter is that industries are in a flourishing condition, and demand, however absurd, have frequently to be conceded in order to prevent the deadlock which would occur if workmen left their employment.

INSURANCE AGAINST UNEMPLOYMENT.

THE Grand Committee commenced their consideration of the second part of the Insurance Bill, which relates to Unemployment Insurance on November 2. The building trade is especially affected by this part of the Bill, since it is one of those industries specified in Schedule 1 upon which the experiment is to be tried.

No amendments of any importance were made at this first sitting, but some discussion took place in relation to sub-clause (4) of Clause 1 which provides that, "Notwithstanding contract to the contrary, the employer shall be entitled to deduct from the wages of, otherwise recover from, the workman the contributions payable by the employer himself." An impression appears to have prevailed amongst certain members of the Committee that the provisions of the Trades Disputes Bill would have some bearing upon the position of employers under this clause, but we are unable to follow this contention.

The Bill in this respect makes no difference between contributions for general health insurance and unemployment insurance. (Clause 4, sub-clause (2), and Schedule 1, par. 7.)

The sub-clause in question is designed to prevent employers from placing the contributions due from them upon the shoulders of the workman, but contributions paid on behalf of the workman can be deducted from the wages otherwise recovered. (See Clause 61, sub-clause (3).)

But, although the Trades Disputes Act appears to have no direct bearing on this question, ill-feeling it has tended to engender between employer and employee does render the whole scheme of the Bill in making the employer the collectors of the insurance premiums contributions exceedingly undesirable.

The employer, in making deductions for wages demanded by the State, is always placed in an unenviable position as regards his servants. They never understand the compulsion he is under, and they credit him with making a profit out of the deductions so made. In the undertakings in which both health insurance and unemployment insurance are combined the deduction from each man per week will be 6d., a very large sum, and any process against the servant where a deduction cannot be made from his wages is, in fact, very difficult. Trades disputes may arise out of these deductions, any proceedings taken to endeavour to recover contributions, and we strongly deprecate employers being made State insurance collectors. Surely some system could be devised whereby the Government could reach the workman directly without the intervention of the employer. The employers could be compelled to make returns to the approved societies and Health Committees, which, besides administering funds, should undertake their collection.

We are not blind to the difficulties which in the way of collection otherwise than through the employers, but the existence of difficulties does not justify the relations of employer and employee being further complicated by State legislation of this character.

THE LONDON CO-OPERATIVE UNION OF BUILDING CONTRACTORS, AND ALLIED TRADES.

We have received the rules of the Co-operative Union of Builders, Contractors, and Allied Trades, incorporated under the Friendly Societies Act on October 23. The first meeting took place on the 4th inst. The Union's business, we are informed, with 3,500 members in hand. Several contracts have been promised to the Union by good firms. For further particulars apply to the Secretary, J. N. C. Josephson, at the registered offices and clubrooms, 45 and 46, Lower Market Waterloo-road, London, S.E.

LONDON ASSOCIATION OF MASTER DECORATORS.

The October quarterly meeting of the Association of Master Decorators the meetings were opened by an address from the President on his visit to the Convention at Derby. Wilkinson also contributed to the interest meeting by giving his impressions of the Derby Convention.

After a discussion on various matters the subject of the meeting was taken on the subject of recent strikes, and the Secretary was asked to sign on behalf of the Association a memorandum to the Prime Minister on the subject.

It was reported that the Water Board had approached with reference to certain works made by them for water used for the down outsides of houses, and, as the result of the representations made by the Association, the practice has been modified, so that it is only made where the building is being repaired and decorated, or where otherwise extensive and needs to be done.

The subject of scholarships, it was also decided that the Educational Committee is now working with the London County Council at present visiting their technical schools with a view to devising a scheme for the bettering of decorators.

A question of white-lead was also discussed, and was resolved—

That, as no suitable substitute for white-lead has been found, its use be continued under the existing regulations.

A vote of thanks was accorded the President who had contributed to the success of the meeting, and the proceedings ended.

W. H. SHIELDS MASTER BUILDERS.

At the annual meeting of the South Shields Building Trades Employers was held at County Hotel, Westoe. The President, James Anderson, presided, and welcomed Mr. E. H. Hannay, the newly-appointed secretary.

Treasurer's report was presented by the Treasurer, Mr. Alexander Ross, and was of a satisfactory nature. Various matters relating to the trades represented were discussed, and a resolution was passed supporting certain proposed amendments of the Insurance Bill.

Regarding the Trades Disputes Act, relating to picketing, was discussed, and action in favour of limiting the number of men in the case of trade disputes was unanimously carried. The President (Mr. Anderson), the Vice-President, Messrs. W. V. Jary and J. Christie, the Treasurer, Mr. Alexander Ross, were elected to their respective offices, and certain committees were appointed. The meeting decided that in future the monthly meetings be held on the last Tuesday in each month in the North-Eastern Bank-chambers. The close of the business meeting the supper was held.

GENERAL BUILDING NEWS.

NEW CHAPEL AT WORKSOP COLLEGE.

A new chapel has been erected from the designs of Aston Webb, R.A., and was dedicated on the 2nd inst. The length from the chancel arch to the west door is 102 ft., the width is 36 ft., the height to the apex of the vaulted roof is 56 ft. The building provides seating accommodation for 450.

BURTON GRAMMAR SCHOOL.

Repairs and improvements have been carried out at this school at a cost of about £1,000. The architect was Mr. H. Beck, and the work includes an art-room, preceptor's room and two classrooms. The builder was Messrs. Kershaw.

NEW INSTITUTE, LILLYSLEIGH.

Plans prepared by Mr. Taliesin Rees, architect, of Liverpool, for this institute, which the architect was Mr. H. Beck, and the work has been approved, and tenders for the same being invited. The institute will be a hall for public use, tea-room, etc.

NEW RED MAIDS' SCHOOL.

Buildings have been erected from the designs of Mr. Frank Wills, architect, and the work includes accommodation for eighty girls. The work was carried out by Messrs. Stephens and Sons, builders.

EDWARD MEMORIAL, FOOTING BROADWAY.

A memorial to the late King was unveiled on Saturday last by the Mayor of London. The memorial is the work of

Mr. Rosenlieb, a young sculptor of Wandsworth, and is a bronze statue 9 ft. high on a 9-ft. pedestal of polished Peterdown granite. It represents the King in the uniform of a Field-Marshal.

TRADE NEWS.

Messrs. Samuel Elliott & Sons, Ltd., Caversham, Reading, the well-known and old-established joinery manufacturers, have several important contracts in hand which will keep the large workshop and Messrs. Elliott's staff fully employed for several weeks to come. As will be seen from an advertisement on another page, the Receiver and Manager (Mr. Sydney W. Tubbs, F.C.A., of Messrs. Dixon, Wilson, Tubbs, & Co., 28, Basinghall-street, E.C.) is offering the plant, machinery, stock, and goodwill of the business for sale as a going concern.

Under the direction of Mr. W. McPherson, F.S.I., architect, Drymen, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump," ventilators and air inlets, has been applied to Drymen Schools, Drymen, N.B.

Messrs. O'Brien, Thomas, & Co., Upper Thames-street, London, and Excelsior Works, South Bermondsey, have recently supplied two of their D. O. Boyd's exhaust roof ventilators for the new Council School at Countesthorpe, near Leicester.

A large chiming clock with one dial is to be placed upon the Parish Church of Hale Magna, Lincolnshire. The order has been given to Messrs. John Smith & Sons, Midland Clock Works, Derby, who are also making clocks for Fleet Church and Freiston Church.

The external stonework of the Middlesex Music-Hall, which was to be opened this week, was executed in B.S.M. Portland. Among the recent orders which have been executed in the British Stone and Marble Company's ferro-stone glazing bar are the grand stand at Newmarket, Messrs. W. H. Smith & Sons' printing works, and the Great Western Railway Company's new station at South Lambeth.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 TO 1909.

At Tuesday's meeting of the London County Council, the following applications under the London Building Acts were dealt with, the names of the applicants being given in parentheses:—

Lines of Frontage and Projections.

Clapham.—Erection of bay windows, porches, and oriel windows in front of fourteen houses on the eastern side and sixteen houses on the western side of Muncester-road, Clapham (Mr. E. J. George for Mr. W. H. George).—Consent.

Hackney, Central.—Erection of a building upon the site of Nos. 538 and 540, Kingland-road, Hackney (Mr. W. Watson for Mr. M. G. Neugeb and Mr. A. P. Grange).—Refused.

Hampstead.—Erection of two houses upon a site on the northern side of St. Cuthbert's-road, Hampstead, next to the north-eastern side of Shoot-up-hill (Messrs. Rix & Wilkins).—Refused.

Hampstead.—Additions in front of the Hampstead Synagogue on the southern side of Dennington Park-road, West End lane, Hampstead (Messrs. Joseph & Smith).—Consent.

Hampstead.—One-story addition at the rear of No. 14, Minster-road, Hampstead, abutting upon the north-eastern side of Fordwych-road (Mr. S. L. C. Gilks).—Consent.

Islington, North.—One-story shop in front of No. 541, Holloway-road, Islington (Mr. G. Carter for Mr. Wolley).—Consent.

Lewisham.—Retention of a metal sign over the one-story shop in front of No. 148, Rushey-green, Catford (Mr. W. Daniell for Messrs. John Best, Ltd.).—Consent.

St. Pancras, East.—Projecting iron staircase next to Clifton-villas at a proposed building upon a site abutting upon the southern side of Clifton-road and the eastern side of Clifton-villas, St. Pancras (Messrs. James, Laycock, & Bellamy for Messrs. Jones Brothers (Holloway), Ltd.).—Refused.

Strand.—Projecting unilluminated sign in front of No. 9, Essex-court, Strand (Messrs. Pratt & Co.).—Consent.

Strand.—Projecting sign in front of The Goupil Galleries, No. 5, Regent-street, Waterloo-place (Brilliant Sign Company, Ltd.).—Consent.

Wandsworth.—One-story shops in front of Nos. 1 to 25, The Boulevard, Balham High-road, Balham (Messrs. W. & E. A. Hunt).—Consent.

Wandsworth.—Addition in front of the Putney Upper Grade Church of England School on the western side of Walker's-place, Putney (Mr. H. G. Leslie for the Managers of the School).—Consent.

Wandsworth.—Erection of bay-windows and porches to six houses on the north-western side and six houses on the south-eastern side of

Hilldown-road, Wandsworth (Mr. G. J. Philpott).—Consent.

Westminster.—Projecting pilasters and cornices on the Victoria-street frontage and a portion of the Spencer-street frontage of the premises of the London County and Westminster Bank, Ltd., Westminster (Messrs. Hall-Jones & Cummings for the London County and Westminster Bank, Ltd.).—Consent.

Width of Way and Lines of Frontage.

Fulham.—Erection of buildings on the south-western side of Burlington-road, Fulham, between No. 33, Burlington-road and the playground of All Saints' School (Mr. L. Kesteven).—Consent.

Stepney.—Erection of a building on the northern side of Oxford-street, Stepney, eastward of Bedford-street (Messrs. F. Borcham, Son, & Gladding).—Consent.

Wandsworth.—One-story addition to a beer-store building at the "Corner Pin" public-house, Summerstown, Wandsworth, to abut upon the northern side of Riverside-road (Mr. E. Penn for Mr. H. Washington).—Consent.

Lines of Frontage and Construction.

Hammersmith.—Iron and glass shelter in front of the George Hotel, The Broadway, Hammersmith (Messrs. Keeling, Teale, & Co., for Mrs. E. A. Ringwood).—Refused.

Kensington, South.—Iron and glass shelter to the Pelham-street entrance to the South Kensington Tube Railway-station (Mr. W. E. Mandelick for the London Electric Railway Company).—Consent.

St. George, Hanover-square.—Iron and glass shelter in front of Nos. 61 and 62, Conduit-street, St. George, Hanover-square (Mr. B. A. Slade).—Refused.

Strand.—Iron and glass shelter at the Argyle-street entrance to the Oxford-circuit Tube Railway-station (Mr. E. P. Grove for the Central London Railway Company).—Consent.

Wandsworth.—Iron and glass roof at the flank of No. 203, Upper Richmond-road, Putney, next to Ravenna-road (City Hosiery Company, Ltd.).—Refused.

Lines of Frontage and Space at Rear.

St. George, Hanover-square.—Seven houses on the eastern side of Park-street, St. George, Hanover-square, to abut also upon the southern side of Upper Grosvenor-street, and the northern side of Reeves-mews, with a projecting portion next to Upper Grosvenor-street, and with an irregular open space about such buildings, so far as relates to (i.) the erection of two houses instead of three on the southern portion of the site next to Reeves-mews; (ii.) the omission of three of the five porches next to Park-street, and an alteration in the position of the two remaining porches; and (iii.) an increase from 6 ft. 6 in. to 6 ft. 8 in. in the projection of the central feature next to Upper Grosvenor-street (Messrs. Blow & Billery).—Consent.

Width of Way, Line of Frontage, and Space at Rear.

Kensington, South.—Addition at the rear of No. 29, Holland Park-avenue, Kensington, next to the eastern side of Holland walk (Messrs. R. A. Briggs & Browning for Mr. G. Pidduck).—Consent.

Space at Rear.

Hammersmith.—Erection of a building on the northern side of King-street, Hammersmith, between Studland-street and Galena-road (Messrs. J. S. Quilter & Son for Mr. A. Carreras).—Consent.

Space at Rear and Projections.

Hampstead.—Two houses on the northern side of St. Cuthbert's-road, Hampstead, with irregular open spaces about such buildings, and with porches next to St. Cuthbert's-road (Messrs. Rix & Wilkins).—Consent.

Space at Rear and Alteration of Buildings.

Hampstead.—Wood and zinc roof over the yard at the rear of No. 21, Belzize-lane, Hampstead (Mr. W. Cayford for Mr. J. W. Barry).—Consent.

Separation and Alteration of Buildings.

City of London.—Deal staircase and the erection of an iron balcony at No. 13, St. Helen's-place, City (Mr. H. Chaffield Clarke for the Leathersellers' Company).—Consent.

Footings to Walls.

Westminster.—Omission of the brick footings to the walls of a house next to the western side of Smith-square, Westminster, and the northern side of new road to lead from Smith-square to Tufton-street (Messrs. Holloway Brothers (London), Ltd., for the Right Hon. R. McKenna, M.P.).—Consent.

Cubical Extent.

Bow and Bromley.—Additional cubical extent at the premises of Spratts Patent, Ltd., Fawcett-street, Poplar, so far as relates to the erection of an additional story (Messrs. Max Clarke & Garbutt for Spratts Patent, Ltd.).—Consent.

City of London.—Additional cubical extent in respect of a division at the premises of

Messrs. Bradbury, Grestorex, & Co., Ltd., abutting upon Aldermanbury, Church-passage, and Fountain-court, City (Mr. H. Chaffield Clarke).—Consent.

Finsbury, East.—Erection of a building on the northern side of Banner-street, St. Luke, exceeding 250,000 cubic ft. in extent (Messrs. M. W. King & Sons for Messrs. Chater Lea, Ltd.).—Consent.

Uniting of Buildings.

City of London.—Uniting of Nos. 18, 19, and 20, Holborn Viaduct, City, with No. 21, Holborn Viaduct, by an opening at the third-floor level (Mr. W. E. Clifton).—Consent.

City of London.—Uniting of Nos. 77 and 78, Fore-street, City, by an opening at the fourth-floor level, and the provision of doors of the said opening (Messrs. W. Gower & Son).—Consent.

Greenwich.—Formation of four openings in a division wall at the premises of the Greenwich Inland Linoleum Company Ltd., Tunnel-avenue, Greenwich, between the existing inlaying-room and a proposed inlaying-room (Mr. W. C. S. Styche for the Greenwich Inland Linoleum Company, Ltd.).—Consent.

Holborn.—Formation of an opening between Nos. 22 and 24, Hinton-wall, Holborn, at the second floor level (Mr. T. Coles for the Educational Supply Association).—Consent.

Hoxton.—Uniting of Nos. 45 and 45, Great Eastern-street, Hoxton, with No. 58, Curtain-road, so far as relates to the further uniting of No. 58 with No. 56, Curtain-road (Mr. W. Campbell Jones).—Consent.

Strand.—Formation of openings in the party wall between No. 3, Clifford-street, and No. 14, Old Burlington-street, W. (Mr. C. H. Townsend for Messrs. Owen Grant, Ltd.).—Consent.

The recommendations marked + are contrary to the views of the Metropolitan Borough Councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Additions to Northern meeting-rooms (4,000l.); Mr. A. M. McKenzie & Son, architects, 543, Union-street, Aberdeen.

Alcester.—Completion of school (700l.); Mr. B. King, Secretary, Education Committee, Warwickshire County Council, Warwick.

Ashford.—Technical institute, Elwick-road; Mr. F. W. Crook, Secretary, Education Committee, Kent County Council, Caxton House, Westminster, S.W.

Atleborough.—Infirmary (14,030l.); Mr. R. Shanks, builder, Chatteris.

Ayrton.—School; Mr. W. V. Dixon, Secretary, Education Committee, West Riding of Yorkshire County Council, Wakefield.

Binley.—School; Messrs. Wilmott, Fowler, & Wilmott, Birmingham.

Bishop Auckland.—Church and Sunday School; Messrs. Gordon & Gunton, architects, Finsbury House, E.C.

Blaby (Leicestershire).—Alterations at workhouse (1,500l.); Mr. W. M. Cowdall, architect, 12, Greyfriars, Leicester.

Blyth.—Offices for Harbour Commissioners; Messrs. Cackett & Burns Dick, architects, Pilgrim-street, Newcastle.

Bristol.—School, Dame Emily Playground (700l.); Mr. T. H. Yabbicom, Surveyor, Bristol Town Council.

Byker.—Block of business premises; Messrs. Marshall & Tweedy, architects, 17, Eldon-square, Newcastle.

Carnwath.—Additions to public school (2,850l.); Messrs. Traill & Stewart, architects, 38, High-street, Lanark.

Chaddlesworth.—School (seventy-two places); Architects, care of the Trustees, Saunders Charity.

Chelmsford.—Enlargement of fire-station; Mr. C. Brown, Surveyor, Chelmsford Town Council.

Dalton-in-Furness.—Alterations to school; Messrs. T. F. Tyson & Sons, builders, Church Walk, Uxterstone, Lancs.

Delziel.—Additions to High School (3,500l.); Mr. James Cowie, architect, 32, Brandon-street, Motherwell, N.B.

Darlington.—School, Reid-street; Mr. A. C. Boyle, Secretary, Education Committee, Darlington Town Council.

Dewsbury.—Isolation hospital (600l.) for the Dewsbury Joint Hospital Board.

Didcot.—Wallingford, and Faringdon (Berks).—Manual instruction centres (880l.); Messrs. Bosher & Son, builders, Chislesey, Berks.

Dudley.—The following plans have been passed:—Extensions to works, Price-street, Kate's-hill, for Messrs. E. Hopkins & Co.; eight houses, Gammage-street, for Mr. J. W. Seckerson; drill-hall and offices, Tricote-road, for the Worcestershire Territorial Association.

Dumbarton.—Catholic school. Clerkhill

(3,000l.); Mr. A. C. Denny, 37, Church-street, Dumbarton.

Dunfermline.—Parish offices (6,000l.); Messrs. Muirhead & Rutherford, Abbey Park-place, Dunfermline.

East Barnet (Herts).—Enlargement of Brunswick Park School (fifty extra places); Mr. A. R. S. Hallidie, Secretary, Education Committee, Herts County Council, Hertford.

Evesham.—Catholic schools; Messrs. Pugin & Pugin, architects, 51, North John-street, Liverpool; Messrs. Espley & Co., builders, High-street, Evesham.

Gillingham.—Offices, stores, etc., for Electricity Department; Mr. J. L. Redfern, Engineer, Gillingham Town Council.

Glasgow.—Picture hall, Renfrew-street (2,200l.); Mr. N. C. Duff, 115, Wellington-street, Glasgow. Preserve factory, Kinning Park (4,500l.); Mr. A. Gardner, architect, 154, Bath-street, Glasgow.

Gower.—Hospital, Fairwood Common (3,000l.); Mr. H. A. Ellis, architect, care of Gower and Oystermouth Hospital Committee, Gwysyllt. School (200 places); Mr. J. C. Davies, Secretary, Education Committee, Denbighshire County Council, Ruthin.

Hampton.—Drill-hall, Tudor-road; Capt. Cranfield, Surveyor, Middlesex Territorial Association.

Hawkebury.—School; Mr. H. W. Household, Secretary, Education Committee, Gloucestershire County Council, Gloucester.

Hendrefoilan (Sketty).—Proposed chalets; Mr. L. Jenkins, Clerk, Board of Guardians, Swansea.

Hilden (near Belfast).—School (3,000l.); Mr. W. J. Fennell, architect, 7, Donegall-square, Belfast.

Hirst (Northumberland).—School (3,000l.); Mr. W. Forrest, architect, Moot Hall, Newcastle; Mr. J. Douglas, builder, Hepscott, Morpeth.

Hitchin.—Building for the Herts and Beds. Co-operative Bacon Factory; President, Lord Lucas.

Huddesdon.—Ginger-beer factory at brewery for Messrs. Christie & Co.

Holmfirth.—School (3,600l.); Mr. W. V. Dixon, Secretary, Education Committee, West Riding of Yorkshire County Council, Wakefield.

Hove.—The following plans have been passed:—Alterations to garages, Connaught-road, for Mr. J. W. Hayler; garages, Hove-street, Messrs. Clayton & Black for Mr. J. Hayler.

Hud Hey.—Motor garage (2,700l.); Mr. W. Tattersall, The Lindens, Haslingden.

Inverness.—Extensions to poorhouse (3,000l.), also villa, Trehshill-road (1,300l.); Messrs. A. Ross & Son, Queensgate-chambers, Inverness.

Police-chambers (3,000l.); Mr. R. I. McBeth, Queen's House, Inverness.

Iwade.—School; Mr. F. W. Crook, Secretary, Education Committee, Kent County Council, Caxton House, Westminster, S.W.

Keresley.—School (160 places); Mr. Bolton King, Secretary, Education Committee, Warwickshire County Council, Warwick.

Kirkintilloch.—Extensions to school (2,000l.); Mr. J. Shanks, architect, Kirkintilloch.

Leicester.—Proposed public hall (17,350l.); Mr. E. G. Mawbey, Surveyor, Leicester Town Council.

Lerwick.—Extensions to Fish Market (2,000l.); Mr. G. Cruikshank, Surveyor, Lerwick Town Council.

Lindale.—Alterations and additions to parish church (1,750l.); the Vicar.

Little Hulton (near Bolton).—Drill-hall, Bridgewater-street; Colonel Fraser, Elliott-street, Liverpool.

Llandrindod Wells.—Adaptation of Victoria Hall for central offices, etc.; Secretary, Local Unionists Club, Llandrindod Wells.

Llanely.—School, near Llanely (6,000l.); Mr. Wm. Griffiths, architect, Falcon-chambers, Llanely.

Loughbrickland.—Dispensary residence (1,200l.); Clerk, Banbridge Board of Guardians.

Lutterworth (Leicester).—Extensions to cottage hospital; Mr. D. Rourke, builder, care of the Governors, Lutterworth Cottage Hospital.

Lydd.—Proposed parochial hall (2,300l.); Vicar, St. Peter's Church.

Manchester.—Shops and offices, Market-street; Messrs. J. Beaumont & Son, architects, 10, St. James's-square, Manchester.

Mullingar.—College Chapel (2,500l.); Messrs. J. O'Callaghan & Webb, South Frederick-street, Dublin.

Nelson.—School, Bankhouse-road (2,000l.); Mr. Gunson, architect, 10, Marsden-street, Manchester.

Newcastle.—Electric theatre; Mr. A. Stockwell, architect, 11, Pilgrim-street, Newcastle.

New Maid (Aberdeenshire).—Extensions to auction mart (2,500l.); Messrs. Walker & Duncan, architects, 3, Golden-square, Aberdeen.

Nuneaton.—Additions to workhouse (1,350l.);

Architect, care of Mr. C. Blakeway, Clerk, Board of Guardians, Nuneaton.

Pudham.—Shed (400 looms) for the Albion Mill Company.

Winton (Bournemouth).—Baptist church (3,000l.); Messrs. G. Baines & Son, architects, 5, Clewer, Winton.

Wolverhampton.—Nursing institution; A. W. Worrall, architect, Queen's-chamber, North-street, Wolverhampton.

Yeovil.—Twelve houses; Mr. N. G. F. Surveyor, Yeovil Rural District Council.

REINFORCED CONCRETE IN UNDERPINNING.

With reference to the article under heading which appeared in our issue October 27, we are asked by Mr. C. R. P. of 87, Bishopsgate, E.C., to state in

owing to the very large number of inquiries he has had on the subject, he has not been able to answer them all immediately, but

do so as quickly as possible. It would be great assistance to him in answering inquiries if architects would state the nature of

particular job for which they require details.

* See also our list of Competitions, Contracts, etc., on another page.

THE LONDON COUNTY COUNCIL.

usual weekly meeting of the London County Council was held on Tuesday in the Town Hall, Spring-gardens, S.W. The Mayor, Mr. E. White, presided.

FINANCE.—The Finance Committee reported a loan of 3,740*l.* was to be made to the Hammersmith Borough Council for housing purposes. The Stepney Borough Council is to have a loan of 15,700*l.* for electricity purposes.

GROUND, GREENWICH. It was reported that plans had been approved for the enlargement of the Randall-place Schools at an estimated cost of 285*l.*

SCHOOL, LIMEHOUSE.—It is proposed to erect a school on a site in the High-street, Limehouse, to provide accommodation for 100 children.

PRESENTATION TO THE LIBRARY.—It was agreed that Mrs. D'Oyly Carte has presented to the library of the Council a copy of the publication of 1825, containing Lieut.-Col. Mordaunt's proposals for the construction of a bankment quay on the north side of the River Thames from Craven-street to Blackfriars-bridge.

SPRINGFIELD PARK.—A plot of land has been acquired in Springfield, Clapton, about 100 acres in extent, for an addition to Springfield Park, and the estimated cost of laying out the same is 350*l.*

WOOLWICH FERRY. Various repairs are to

be carried out to the river bank in front of Stanley-road, North Woolwich, at an estimated cost of 600*l.*

WATERLOO BRIDGE.—Owing to the accumulation of water under the wood blocks forming the carriage-way of this bridge, repairs are to be carried out at a cost of about 250*l.*

TRAMWAY DEPÔT, POPLAR.—It is proposed to erect a permanent-way depôt at Leven-road, Poplar, at an estimated cost of 15,350*l.*, which includes 110*l.* for the erection of a wall between the depôt and Bromley Hall road school.

OLD OAK ESTATE.—In a report of the Education Committee it was stated that it was desirable to provide additional public elementary school accommodation for about 1,500 children on this estate at Hammersmith. Three temporary iron buildings are to be erected to serve as school premises until a permanent school is erected.

FULHAM EMPIRE.—A petition was presented to the Council, signed by 600 school managers, teachers, and others in Fulham, against the granting of a music and dancing licence to the new theatre of varieties which Mr. Oswald Stoll intends to erect in the Fulham-road. A petition was also presented, signed by 17,538 people in Fulham, in favour of the licence being granted.

FIGURE CASTINGS.

Three castings which the Carron Company, Stirlingshire, has recently produced in iron from the models of Mr. Hibbert Binney, A.R.S.A., road, N.W., and under the supervision of the architect, Mr. Ernest E. Fetch, A.R.I.B.A., John-street, Adelphi. When finished they will be fixed in the forecourt of Mr. Fetch's new Municipal Buildings at South Shields.

In referring to the work the company say they "would have preferred for several reasons to have executed it in bronze or lead, and it required some enterprise to undertake the job in cast-iron, a material which, though economical, does not lend itself to touching up after casting. The single figures are about 10 ft. high."

METROPOLITAN ASYLUMS BOARD.

The Metropolitan Asylums Board, at their fortnightly meeting on the 4th inst., dealt with the following, amongst other matters:

Durand Asylum.—On the recommendation of the Asylums Board it was decided, subject to the sanction of the Local Government Board, to roof in the upper yard of the workshops for males at the above asylum at an estimated cost of 700*l.*

South-Western Hospital.—It was decided to apply to the Local Government Board for sanction to replace the existing corrugated-iron building for the storage of steam coal at the above hospital, with a brick building, estimated to cost 380*l.*

Joyce Green Hospital.—The Works Committee recommended, and it was agreed to, subject to the consent of the Local Government Board, to accept an estimate for the supply of high-efficiency inverted gas burners to the hospital, without, in the first instance, advertising for sealed tenders.

METROPOLITAN WATER BOARD.

At the monthly sitting of the Board on the 3rd inst., the following matters were dealt with:—

Repairs to Cottages.—It was agreed to accept the tender of Messrs. Clemens Brothers, amounting to 750*l.* 10*s.*, for the execution of repairs to the Board's cottages at Albion-terrace, Sewardstone, and the tender of Messrs. Bate Brothers, amounting to 272*l.*, for structural alterations to the Board's cottages at Brookfield-lane, Cheshunt.

Roads.—An application by the Hornsey Borough Council to construct a carriage-way over the Board's reservoir land at Fortes Green, and a footplate on the east side of the reservoir, were acceded to. It was resolved to incur an expenditure of 1,300*l.* in making up and paving Kirtling-street and Cringle-street, Battersea.

Linking up Supplies.—An estimate of 3,500*l.* was affirmed for the laying of a new main in the North Woolwich subway under the Thames, in course of construction by the London County Council, with a view to the connection of the water supply on the north and south side of the river.

LEGAL COLUMN.

Form IV. of the Finance Act.

The original action, *Dyson v. Attorney-General*, brought to test the validity of Form IV. under the Finance Act, came on for hearing recently in the Chancery Division. It will be remembered that this case has already been to the Court of Appeal, but simply on a preliminary point as to whether such an action could be brought against the Attorney-General at all. This point was decided in the plaintiff's favour by the Court of Appeal (see the *Builder*, December 24 last) and the case was to proceed to trial.

In the meantime another test case, *Burghes v. Attorney-General*, has come before the Courts on Form VIII. (see the *Builder*, May 10 last). Two points raised in *Dyson's* case were decided in this case—1. That the plaintiff had not been given the full thirty days to comply with the notice; 2. That the Commissioners had no right to require the plaintiff to send the form to anyone but themselves.

When *Dyson's* case came on for hearing the Attorney-General at once intimated that he would submit to judgment, as the two points decided in *Burghes's* case, which is under appeal, would entitle *Dyson* to judgment here.

In *Dyson's* case, however, a third and very important point was raised, viz., that it was *ultra vires* the Act to issue the question marked (b): "If the person making the return is also the occupier, state the annual value, i.e., the sum for which the property is worth to be let, the owner keeping it in repair."

Owing to the course the proceedings have taken this latter point still remains undecided, which appears to be a matter for regret seeing the number of persons involved in answering such questions.

From the proceedings in *Dyson's* case it appears that the Government official to whom the forms had to be sent was the village blacksmith.

Iron Figure and Lamp for Municipal Buildings, South Shields. Designed by Mr. Hibbert Binney.

Cast-Iron Figure and Lamp for Municipal Buildings, South Shields. Designed by Mr. Hibbert Binney.

LAW REPORT.

Costly Dilatoriness.

The Aerated Bread Company, Ltd., 24, "Batechup," were summoned as the owners of 86 and 88, Cannon-street, for neglecting to comply with an order of the London County Council made under the Buildings Act to have double iron doors and roller shutters placed in the party wall between 88, Cannon-street and 32, Bush-lane.

Mr. Todd, District Surveyor, said nothing had been done in the direction of complying with the order until the 23rd ult. (although these proceedings had been pending since May 16 last), when he understood an order was given to make the doors. The case had been before the Court since September 22.

The Lord Mayor said there had been a most unwarrantable delay on the part of the company, and an entire failure on the part of those advising the company to appreciate their position in the matter, and he should fine the company 20*l.* and costs.

LONDON COUNCILS.

Hermesley.—Plans have been passed for a motor garage and storage premises in Leroy-street for Messrs. J. E. Witer & Co., 89, Newington Butts, S.E., on behalf of Mr. J. Pace, 44, Leroy-street, S.E.

Deptford.—Plans have been passed for Messrs. Lawrance & Sons, for the erection of a new police-station in Amersham vale, also for Mr. J. O. Cook, for additions to the Key Glass Works, Coldblow-lane.

Hackney.—The following plans have been passed:—Mr. E. E. Fowler, factory, Bull-alley, near Grevdon-street; Mr. M. B. Porry, factory, Cazenove-road; Messrs. J. W. Falkner & Sons, cinematograph theatre, Kingsland-road.

Hornsey.—With regard to the scheme which the Highways Committee have had under consideration with regard to the widening of Seven Sisters-road at the tramway terminus, the Borough Engineer reports that he had been advised by the Chief Engineer of the London County Council to again put the proposal forward with a plan which provided for the adding of a strip of Finsbury Park on the north-west side of Seven Sisters-road for a length of about 740 ft., to form a siding for a double line of rails for the Middlesex rails, the track to be 68*ft.* 6 in. wide. It was also suggested to retain the footpath on the north-west side of Seven Sisters-road and form a new one on the north-west side of the proposed siding. As an alternative he suggested approaching the Middlesex County Council with a view to depositing a County Bill, authorising the construction of an independent light railway the whole length of Seven Sisters-road, between the Finsbury Park terminus and Green-lanes, and for the acquisition of a strip of Finsbury Park land for this purpose. At the last meeting of the Council the Highways Committee reported having written to the London County Council urging them to carry out the suggested widening, and to the Middlesex County Council, suggesting the promotion of a Bill on the above-mentioned lines. The tender of Messrs. William Griffiths & Co., at 34*l.*, has been accepted for making up Woodside Cottages, Churchyard Bottom. The following plans have been passed:—Mr. T. F. Waggitt, Finsbury-pavement, alterations and additions to No. 80, North-hill, Highgate; Messrs. F. Cottrell, Ltd., alterations and additions to lodge at Womesley House, Dickenson-road, Stroud Green, also for a motor garage at Woodthorpe, Shepherd's-hill, Highgate. Plans have been lodged by Mr. Herbert Collins, trading as Messrs. Herbert & Co., Rookfield-avenue, Muswell-hill, for twelve houses, in St. James's-lane, Muswell-hill; also by Mr. C. Rollason for a temporary building for an electric theatre, St. James's-hill.

Lambeth.—The Public Health Committee report that, in the new by-laws made by the London County Council, defining the person responsible under the drainage by-laws and the by-laws as to depositing plans under the Metropolis Management Act, 1855, and which have just been approved by the Local Government Board, all plans, sections, and particulars relating to work are to be deposited by the builder, who shall be the person liable to the penalties provided in the said by-laws for the failure to deposit such plans, sections, and particulars, and that such builder shall, in carrying out any such work as aforesaid, observe all requirements contained in the by-laws made by the London County Council under the provisions of the Metropolis Management Act, 1855, sect. 202, and he shall be liable to the penalties provided for a breach of the said by-laws. The word "builder" is interpreted by the by-law as meaning the builder, contractor, or the person actually carrying out

the work, but not including workmen in the employ of such builder, etc. Repairs are to be carried out to the kerbs and footways of Geneva-road, at an estimated cost of 200*l.* Tenders are to be invited for tar-spraying roads during the financial year 1912-13, at a cost not exceeding 1,000*l.* The work of paving the footways on the west side of Lyham-road is to be proceeded with immediately. **Walthamstow.**—Plans submitted by the Engineer have been approved for making up and paving Merriam-avenue. An offer has been received from the Trinidad Lake Asphalt Paving Company, Ltd., to erect a plant in Walthamstow for the manufacture of Trinidad asphalt macadam under certain conditions. The Council have decided to take from the company a quantity of not less than 2,500 tons within the next two years, provided the company erect the plant and charge for the macadam at a rate not exceeding 1*l.* 6*s.* per ton, and for bitumen 5*l.* 5*s.* per ton, both delivered. Plans have been passed for Mr. T. Baker for six shops, Winchester-road, and for Messrs. Fowler, Richardson, & Pottier, for a factory, High-street. Plans have been lodged by the following:—Mr. P. Connist, theatre and lock-up shop, Marlowe-road; Messrs. F. H. Heath, Ltd., theatre, Wood-street; Mr. J. Starkey, twelve houses, Blackhorse-lane.

Westminster.—Macadam repairs are to be carried out in Ranelagh-road, at an approximate cost of 160*l.* A plan has been passed for buildings abutting on Vauxhall Bridge-road for Mr. E. Wimperis.

Wood Green.—Plans and estimates submitted by the Surveyor for paving, channelling, and making-up portion of Woodside-road and a portion of the Avenue, at estimated costs of 647*l.* and 403*l.* respectively, have been approved, and notices are to be served upon the frontagers to carry out such work. Application is to be made to the Local Government Board for sanction to borrow 115*l.* for taking up and relaying the existing surface-water sewer in the above-mentioned portion of Woodside-road, as the work could not properly be charged to the frontagers. Amended plans have been submitted by Mr. C. H. Croxford, Surveyor to the Council, for laying out the land at the rear of the Town Hall, The 500*l.* and a caretaker's lodge, etc., at 400*l.* The whole scheme, including the two foregoing buildings, is estimated to cost 5,350*l.* Plans submitted by Messrs. Humphreys, Ltd., for extensions to the church, Wesley-avenue, have been approved. Plans have been lodged by Messrs. Higgins & Thomerson, on behalf of Messrs. Edmonds, Denham, & Goyder, Ltd., for the construction of a basement at No. 10, Cheapside, High-road, Wood Green.

FOREIGN AND COLONIAL.

Hardwares and Building Trade Specialities, Toronto, Canada.

H.M. Trade Commissioner reports that a Toronto agent is desirous of getting into communication with British manufacturers of specialities for the building trades. The name and address of the agent in question may be obtained by British manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, 73, Finsbury-lane, London, E.C. Any further communications regarding the inquiry should be addressed to H.M. Trade Commissioner for Canada, 120, Board of Trade Building, Montreal.

Builders' Materials in Russian Far East.

The following information is from the report by H.M. Consul at Vladivostok (Mr. R. M. Hodgson) on the trade of that district in 1910; which will shortly be issued:—

Wire nails are imported from Germany or Belgium. For private buildings and for general purposes a very thin nail is required; the principal users being Chinese. Government building contracts require large quantities of nails. American nails come in occasionally, and, this being so, there seems to be no good reason why British manufacturers should not compete, having a great advantage in freights (which are 2*l.* 12*s.* or thereabouts from New York, as against 1*l.* to 1*l.* 5*s.* from Europe). C.I.F. prices for Belgian and German nails are from 1*l.* 10*s.* to 1*l.* 15*s.* (50 casks per cask 10*s.* 7*d.* to 12*s.* 1*d.* cwt.). They would require to be packed in 5-lb. (Russian) [= 4*lb.* avoirdupois] packages. Locks, door, and window fittings, stoves, and builders' accessories generally are of Russian and German manufacture, and of the poor quality which this market demands. American locks, bolts, and hinges find a good sale. British locks should be saleable in small quantities on account of their high quality. Window glass is imported almost entirely from Belgium, and is of what is known as the

"china" quality. Higher grade glass is very little in demand. The consumption of window glass is largely on the increase.

Technical Institute, Spain.

The *Gaceta de Madrid* of October announces that tenders will be opened on November 30 at the offices of the "Subsecretaría, Ministerio de Instrucción Pública y Bellas Artes," Madrid, for the erection of General and Technical Institute in Castell de la Plana. The upset price is about 44,000*l.* and a deposit of about 1,500*l.* is required to qualify any tender. Under the terms of the contract Spanish material only may be used, but if it is impossible to settle the matter satisfactorily by adhering to this condition then a further call for tenders will be made which will be open to foreigners, for the supply of such material as cannot with advantage be procured in Spain; but even in this case Spanish products will, other things being equal, be accorded a preferential margin of 10 per cent. over foreign estimates.

Public Works, Straits Settlements.

The Registrar of Imports and Exports Singapore (Mr. A. Stuart) reports that the following public works are to be undertaken in 1912:—

Singapore.—Erection of new lunatic asylum, 11,660*l.*; installation at the General Hospital of staircase, lift, and steam disinfecter for clothing, 1,516*l.*; building of an outdoor dispensary, 1,680*l.*; erection and extension of schools, 12,296*l.*

Penang.—Continued provision for the railway, 11,666*l.*; rebuilding of hospital, 2,102*l.*; completion of new dam at reservoir, 6,500*l.*; erection of four new schools and a jail ward.

Malacca.—Dredging at mouth of river, 1,750*l.*; erection of revetment wall to reservoir, 2,820*l.*; erection of two new court houses.

OBITUARY.

M. E. André.

The death is announced of M. Edouard François André, in his seventy-second year. M. André was a pupil in the Natural History Museum, Paris, and entered the "Service Promenades et Plantations"; he laid out Parc des Buttes-Chaumont in Paris, St. Paul, Lancashire, and several public parks, gardens and parks in Monte Carlo, France, England, Italy, Holland, Russia, Uruguay, etc. He was editor for a long period of *La Revue Horticole*, and was the author of "L'Art des Jardins," and of "Un Mois Russe," written after his visit to St. Petersburg in 1870 as a member of the jury of the International Horticultural Exhibition.

Mr. John Brown, F.R.S.

Mr. John Brown, of Longhurst, Dumfriesshire, who died on November 1, was an Associate Member of the Institution of Electrical Engineers and Fellow of the Physical Society, London. He was the inventor of the viagraph for recording inequalities of road surfaces, and was warmly interested in the work of the Institution. He compiled many scientific books, and acted as Secretary in Belfast for the visit in 1902 of the British Association.

Mr. F. E. Houghton.

We have to announce the death, which took place on the 3rd inst., of Mr. Francis E. Houghton, who was for thirty years the Superintendent of the main drainage works at Ormeau, and did much useful work there. He was about eighty-four years of age, and was one of the oldest subscribers to the *Builder*, having taken in the paper from the first issue and we regret to record his death.

PATENTS.

APPLICATIONS PUBLISHED.*

23,144 of 1910.—Henry Malcolm Bigwood Thomas Henry Hill: Hooks or clips for sewing, spouting, piping, and other articles of brickwork, woodwork, or the like.

23,825 of 1910.—Henry Kupper: Lock fastenings.

23,977 of 1910.—Alfred Ferguson: Lead joint for connecting lead flush or flow pipe with horn of earthenware or metal basins.

24,959 of 1910.—John Halliworth: Fastenings for windows, floors, and the like.

25,547 of 1910.—William Parkes: Lock latches.

25,596 of 1910.—William Alfred Hudson: Joints for cornice poles and other purposes.

* All these applications are in the stage which opposition to the grant of Patents of them can be made.

of 1910.—Thomas James and Charles Contrivance for facilitating the fastening of electric conductors to walls or other surfaces.
 of 1910. Albert George Burrell: Locking device for sash windows.
 of 1910.—Charles William Trotman: Improved fireplaces.
 of 1910.—Paul Leist Wettler: Fastenings for casements and other hinged windows.
 of 1911.—Thomas William Twyford: Improved valves.
 of 1911.—Duncan Falconer: Fastenings for window and similar sashes.
 of 1911.—Charles Martin Burrell: Improved window and sash.
 of 1911.—William Henry Tonks and Sparks: Opening and closing device for hinged windows or fanlights.
 of 1911.—Max Mannesmann: Construction of buildings.
 of 1911.—Max Mannesmann: Staircase for forced concrete.
 of 1911.—Max Mannesmann: Construction of buildings.
 of 1911.—George William Day: Better and easier attaching of the cord to the laths of venetian blinds.
 of 1911.—Edgar Frankignoul: Foundation of buildings.
 of 1911.—Egon von Seidlitz und Esdorf: Door stops.
 of 1911.—Johan Fredrick Bjurlund: Improved girders.

brackets 31, to reinforce the caps. The girders may extend over the columns like cantilevers, and may be single; or two girders crossing at right angles may be monolithic. The separate girders abut against a short stud on the cap,

13,787 of 1910.

13,153 of 1910.
 and having in its end a recess for engagement with a crosshead 7 on a rotatable shaft 8, mounted in a bearing 9 on the frame. Means for turning the shaft comprise a pin 10 on the shaft 8, having a pin engaging plate 11, which is moved up and down by a racked rod 12, pinion and operating
 of 1910.—John E. Conzelman: Reinforced concrete structures.
 relates to concrete buildings wherein superimposed columns are connected by a member having upper and lower plates, to which columns are bolted, the upper columns into a socket. The central member may be box form with side openings, through the floor reinforcements pass.
 of 1910. John E. Conzelman: Reinforced concrete structures.
 relates to concrete floors and like structures, wherein slabs are supported by girders which rest on columns. The slabs are placed on the column caps, so as to form a space into which project the main part reinforcing-bars of the girders, and bars surround the foot of a superimposed girder. The girders are provided with longitudinal bars 13, and transverse bars 14, the slabs with bars 21, 22. The columns may be made separately and centred on the girders; or each cap and column may be monolithic; the column skeletons consist of bars 27, and diagonal flat bars, with

and bars project from the girders, column, and cap into the enclosed space over the column. The superimposed columns are connected by semitubular members 52, and nuts screwed on the column bars.
 13,782 of 1910.—John E. Conzelman: Reinforced concrete structures.
 This relates to the construction of floor slabs by spacing the slabs slightly apart, and consists in casting concrete in the spaces 8 so as to form beams with lateral tongues which enter recesses 10 in the edges of the slabs. The beams may have shouldered or sloping sides, or the edges of the slabs may be grooved. The slabs may be placed in contact, but with recesses at the corners, forming a cruciform space into which reinforcing-bars may project, and which is filled in with concrete. Superimposed columns are connected to the slabs by short vertical rods, by a metal socket, or by rods 33, grouted in grooves 32, with adjusting wedges 35, and lugs 34.
 14,786 of 1910.—Thomas Dutton Boulton: Chimney-tops.
 This relates to chimney-tops wherein curved

13,782 of 1910.

tubes with open ends, top and bottom, are situated around, and communicate laterally with a vertical shaft. The tubes may have vertical upper openings and inclined lower openings, which are larger than the upper ones.

TRADE CATALOGUES.

An ingenious substitute for the ordinary wooden herring-boning has been brought to our notice by the Adjustable Joist Strut Company, of 20, New Bridge-street, London, E.C. The "Xtrut," as the device is named, consists of two V-shaped iron castings connected by a bolt. By tightening one of the two nuts upon the bolt the V-pieces are forced apart, the

Patent No. 18257, 1909.

spikes cast upon their feet enter the joist, and the strutting is complete. The invention should prove a great advance upon the ordinary wooden strutting, with its numerous split toes and risk of shrinkage. At the price at which the "Xtrut" is placed upon the market, the cost of material and labour should show a considerable saving over the old method.

The Patent Rapid Scaffold Tie Company, Ltd., of 124, Victoria-street, London, S.W., send us a booklet containing particulars and price list of their "Scaffixer" scaffold-ties. Among the contracts where these ties have been exclusively used we note the new Middlesex Theatre of Varieties, the new Money Order Office, Holloway, the new Y.M.C.A., Tottenham Court-road, and the Savoy Hotel extension.

Messrs. John Russell & Co., Ltd., of 145, Queen Victoria-street, forward their latest and very handsomely-produced catalogue of grates, ranges, chimney-pieces, sanitary goods, etc. The mantel-suites illustrated cover a wide range of price and design, and include every type and form of grate. Amongst the great variety of bathroom suites we particularly notice the "Solace" floor bath, an excellent and luxurious type of bath which should prove extremely popular where circumstances admit of its adoption. Messrs. John Russell also supply cast-iron grates and railings, ornamental cast and wrought iron work for porches and verandahs, rain-water pipes and connexions, and every form of builders' ironmongery, including door and lock furniture. We have received from Messrs. C. & R. Light, Ltd., of Curtain-road, London, E.C., their latest list of their current stock of hardwoods, including whitewoods, plain and figured oak, satin walnut, and Louisiana red cypress.

TRADE CATALOGUES.—Continued on page 554.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointment xvii.; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary. The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

** It must be understood that the following paragraphs are printed as news, and not as advertisement; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

NOVEMBER 17.—**Nottingham.**—BAPTIST CHURCH AND PREMISES.—Limited to Nottingham architects. Assessor, Mr. H. W. Wills, A.R.I.B.A. Particulars from Messrs. Rorke & Jackson, solicitors, King-street, Nottingham.

NOVEMBER 30.—**Cardiff.**—TECHNICAL INSTITUTE.—The Cardiff Education Committee invite designs and estimates for a technical institute. See advertisement in issue of August 18 for further particulars. Successful architect to carry out work. Premiums of 125l., 75l., and 50l. to Mr. E. T. Hall, F.R.I.B.A., assessor.

NOVEMBER 30.—**Hastings.**—EAST SUSSEX HOSPITAL.—The Joint Committee of the East Sussex Hospital and King Edward VII. Memorial Funds invite designs for new hospital. See advertisement in issue of August 25 for further particulars. Premiums of 125l., 75l., and 50l. Mr. E. T. Hall, F.R.I.B.A., assessor.

DECEMBER 5.—**Sofia.**—NEW MUNICIPAL BUILDING.—See Competition News, page 508, November 3.

DECEMBER 29.—**Glasgow.**—DESIGN FOR A BRIDGE.—Designs are invited (Alexander Thomson Travelling Studentship) for a bridge. Premiums of 60l. and 20l. are offered. See advertisement in issue of December 24, 1910, for further particulars.

DECEMBER 30.—**Welsh Bisteddof, 1912.**—DESIGNS FOR WORKMEN'S DWELLINGS.—Prize, 50l. Particulars from Welsh Housing Association, 8, Temple-chambers, E.C.

JANUARY 1, 1912.—**Rochdale Infirmary.**—EXTENSIONS.—Limited to Rochdale architects. Assessor, Mr. Alex. Graham, F.R.I.B.A.

JANUARY 6, 1912.—**Bolton.**—Miners' Federation Hall and Offices. Limited to architects within twenty-five miles of Bolton. Premiums, 50l. and 25l. Assessor, Mr. Jonathan Simpson, F.R.I.B.A. Particulars from Messrs. Fielding & Fernhough, 7, Fold-street, Bolton.

JANUARY 9, 1912.—**Stafford.**—PUBLIC LIBRARY.—The Stafford Corporation invite designs for a Public Library. Mr. Henry T. Hare, F.R.I.B.A., assessor. Second and third premiums of twenty and forty guineas. Particulars from Mr. W. Plant, A.M.Inst.C.E.

JANUARY 29, 1912.—**Montevideo.**—Government palace (premiums, 2,125l. and 850l.) and town improvement scheme (premiums, 1,000l., 640l., and 425l.). Conditions may be seen at the Board of Trade, 78, Broad-street, E.C.

JANUARY 31, 1912.—**Australia.**—DESIGNS FOR FEDERAL CAPITAL CITY.—The Government of the Commonwealth of Australia invite competitive designs for the laying out of this Federal capital city. See advertisement in issue of September 1 for further particulars. See also page 508, November 3.

JULY 1, 1912.—**Dusseldorf.**—A plan for the extension of the City of Dusseldorf. Premiums of 1,000l. to 375l. Conditions on application to the Chief Burgomaster, Dusseldorf. A translation appeared on page 365, September 29.

NO DATE.—**Armadale.**—Public hall and offices, to cost 2,500l. Premiums of 15l. and 10l. Particulars from the Town Clerk, Armadale.

NO DATE.—**Jordanhill, Glasgow.**—PROPOSED TRAINING COLLEGE.—See Competition News, page 508, November 3.

* NO DATE.—**London.**—NEW OFFICES. The Port of London Authority invite designs for new Head Offices in Trinity-square, E.C. See advertisement in this issue for further particulars.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

NOVEMBER 11.—**Bandon, Wall.**—Erection of a wall, etc., around the well at Crossbarry. Specification from Mr. Abram Haynes, Clerk of District Council, Council-room, Workhouse.

TO CORRESPONDENTS

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other docu-

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100l. unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

The Forecourt Gates to Drayton House. Attributed to Jean Tijou.

From Mr. J. Starkie Gardner's "English Ironwork." (Batsford.) (See page 559.)

It would appear from a paper which M. Henri Blanchard read before a recent Congress of French architects, and from certain resolutions which he submitted, that the system which prevails in France for the re-education of architects—a system which is established on pretty much the same basis as that adopted in this country—does not give general satisfaction. The average fee of 5 per cent. is considered an inadequate basis of pay for large public

works, but it is not considered an adequate basis where small and private work is concerned—the kind of work which engages the attention of a large proportion of architects. Here, indeed, the 5 per cent. arrangement is considered far from being a sufficient compensation for the art, skill, and time employed on the work. M. Blanchard asks, therefore, that certain conditions should be formulated by the chief architectural societies in France—the Société Centrale, the

Société des Architectes diplômés par le Gouvernement, and the Association Provinciale—by which the rate of pay should be regulated on a more equitable basis, so as not only to include the actual time engaged on the work calculated on the practice of a liberal profession, such as that of law or medicine, but also to take into consideration the special qualifications of the architect and the particular type of work for which his services are sought.

Pillar of Ornament and Gates. Designed by Tijou before 1690 for the Screen of the Fountain Garden at Hampton Court.

From Mr. J. Starkie Gardner's "English Ironwork." (Batsford.)

M. Blanchard considers that it is within the scope of practical politics to formulate an average rate of fees which would assist an architect, in such circumstances, to arrive at some arrangement with his client more generally satisfactory than is at present the case. It is interesting to note that the rates fixed by the Conseil Municipal of Paris are 6 per cent. for the first 200,000 fr., decreasing by $\frac{1}{2}$ per cent. for every 200,000 fr. until 1,000,000 fr. are reached, when the fee is fixed at 4 per cent. for any subsequent increase of the total cost of the work. It remains, however, to be added that where a scheme in its execution presents special difficulties, either from an artistic point of view or from some other cause, the amount of the fee is subject to proportionate augmentation to be assessed by the Conseil Municipal. In the contrary case, in which the responsibility and work of the architect is less, as, for instance, in the case of enclosing walls, paving, etc., his remuneration is subject to a diminution, the scale of which is again decided by the same authority.

The discussion on M. Blanchard's paper indicated that there is a considerable difference of opinion among French architects as to the advisability of attempting to change the present conditions under which architectural remuneration is effected. Although 5 per cent. is the honorarium which generally prevails over the whole country, it does not appear to be recognised by law except in the case of public work. Some of the provincial societies would seem to have formulated a scale of charges which is adopted by their members and which works satisfactorily. French architects,

the discussion suggested, have to encounter in the law courts a certain bias generally unfavourable to them on the part of the judges. M. Blanchard argued, and many of his *confrères* supported his view, that it is necessary to establish a minimum protective basis of charges, chiefly on account of the younger men, who have often to work for extremely unremunerative fees. On the other hand, it was generally agreed that the architect who has "arrived" is in pretty much the same position as the portrait painter of eminence who can approximately fix his own charges before he

accepts a commission. But that is the case all the world over. Men in this position are *hors concours*. But the practice of architecture involving as it does professional elements to which the practice of painters and other artists are strangers, its exponents can scarcely look outside the conditions which govern their own profession for guidance and precedents. In any case, the position of the man who has "arrived" should not make him indifferent to the kind of sweat to which his younger or less fortunate brethren may, through the force of circumstances, be subjected, and for which the law, according to existing decisions, offers no remedy. Whether indeed the architect be young or in the prime of life, whether he has attained eminence or the position of respectable mediocrity, the law fastens upon him so many responsibilities that his scale of charges should be in proportion to his burden of risk and liability. The matter is summed up in the observations which were made at the earlier Congress, in which comparison was made between the practice of architecture and that of other arts and professions. The painter and the sculptor, it was pointed out, obtain the value of their works; the physician and the counsel charge fees in accordance with their status and merits. The counsellor may advise his client badly, the cause may be lost, yet his fees are paid. A mistaken diagnosis on the part of a physician may involve the death of a patient, but the error is buried with him and the doctor receives his cheque. The architect, on the other hand, always receives 5 per cent.; but if he makes a mistake or is deceived justice may be invoked against him; he may suffer in pocket, in reputation, and his future prospects be seriously affected. But it is not so much with these issues of responsibility and risk that M. Blanchard was concerned; it is rather with the financial issues of the artistic skill involved in the performance of his work in which he seeks to establish for the architect equitable compensation.

It may be observed in connexion with

Overthrow to Centre of Gates, Oakley Park, Cirencester.

From Mr. J. Starkie Gardner's "English Ironwork." (Batsford.)

question of the fees of French architects that M. Blanchard seeks the sort of the three principal societies of architects who have their headquarters in Paris. There are, in fact, many architectural societies in France; and there is the same time no country in which the work of an architect is more adequately prized and appreciated. The various societies of these societies act and counteract each other for the general good of architecture as a whole; and in working for a high standard of practice the position of the architect gains greater distinction and influence. It is perhaps unnecessary to say that the membership of any of these societies is a finite guarantee of artistic or professional qualification. They are not unions. If men work together in corporate capacity for the advantage of art or craft, and incidentally for their own material advantage, it is natural that they should insist that a high standard of efficiency, in the particular art or craft, should be the *raison d'être* of individual membership. If this is not held in view the wholesome influence of the corporate body cannot be maintained, and its degrees or diplomas only confer a meretricious distinction. It is necessary, however, to say that the constitution and conditions of membership of the French societies vary

Balustrade of the Early XVIIIth Century. From a Mansion in Warwickshire. Probably of local craftsmanship.

From Mr. J. Starkie Gardner's "English Ironwork." (Batsford.)

considerably from British custom. We hope later to explain the various distinctions in the constitution of these institutions.

ENGLISH RENAISSANCE IRONWORK.*

TO the student of the decorative treatment of ironwork in the XVIIth and XVIIIth centuries Mr. Starkie Gardner's book will make a strong appeal. While we have had works illustrating examples of this period, no one has hitherto attempted to deal with the subject in an historical form, which, while giving a comprehensive review of the craft during the period selected, is at the same time sufficiently condensed to come, with its numerous illustrations, within the convenient compass of an average textbook. This aim is probably responsible for a slight disproportion in the space allotted to the various examples of the employment of ironwork, some two-thirds of the book being devoted to gates, while railings, balustrades, balconies, grilles, lamps, signs, and vanes are compressed into the remainder, with the result that staircases in particular hardly receive the attention they merit. It is true that Mr. Gardner in his Preface states that preference has been given to exterior examples, as more liable to damage and decay, but it somewhat detracts from the value of a work planned on the lines of this one to exclude typical and characteristic work because it happens to have a roof over it.

Having relieved our mind of the most important criticism to which this book seems open, we must in fairness add that had it been entitled and dealt with gates alone it would still have been a valuable contribution on its subject. We rather think that Mr. Gardner felt, and rightly felt, that in the gate and its adjuncts the smith found and solved all the most difficult problems of his art—certainly no other branch of his work calls for so keen a sense of proportion and composition. The magnificent series of great

gates illustrated and described in this work is alone sufficient excuse for its production.

After a brief introductory chapter on mediæval methods, followed by one dealing with the art as practised in the Jacobean period, the author brings us to the sudden and revolutionary developments due to the skilful craftsmanship of Jean Tijou, who, coming over with the Prince and Princess of Orange, was at the time of his advent already a master in his art far more accomplished and sophisticated than any English smith of this period.

Whether Tijou's influence was in every way for the best may perhaps be doubted. Mr. Gardner takes the view that Sir Christopher Wren, for one, considered his work florid and overloaded; but his knowledge of Renaissance ornament and his technical skill placed him head and shoulders above his competitors; and resulted in his becoming the dominating influence in English ironwork for the next half-century. His work has been criticised as less characteristic of metal than that of earlier date; and certainly much of his foliage is somewhat over-modelled and too independent of structure. Mr. Gardner attributes these defects to the fact that Tijou himself appears to have been an embosser, and therefore inclined to smother the actual smithing with his acanthus rosettes, masks, draperies, etc. The influence of Daniel Marot on his designs is also noted.

To what extent the great output of wrought-ironwork in the earlier half of the XVIIIth century was due to the men who had assisted Tijou is not quite clear, but it is obvious that it was largely influenced by his methods, more particularly in the case of Robert Bakewell and the brothers Roberts. Mr. Gardner illustrates many beautiful examples of forecourt screens and gates dating from this period, in which the verticality of the simpler portions is admirably contrasted with and set off by the more elaborate scroll work in the overthrows and in panels. Unfortunately, while in the country the taste for the landscape garden resulted in the removal of many of these screens, commercial considerations have proved hardly less destructive in our cities, and those remaining have, in many cases, been shifted to form park entrances and divorced from

the buildings they were originally designed to enhance.

We now come to the time when the architect begins to exercise a controlling influence over the crafts. Gibbs's "Book of Architecture," published in 1728, is given as the first work of an architect to include designs for wrought-ironwork. Three of his examples of forecourt screens are reproduced by Mr. Gardner, who points out that they are largely based on the work at Versailles; in his view they mark the doom of smithcraft as a fine art—a view that it is not easy to accept, as they are obviously based on lines appropriate to the work of the smith, and do not appear to preclude his practice of his art in any way except in respect of its due subordination to a general architectural scheme.

Our author uses this text as the basis of an appeal that the architect should give more freedom to the craftsman in the design of his special work, claiming that whenever and wherever art reached its noblest expression there were master craftsmen and *maîtres ornementistes* held

in honour and esteem; but that in the days for a craftsman to become known may too often debar him from architectural work, on which, as things are, he must mainly depend. We confess that we cannot believe that such an assertion is justified by facts, as we have always found that the architect is eager to welcome the imaginative and intelligent craftsman, provided he is free from vanity that prompts him to insist on exaltation of his own craftsmanship in a manner that would detract from the harmony of the whole design of which it must necessarily form a part.

Wrought-ironwork is not so confined in its technique as to be beyond the range of the architect's comprehension, and Mr. Gardner realises this; the tribute he pays to the work of Robert Adam in this branch of design.

In the space allotted to other branches of smith's work some excellent illustrations of stair ramps and fanlights are given, including a number of the latter reproduced from the designs published by Joseph Bottomley, in the style of Adam brothers, many of which may be seen in our London streets. The illustrations of vanes and weathercocks hardly up to the standard of the rest of the book, but, taking the work as a whole, it is undoubtedly a sound appreciation of the position taken by ironwork among the arts of the Renaissance in England.

THE R.I.B.A. AND THE AUSTRALIAN CAPITAL

HOWEVER keenly the necessity will be regretted, it will generally be recognised that, under the circumstances, the Institute had no option but to request its members not to take part in the competition for the new Australian Capital. It is possible that the expression of its disapproval at this late stage in the proceedings will inflict some hardship on individual members who may have started designs in the confident expectation that the conditions would ultimately be brought into line with the Institute's requirements. In this expectation the Institute may have shared, and may have thought that, negotiations being in progress, it was more courteous to refrain from taking definite action while there was a hope of bringing them to a successful conclusion.

Where great distances are involved a certain amount of delay may be unavoidable. It is understood, moreover, that the Institute, fully recognising the necessity for prompt action, made immediate representations to the High Commissioner, who communicated with the Government direct by cable. This necessity, however, not being so apparent to the Australian Government, their request took its leisurely course through the usual channels of official correspondence. In consequence, a position is created that is most unsatisfactory and altogether unbusinesslike. In order to avoid similar trouble in the future the Institute might perhaps think it worth while to consider the advisability of immediately and as a matter of routine, announcing its disapproval of every unsatisfactory

Model of Sir Cloudesley Shovel's Frigate on Rochester Town Hall: about 1708.

From Mr. J. Starkie Gardner's "English Ironwork." (Bat-ford.)

petition the moment it appears and negotiations are entered into with promoters. This disapproval could be withdrawn as soon as the conditions are brought into conformity with its relations. Competitors would then withdraw from the very first moment exactly where they stood, and hardships might be avoided which are sometimes apt to develop into grievances.

It should not be forgotten, however, that it is not always a hardship to be exempted from taking part in a badly-arranged competition. But, however such hardships may be, it is impossible altogether to ignore the fact that, under the present arrangement, every member of the Institute is in a position to acquaint himself with its relations, and should be able in the majority of cases to judge for himself whether a set of conditions is in conformity with them.

It is obvious that they are not, any member who starts before the Institute has given its sanction appears to do so in his own risk.

Not everyone perhaps can altogether understand what it must mean to the young, progressive, and up-to-date architect, with reputations to make, whom the Australian Minister expects to compete, deliberately stand aside from what may appear the chance of a lifetime; they are just the very men who will lose—if the Australian Minister does—that the sort of reputation an honorable man desires is not to be won by disloyalty to the best traditions of his profession.

After all, however hard it may be on individual members of the profession, it is still on the people of Australia. Perhaps it is only as it should be, the responsibility for this lamentable loss is not on the architects, but on the Australian Government.

NOTES.

Alfred Stevens. THE memorial exhibition of the models and drawings of Alfred Stevens just opened at the Tate Gallery will be admired by all architects, for no English sculptor (without extending the comparison to other countries) has passed at the same time such a variety of individual expression combined with the constructive and decorative creation of his art. Alfred Stevens had some lack of appreciation in his time, and his fame is, at it were, still being made. His work is largely known, even to the average art critic in England; and, abroad, the Belgian artist of the same name, an excellent one, but certainly not a man of equal gifts, possesses a considerable reputation. The Memorial Committee who are responsible for the initiation in the case of the Tate Gallery Exhibition, and for the gallery which henceforward will be specially reserved for his work, after the manner of the Turner and Watts exhibitions, owes its origin largely to the efforts and appreciation of Professor Legros, while the bust of Stevens is to be seen at the entrance to the gallery by Professor Lanteri—men of French nationality who have so largely identified with the

progress of the modern art movement in England. In this connexion it is interesting to recall the astonishment which Rodin, a sculptor of a very different method, expressed a few years ago on first seeing the work of Alfred Stevens, and his surprise that British sculpture possessed a man of such qualities. Alfred Stevens was an artist of considerable versatility; his drawings and portraits, while assisting one in the understanding of his main tendency, are none the less interesting on their own account. And we are glad to think that the British Museum, the Victoria and Albert Museum, and the Tate Gallery now share in the possession of a practically complete representative collection of his works.

Part of London Offices for the preliminary competition.

WE notice in the announcement of the arrangements for the preliminary competition for offices for the Port of London Authority that the promoters intend to reserve to themselves the right to invite six architects, other than the competitors in the preliminary competition, to take part in the final one. If this is intended to be simply and solely a right held in reserve to be exercised only in case of urgent necessity, no great objection need be taken to it. For a variety of reasons it may sometimes happen that designers of ability stand out, and that a preliminary competition produces no design worth building. In such a case no one would grudge the promoters the desire to obtain one that is, and we assume that it is simply for this purpose that this right is reserved. As in this particular case there is no reason to anticipate any difficulty, the promoters should have no occasion to exercise it. If, however, there is the slightest danger that anyone should make the mistake of taking this as a hint that if he happens to be too busy or too indifferent to enter the first competition at his own expense he has only to wait for an invitation to take part in the second at the promoters' expense, it might be only kind to deceive him at once. Recent experience in a somewhat similar form of procedure is not altogether encouraging. The exercise of this right was not found necessary in the Wesleyan Hall Competition, and in that for the London County Council building nothing was more noticeable or more freely commented upon at the time than the fact that so few of those who were specially invited justified their invitation, and that those who did justify it were the very ones who might be expected to compete whether they were invited or not. This latter significant fact points to the conclusion that, unless they are sure of an invitation to the final competition, all the most competent men will enter the preliminary one. A chance to distinguish themselves, a fair field and no favour is what really attracts them. Given these essentials, the Port of London Authority need have no fear that the best men will not compete in the first competition. There is no harm, however, in holding in reserve the right to invite others in case of accidents, provided it is distinctly understood that there is no deliberate intention of using it without adequate excuse.

Preservation of Churches from Fire.

THE Council of the Royal Institute of British Architects has done wisely in drawing the attention of those responsible for the care of our churches to the risks they run from fire. Periodical examination of heating apparatus and electric installations is advised, and the necessity for competent supervision of new installations is emphasised in view of the fact that these are frequently the cause of the deplorable destruction of works which it is impossible to replace. Further suggestions refer to insurance policies, and it is pointed out that stained glass, organ, fittings, and furniture are frequently undervalued, and the amount of the insurance has proved entirely inadequate for their proper reinstatement.

Balliol College Chapel.

THE term vandalism as we understand it does not merely apply to the act of doing away with, or improving out of artistic existence by indiscreet restoration, a building sanctified by its age; it applies with equal force to any unwarrantable interference with comparatively modern structures which possess sufficient quality to express in some way or other the spirit of their time. There are few more representative buildings of the latter type than Balliol College Chapel, and none perhaps which expresses more adequately a momentous intellectual and religious movement, such as the Tractarian movement at Oxford. It is, further, the work of one of the most individual architects of his time. To do away with such a building without more reasonable cause than at present appears would be an act of vandalism of a very wanton character. The building is in good repair, increased accommodation is not, we gather, demanded. So there is, *prima facie*, no reasonable justification even for the suggestion of such a change. But—and we would wish to emphasise this—a wealthy patron appears who wishes to see erected on its site a replica of the still older building, now, of course, gone for ever, designed from an old print. That is to say, Butterfield's Chapel, which is not only a work which evokes as architecture the admiration of Mr. Norman Shaw and many others entitled to express an opinion on architectural merit, but which also, according to others, gives architectural expression to a movement of the widest interest, has to be demolished at the will of a person possessed with sufficient wealth to gratify it. It will be seen that the principles behind the issues at stake in the present instance are considerable, and if we were to apply them over a larger area (as we might) evil and destructive. No building of more or less national importance would be safe.

"Real Old-Fashioned." from "The Office Window" of Tuesday's Daily Chronicle.

and we hope it may catch the eye of any or every future Mr. "Trust Smelter," and that the point may not be lost by anyone who may chance to read what our contemporary says:—

"Mr. Smelter Trust Stokes (the name is congealed under stress of space) is building a house in Connecticut, and it is going to be real old-fashioned. Most of it was built from

our battleship *Wellington*, which Mr. Stokes bought for 50,000. Now he has bought a Suffolk manor-house of the Tudor period. Half of it is there already, the other half will be there in the spring. The combination should be striking when Mr. Smelter Stokes has completed his freak house. One of these days we may wake up to find Westminster Abbey missing. And to rediscover it as the dining-room—with the Hippodrome close at hand as the drawing-room—in the splendid home of another Mr. Trust Smelter—if that is his 'unfounded name.'

Mortar at Tattershall Castle.

AS THE ownership of Tattershall Castle has lately been brought so much before public notice in connexion with the removal of its famous fireplaces, it may interest our readers to know that a specimen of the mortar employed in its erection was included in the analyses made and quoted in an article on ancient mortar published in the *Builder* of February 11, 1893. The mortar contained 24.83 per cent. of lime. The sand employed consisted of two different kinds, the greater portion consisting of small sharp grains of good quality, the remainder being somewhat rounded and water-worn. The relationship of lime to sand was as 1 to 1.75, whereas in the present jerry mortar the relation is often only 1 of lime to as much as 7 of sand. Though the proportion of lime is satisfactory, the percentage of amorphous silica existing as hydrated silicate of lime is comparatively low, namely, 3.05 per cent. On the whole, therefore, the mortar for excellence in durability cannot be compared with that of Tintern Abbey, Whitby Abbey, or even Fountains Abbey.

The Late Mr. D. G. Driver.

IN the wholly unexpected and greatly-regretted death of Mr. D. G. Driver the Architectural Association lose a singularly devoted and able Secretary, whose record of twenty years' service covers a period of great importance and activity in the history of the Association. His advent marked a parting of the ways, for soon after his appointment the modern necessities made it imperative for the Association to abandon, to some extent, the old voluntary system which had served so well in the past for a more progressive educational policy, and much of the work necessary to carry out the important developments which have given us the Association we know to-day fell upon Mr. Driver and the staff. He combined many of the qualities which make an ideal Secretary, not the least being great capacity for the duties of the permanent head of a large and progressing society and a readiness to assist—with a cheerfulness which made the service appear almost a personal matter—all who applied to him for information or help. It may be said of him more than of anyone else we know that his readiness to oblige others, often involving no little trouble and self-sacrifice, had become part of his nature, and his cheerful willingness and engaging friendliness endeared him to all with whom he came in contact and is the secret of his popularity and success. As we have already said, the Association have lost a most able Secretary, and they will find it no easy matter to fill his place.

THE LATE MR. D. G. DRIVER.

A MEETING of the Architectural Association was held on Monday at Tufton-street, Westminster, S.W., Mr. Gerald C. Horsley, President, in the chair.

The minutes of the last meeting having been read by the Hon. Secretary, Mr. H. A. Hall, and confirmed,

The President

said the next business was of great sadness, for it fell to him to announce the death of their Secretary, Mr. Driver. This sudden event took place early on Saturday morning, and so far they had no particulars concerning it; they had only heard that Mr. Driver died suddenly. They all knew that their Secretary had been out of health for many months, culminating in a breakdown last summer, when he was obliged to go away for eight weeks. He returned from his holiday apparently quite strong and well, but he could not have really recovered, and sometimes since his return, although he appeared well and strong to most, it seemed to some of them that the effects of his illness were still upon him. He (the President) feared that that must have been the case. He was going to ask Mr. Arthur Bolton to move a vote of condolence with Mr. Driver's relatives, and Mr. Keen to second it, and afterwards, acting on the decision of the Council, to adjourn the ordinary meeting arranged for that night

as a mark of respect to their late Secretary. This he was sure they would all agree to as a small indication from the general body members of the Association of their deep feeling in the matter, and their realization of the great loss which they had sustained. He had only to remind them that Mr. Driver was appointed Secretary exactly twenty years ago, and that during the whole of that time he had devoted all his energies—and he might say all his time, for he worked as hard and late—to the best interests of the Association. They would all miss their old friend the Association as a society would miss him as an earnest worker and as a devoted adherent.

Mr. A. T. Bolton,

in moving a vote of condolence to the relatives of the deceased, said he was anxious to do so, as being, he believed, a member on the Council longest acquainted with Mr. Driver. It was, as the President had mentioned, twenty years since Mr. Driver came to them, and it seemed difficult to think of the Association without him, although there were two or three in the room besides himself who could remember the time before, when the Association was conducted with the zeal and self-sacrifice of honorary secretaries alone. Ever since Mr. Driver had been with them he had worked with the most indefatigable zeal and the most wonderful good temper, devoting himself to putting the Association on a splendid business footing. Their Secretary never became an official; he seemed to remain the friend of all and to know everybody. He (the speaker) never knew anyone less bound with red tape, and it was characteristic of him that any suggestion for the good of the Association he would immediately see in the best light and give excellent support to in the Council in carrying it out. Mr. Driver had other interests except those of the Association, and he (the speaker) well knew, after long and complicated Council meetings when everyone else had left at a very early hour—in the old days that was, when the Council was not so businesslike—it fell to Mr. Driver to put all the proceedings in order. He managed everything in quite a wonderful way, thanks to a marvellous capacity for detail and a wonderful memory. At the time when he (the speaker) was under the mastership of the Day School he would have been very unwilling to do so but for his knowledge of the unfailing assistance would receive from Mr. Driver, who was always ready to give up his time to sug-

The Late Mr. D. G. Driver.

by which things could be carried out in the best way. A long list of Past-Presidents of the Association knew the value of his services, and had expressed their indebtedness to the Secretary for his help. Mr. Driver was to be present not only at the meetings of the Association, but he often attended the private meetings as well, and members were very glad to see him. If anyone resigned from the Association it fell to Mr. Driver to know they could get the resignation withdrawn. He would write round for subscriptions for special objects, and, in short, he endeavored to have no object in life except the prosperity and progress of the Association. His recollection that would linger in many of the members would be that of Mr. Driver's mind on the eve of some A.A. function, or visit, or meeting that he had an idea it would be a failure. If you ran across him then, it meant attending, for he would say to you that nothing else could avert the fate of the A.A., that it became impossible to find anyone with such admirable traits to succeed him.

Arthur Keen

Mr. Keen was glad to bear his testimony as to the value of the work of Mr. Driver, and he could testify gladly as to the qualities shown by their Secretary on occasions. One thought of him as a man of many years' standing and as the friend of many friends, and one envied him that position. He had always been struck by the fact that wherever Mr. Driver went he was always met by a crowd of people, and he would write round for subscriptions for special objects, and, in short, he endeavored to have no object in life except the prosperity and progress of the Association. His recollection that would linger in many of the members would be that of Mr. Driver's mind on the eve of some A.A. function, or visit, or meeting that he had an idea it would be a failure. If you ran across him then, it meant attending, for he would say to you that nothing else could avert the fate of the A.A., that it became impossible to find anyone with such admirable traits to succeed him.

G. E. Nield

Mr. Nield should like to associate himself with the vote of condolence, as he regarded Mr. Driver as a particularly old friend. The money that had been borne was perfectly adequate; it did not matter how long one had been away from the Association, one was always remembered by Mr. Driver, and if one wanted information or help he was always ready and willing to give every assistance. The motion was then agreed to in silence, the members present rising from their seats as the President put the motion. The President said there was one announcement to make as to the conversation arranged for November 23 at Tufton-street. The Council had had the matter under consideration, and they had decided that the wish of their Secretary was always that the work of the Association should go on without hindrance, and it was felt that it would have been Mr. Driver's wish that conversations should be held on the date named.

The next ordinary meeting of the Association will be held on November 27, when the paper entitled "Thoughts on Jacobean Architecture" will be read by Mr. Arthur T. Bolton.

ENGINEERING SOCIETIES.

The Institution of Civil Engineers.

At the last meeting of this Institution, on Friday, two papers were read, the first being on "The Loch Leven Water-Power Experiments," by Mr. A. H. Roberts, M.Inst.C.E. The site of the reservoir is favourably situated for storage purposes, and the full reservoir is about $\frac{1}{2}$ miles in length and 1 mile in breadth. Its greatest depth is 75 ft., it impounds over 20,000 million gallons of water. The Blackwater dam is 3,112 ft. in length, with a maximum height of 85 ft., its surface being 1,068 ft. above Ordnance mean. About half its length is formed as a waste-weir in six horizontal steps of 6 in.

each. The foundation is of an exceptionally sound character; only a few feet of the surface beds had to be removed to obtain a satisfactory foundation. The second paper was entitled "The Hydro-Electric Plant in the British Aluminium Company's Factory at Kinlochleven," by Mr. F. B. Sommerschein, Assoc. M.Inst.C.E.

The Concrete Institute.

At the twentieth ordinary general meeting of the Concrete Institute on the 9th inst., at Denison House, Westminster, S.W., an address was delivered by Sir Henry Tanner, President, of which the following is an abstract:

"This Institute has now been in existence some three and a half years, and as this is the first Presidential address that has been presented it seems to be a fitting opportunity for taking stock of the work it has done during that period, and in so doing I may touch upon matters to which I have never referred on other occasions. As some of you are aware, it came into being at a luncheon given by Mr. Edwin O. Sachs at the Ritz Hotel in July, 1908, and Lord Plymouth was elected first President.

The membership is distributed approximately as follows: 350 in London, 260 in the country, and 260 abroad; while the professions, etc., are represented by 582 engineers, ninety-one architects and surveyors, thirty-one concrete specialists, forty-five chemists and cement manufacturers, and twenty-eight contractors.

Less interest appears to be taken in the papers read and discussions thereon than was formerly the case, while it becomes increasingly difficult to obtain papers which are at once suitable and of sufficient interest. It is desirable, therefore, that the causes which give rise to this state of things which has arisen should be inquired into and remedied.

Concrete and reinforced concrete form parts only of structures, frequently there is much steelwork and other materials involved including heavy timbering, either permanent or in false work.

It is considered, therefore, that structural engineering being so intimately connected with our special subject might well be regarded as coming within our purview and that papers on such matters should be read and discussed. This is particularly the case having regard to the large number of engineer members. This can be done without in any way trenching on the prerogative of other societies, as there is no Institute dealing particularly with such subjects. I hope that the results which this Committee may arrive at will be to the distinct advantage of the members.

The Committee is empowered to take energetic steps to foster the structural engineering side, and thus we see how in future we shall in effect be not only a Concrete Institute, but an Institution of Structural Engineers as well. With the extended field as indicated above in which practically all our members are interested, and the majority actively engaged therein, our work should be much more valuable and our membership influenced accordingly.

In this connection I cannot but think that membership requires better classification, and could usefully be rearranged on the lines of several of the engineering societies. In the future also it may be possible and advisable for us to hold an examination in advanced structural engineering, which shall in no way trench upon the examinations of other bodies, but be supplemental thereto. Such prospects of extended scope for the energies of members is encouraging.

Further, I think that much more use might be made of the *Journal*. Many members and others must be in possession of information which would be of the greatest value to their brethren, while short articles of approved quality and matter would, I believe, be welcomed by the Council. The *Journal* should be issued regularly at intervals not exceeding three months.

I am pleased to be able to say that the Institute of Civil Engineers has taken up the subject of reinforced concrete through the Committee which it appointed some time ago, and to which my name was added in June of last year, and a considerable sum of money has been devoted to experiments which are in process of being carried out, and I hope for much advantage from what I may regard as the co-operation of that Institute. There is no doubt that experiments are needed in this

country with a view to obtaining a consistent and complete series based on materials to be obtained here and mixed and tested under similar conditions. At the present time we have to rely on experiments in America, Germany, and France with cement of varying character and local aggregate, and it would be of the greatest advantage if these could be repeated in some cases at intervals for some years; the improvement in strength being so great. Perhaps this want may be removed.

For some time past the Joint Committee appointed by the Royal Institute of British Architects, upon which we are represented, have had under consideration the revision of its first report, and the revised edition was published several months ago in a much more handy form than before, and at the small price of 1s. As Chairman of the Committee I desire to thank the members of the Sub-Committee, upon whom the work really fell, for their labours so freely given; while it is satisfactory to think that this report, so far as it goes, is accepted generally as the basis of local regulations for governing buildings of this character. These regulations require to be framed in such a way that they can be amended in order to keep pace with the acquisition of fuller and more complete knowledge, which will no doubt come in due time.

The importance of being able to do this is shown by it having been necessary for the London County Council to obtain an Act of Parliament in order to make such alterations and additions to its Building Act to admit of reinforced concrete being used in an adequate way, and so preventing the development of a method of construction which has been proceeding in America and on the Continent at a pace considerably in advance of this country, and at a saving of much money, while under suitable conditions it is a far better method of construction to adopt for safety, as in the case of countries liable to seismic disturbances.

However, with the approval by the Local Government Board of the London County Council by-laws, after submission to several societies, including ourselves, for observations, it may be expected that there will be a considerable extension in the use of reinforced concrete in London, as also in other parts of the country; other cities having also taken steps to admit of such methods of construction being used, and it may be hoped that the list may be much extended.

The preparation of such reports and the adoption of by-laws regulating the use of reinforced concrete must tend to standardisation in design, and this must prove all for good. We have fortunately been fairly free from any serious failures in reinforced concrete construction, but experiences in America and on the Continent show that there is need for watchfulness. Although most of the failures have been attributed to bad construction and the ignorance or carelessness of contractors and their employees, cutting in design may have been a contributory cause.

It is interesting to note that the American Joint Committee on Concrete, which some time ago, like our own Joint Committee, issued an interim or first report, has now under consideration a further report brought up to date.

The Board of Education appointed a Committee to inquire into the question of economy in building, and as to whether buildings of a more temporary nature could not very well be brought into use. Reinforced concrete came in for its share of the discussion, but the estimates of cost varied largely, from 33 per cent. less to 10 per cent. more than for ordinary building. No difference of locality will account for these variations. It seemed to me that witnesses having a more intimate knowledge of the cost of such buildings might have been called, while it should be possible to standardise such buildings and so effect considerable economy. There can be no question of the greater desirability of structures of these materials with a minimum expense for maintenance, less cost for heating, concrete being a good non-conductor, while the reduced cube must make for economy. A loan period of thirty years was referred to, while the usual loan period for schools of ordinary construction was stated to be fifty years. It is impossible to understand the difference in treatment. It is very little good encouraging specific proposals for the use of novel materials or methods for public elementary schools when such differences of

treatment prevail, and in effect penalising any new system of building, while local by-laws make no special provision proper to the use of reinforced concrete. In order, however, to remove this last difficulty it was suggested in the report that legislation should be promoted to exempt school buildings, the plans of which had been approved by the Board of Education from the operation of local building by-laws. It also recommended that the building regulations of the Board of Education should be revised with the same object of removing obstruction.

The Council inaugurated a series of lectures of an elementary character given by Mr. R. W. Vawdrey during the spring, which were fairly well attended, but we can scarcely hope to effect much good in competition with the courses given at the London County Council Schools and under the auspices of the London and other Universities, which have the advantage of testing apparatus, etc., and are generally better equipped. This is a matter worthy of the consideration of the Council.

The Standing Committees of the Institute have done good service; the new notation appears likely to be adopted generally in English-speaking countries, and its adoption is now being considered in America, with, I understand, reasonable hopes of success. We have already intimated that we shall be happy to co-operate with the American Joint Committee in endeavouring to arrive at some common notation.

Useful papers have been read before the Institute during the past sessions, and among those of last session that read by Mr. R. W. Vawdrey on "The Dissociation of Competitive Designs and Tenders" is one of much interest to many.

Competition in reinforced concrete work has now proceeded to inordinate lengths, and it would seem that we have obtained the chief advantage to be derived from competition in design and that steps should be taken to put some limit to it. To effect this designers must be placed more in the position of consultants, and not so closely associated with contracting firms as has hitherto been the case.

Much is said about the architectural treatment of concrete, and that that treatment should be appropriate to the material. This subject was dealt with by Professor Beresford Pile in a most interesting paper, and we hope that the discussion may be continued in a full meeting later on. The subject is a difficult one, and formed one of the items to be discussed at the International Congress of Architects, but although there was some discussion, it was considered that the time was not ripe for any resolution to be moved. The great desire is to make the whole building of reinforced concrete, including the external walls, and developing some new method of architectural treatment.

I now come to the future. The Institute has a strong Council and an energetic Secretary, who are anxious that the Institute should take its proper place in the scientific world, and the members look for information and general assistance.

To some extent, as I have shown, the Council has devoted itself to meeting this want, and is, I think, fully alive to the necessity of obtaining good papers, but the great difficulty is to obtain the offer of them. Everyone should therefore use his influence in this direction. After all, Institutions of this nature are established for mutual information, and it is the business of all members to assist in this object.

It may be thought that my remarks have a pessimistic tendency, but that is not intended, my desire being to urge all our members to take what part they can in the work of the Institute for the benefit of all. With the extension of our scope to include structural engineering in its broad aspect we shall have a wider outlook and a future of great usefulness with a possibility of a considerable increase in membership. I therefore conclude with feelings of the most optimistic character.

Bristol Association of Engineers.

The first dinner of the current session was held at the Imperial Hotel, Clifton, under the Presidency of Mr. T. J. Moss-Power. The President, before giving his address on "Modern Engineering Practice in Sewerage and Sewage Disposal Works," made a few

general remarks. He said they were now commencing the eighteenth session, and gave some particulars as to the organisation, formation, and past work of the Association. It appeared that some sixty-eight papers had been read and discussed, and numerous visits had been paid to works. The President, in the course of his address, said:—"It is a pleasing aspect for engineers on looking out over the face of the world to see how much of the real progress of civilisation is due to their efforts, and how proud of this fact must every engineer be, no matter in what branch of engineering he may be engaged. The self-satisfaction that comes from having created something which is of positive benefit to his fellow-man is indeed worth all the trouble, and the greater the effort put forth, the greater the satisfaction. A judicious blending of physical exercises, including the art of national and self defence, with sound scientific and practical education on lines most fitted for the career it is intended the youth to follow, is, I consider, what is desirable, and with this object in view there should be greater co-ordination amongst the many educational institutions than exists at the present time."

GENERAL NEWS.

Professional Announcements.

Mr. C. Orlando Law, architect and surveyor, asks us to note that he has changed his address from "Dacre House," Arundel-street, Strand, W.C., to 15, Rossmore-gardens, Cheyne-gardens, S.W. We should like, as courteously as possible, to intimate to Mr. Law that the initials "L.R.I.B.A." used after his name are not considered permissible. "Lic.R.I.B.A." or "Licentiate R.I.B.A." is the approved form.

We regret to announce that Mr. Geo. Stanley Rees, architect, of Calgary, Alta, Canada, while in the enjoyment of what seemed to be the best of health, has been stricken by a stroke of paralysis. For three days his life was despaired of, and now he is denied the power of speech. Hopes are entertained of his complete recovery.

The Architectural Association Conversazione.

The Council of the Architectural Association have decided that the annual conversazione, arranged to take place on the 23rd inst. at Tufnell-street, S.W., shall not be deferred owing to the death of their Secretary, believing that that decision would have been in accordance with the wishes of Mr. D. G. Driver, who had the welfare of the Association always at heart.

Lectures on Reinforced Concrete.

In view of the revised syllabus of the R.I.B.A. Examinations (which now includes reinforced concrete in the final stage), a special course of six lectures on "The Principles of Design in Reinforced Concrete," specially adapted for architectural students, is to be given at the Westminster Technical Institute, Vincent-square, S.W., on Friday evenings, commencing November 17. The lectures cover the design of beams, floors, slabs, columns, arches and walls, shear deflection, falsework, etc.; and are based upon the latest R.I.B.A. report, which is recommended as a text-book. The fact that examples of design are to be worked out during each lecture would appear to indicate that the treatment will be practical and not exclusively shrouded in mathematics. The fee for the course is 2s. 6d. The lecturer is Mr. E. J. Waldram, the author of the recent series of articles in these columns upon "Definitions used in Structural Mechanics."

The Surveyors' Institution.

The portrait of Mr. Daniel Watney which was painted by the Hon. John Collier was presented to Mr. Watney at the Surveyors' Institution, 12, Great George-street, Westminster, on Monday. Subsequently Mr. Watney requested the President to accept the picture on behalf of the Institution.

Election of a Royal Academician.

The vacancy created by the death of Mr. Edwin A. Abbey, R.A., in last August, has been filled by the election, on November 8, of Mr. Lionel Percy Smythe, A.R.A., and member of the Royal Water-Colour Society. Mr. Smythe, a painter in water-colour and in oil, has exhibited in the Royal Academy rooms during more than forty years past, and

was elected an Associate in 1898. His "Germinal," in water-colour, was purchased in 1896, for 100 guineas, by the Chantrey Trustees, who also, it is understood, would have bought in 1901 his "Within Sound of the Sea" had it been painted in England.

Co-Partnership Tenants, Ltd.

Earl Grey is to be welcomed back to Canada at a dinner to be given in the Holborn Restaurant, London, this Friday, November 17, at 7.30. Mr. Justice Neville will preside.

Fritwell Manor.

Sir John Simon, the Solicitor-General, has purchased Fritwell Manor, an estate between Bicester and Banbury, Oxon. The late Mr. Thomas Garner, in partnership with the late Mr. George Bodley, devoted much time and money to the restoration of the building. The house, with 12 acres, and the advowson of St. Olave's, Fritwell, has been sold for 7,300.

Metropolitan Mayors, 1911-12.

Amongst the mayors who were elected last week are the following:—Mr. E. M. Preston, L.C.C., mayor in 1909 (Deptford); Mr. G. W. Holtzapffel, proprietor of the long established firm of lathe and tool makers (Hampstead); Mr. W. Whitaker Thompson, late Chairman, L.C.C. (Kensington); and Mr. F. J. Sedgwick, engineer, and member of the Borough Council (Poplar).

Bunyan Window, Westminster Abbey.

The window, by Mr. J. M. Comper, will be formally presented to the Abbey on January 25. It is fixed in the west wall of the north transept, and has cost 1,200l. The headlight depicts the Lamb of God; in the eight other lights are scenes taken from the Pilgrim's Progress, including Christian's deliverance of the burden of Sin, the Interpreter's House, the fight with Apollyon, Vanity Fair, and Christian and Hopeful entering the Celestial City.

Lighting of the City Streets.

The Streets Committee of the Corporation have formulated a scheme for lighting the street with both electricity and gas by means of lamps centrally hung, as much as possible, after the kind now used in Cheap-side, west end, for electricity, and in Cannon-street, east end, for gas. It is calculated that the new project will result in the saving of many thousand pounds a year in respect of cost; and the increasing of the illumination-power by nearly 50 per cent.

International Exhibition, Amsterdam, 1912.

The Corporation of Amsterdam will hold, on April 13—June 8, next year, an International Exhibition of works by living artists, to include sculpture, paintings, water-colours, and pastels, designs in black-and-white, lithographs, and engravings. Exhibitors should be forwarded between February 26 and March 2 to the Comité Exécutif, Exposition Internationale Municipale des Ouvrages des Artistes Vivants, Musée Municipal, 13, Paulus Potter-straat, Amsterdam.

Bournemouth's Sea-Front.

A Local Government Board inquiry was held at Bournemouth a few days ago with respect to an application by the Town Council to borrow about 10,000l. to construct an overcliff drive along the sea-frontage of Boscombe Manor and Wentworth Lodge estates, between Boscombe and Southbourne, and for works of sewerage. The Town Clerk, and the Borough Surveyor, Mr. F. W. Lacey, gave particulars of the scheme, which provides for a drive nearly a mile in length, and opens out some fine views of the Isle of Wight and Purbeck Hills.

Christ Church, Endell-street, W.C.

The Rev. S. A. Griffiths, incumbent, makes an appeal for a sum of about 950l., wherewith to carry out the repair and restoration of the fabric. The church was built of Kentish rag with Bath stone dressings for the parishioners of St. Giles-in-the-Fields, in 1844-5, after the designs, in the Early English style, of B. Perry, illustrated in the *Builder* of March 8, 1845; it was restored in 1877 by Butterfield. The church was struck twice, and the spire was shattered by lightning on August 17, 1887, scarcely did any portion of the edifice escape. The County Fire Office undertook to rebuild the spire, at the cost of 1,616l., and the fabric was reinstated in other respects under the directions and superintendence of Mr. R. E. Tyler, F.R.I.B.A.

Section of Sanatoria : National Insurance Bill.
 (Clause 47 of the National Insurance Bill, which clause was passed in the House of Commons on November 9, provides for the distribution by the Local Government Board, with the consent of the Treasury, of such sums may by statute be available for the provision of sanatoria and kindred institutions, and empowers the Board to authorise a county council, on receiving a grant, to provide any such institution, to erect the buildings, to pay the cost, so far as it is not met by the grant, out of the county fund, and to manage and maintain the sanatorium.)

Richmond Hill.

At the meeting of the Surrey County Council at Kingston on the 14th inst. a report was presented by the General Purposes Committee stating that plans had been submitted relating to a proposal by the Earl of Arundel to construct a cut from the Thames between Richmond and Kingston through the riverside lands at Ham to a small dock proposed to be formed upon a site near the river, where excavations for gravel are now being made. The Committee recommended the Council to agree to the proposal, subject to certain modifications of the plan being agreed by Lord Dysart. Several members, however, took exception to the construction of the dock on the ground that it would be detrimental to the amenities of the view from Richmond Hill, and Councillor Thompson (of Richmond) proposed, and Councillor Humphreys (of Richmond) seconded, a motion that the matter should be referred back, and this was agreed to.

Heroes of the French Revolution.

M. François Sicard has completed in plaster a group of statuary, on which he has been engaged for some years, symbolising the Great Revolution and the National Convention.

The monument has been placed temporarily in the Panthéon to enable the sculptor to make alterations before it is executed in marble. The composition is dramatic and well conceived. Portraits of Robespierre, Danton, Hoche, Desmoulins, Marat, Vergniaud, Carnot, and Condorcet are included, and when completed the memorial will be an attractive feature of the Panthéon.

Haggerston Castle, Northumberland.

Haggerston Castle, near Berwick-on-Tweed, which was almost entirely destroyed, with much of its valuable contents, by fire on November 5-6, was rebuilt some fifteen years ago, at a cost of more than 100,000*l.*, by Mr. C. J. Leyland, upon the site of the mansion which replaced the old Castle. The old Castle, the seat of the ancient family of Haggerston, was burned down in 1618, with the exception of the tower wherein Edward II. in 1311 received the homage of Thomas, Earl of Lancaster, grandson of Henry III., for the earldom of Lincoln, which he acquired by marrying Alice, daughter and heir of Henry Lacy, Earl of Lincoln. The tower, standing beyond the conservatory of Mr. Leyland's house, has fortunately been again saved.

Llanrwst Sewage Disposal.

The Llanrwst Urban District Council have approved and adopted a scheme of sewage disposal for their town, prepared by Mr. Harry W. Taylor, A.M.Inst.C.E. (Messrs. Taylor & Wallin), of Newcastle-upon-Tyne and Birmingham. As the valley of the Conway is subject to severe floods, special means of protection had to be taken to avoid damage and interference from this cause. The cost of the works is estimated at 5,000*l.*

Lord Howard de Walden's Estate, Marylebone.

Lord Howard de Walden's scheme for dealing with his property in the parish of

Marylebone (of which we gave a brief historical account in our issue of September 2) embodies the offer to his tenants of leases for 999 years at the rents reserved by the existing leases. They are invited to submit the terms upon which they would be prepared to extend their present leases and purchase 999 years' leases; or, if they prefer it, the terms upon which Lord Howard de Walden is prepared to grant extended leases will be communicated to them upon application to the Estate Office, 23, Queen Anne-street, W. If it be so desired, his lordship is prepared to leave two-thirds of the price of the reversion upon mortgage for five years certain at $\frac{3}{4}$ per cent. In every instance the claims of a sub-tenant who is a substantial occupier will be considered before any terms are arranged. In a circular letter addressed to his tenants Lord Howard de Walden says :—

"My wish and intention is to offer my tenants as much freedom in dealing with the properties they occupy as is compatible with their mutual protection, such covenants only as may be necessary for that purpose being retained. . . . The offer will be of a lease for a term of years which, with the existing term or terms, will make up 999 years from the present time. The rent reserved will be that reserved by the existing lease or leases, and the consideration payable by the tenant will be a sum equal to the reversionary value of the property after deducting the rent reserved, such reversionary value being the difference between the value of the existing lease at the present rent and of the lease to be granted."

Property Sales.

The Hurlingham Club have purchased Broome House and its grounds, appertaining to the Sullivan estate, Fulham; the early Georgian mansion and the land, 24 acres in all, realised 20,000*l.* Other properties recently placed in the market comprise Ancaster House, having a main frontage of 600 ft., on Richmond Hill, close to the park gates (1798), and opposite the Star and Garter Hotel, which, originally a shooting-box of the Duke of Ancaster, was given by George III. to Sir Lionel D'Yerville; Moatlands, Brenchley, the seat in olden times of the Brenchells, or Brenchleys, of whom Sir William Justice of the Common Pleas, and his wife Joan (1446) were buried in the nave, Canterbury Cathedral; and Westerhall, Dumfries, which for seven centuries has continued in the family of the present owner, Sir Frederic Johnstone; the house was built in the end of the XVth century, and the whole estate extends over 11,180 acres. Advertising to the announcement in our last week's number of the purchase by Earl Curzon of Kedleston, of Tattershall Castle, we may mention that in the Victoria and Albert Museum are plaster casts of the four chimneypieces that Pugin used as models for fireplaces in the Houses of Parliament.

A New Ordnance Map.

Mr. Edward Stanford, official agent for the large-scale Ordnance maps, announces the publication of the first 165 sheets of a new issue on the scale of 50 in. to a mile (1:1,250). Hitherto, apart from the town plans, the largest scale on which urban districts have been obtainable has been the well-known 25 in. to a mile, and the new issue is based on an enlargement of that map. The large-scale map has been specially prepared for use primarily in connexion with land valuation, and the area covered by each sheet is one quarter of that of a 25-in. sheet. The size of the sheets is 40 in. by 27 in., and the price 2s. 6d. each. The sheets already issued are in the undermentioned districts—Cheshire: Bollington, Chorley, Northwich, Pownall, Poynton. Durham: Crawcrook, Hedworth, South Shields. Hampshire: Aldershot, Alton, Andover, Basingstoke, Bishop's Waltham, Cosham, Emsworth, Fareham, Havant, New Alresford, Odiham, Petersfield, Portsea, Portsmouth, Romsey, Southampton, Stockbridge, Titchfield, Waterloo, Whitechurch, Winchester. Lancashire: Ashton-under-Lyne, Barton-on-Irwell, Denton, Middleton, Pendleton, Penketh, Poulton, Warrington, Winwick, Woulston. Leicestershire: Market Harborough. Northumberland: Cramlington. Sussex: Petworth. Yorkshire: Billingley, Bridlington, Calverley, Cottingham, Doncaster, Filey, Harrogate, Haworth, Kingston-upon-Hull, Knaresborough, North Bierley, Norton, Ovenden, Pontefract, Sedburgh, Settle, Snaith, Sutton and Stone Ferry, Thornton, Todmorden, Tong, Wetherby.

Monument in the Pantheon to the Convention Nationale.
 M. François Sicard, Sculptor.

COMPETITION NEWS.

Central Fire-Station for Hendon.

The Fire Brigade Committee of Hendon Urban District Council report having considered the merits of the designs submitted in the limited competition for the central fire-station scheme, and a report from the surveyor thereon, and have come to the conclusion that Design No. 4, submitted by Mr. H. A. Welch, A.R.I.B.A., should be placed first in order of merit, and that Design No. 6, submitted by Mr. T. Millwood Wilson, second. In the course of the discussion that followed Mr. King said the designs were such as warranted the action of the Fire Brigade Committee in appealing only to local architects. He moved that all the designs should be placed on public exhibition. This with the report was carried.

Parliament Buildings, Wellington.

The award in this competition, limited to New Zealand architects, is as follows:—

- (1,000l.) Messrs. John Campbell, F.R.I.B.A., & Claude Paton, of Wellington (illustration below).
- (500l.) Messrs. Turnbull & Son and J. S. Seddon, of Wellington.
- (300l.) Mr. William H. Gummer, Auckland.
- (200l.) Messrs. John Campbell & Charles A. Lawrence, Wellington.

Thirty-three sets of designs were received. Mr. John Campbell is the Government Architect, New Zealand, which gives point to the following clause in the conditions of the competition:—"Any officer in the Government Service desirous of competing must prepare his designs entirely in his own time, at his own expense, and on his own premises, or, at any rate, not in the Government Offices."

We understand from the *British Australasian* that the professional adjudicator was Colonel Vernon, late Government Architect of New South Wales, who thought that "a very high order of merit was shown in many of the designs submitted."

The first portion of the buildings is estimated to cost about 160,000l., and the second about 90,000l., or a total of about a quarter of a million for the whole work. The principal feature of the front elevation is a stone stairway 40 ft. wide, flanked by two groups of statuary, leading up to the main floor of the building, which is to be 14 ft. above the ground surface. The stairway will extend beyond the main frontage, and will be flanked on either side by long colonnades of Ionic capped pillars 10 ft. wide. At either end of the building pavilions will project out beyond the colonnade, in a similar fashion to the stone stairway. Another feature of the front elevation will be a dome 35 ft. in diameter, placed over the main staircase. The base of the building is intended to be rusticated.

Gidea Park: List of Awards.

The complete list of awards in the series of competitions at Gidea Park is as follows:—

- Class I.—A detached house, to cost 500l. :—
 (1) Gold medal and 250l., Plot 208, Mr. Geoffrey Lucas, F.R.I.B.A. (builders, Messrs. Wm. Moss & Sons, Ltd.). (2) 100l., Plot 240, Mr. Reginald T. Longden, Lic.R.I.B.A. (builders, Messrs. Wm. Moss & Sons, Ltd.). (3) Highly commended, Plot 43, Mr. W. Curtis Green, F.R.I.B.A. (builders, Messrs. Falkner & Sons). (4) Hon. mention—Plot 205, Mr. C. Quaife May (builders, Messrs. William F. Bay, Ltd.); Plot 203, Messrs. D. Bamford, A.B.I.B.A., & Aitken (builders, Messrs. Jones & Andrews); Plot 1046, Mr. Ernest Willmott, F.R.I.B.A. (builders, Messrs. Wm. Moss & Sons, Ltd.); Plot 242, Mr. E. G. Theakston, Lic.R.I.B.A. (builder, Mr. F. W. Jarvis); Plot 201, Messrs. Forbes & Tate (builders, Messrs. W. King & Son); Plot 241, Mr. Edwin Gunn, A.R.I.B.A. (builder, Mr. F. W. Jarvis); Plot 57, Messrs. G. L. Pepler, F.S.I., & E. J. Allen, A.R.I.B.A. (builders, Messrs. Grace & Marsh).

Class II.—A detached cottage, to cost 375l. :—(1) Gold medal and 200l., Plot 273, Mr. C. M. Crickmer, Lic.R.I.B.A. (builder, Mr. H. Hurst). (2) 100l., Plot 291, Mr. Herbert A. Welch, A.R.I.B.A. (builders, Messrs. Wm. Moss & Sons, Ltd.). (3) Hon. mention—Plot 288, Mr. Percy B. Houtton (builders, Messrs. Wm. Moss & Sons, Ltd.); Plot 266, Mr. Arthur H. Moore, A.R.I.B.A. (builder, Mr. J. Butterfield); Plot 265, Mr. A. P. Starkey (builders, Messrs. W. H. Maxey & Son); Plot 302, Mr. C. W. Yates (builders, Messrs. Butcher & Son); Plot 305, Mr. F. Sherrin (builders, Messrs. Alfred Brown & Son); Plot 327, Mr. J. Myrtle Smith, A.R.I.B.A. (builder, Mr. P. R. Paul).

Class III.—For the best internally-fitted house in Classes I. or II. (prize divided) :—

- 25l. to Plot 348, Mr. Stanley P. Schooling (builders, Messrs. Dowling & Davis); 25l. to Plot 282, Mr. Ernest Willmott, F.R.I.B.A. (builders, Messrs. Wm. Moss & Sons, Ltd.).
 Class IV.—A town plan of Gidea Park :—
 (1) 100l., Messrs. W. Garnett Gibson & Reginald Dann. (2) 50l., Messrs. Geoffrey Lucas, F.R.I.B.A., & T. A. Lodge. (3) Highly commended, Mr. Oswald P. Milne, Lic.R.I.B.A. Commended—Mr. T. F. Pennington, A.R.I.B.A.; Mr. Frank Gray Wallis; Messrs. R. Bennett, A.R.I.B.A., & W. Bidwell; Mr. Gilbert Waterhouse. Perspective prizes 10 guineas to Mr. Oswald P. Milne, Lic.R.I.B.A.; 10 guineas to Messrs. T. Millwood Wilson, Lic.R.I.B.A., with H. A. Welch, A.R.I.B.A.

Class V.—A garden design for house or cottage in Classes I. or II. :—(1) 25l. to Plot 43, Mr. W. Curtis Green, F.R.I.B.A. (contractors, Messrs. Falkner & Sons, and Messrs. Barron & Sons). (2) 10l. to Plot 209, Geoffrey Lucas, F.R.I.B.A. (contractors, Messrs. Barron & Sons).

Class VI.—A perspective drawing, suitable for reproduction, of a house or a cottage entered for competition in Classes I. or II. :—
 (1) 10l. to Mr. H. S. East, A.R.I.B.A. (2) 5l. to Mr. R. Mauchlen.

Class VII.—(Competition open to builders) For excellence of workmanship and construction in the erection of a house or cottage in Classes I. or II. :—(1) Gold medal and 100l. Plot 43, Messrs. Falkner & Sons. (2) 50l. Plots 241 and 242, Mr. F. W. Jarvis.

The judges in the above competitions were Mr. E. Guy Dawber, F.R.I.B.A., Mr. H. V. Lancaster, F.R.I.B.A., and Mr. Mervyn E. Macartney, F.R.I.B.A.

Class IX.—Improvements in materials used in house building, etc. Bricks—Silver medal, Plot 244, silver grey bricks supplied by Messrs. S. & E. Collier, Reading (architect, Mr. C. Williams Ellis; builders, Messrs. Allen Bros.); silver medal, Plot 256, wood-barn brown bricks supplied by the Sussex Brick Company, Warnham, Sussex (architects, Messrs. Fair & Myer, A.R.I.B.A.; builders, Messrs. Jones & Andrews). Artificial stone paving—bronze medal, Plot 44, supplied by the Victoria Stone Paving Company, Stratford (architects, Messrs. A. E. Sawday, F.R.I.B.A., and T. T. Sawday, A.R.I.B.A.; builders, Messrs. Lovell & Son). Woodwork—highly commended, Plots 43 and 274, cypress wood (architect, Mr. W. Curtis Green, F.R.I.B.A.; builders, Messrs. Falkner & Sons). In Class IX. the judges were Mr. Walter Cave, F.R.I.B.A., and Mr. Lawrence Weaver, who "were impressed not only with the general good quality and interesting variety of the materials used, but also with the abundant ingenuity and taste with which they were employed."

Class X.—Improvements in fittings used in house building (sanitary, cooking, lighting, and heating, etc.) :—Silver medal, Plot 256, "B. K." range, exhibited by the Coalbrookdale Company, Ltd., Burners-street, W. silver medal, the "Interoven" stove, exhibited by Interoven Patent Stove Company, 78 Great Queen street, Kingsway, W.C. Mr. Max Clarke, F.R.I.B.A., was the judge for this class.

Class XI.—Furnished house :—Silver medal, Messrs. Heal & Son, Tottenham Court-road; silver medal, Messrs. Vining & Gilrow, Ltd., Oxford-street; bronze medal, Messrs. Hindle & Wilkinson. Judged by Mr. Halsey Ricardo, F.R.I.B.A.

Northwich Baths.

Mr. F. T. Baggallay, F.R.I.B.A., has made the awards in the competition for the proposed public baths, Northwich, as follows:—
 1. Mr. J. E. Franck, A.R.I.B.A., Pancras-lane, Queen-street, E.C. 2. Mr. A. E. Powles, F.R.I.B.A., Northwich. Mr. D. C. Leigh, A.R.I.B.A., Weaverham. The drawings will be on view at the public library for fourteen days from Wednesday next.

Parliament Building, Wellington, N.Z. Design awarded First Premium (1,000l.)

(From the New Zealand Times.)

By Messrs. John Campbell, F.R.I.B.A., and Claude Paton.

LONDON COUNCILS.

Barnet.—Plans have been passed for four houses, Rodford-avenue, for Messrs. Lavington & Co., Ltd.

Barnet.—Steps are to be taken with a view making up the following streets:—Netherland-road, Fitzalan-road, Dudley-road, Wooding-avenue, Bilsbury-avenue, and Rose-avenue. Plans have been passed as follows:—Mr. T. Richards, four houses, Fairview-avenue; Mr. J. C. Williamson, six houses, Cypress-avenue; Mr. W. T. Andrews, motor garage, Thirwood, Holden-road.

Enfield.—The tender of the Patent Portland Cement Company, Ltd., has been accepted by the Rural District Council for trying out the work of paving Friern Road, at 5s. 6d. per yard super., laid in concrete.

Greenford.—At the last meeting of the district Council it was decided to proceed with a town-planning scheme for the district.

Hendon.—The tender of Mr. Haddo, at £10s., has been accepted by the Rural District Council for the erection of an observatory at the Isolation Hospital at Stanwell.

The following plans have been passed:—Mr. Elwell, six houses, Cecil-road, Pinner; Messrs. Steeles, five houses, Longley-road, Pinner; Mr. Bell, three houses, etc., College Hill, Harrow Weald; Mr. H. Curry, additions, The Ridge; Mr. H. T. Tennant, alterations to Bentley Priory, Harrow Weald. Plans have been lodged by Mr. J. Hare, for alterations to "Kinkigh," Edgware. The Surveyor has been instructed by the Urban District Council to prepare plans and estimates for making up the following streets:—The application is to be made to the Local Government Board for sanction to a loan of £242, to carry out improvements works the junction of Green-lane and Brent-street.

The Surveyor is to carry out the work of constructing a new sewer at Elm-terrace, Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively. In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

In connection with the preliminary plans prepared by the Surveyor for own planning scheme, it has been decided to lodge the portion of the district north of Elm-hill, and a surface water drain from Elm-hill-road at estimated costs of 101L. and 10L. respectively.

Leyton.—Plans have been passed for Mr. A. Radcliffe for nine houses in Essex and Grange Park roads, also for Mr. F. J. Sturdy, for additions to the Nurses' Home at West Ham Infirmary, James-lane. The London General Omnibus Company have lodged plans for a motor garage, Leyton Green.

Poplar.—A plan has been passed for Mr. W. Pringle for rebuilding "Falcon" beer-house, East India Dock-road.

Richmond.—The Surveyor has been instructed to put into hand the work of renewing the grass verge and fixing kerbs in Kew-road at an estimated cost of 100L. It has been decided to take such steps as may be necessary under the Housing, Town-Planning, etc., Act, 1909, and the regulations made by the Local Government Board thereunder, with a view to an application being made to the Board for permission to prepare a town-planning scheme. Plans have been passed for Messrs. S. N. Soole & Son for rebuilding dye works in Water-lane; also for Mr. H. G. Leslie for four houses in Fitzwilliam-avenue.

Southgate.—The following plans have been passed:—Mr. W. Bass, four houses, High-west-road, Bounds Green; Messrs. Emden, Egan, & Co., Queen's Hall Electric Theatre, Green-lane, Palmer's Green; Messrs. Parmiter Brothers, four houses, Green Dragon-lane, Winchmore Hill.

Staines.—At the last meeting of the Board of Guardians Mr. Kingston moved that the Clerk be instructed to apply to the Local Government Board for consent to a loan for the purpose of building a Boys' Home. He said, in regard to this proposal, that he had attended the Local Government Board Offices with a Mr. G. W. Manning to discuss the scheme. He took with him two sets of plans, one prepared by Mr. Manning and the other by Mr. Scott of Staines (the latter having been submitted without fee or reward), and after going into the plans, those submitted by Mr. Manning were finally approved. He (Mr. Kingston) further moved that Mr. Manning be instructed to get out specifications and quantities, and further, that tenders be invited for the erection of the building. The motion was agreed to. The estimated cost is put at £2,000.

Tottenham.—The Engineer has been instructed to prepare plans and estimates for making up Barry-avenue, Rusper-road, and a portion of Craven Park-road.

Wandsworth.—Tenders are to be invited for paving part of Lessingham-avenue, Tooting, as a new street. The following plans have been passed:—Mr. G. E. Jones, eight houses, Uganda-street, Balham; Mr. J. Copp, seven houses, Dowton-avenue, Streatham; Messrs. H. Somerford & Son, additions to Queenswood School, King's-avenue, South Clapham.

Watford.—The following roads are to be repaired with granite at the cost stated:—London-road, 399L.; High-street, 745L.; Market-street, 218L.; Cassio-road, 91L.; Whippendell-road, 303L.; Harwood-road, 199L.; Rickmansworth-road, 329L.; Woodford-road, 177L. The following plans have been passed:—Messrs. Morrison, Jones, & Taylor, Ltd., workshop, the Rookery; The Governors of the Watford Grammar School, alterations and additions, Shepherd's Lodge, Rickmansworth-road; Watford Manufacturing Company, additions to Confectionery, Victoria Works, Sandown-road.

Woolwich.—Electricity mains are to be extended at an estimated cost of 275L. The Works Committee have received a letter from Mr. R. Stewart on behalf of Lord Rowallan, to the effect that he proposed to develop the portion of the Corbett Estate, east of Gienesk-road, and north of the South Eastern and Chatham Railway. The following plans have been passed:—Messrs. F. Boreham, Son, & Gladding, architects, 75, Finsbury-pavement, E.C., on behalf of Messrs. F. W. Smith and W. F. Goodwin, adaptation of No. 65, High-street, Plumstead, into cinematograph theatre; Mr. J. J. Bassett, builder, 121, Earls-hall-road, Eltham, on behalf of Lord Rowallan, six houses, Dunvegan-gardens, Dunvegan-road, Eltham.

CORRESPONDENCE.

Official Architecture.

SIR,—In regard to Mr. Stokes's criticism of "Official Architecture" and its cost, I should like to lay before you a few observations, if you would kindly allow me, based on personal experience at the Office of Works.

Firstly, if the difference in cost between Government and private architects' work is due to the rate of pay to the assistants of the former, I am sorry for the assistants of the latter. One material advantage the capable Office of Works' assistant does possess, that of being in a practically per-

manent job, for the quantity of work varies little from year to year. This fact has attracted certain discourteously competent architectural men to the Office of Works, who have most of them passed on to the permanent staff. Such buildings as the new Money Order Office at Holloway and the Post Offices at Dudley and Torquay show that sufficient talent exists to carry out on sound traditional lines all except the very large Government buildings. These latter nearly always have been made the subject of competitions, in which private architects have joined.

Meanwhile the separation of maintenance, clerical, and purely structural work from architectural work might be carried further, but at the present time there is already a trend in that direction. For instance, those members of the permanent staff with the greatest architectural abilities are retained in London to prepare and carry out designs for new buildings and large alterations and additions.

I suggest the question as to whether the Office of Works is an expensive department, whose work could be more cheaply done by private architects, might be partly elucidated by the publication of details from both sides showing incomes, salaries, and hours of work of all parties involved.

MEDUS.

The R.I.B.A. Examinations and Official Architecture.

SIR,—I quite agree with your correspondent Mr. E. J. Dixon that the Institute examinations should possess a definite value, not only outside, but within the profession itself, so that they may prove a real asset to those who have passed them, in place of their present obscure value, especially to assistants.

But, as you, Sir, point out in your leading article of November 3, the question of obtaining this value is really bound up with the more important question of education, and while this is in its present chaotic condition it should be the aim of the Institute examiners to lead rather than to follow. The revised syllabus of the R.I.B.A. seems to imply that the examiners themselves are not quite certain what an architect ought to know, and so they offer a sporting chance to everyone, be he antiquary, scientist, or artist. But if this broadening of the examination net is to be obtained by merely widening the meshes, the result is not likely to be very successful.

I am reminded while on this subject of examinations that the Office of Works, whose architectural shortcomings the President of the R.I.B.A. has been recently at pains to point out, is recruited by an examination on very much the same lines as the present R.I.B.A. Final. No doubt the examination is a farce, as all such examinations must be, as a test of the ability to produce architecture, yet I cannot help thinking that the remarks of Mr. Stokes in reference to official architecture in general are not only a little unjust in criticism, but also perhaps rather short-sighted in policy.

Looking in particular at the architectural productions of the London County Council during the last ten years, they appear to me to show a standard of ability and taste in design and a unity of purpose which are not only above the general average of the profession, but which could not have been achieved—especially in the last particular—under any other conditions than those of a competent body of assistants working under an able and sympathetic chief. Had these same commissions been scattered broadcast over the profession we should probably have obtained a heterogeneous collection of buildings of all kinds, good, bad, and indifferent, instead of a school of design to which few can take serious exception. That official architecture has both its dangers and its limitations is most true, but that if properly controlled it can produce good work I think Mr. Riley's department has proved.

Mr. Stokes again objects that the work is costly; that whereas the outside practitioner can work for 5 per cent., the official departments want from 7 to 10 per cent. It seems to me that this simply proves that the outside profession is sadly underpaid, and not that the officials are overpaid.

E 2

As a matter of fact, we all know that if an architect does his duty by his work and pays his assistants a fair salary for their work he is in many cases underpaid on the 5 per cent. basis. It is only by managing his office in the most economical manner—that is, by employing the smallest possible number of assistants at the lowest possible salaries—that he can make it pay at all. Surely it would be better policy for us to work up to the official 10 per cent. than to drag them down to our 5 per cent.!

JOSEPH V. HIBBERT.

Architectural Examinations and the Preparation of Designs for Public Buildings.

SIR,—These ever-recurring subjects for discussion are both to the front just now. The moral which may be drawn from Professor Reginald Blomfield's article in the last number of the *Journal of the Royal Institute of British Architects* is that architectural examination is a necessary evil, more or less. In so vast a field as architecture it is difficult to test a man in a few days. If it were possible to spread the examination over several years, then it would be a thorough test. This is practically what is done in the Office of Works. A man of *prima facie* ability is engaged as an ordinary assistant. If he passes the test of actual office work for some time and shows designing ability, he is gradually put on work of increasing importance, and in time is engaged on the largest buildings.

The architectural staff was formerly selected by an open competitive examination, but owing to the want of designing ability in many of the men who passed this examination it was abolished, and the architectural work given to the men previously referred to who had been engaged as ordinary assistants, and proved their ability by years of office work under the direct supervision of the heads of departments. But the authorities deny the men, who have thus proved their ability, any official recognition, adequate payment, or possibility of promotion, because they did not enter by the abortive examination, which was abolished because it completely failed as a test of architectural ability, and reject all recommendations made by the architectural heads for the improvement of the position of the working staff.

It is not to be wondered that this has produced a state of what Lord Rosebery once called "honest dissatisfaction."

As a dissatisfied staff cannot be an efficient or economical working instrument, it is eminently desirable that the Commissioners of Works should put their house in order thoroughly and quickly.

EFFICIENCY.

Commissions and the R.I.B.A. Scale.

SIR,—In these days of strenuous effort on the part of the Royal Institute of British Architects to raise the status, education, and ability of its new members it is surely sad to find Fellows of the Institute accepting commissions at rates of remuneration under those of the Institute scale.

I enclose a newspaper cutting containing the report of a case in which the architect (who is a Fellow of the Royal Institute) sued for the balance of his remuneration, which had been mutually arranged at 3½ per cent. on the total cost of the work, a house costing 5,000l.

The client was found liable, but counter-claimed against the architect on account of "want of supervision and lack of skill." The counterclaim was upheld.

Were I an ordinary unsophisticated layman proposing to build a house I would mentally note the following—

- (1) That the fee of a F.R.I.B.A. would not exceed 3½ per cent.
- (2) That the employment of a F.R.I.B.A. would not ensure proper skill and supervision.

It would not then take me long to decide whether I should employ a F.R.I.B.A., a less-experienced, and presumably less skilful, member of the Institute, i.e., an Associate, or perhaps a Licentiate (who rejoices in a somewhat impressive title), or whether I should employ a builder, who would build me a "good, substantial, and well-built house, excellently fitted up with every modern convenience" (vide advertisement), and save the architect's fee.

The Council of the Royal Institute are

making excellent progress in the matter of stiffening up the examinations and generally raising the qualifications for admission to membership of the Institute. It would, I think, be wise to "stiffen up" the conditions under which architects would be allowed to practise under the title of F.R.I.B.A., as cases such as that I have cited are intolerable, and are not calculated to reassure the public as to the professional qualifications and methods of members of the Royal Institute of British Architects.

A set of simple by-laws would do it.

ASSOCIATE.

Stafford Library Competition.

SIR,—I have recently seen the conditions to competing architects in this competition, and I should like to say that, in my humble opinion, the Town Council of Stafford and their assessor, Mr. H. T. Hare, who, I understand, has drawn up these conditions, are most decidedly to be complimented. It is a pleasure almost unique to see such a reasonable, fair, and yet comprehensive set of "conditions."

Everything necessary is asked of competitors, and, what is the point, nothing which is unnecessary, thereby making the labour to competitors as light as possible.

In these days, when the promoters of open competitions so frequently, in quite small buildings, ask for elaborate drainage schemes, heating pipes, radiators, and ventilators, etc., indicating ¼-in. details, perspectives, an unnecessary number of elevations and sections, etc., to say nothing of reserving the right to altogether discard the assessor's award, and asking competitors to "quote" for a wholesome set of conditions as those compiled for this competition by Mr. Hare.

I think every architect who knows the amount of time and thought involved in preparing a set of competition drawings will join with me in expressing his hearty appreciation of the Stafford Town Council and Mr. Hare.

HENRY R. COLLINS.

The Arrangement of Our Museums.

SIR,—I was much interested in your article on "Museums" in your issue of October 27. I cordially endorse your views that museums should be more "understandable of the people" and more simply educational.

I have for some thirty years been collecting objects bearing upon the history of the "Folk." A popular Folk Museum would very soon fill half the Crystal Palace, and would be really enjoyed by even women and children. I do not think anyone yet knows the real educational value of a properly-arranged simple museum. Existing museums begin in the middle of the book! They leave out the first chapters.

EDWARD LOVETT.

A Building in the Adelphi.

SIR,—I was interested to see in your issue of November 10 your historical note as to the Society of Arts' building in John-street, Adelphi.

The wording, however, of Sir Henry Wood's remarks, as quoted by you, would almost lead one to suppose that the arches and subterranean roads were things of the past, but this, it may interest your readers to know, is very far from being the case.

There are no cows kept there now, it is true, though the present freeholder will remember their being kept in the arches; but, besides other things, there is still an enormous quantity of wine stored in them, and I think that there must be quite a hundred persons of one sort or another in daily employment in these lower regions of the Adelphi. The subterranean roadways are in continual use, and one, the most frequented, goes actually beneath my firm's drawing office. These roadways, however, are, and always have been, private property and are not public thoroughfares, though the public are allowed access to them.

Practically the whole of the Adelphi was underpinned, as stated, in the early seventies, and the arches made thoroughly secure.

My firm has superintended a great deal of work in alterations and additions to various properties in the Adelphi for our client, the freeholder of the estate; and we have had ample opportunities of testing the quality of the work of the brothers Adam

and of noting the excellence with which it was all carried out. There is still on the estate a great quantity of beautiful and valuable ceilings, mantelpieces, stoves, doors, mouldings, etc., which are a constant source of enjoyment, though unfortunately, owing to carelessness and indifference in days past, many very beautiful things have disappeared. The more experience one has of the work of the Adam brothers the more one is compelled to respect and admire it, and the thorough way in which they carried it out, even though their particular style may not happen to appeal alike to everyone.

ARTHUR B. HAYWARD,

Architect and Surveyor, Adelphi Estate.

Samuel Elliott & Sons, Ltd.

SIR,—We note in your last issue your mention that the above-named is the "old-established firm" of woodworkers. This is incorrect, inasmuch as the company only started business in October, 1902. We are the old original firm of joinery and moulding manufacturers, established upwards of forty years at Albert Wood Newbury.

For Elliott's Moulding and Joinery Company, Ltd.,
E. BUCKINGHAM, Managing Director.

INTERCOMMUNICATION COLUMN.

Cubic Space in Factories.

SIR,—I shall be obliged if any of your readers could inform me under what rule or regulation the restriction is placed by which the height above 12 ft. 6 in. is not included in calculating the cubic extent of factories and workshops providing the 250 ft. cube for every person employed.

MARYLEBONE.

Lychgates.

SIR,—I should be very grateful if you would kindly let me know of a few very fine specimens of lychgates as soon as possible, that I can take the necessary measurements and sketches at once.

REGINALD L. LLEWELLYN.

FIFTY YEARS AGO.

From the *Builder* of November 16, 1861.

Architectural Examinations and the Institute of British Architects.

It ought to be thoroughly understood at this time, but apparently it is not, that when the Council of the Royal Institute of British Architects is now doing is simply a response to the cry which had been often raised by younger members of the profession: "Give us the opportunity of showing that we have fully studied our profession and are fit and competent to practise it." We do not agree in opinion with those who would close the profession against all who had not made certain provisional studies and passed certain examinations. Such a restriction is an artificial profession, if it could be brought about—and we know very well it could not be—would be more harmful than useful; at this we have said for years, and we have given reasons for so saying. What proposed by the Council of the Institute, however, has, as our readers equally well know, our warmest concurrence. It is purely an educational movement, and pointing out to students the course of study to be pursued, and the sort of knowledge to be striven for, and affording them the opportunity of showing that they have pursued that course and acquired more than less that knowledge, is likely to effect great good. At present architectural education is very insufficiently attended to; the want of precise knowledge is often, in consequence, very strikingly apparent.

HUCKNALL TOWNARD'S SEWAGE.

New sewage disposal works have been erected at a cost of 8,954l., from the plans prepared Messrs. Sands & Walker, engineers, of Nottingham. The total capacity of the tanks is 350,000 gallons, which will be adequate for a population of 17,500. The contractor for the work was Mr. A. J. Cottle, of Sidmouth.

brief notices of the following architectural societies appear on p. 572: "Gloucestershire Architectural Association"; "Glasgow Architect-Craftsmen's Society."

Law Reports (p. 585) include: "Barnstable Building Dispute"; "Wallasey Building Dispute"; "Minter v. Waldstein."

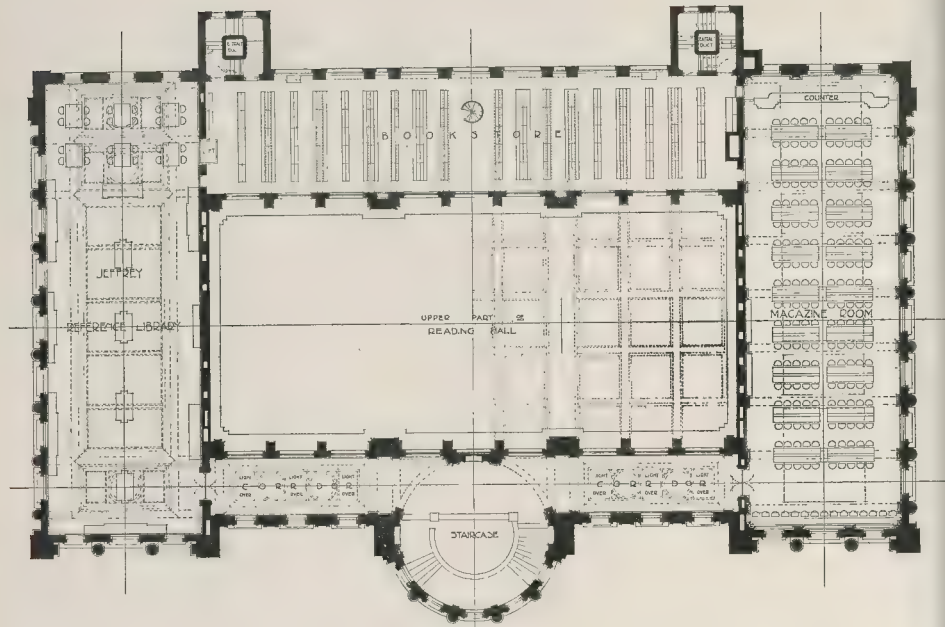

Battersea Polytechnic (Lectures on Illuminating Engineering).—Dr. W. J. Ettles on "Illumination and the Eye." 7.3 p.m.

Glasgow Technical College Architectural Craftsmen's Society.—Mr. T. G. Gilmour on "Town Planning." 8 p.m.

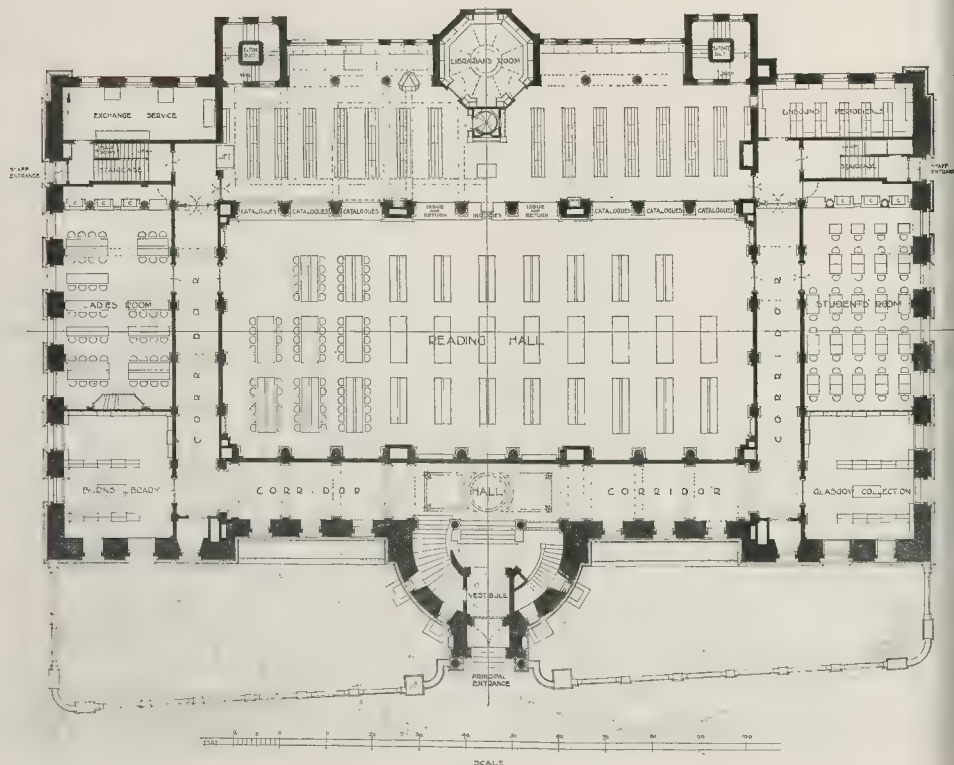

The plans show a building in which a fine architectural arrangement has been preserved without sacrifice of the public convenience, and while one might have liked to see the large reading-room definitely expressed on the exterior, the difficulty of so doing is obvious when the accommodation required on such a limited area is considered.

The New Mitchell Library, Glasgow.
Mr. W. B. Whittie, F.R.I.B.A., Architect.

Plan of First Floor.

The Mitchell Library, Glasgow. Ground Floor.

Mr. W. B. White, F.R.I.B.A., Architect.

The main reading-room is a well-proportioned room 113 ft. by 52 ft., and gives accommodation for 322 readers at thirty-one tables. Longinally it is divided into three principal bays massive piers, panelled and ornamented in inter, and each main bay is further divided into Ionic columns, which carry the entablature running round all four sides at a height of 26 ft. The ceiling is segmental in form, and is carried on the main piers with moulded and enriched springing from the entablature level and rising to a height of 44 ft. in the centre. The room is lighted entirely from above by glass panels between these ribs. The lower walls between these piers are panelled to a height of 6 ft. 6 in. in Italian walnut polished and dulled. Other furnishings and fittings in this room are of the same wood. The upper walls and ceiling are finished entirely in plaster and one's cement.

In the public corridors the walls are lined 6 in. high with Crestola marble in panels of bands of ribbed Greek Chippolino, and over the ceiling and the ceiling are nicely treated in plaster. To minimise the noise arising from the floor in the corridors, the floors are laid with rubber tiling in black and white squares.

In the ground floor the corridors give access to the rooms for ladies, for students, and for special collections. The ladies'-room and students'-room occupy positions north and south respectively of the reading-room, and are of similar size, 48 ft. 6 in. by 23 ft. Both are finished in French polished Tobacco mahogany, are differently treated in detail. The former is fitted for fifty readers at nine tables, and the latter for forty-one readers at individual tables. It is intended that only those with special tickets will be allowed to use the students'-room. Old Glasgow and the Burns rooms are each 6 ft. by 23 ft., and are finished and fitted in Austrian oak. The public staircase leading to the upper floor occupies the semi-circular projection which, surmounted by the dome, forms a prominent feature of the exterior, and the manner in which the wheeling flights of steps in the interior of the dome are treated is very interesting and successful. The whole of the prior stringers, balustrades, etc., are of Bath stone, while the steps are of white marble, so that a very rich and monumental effect is attained.

The upper floor corridor gives access to two large public rooms. On the north and occupies the whole length of the Berkeley-street front is the magazine-room, which is seated for 19 readers at nineteen tables. The furnishings of this room are of French polished Tobacco mahogany, the walls being decorated with fluted pilasters carrying an entablature, from which a segmental plaster ceiling springs. The room is top lit by glazed panels in the ceiling.

The other room provided on this floor is that containing the Jeffrey Reference Collection, and of similar dimensions and treatment to the magazine-room except that the furnishings are Austrian oak. Exhibition cases are arranged in part of this room, and the remainder furnished with tables for readers. The floors in all public rooms are laid with oak wood blocks of a variety of patterns, with borders of oak and ash. For the administrative department of the library and for the staff accommodation is provided principally on an intermediate floor between the ground and first floor, with separate staircases and entrances. The octagonal room on the ground floor behind the main service entrance is a workroom provided for the librarian in addition to his private room.

The system of cataloguing and book storage adopted will probably be considered, when judged from a modern library standard, to be the weakest point in the whole scheme, but regarding this we understand no alternative was allowed. The book catalogue system used in the old Miller-street building evidently commends itself to the authorities, and it is here stated and the books are stored as before, without any special precautions for their protection against fire. The books most used are arranged immediately behind the service entrance to the number of about 40,000. The remainder of the book storage is on four floors immediately over this, and in addition the upper part of the basement is devoted to this purpose. All the floors are connected by book stairs.

At present the collection of books numbers over 200,000, but storage for double that number is provided, so that the growth of the library for many years to come has been considered.

The bookcases throughout are of Tobacco mahogany French polished. The heating and ventilation of the public rooms is on the Plenum system, the air being thrown in high up in the rooms and extracted at the floor.

Extract shafts and fans are used. Rooms other than public ones are heated by steam radiators, as also are the corridors and book stacks.

Externally the building is faced with white Northumberland stone from the Blackpasture quarries, and is, if somewhat broken in outline, very successfully treated. It has a base of grey unpolished granite, and the dome, which forms the central feature and marks the entrance, is finished externally with copper.

Taken as a whole, the building is one that meets very well the claims of public convenience, staff control, and architectural arrangement, and is a notable addition to Glasgow architecture.

The following is a list of contractors engaged in the work:—

Mason and brick work—Messrs. P. & W. Anderson, Ltd., 64, Douglas-street, Glasgow. Wright work—Mr. John Cochran, 70, Dobie's-loan, Glasgow. Constructional steel work—Messrs. A. & J. Main & Co., Ltd., Postoffice, Glasgow. Plumber work—Messrs. James Ingleton & Co., 166, George-street, Glasgow. Slater work—Messrs. John McQuat & Son, 88, London-street, Glasgow. Patent roof cladding—Pennycook Patent Glazing Company, Ltd., 11, West Regent-street, Glasgow. Plaster work—Messrs. D. & J. McKinnis, Gilbert-street, Glasgow. Fireproof flooring—Columbian Fireproofing Company, Ltd., London. Marble, tile, and rubber work—Messrs. Galbraith & Winton, 185, St. Vincent-street, Glasgow. Electric lighting—Messrs. Allan, Arthur, & Ure, 192A, St. Vincent-street, Glasgow. Heating and ventilation—Messrs. Ashwell & Nashit, Ltd., Leicester. Fire alarm installation—Pearson Fire Alarm, Ltd., Redcross-street, London. Metal sashes—Messrs. Fred. Baby & Co., Ltd., Petershill-road, Glasgow. Wood-block flooring—The Scottish Block Flooring Company, 45, Hope-street, Glasgow. Painter work—Messrs. Macfarlane & Smith, 188, West Regent-street, Glasgow. Pneumatic tubes—The Lamson Pneumatic Tube Company, Ltd., London. Bookcases—Messrs. Wyllie & Lochhead,

Ltd., 45, Buchanan-street, Glasgow. Fittings and furnishings—Mr. John Cochran, 70, Dobie's-loan, Glasgow. Lifts—Messrs. John Bennie, Ltd., 151, Moncrieff-street, Glasgow. Blackpasture stone—Messrs. Robertson, Ltd., Gainsburgh. Leaded glass work—Messrs. Wm. Meikle & Sons, 19, Wellington-street, Glasgow; Messrs. Oscar Peterson & Co., Blythwood-square, Glasgow. Electric fittings—Messrs. J. W. Singer & Sons, Frome, Somerset. Spital & Clark, 45, Newhall-hill, Birmingham. Adjustable fittings for shelves—Messrs. Tonks, Ltd., 12, Farringdon-avenue, London. Bronze figure over dome—Mr. Thos. J. Clapperton, 48A, Giebe-road, Chelsea. Clerk of works—Mr. Andrew M. Brown, Stanley House, Govan.

The Castle, Nottingham.

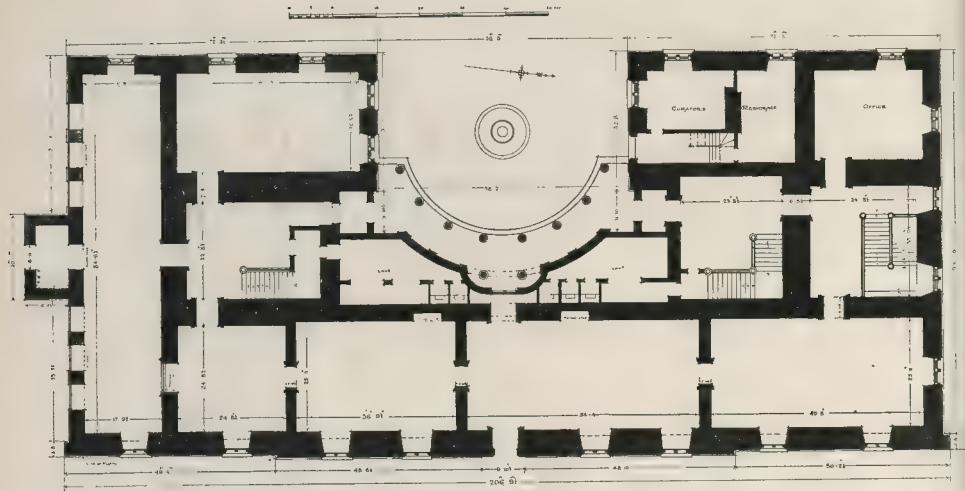

STANDING on a huge rocky spur of New Red-stone formation, the site of Nottingham Castle, by reason of its commanding position, has been occupied from early times by buildings erected to overlook the town. Historians mention the existence of a tower as early as the VIIIth century. A Norman fortress was erected by William Peverill, son of the Conqueror in 1086, the outer Ballium, with its bastions and gatehouse, being probably built about a century and a half later, and considerable additions were made in the XVth century. But after being variously occupied as Royal Palace, citadel, and prison, the greater portion of the old building was razed to the ground, and the present Renaissance edifice erected in 1674 by William Cavendish, first Duke of Newcastle.

Tradition has it that the architect was March, a Lincolnshire man, and in Walpole's "Anecdotes" mention is made of March (said to have been an assistant of Inigo Jones), "who designed additional buildings at Bolsover and Nottingham Castle." But in his will the Duke writes: "I have begun to carry up a considerable building at Nottingham Castle, which I earnestly desire may be finished according to the form and model by me laid and designed."

The treatment of the upper windows appears to confirm this inasmuch as the Duke was in the Netherlands for many years, fully accounting

Nottingham Castle: Measured Drawings by Mr. J. Woollatt, A.R.I.B.A.

Nottingham Castle: Ground Plan. Drawn by Mr. J. Woollatt, A.R.I.B.A.

for the peculiarities of design. In all probability March was clerk of works, or held some similar position, and may have been responsible for parts of the design.

Attention may be drawn to the strength and vigour of the design, its good proportion, and the skilful treatment of the surface texture, and the correct emphasis of the chief floor, showing the influence of an architecturally trained mind.

The mullions and transoms of the main windows and the inner circular heads of the upper windows were added when the building was restored in 1876. The top parapet is also modern and utterly out of sympathy with the rest of the design.

The effect of the richly ornamented cornice and the boldly treated scroll work of the upper windows, despite the fact that they cut into the architrave, combine to form a most picturesque and delightful treatment.

The enrichment is distinctly original and detail very refined, noticeably the architrave; this, added to the good proportion of the whole, tends to allay any feeling of restlessness which otherwise might be caused by the breaking of the entablature round the columns.

The refinement of detail, the originality and vigour of design, make it compare very favourably with its more magnificent neighbour, Wollaton Hall, only three miles distant, which had been in existence about ninety years when the Castle was erected.

The old gatehouse has recently been restored by Mr. T. G. Jackson, R.A.

BOOK RECEIVED.

NOTES ON THE ART OF REMBRANDT. By C. J. Holmes, M.A. (London: Chatto & Windus. 7s. 6d. net.)

DESTRUCTIVE FIRE IN SHOE-LANE, E.C.

The fire which broke out on the morning of November 10 practically destroyed the premises of Messrs. Pontifex & Sons, engineers, copper-smiths, and brass-founders, in Plum Tree-court, and Shoe-lane, and greatly damaged the premises occupied by Messrs. Max Emanuel & Co., china-ware merchants, and Messrs. Hill & Co., engravers and etchers, as well as the Farringdon Engineering Works; the damage is computed at some 30,000l. The premises of Messrs. Pontifex & Sons (formerly Pontifex, Son, & Wood) stand on the site of, and at one time incorporated, the Holborn, or Oldbourne, Hall, cited by Stow as "now letten out into tenements." In Wilkinson's *Londina Illustrata* are drawings of the carved fireplace and mantelpiece in the chief room, and of the exterior of the Hall, with the ceiling dated 1617, drawn and engraved by Banks in 1823.

ARCHITECTURAL SOCIETIES.

Bristol Society of Architects.

A meeting of the Bristol Society of Architects was held on the evening of the 8th inst. at the Fine Arts Academy, Clifton. It being the opening night of the winter session a good company assembled at a conversazione on the invitation of the President (Mr. J. Foster Wood, F.R.I.B.A.). On the walls of the central gallery was hung a very interesting collection of architectural studies and travelling sketches. Many of these were dated about 1860, having been made by the late Mr. Joseph Wood, the father of the President. Other contributors were Mr. G. C. Awdry and Mr. W. V. Gough. The drawings were closely examined, and very much admired by those present. Refreshments were served during the evening, and at the conclusion, on the motion of Mr. Mowbray Green, seconded by Mr. R. C. James, a hearty vote of thanks was accorded to the President.

Gloucestershire Architectural Association.

A meeting of the Gloucestershire Architectural Association was held recently at the Municipal Art Gallery, Cheltenham, the President (Mr. Walter B. Wood) being in the chair. Among those present were Messrs. H. W. Chatters, S. H. Healing, T. Overbury, R. Phillips, A. L. Iredale, D. R. Lyne, H. F. Trew, S. W. Thurston, and H. S. Davis. The extensive collection of architectural books at the Cheltenham Municipal Library was displayed for the inspection of members, and lists prepared by the Librarian were distributed. During the evening a paper was read by Mr. William Jones, the Librarian, who is an hon. member of the Association, entitled "A Talk upon Books on Architecture." The meeting closed with a hearty vote of thanks both to Mr. Jones and the Library Committee, proposed by the President and supported by Messrs. Chatters and Overbury.

Glasgow Technical College Architectural Craftsmen's Society.

At a recent meeting of this Society, Mr. James S. Boyd in the chair, papers were read dealing with the construction of a country house in stone, brick, or concrete.

Mr. Gilchrist, in his paper, referred to the abundance of good freestone, its adaptability to architectural treatment, both structurally and ornamentally, its great durability, and, from a hygienic point of view, the greater comfort it afforded its inhabitants. Brick houses were fully dealt with and numerous examples given, both ancient and modern, proving its great adaptability for domestic buildings, either cottage or mansion.

Mr. Park said that the advantages of con-

crete construction were its great mobility; it could be adapted to every shape and form of structure; and its great strength and fireproof qualities, even in thin walls, made for economy, both in space and material.

The lecturer described several methods of building, both *in situ* and in blocks. A discussion followed.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. E. White (Chairman) presiding.

LOANS.—A loan of 6,316l. is to be made to the Islington Borough Council for electricity undertaking. The Stepney Borough Council is also to receive a loan of 2,500l. for electricity meters.

TRAMWAYS.—The matter of the tramways from Marble Arch to Cricklewood was adjourned.

SCHOOL.—The Essendine-road School, Paddington, has been enlarged to provide additional accommodation for forty physically defective children.

COUNTER'S-CREEK SEWER.—It is proposed to construct a side-entrance and manhole on this sewer between King's-road, Chelsea, and the Lots-road pumping-station, and also two manholes on the King's-road branch of the sewer, between Millman-street and Ashburnham-road, Chelsea.

VICTORIA EMBANKMENT GARDENS.—Owing to various complaints received by the Council on the lack of convenience accommodation in this vicinity, it is proposed to erect conveniences at the gardens, upon a site adjoining Hungerford House, and tenders are to be invited for that purpose.

WHITE HART-LANE ESTATE.—Eight new cottages are to be erected on this estate at an estimated cost of 1,627l. Six of the cottages will comprise three rooms and a scullery, and two of them four rooms and a scullery.

THEATRES AND MUSIC-HALLS.—The following drawings have been approved by the Committee:—

Adelphi Theatre, Strand—provision of a teak partition and door in the orchestra enclosure.

London Coliseum—new rooms to be used as offices.

London Opera House—additional exit accommodation from two large rooms at the back of the stage and escape from the flies on the o.p. side.

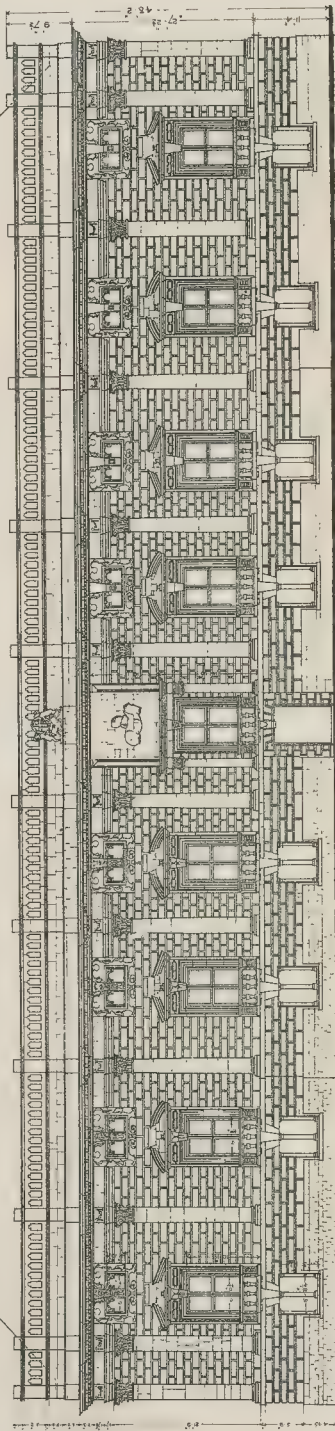

Surrey Vaudeville Theatre, Blackfriars-road—installation of a stage distribution-board.

CINEMA THEATRE.—A new cinematograph hall is to be erected at 134, Stratford High-road, and drawings have been approved for that purpose.

MONTHLY REVIEW *of* ENGINEERING.

The Fyvie Hall in the Polytechnic.

THE REGENT-STREET POLYTECHNIC.

Introduction.

On the west side of Upper Regent-street is a building familiar to middle-aged people in their youthful days as that known as the Royal Polytechnic. Founded in 1838 for the exhibition of studies in the Arts and Practical Science, especially in connexion with agriculture, manufactures, and industry, the institution was so much appreciated as to call for enlargement of the building in 1848.

The accommodation then provided for an exhibition of mechanical and other models was divided into several rooms, and there were a hall devoted to manufacturing processes, a lecture hall, and the great hall. The latter, lighted from the roof, contained models and designs, for many years the floor was mainly occupied by two canals with the water area of 100 sq. ft. The canals afforded appropriate facilities for the exhibition of models representing a dockyard, locks, water-wheels, and boats, while at the west end was a tank, 14 ft. deep, over which hung a large diving bell. This appliance was one of the chief attractions of the Polytechnic at the time to which we refer, but the institution is probably best remembered as the home of Pepper's Ghost.

It is not quite fair that the Royal Polytechnic should be chiefly associated with its popular attractions, because a great deal of useful work was done, including courses of lectures and tuition in various subjects.

After the fire of 1881 the building was sold to Mr. Quintin Hogg, by whom the Polytechnic was founded on the lines still retained.

Successive developments have involved additions to the building from time to time, and at last, owing to the continued extension of the departments for technical instruction, it became necessary to remodel the structure.

The cost of reconstruction has amounted to £100,000, including contributions as a memorial to King Edward VII. to the extent

of 50,000£, among the latter being the special gift of 30,000£, by Lord Leith of Fyvie. The idea of making the building a memorial to King Edward has received the sanction of the King, and the fact is suitably recorded by a handsome marble tablet in the main entrance hall.

The whole of the work, with the exception of the Regent-street facade, which was placed in the hands of the land estate architect, Mr. F. T. Verity, was executed to the

designs and under the superintendence of Mr. George A. Mitchell, A.R.I.B.A., the Director of the Day Department of the Polytechnic. The contractors were Messrs. Holloway Bros. (London), Ltd., of Belvedere-road, S.E.

General Description of Building.

The visitor inspecting the new house of the Polytechnic will probably find it difficult to distinguish between the old and new

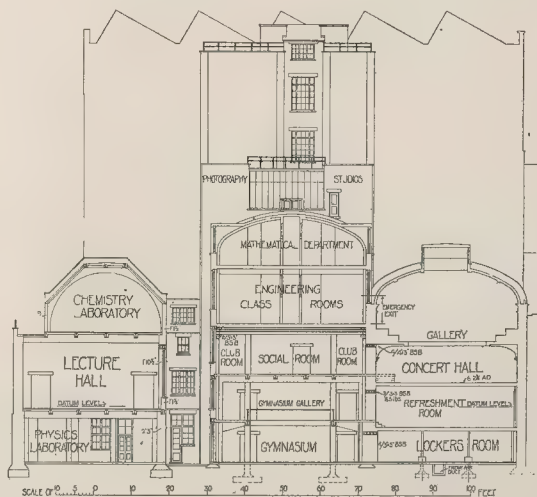

Fig. 1. Section Parallel to Regent-street.

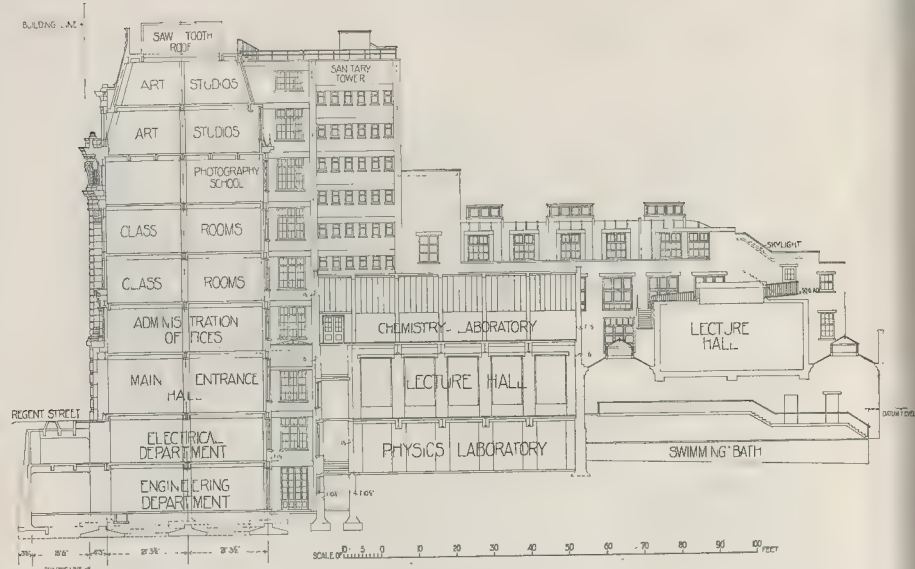

Fig. 2. Longitudinal Section.

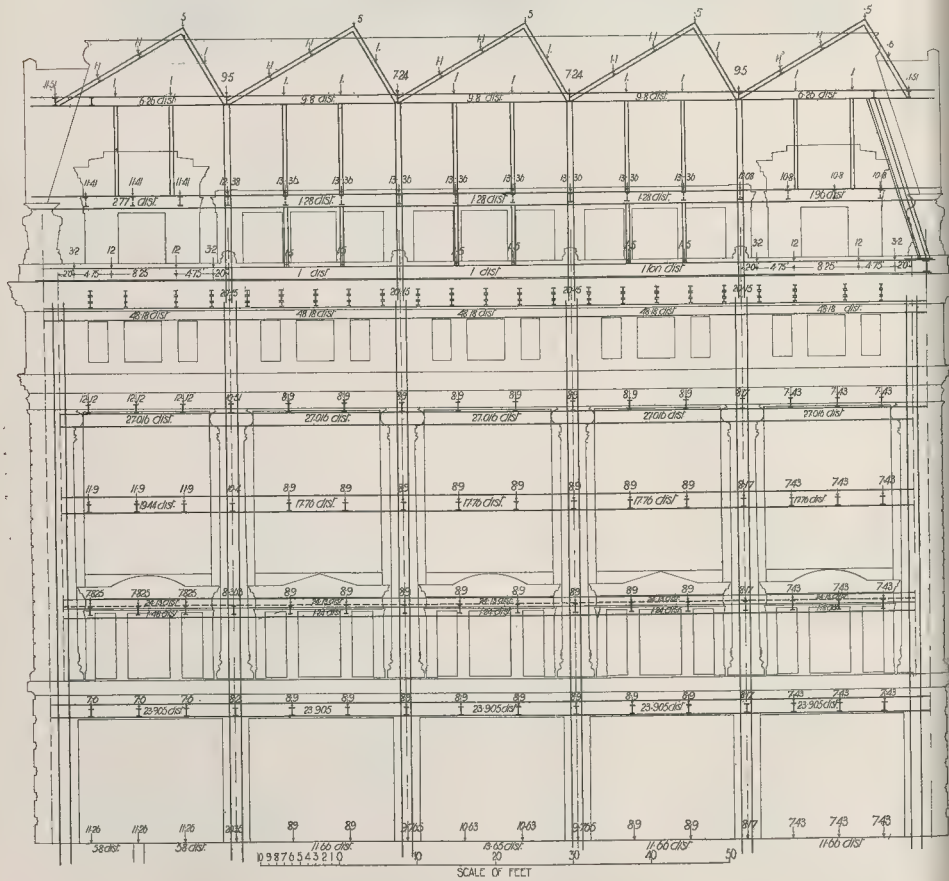

Fig. 3. Steelwork to Regent-street Front.

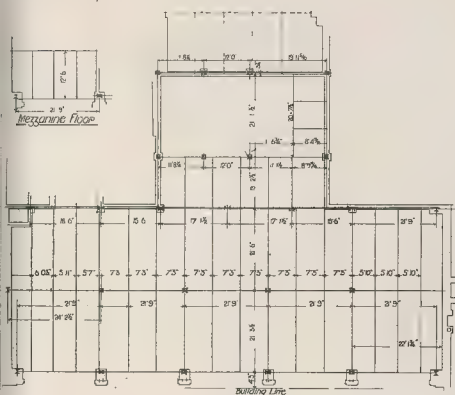

Fig. 4. Basement Plan showing Steelwork in Ground Floor.

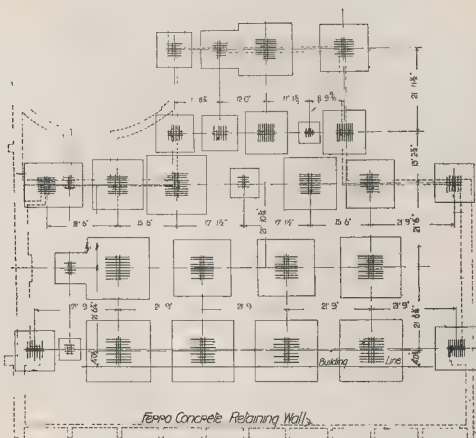

Fig. 5. Plan of Grillage in Front Portion of Building.

ions of the building, although here and there some apartments are clearly to be traced as the work of bygone architects. As a whole, however, the general impression to be gathered is that of a new building, the greater part of the work being new, and what is old has been skillfully remodelled and blended with the recent construction.

The front portion of the building has a depth of 118 ft. long on Regent-street and extends back for a distance of 82 ft., the basement and sub-basement stories extending 19 ft. beyond the building line below street pavement. Ample light is provided by means of pavement lights supplied by the British Luxfer Prism Syndicate, Ltd., Finsbury. This part includes nine stories in all as follows:—

Description.	Height.	Height Below or Above Ordnance Datum.
	Ft. In.	Ft. In.
Basement	13 0	24 6 B.D.
Sub-basement	13 0	11 6 B.D.
Ground floor	16 0	1 6 A.D.
First floor	13 0	30 6 A.D.
Second floor	13 0	43 6 A.D.
Third floor	13 0	56 6 A.D.
Fourth floor	13 0	69 6 A.D.
Fifth floor	13 0	82 6 A.D.
Sixth floor	13 0	95 0 A.D.

Above the main roof a range of five saw-tooth roofs give north light to the art studios on the sixth story. The foundation level is 6 ft. 6 in. below the sub-basement

Fig. 6. Foundation Grillage.

floor, and the total height of the building is 137 ft., measured from foundations to the top of the saw-tooth roofs. All this part of the building is new throughout.

The back portion of the building is 136 ft. wide over all and extends back for a distance of 126 ft. Here are situated various large halls for concerts, lectures, and other purposes, and affording accommodation for the swimming-bath and gymnasium. Some of the halls are lighted from the top, and therefore limit the height of the building in certain parts. The back portion may be roughly stated as being equal to four stories high, or about 80 ft. maximum height above foundation level.

The total area covered is approximately 30,000 sq. ft., and the contents of the building about 2,000,000 cubic ft.

Figs. 1 and 2 are respectively transverse and longitudinal sections, the former being on a line through the front and back portions of the premises, and the latter on a line parallel to and looking towards Regent-street.

These two drawings will enable the reader to gather an impression, although by no means a complete one, of the accommodation provided for the valuable work conducted at the Polytechnic.

Referring to Fig. 1, and commencing at the left-hand bottom corner, we find in the front portion:—

- Sub-basement—Engineering department.
- Basement—Electrical department.
- Ground floor—Main entrance hall.
- First floor—Administration offices.
- Second floor—Classrooms.
- Third floor—Classrooms.
- Fourth floor—Photography school.
- Fifth floor—Art studios.
- Sixth floor—Art studios.

Behind these departments is the main staircase and lift well, and behind them a sanitary tower, with ample lavatory accommodation of every kind on each floor.

The back portion of the building on the

same line comprises:—Physics laboratory and swimming-bath, approximately at basement level, two lecture halls at ground-floor level, and chemistry laboratory at first-floor level.

Turning now to Fig. 2, we have, at the left-hand cross-sections of the physics laboratory, lecture hall and chemistry laboratory; in the middle, sections of the gymnasium, social-room, with a range of clubrooms on either side, engineering classrooms, the mathematical department, and photography studios; and at the right hand, the locker and refreshment rooms, with the

Fig. 7. Section showing Steelwork in Main Cornice, Mansard Roof, and Parapet.

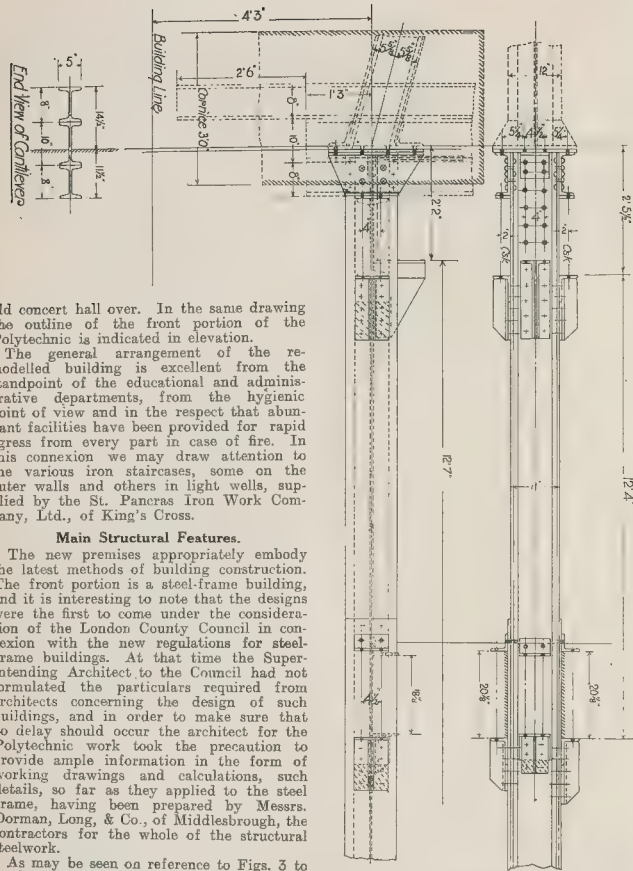

Fig. 8. Stanchions and Cantilever Support for Main Cornice.

old concert hall over. In the same drawing the outline of the front portion of the Polytechnic is indicated in elevation.

The general arrangement of the remodelled building is excellent from the standpoint of the educational and administrative departments, from the hygienic point of view and in the respect that abundant facilities have been provided for rapid egress from every part in case of fire. In this connexion we may draw attention to the various iron staircases, some on the outer walls and others in light wells, supplied by the St. Pancras Iron Work Company, Ltd., of King's Cross.

Main Structural Features.

The new premises appropriately embody the latest methods of building construction. The front portion is a steel-frame building, and it is interesting to note that the designs were the first to come under the consideration of the London County Council in connexion with the new regulations for steel-frame buildings. At that time the Superintending Architect to the Council had not formulated the particulars required from architects concerning the design of such buildings, and in order to make sure that no delay should occur the architect for the Polytechnic work took the precaution to provide ample information in the form of working drawings and calculations, such details, so far as they applied to the steel frame, having been prepared by Messrs. Dorman, Long, & Co., of Middlesbrough, the contractors for the whole of the structural steelwork.

As may be seen on reference to Figs. 3 to 8, the skeleton is a complete and well-connected structure in itself. The floors and roofs are completed by ferro-concrete (Hambro) panels, and the enclosing walls are of brick or stone, reduced in thickness as permitted by the new regulations, and as dictated by architectural requirements.

In consequence of rebuilding operations it was necessary to underpin the party walls on each side and to underpin the back and other walls on the site of the institution itself.

Steel Construction.

Fig. 3 is a diagram of the steel framing in the front walls and is typical of the framework throughout the front portion of the building. The same drawing gives the load in tons on each member of the steel frame, and indicates in thin lines the steel lines of the stone front.

Fig. 4 serves the purpose of illustrating the arrangement of the stanchions, girders, and joists incorporated in the skeleton. This drawing is a plan showing the beams in the ground floor, and may be taken as typical of all the floors above as far as the disposition of the members is concerned.

In the main portion of the building the stanchions are in three rows parallel to the street, spaced about 21 ft. 3½ in. and 21 ft. 6 in., the spacing of the columns in each row ranging from 15 ft. 6 in. up to 24 ft. 2½ in., according to requirements.

The floor bays are divided up into panels from 5 ft. 7 in. to 7 ft. 3 in. wide by 21 ft. 3½ in. and 21 ft. 6 in. long, as governed by the stanchion spacing.

The projecting portion of the new building is occupied by stair and lift wells and the sanitary tower previously mentioned.

Fig. 5 is a general plan of the steel grill-

ages for the stanchions, this plan corresponding with that in Fig. 4. In most cases it will be observed that each stanchion has a separate grillage foundation constructed upon a concrete foundation block and embedded in concrete for rust protection. There are, however, a few grillages where the concrete blocks unite owing to the relatively close spacing of the stanchions. Fig. 5 also indicates the outlines of the ferro-concrete retaining wall described under another head.

Fig. 6 contains details of typical grillages, one of the smallest and one of the largest, the latter designed for the load of 500 tons. The small grillage comprises four 5-in. by 3-in. by 2-ft. 3-in. I-bars in the lower tier, and two 8-in. by 4-in. by 2-ft. 3-in. I-bars in the upper tier, upon which the stanchion bases are seated.

The large grillage illustrated comprises eleven 12-in. by 5-in. by 6-ft. 3-in. I-bars in the lower tier, and three 24-in. by 7½-in. by 6-ft. 6-in. I-bars in the upper tier. All the bars are connected by screwed ties with distance pieces.

The concrete foundation blocks range from 5 ft. 6 in. to 16 ft. 9 in. square.

Fig. 7, reproduced from one of the architect's drawings, shows some particularly interesting features of the steel construction. The heavy stone cornice of the Regent-street front is supported by cantilevers with the projection of 4 ft. 3 in. beyond the centre line of the stanchions, which also carry brackets for heavy girders and from their cap rise the sloping struts of the Mansard roof. This is surmounted by a range of saw-

tooth roofs and a steel-framed parapet as shown.

Fig. 8 represents part of a front stanchion from fourth to fifth floor levels, and includes full details of the connexions, bracket for girder, cantilever support for cornice, and Mansard roof inclined strut. As shown in the detail, each cantilever is formed of the I-bars, two 8 in. deep and one 10 in. deep.

In succeeding articles we propose to give further structural notes and particulars relative to the engineering equipment of the Polytechnic building.

FIREPROOFING IN AMERICA.

The following is an abstract of a paper by Mr. Richard L. Humphrey, of Philadelphia, President of the National Association of Cement Users, read at the nineteenth ordinary general meeting of the Concrete Institute, held at Denison House, Westminster, S.W., on October 26:—

"America has, as you all know, the proud distinction, if you wish to put it in that way, of having the greatest fire losses in the world. The losses in America are enormous—nearly ten times the average of Europe. It would seem, therefore, that it was rather incongruous for America to come and talk to a country that is particularly low in fire losses on the subject of fireproofing.

But I think if you bear with me a minute you will see that perhaps the very fact that we have such enormous losses in America has led us to study this subject of fireproofing and fire prevention, and it has been a necessity to find out ways and means to prevent this enormous annual destruction of building materials by fire.

I find that in America we build, under our rather poor building laws, buildings of a low fire resistance, and equip our fire departments with magnificent fire-fighting appliances, high pressure water systems, so that the country is subjected to a great annual tax for the maintenance of this expensive fire-fighting system.

The annual losses are not by any means represented by the annual destruction of property. In addition to the destruction of property and building materials, there is the annual tax that is necessary for the upkeep of the fire-protection service, and then the additional tax that comes from the very high rates of insurance; so that, year by year, the total annual losses from fire, which I believe are entirely preventable, are represented by a great deal more than the two or three dollars per capita which is merely the value of the property destroyed.

We feel in America that where the question of the concentration of the resources is receiving so much careful attention it is of the utmost importance that we should study the conservation of our building materials; so that I think now generally throughout America there is a tendency to revise the building laws for the purpose of ensuring the erection of better structures. But, of course, it is impossible to make those laws in a large measure retroactive, and there must necessarily exist for many years to come buildings which at best can only be described as tinder-boxes.

Of course, in America great conflagrations have occurred. The one in Chicago was perhaps only second to that in San Francisco, but in Boston in 1872 and Baltimore in 1904 conflagrations of great size, which destroyed property worth millions of dollars, occurred, but were only small in comparison with the large areas of Chicago and San Francisco. In Baltimore the fire-fighting service from Philadelphia, New York, and Washington were practically powerless because in the extreme cold weather which prevailed at that time the water service was of little value. It is interesting to note that in the San Francisco fire it is estimated that the profits of twenty years were destroyed in a fire of three days' duration.

It frequently happens that the walls of structure are standing after a fire, and people point to those walls as an evidence of the fact that the building has satisfactorily passed the conflagration. It often happens that the walls are of concrete, and after the fire are in good shape, and only require a removal of the floor doors, and windows, and roof, to make a habitable dwelling. The floors and columns are fireproof, but the front walls are cast-iron, which are destroyed, or the walls of brick fall down. One of the best examples in America of the behaviour of reinforced concrete in

us conflagration was the building of the Antors Trust Company, of Baltimore, and tests were made on those floors after the way the building department, and they were found to be amply safe under the ordinary fire laws. In the destruction of the lining building opportunity was afforded for construction of a modern building, and it was necessary to tear down the rebuilt structure because it did not fit in with the new store, although it was in very good condition.

Stone is very largely used, not only in this country and in America, but all over the world, as an ornamental material, and it is evident, from the study of buildings where there have been fires of intense heat that the stone is almost entirely destroyed. It is almost impossible to replace the ornamental character with-rebuilding the structure entirely, and the use of granite and hard sandstone in which splinter and split, is ample evidence of the subject of natural building stones should be studied with a view to determining their resistance to fire. The United States Government have undertaken some studies of this kind, and they have found that it makes a material difference as to how the stone is treated in its fire resistance. They found that granite can be quarried so as to offer almost 100 per cent. greater resistance to fire in one direction than it does in the other direction; so in the matter of ornamental buildings there is much to be learned in the manner in which the stone is quarried from the point of view of its fire resistance. Of course, in some cases the destruction cannot be estimated. The mere fact that the skeleton remains is not much consolation, and when ornamental parts are also structural parts carrying the weight, then, of course, the construction seriously endangers the safety of the structure.

It is a striking fact that architects and people generally in America regard burnt clay as an admirable fireproofing material; and I think in large measure this opinion has been based on the fact that small pieces of burnt clay when used in a fire and got hot and thrown into a fire are not disintegrated. But the clay is used in that way. It is used in the shape of bricks. In the process of manufacture it often happens that these tiles are cracked in the corners, and when a column thus fireproofed is subjected to the action of heat, the unequal expansion of the outer face of the tile as compared with the inner face against the steel, an expansion which the thin web at the corner is unable to resist, cracks the tile and the web. As a result the tile is broken away from the column, and the column is left to the action of heat and collapses.

It often happens that in the construction of columns an attempt has been made to fireproof them by binding around the column a metal

fabric and then plastering it. In the Fairmont Hotel about 100 columns fell as a result of this kind of fireproofing. It frequently happened that the floor settled as much as a foot. Now you must bear in mind that there was no great fire in that building. The hotel had not been completed, and the only material there was the lumber that was used in the construction of the building, which was not a great amount, but the burning of this lumber was sufficient to develop enough heat to buckle the flimsily-constructed columns, and in the destruction of such buildings one frequently sees the folly of those flimsy evasions of the law.

It is quite general in a fire to find that where terra-cotta tiles have been used the lower face by reason of its expansion has flaked off. Perhaps as much as 35 per cent. failed so as to come off, while a larger per cent. perhaps are cracked so badly as to be able to be pulled off with the fingers. Now in a case of that kind nothing can be done in the way of restoration except by entire reconstruction of the floor.

The suspended ceiling was found in the San Francisco and Baltimore fires to have acted as an excellent shield, and greatly increased the fire resistance of the floor. Unfortunately in carrying out this idea it frequently happens that ordinary gypsum or plaster is used, and with a very flimsy anchor the gypsum loses its life at a very low temperature, the anchor is destroyed, and the ceiling falls.

It generally happens that the roof trusses of a building are never protected. The upper ceiling is rendered reasonably fireproof, but the steel trusses of the roof are not protected, and as a result, it frequently happens that the roof becomes the entry for a fire from the outside. It is just as necessary to protect the steel work of the roof as it is any other part of a structure.

It is not only necessary that the floors and columns of a building shall be properly protected against fire; it is also necessary that not only the interior but the outside shall be protected. It frequently happens that the windows are perhaps metal frames protected with terra-cotta or some similar fireproofing, and the destruction of these windows leads to an easy access for the flames to spread from floor to floor and lead to the entire destruction of the building.

In some cases where metal doors and windows were used and plain glass used in the windows the glass simply softened and fell down, and so, of course, the barrier was of little value. On the other hand, when the window is constructed with metal frames and wire-glass windows of approved type the glass often softens, but still stays in place and prevents the fire from gaining access to the building.

I believe personally that concrete is going to play a very important rôle in the question of fireproof construction of the future, and it was for this reason that I took for my subject

to-night the subject of fireproofing because I believe that the Concrete Institute of England and the concrete organisations of America have a very important responsibility and a very important task before them."

A discussion followed in which Messrs. E. O. Sachs, E. Fiander Etchells, William G. Kirkaldy, E. P. Wells, and Sir Henry Tanner took part.

THE SITTER VIADUCT, SWITZERLAND.—I.

AMONG the various works involved in the construction of the Bodensee-Toggenburg Railway in Switzerland the steel and masonry viaduct crossing the Sitter River, near Saint-Gall, and close to the station of Bruggen, is a remarkable structure, in the erection of which some interesting timber falseworks were employed.

This viaduct, 380 metres long, comprises at one end four masonry arches of 25 metres span, and at the other end two masonry arches of 25 metres span and five smaller arches of 12 metres span. Between the two series of masonry arches there is a steel lattice girder of 120 metres span, crossing the lowest part of the valley at 98 metres above the river.

Fig. 1 is a general view of the completed bridge, where part of the timber construction tower, built for erecting the steel girder, is still in position.

Masonry Piers and Arches.

The masonry part of the viaduct is chiefly remarkable for the height of the piers, particularly of those acting as supports for the middle span. One of these piers is 85 metres high from the foundation block to the seating of the steel girder, and the other is 59 metres high between the same levels.

The higher of the two piers measures 13.45 metres by 11.60 metres at the base and 7.25 metres by 7 metres at the top, the maximum pressure on the foundations being limited to 10.5 kilogrammes per square centimetre. The batter on the side facing the valley is one in twenty, and the batter on the upstream and downstream sides ranges from one in twenty to one in fifty by successive degrees from foundations to summit.

The two masonry arches next to the steel girder are of the three-hinged type. The spandrels are constructed with expansion joints above the three articulations, in order that the movements of the piers at the top and the variations of pressure on the structure shall not be liable to cause dislocation of the masonry.

The arches were built on trussed centring, supported by the piers, and steel gangways were fixed at springing level so as to afford

Fig. 1. The Sitter Viaduct, Switzerland.

Elevation at End of Girder Span.

Fig. 2. Sitter Viaduct: Details of Steel Girder Span. (From Genie Civil.)

ready means of communication between the entire series of piers at each end of the bridge.

The foundation block of each pier consists of mass concrete, the proportions of which were varied in accordance with the load to be carried, the unit loads ranging from 5½ to 10.5 kilogrammes per square centimetre. The pier shafts are built of dressed stones in mortar of cement or hydraulic lime according to circumstances, and at every 10 metres of height the masonry includes bed courses of hard gritstone. The pier caps and the arch spandrels are in granite. The masonry part of the viaduct comprises some 27,200 cubic metres in all.

Before construction of the foundations, 10,400 cubic metres of earth and rock had to be excavated, 2,200 cubic metres of this being for the highest pier, and deposited at the approaches to the viaduct.

Aerial Cableways.

The masonry work was executed with the aid of two aerial cableways bringing materials from the Saint-Gall side, because at the time of construction the railway tunnel on the other side of the valley was not completed. Sand and gravel for mortar and concrete were obtained from the river bed, but stone, cement, steel, and all other materials were delivered on the site by rail

and transported by the aerial cableways. One cableway was placed 2 metres to the right and the other 7 metres to the left of the axis of the viaduct. On each cable ran a carrier with endless haulage cable, and tackle for lowering and hoisting skips, the installation commanding the works from one end to the other.

In order to prevent the swaying of the smaller cables and consequent injury to workmen, these cables were held by stirrups at a fixed distance from the main cable, and picked up by the travelling carriage during operation of the cableway.

Mortar and concrete, prepared on the bank of the river, were hoisted in skips from the base of the highest pier and distributed to all parts of the works, which were placed in communication with the control station of the cableways by means of electric bells.

The actual capacity of the two cableways was not more than 35 cubic metres per day of ten hours, owing to the unavoidable delays attending the loading and discharging of the skips.

For some of the smaller piers auxiliary transporters were employed, conveying materials directly from the railway line.

Mortar was mixed throughout in the following proportions: Hydraulic lime mortar, 360 kilogrammes of lime per cubic

metre of sand; cement mortar, 1 part cement to 3 parts of sand.

Steel Girder Span.

The construction of the timber tower and the execution of other works necessary for assembling and erecting the girder span 120 metres occupied more than two months.

This girder, which is the greatest so far in Switzerland, was designed, constructed and erected in place by Messrs. Theodor Bell & Co., of Kriens-Lucerne. From centre to centre of the main girders it is 5.15 metres wide, the reason for this small width being the desire of the railway company to keep down the dimensions of the masonry piers. To ensure the transverse rigidity of the span, the depth of the girders was kept down to one-tenth of the span, instead of one-seventh or one-eighth as customary for work of the kind. The members of these girders, as well as those of the horizontal wind bracing, have been strengthened to allow for the reduced depth.

As the dead weight of the bridge is more than double the permissible rolling load, the transverse stability under the effect of traffic is better assured than if the spans were smaller, the proportion of depth to width remaining the same.

The main girders, of parabolic profile and are 5.15 metres deep at the ends and 12.30 metres deep at the middle. Fig. 2 gives details of the construction and renders unnecessary further description and dimensions. The longitudinal girders on which the sleepers are laid have been fitted as to provide for expansion and contraction and at the same time so as to be unaffected by movements caused by the expansion and contraction of the main girders.

Along the axis of the span a footbridge connects the two ends (see Fig. 2, section at middle of span). This bridge can be reached by ladders from the decking and makes inspection of the structure possible at all times.

ELECTROLYSIS IN REINFORCED CONCRETE.

TWO INDEPENDENT investigations of electrolytic corrosion of steel embedded in concrete are discussed in papers read before the Western Society of Engineers and the American Institute of Electrical Engineers. One paper by Professor Charles F. Burgess deals with the object of obtaining quantitative data on the corrosion of reinforcement under various conditions, and the other by Messrs. C. Edvard Magnusson and G. H. Smith gives the results of research into the nature and causes of the corrosive process and methods of preventing it. Professor Burgess's test specimens were made so as to ensure the corrosive efficiency of the current maintained at the pressure of 8 volts and from the results obtained it appears that when the blocks were placed in ordinary air a corrosion of from 0.32 oz. to 1.23 oz. of iron per year is possible per square foot of iron exposed, and that a 3 per cent. solution of common salt increases the rate of corrosion about one hundred times. The data obtained at pressures lower than 8 volts can be approximately deduced by the application of Ohm's law. The interest of the investigation to Messrs. Magnusson and Smith centres mainly upon suggested means of preventing electrolytic corrosion. Their results show that concrete is a good insulator when dry, but that its conductivity of these materials, varying with porosity and the nature of the solution in the pores. It is scarcely practicable to fill all the pores in concrete and mortar and to eliminate moisture so completely as to insure its conductivity. Therefore some other treatment is necessary. The authors find that corrosion can be entirely prevented if the embedded steel is treated so that the current leaves it through some other metal capable of preventing oxygen ions from coming in contact with iron. Experiments with aluminium paint were successful, although the protective coating broke down after a time, and the authors believe that aluminium plated bars would be perfectly immune from electrolytic corrosion.

THE BUILDING TRADE.

THE CLERK OF WORKS.

Of all names associated with building that of "Clerk of Works" is one of the most ancient, although it is doubtful whether this title applied to an individual performing the same functions as in use. In the account of the castle executed at Porchester Castle by the Earl of Arundel in 1321 and 1322, we read that the work was done under the supervision of the "Clerk of Works," Peter de Pulford. However, probable that this gentleman held a higher position than that generally ascribed to his modern namesake, and would be more on his own initiative rather than as representative of an architect. Withstanding the fact that the modern clerk of works may not hold such an important position as his ancient brother, he is still an important factor in the present-day building operations. His position calls for a very wide knowledge of building operations, unimpeachable honesty, and an unlimited amount of tact. He should be fairly educated, very methodical, have a manner that commands respect. We have heard it suggested that "C. of W." as a signature stands for "Cock of the Walk." This is a libel in most instances, although there are cases where this interpretation might apply, but, while in effect this should be his position, the discreet clerk of works is not to emphasise the fact. The most useful clerk of works is the individual who has had practical experience by being at some prominent trade—varying as the general character of the work he has to attend varies, e.g., for good-class church a mason is often the best man, and so on; while it is advisable that he should have had practical training in one trade, his general experience should extend over all, as he will be called upon to exercise judgment upon greatly varying matters as regards quality of both workmanship and materials. The most reprehensible practice obtained in the offices of sending out a pupil to act as clerk of works, which was all very well for the architect, and not so bad for the pupil, as he had experience in practical working which would serve him in good stead in conjunction with the office training, but what of the employer and in many cases the builder? If the builder was unprincipled he took advantage of the so-called clerk of works' inexperience. On the other hand, it sometimes happened that the tendency of youth and inexperience to lack a little brief authority, caused a good deal of unnecessary trouble, by finding fault with little cause, at the same time passing over matters of much greater importance. We think it can be safely said that this state of things is no longer prevalent as was once the case. The point to be considered is how far should a clerk of works' duties extend. In the first place, how far should the practice go of making drawings? Doubtless the clerk of works who makes drawings is a very useful man for the architect, but beyond a few explanatory details of the work should be done in the architect's office, and unless employed on the job as an assistant pure and simple—in which case he would cease to be a clerk of works—his proper work should be confined to superintendence of the works, giving general directions, booking day time and materials, and sending a note of all buried work which may be met to measurement, if it is not possible to measure such work at the time of its execution. He should not act as architect's assistant at the instance of the employer. Like the foreman, he is useful on the works than in the office, and in works of any magnitude he will find his hands fairly well occupied without attempting to do much in the way of office work. Another question that often arises is how far the clerk of works is empowered to issue orders involving extra cost. Doubtless cases arise where some such power should be exercised, but it should be to a very limited extent, and he would be well advised to hesitate before giving such orders, much trouble having to be owing to the builder having received instructions to do work in a certain way involving extra cost which certainly was not in the clerk of works' mind at the time of giving the order. In this case it is the duty of the builder to point out the fact and make a

definite statement in writing to that effect. This would save a great deal of future strife and misunderstanding, as the matter would be referred to the architect as the one empowered to order extra work. Most of us at some time or other have found ourselves somewhat embarrassed by unexpected claims at the close of the works which could be more easily settled during their progress, if not avoided altogether.

Many contractors considered the signature of the clerk of works on a day-sheet as equivalent to an order, or at least an acknowledgment of an extra, but this should never be the case unless there is a clear understanding to this effect at the outset. It should not even be considered an acknowledgment of the fact of the work being a day-work item. It should represent a check as to the correctness of time and materials charged, and nothing beyond this. The question as to whether the work is extra or whether it should

be charged day work in lieu of being measured, should be left to the proper person to deal with these questions—the surveyor engaged to deal with the accounts. The clerk of the works, from his intimate knowledge of the work during its progress, can often give invaluable information which may lead the surveyor to a better judgment as to how these particular items may be dealt with.

A well-kept diary noting the state of the weather, the arrival of drawings, the advent of special tradesmen, any special instructions given, and many other small details—small in themselves at the time, but often of large importance at a later date—will be found of the utmost value in case of any dispute as to delay and other matters that will arise even on the best-regulated building work. A weekly report should be made to the architect somewhat in the form here given:—

No. 28.

Clerk of Works' Report of Work in Progress at BLANKLEY INSTITUTE.

For Week ending Friday, July 21, 1911.

To JOHN SMITH, Architect, LONDON.

WORKMEN EMPLOYED.		STATE OF THE WEATHER.		DRAWINGS RECEIVED
No.	Hours on Day Work.			N.B.—The Numbers of the Drawings only to be stated.
1	Foreman.			
	Excavators.	Sat.	Fine.	125
6	Labourers	5	Mon. —	126
4	Bricklayers.		Tues. —	127
2	Masons.		Wed. Wet, half day.	128
12	Carpenters and Joiners	7	Thurs. Fine.	
	Slaters.		Fri. —	
2	Plasterers.			
	Plumbers.			
	Glaziers.			
	Painters.			
	Smiths.			
	Fitters.			
1	Scaffolders.			
	Engine Drivers.			
	Machinists.			
11	SUB-CONTRACTS			
Total.				
	Engineers.			
	Electricians.			
	Sculptors and Carvers.			

DRAWINGS AND PARTICULARS REQUIRED.

Details of Joinery to Committee-room and Retiring-rooms.
Selection of Flushing Tank and Sanitary Fittings.

DAY WORK.—The clerk of works is to obtain immediate notification of the employment of any men on day work, to check daily and enter the total in his report. He is also to obtain a weekly account of same from the contractor for all work done and material used in day work, which account must be signed by the foreman and clerk of works, and sent to the architect without delay.

NOTES ON PROGRESS OF WORKS, ETC.

Taking down the centering from ceiling of Small Hall, etc.; hacking to ceilings, etc.

Preparing roof over Small Hall, etc.

Fixing stone coping and pointing to brickwork of east and west walls.

Very steady progress is being made.

EDWARD BROWN, Clerk of Works.

Amongst other qualifications we have mentioned, after unimpeachable honesty (which for obvious reasons we place first) comes that of tact. Some clerks of works, more particularly those of somewhat limited experience, show a deplorable lack of this qualification, and seem rather disappointed than otherwise if they have "nothing whatever to grumble at," and appear to think that unless they can go to the architect with a long list of complaints and statements as to how "I had that out" or "this down" that the architect will think they are not doing their duty. We have in our mind now two clerks of works working for the same architect, and at the time acting on two different works, but the same contractors. In the one case there was nothing but trouble from beginning to end, largely arising from this lack of tact, and also, we are afraid we must say, from an arrogant nature. There was a strong suspicion that the time of complaint was often delayed till the rectifying of the offending portion meant removing a large amount of work which might have been avoided had the defect been pointed out or mentioned at the time. The result was trouble all round. The architect was often placed in a very awkward position in steering between weakening the power of the clerk of works and justice to the contractor—a position not rendered any easier by the fact that the clerk of works was the nominee of the employer. The builders looked with suspicion upon every complaint made, and altogether it was a relief to everyone concerned when the work was finished. In the other case it was altogether different, although if there was any cause for complaint the clerk of works made it perfectly clear in no uncertain voice that "that will not do." He was a man fully up to his work, and commanded the respect of the builders by his knowledge, and they knew that what he said he meant. He never had to ask twice to have anything removed, and the architect was not troubled with any complaints. We are in a position to say, with a full acquaintance with all the parties and the works themselves, that the second job was equal in all respects to the first, and as both were of the same class, one was able to make a fair comparison and a later acquaintance with the work bears this out.

We will close these rambling notes with an instance of where great tact was required, but where we are afraid the circumstances placed too great a strain upon human nature. The architect of a provincial job losing his clerk of works took a strong fancy to the foreman, and with a strange lack of the idea of the fitness of things, offered the foreman the post of clerk of works on the same job. The contractor was to put it quite mildly, "keen." The new clerk of the works coming on to his duties with a pretty full knowledge of the "tricks of the trade," in which he had had a good training under his late employer, was virtue itself. The sequel can well be imagined. He was up to every move, and, not having all the discretion which his unique position demanded, he made his successor's life a perfect misery. We, however, think the blame attached more to the architect who placed him in such a position than the clerk of the works himself. As we have said, it was too great a strain upon human nature, and the opportunity of "getting his own back" from his late employer was a temptation not to be resisted by any ordinary human being.

It may be said that the points we mentioned are obvious to all, but it is often the obvious that is missed, therefore if we have said nothing new, but have only driven home some of the qualifications and characteristics which make the clerk of works as he should be, something more than a mere policeman, we shall feel we are justified in putting these few rambling notes together.

TWO DECEASED BUILDERS' ESTATES.

The estate of the late Mr. James Smart, of Newcastle, builder and contractor, who died on September 29, aged sixty-eight years, is of gross value of 102,328*l.*, with net personality 3,626*l.*; the gross value of the estate of the late Robert Rothwell, of Deepish, Rochdale, builder and contractor, is sworn at 35,038*l.*

BELGIAN CEMENT TRADE DECLINING.

Sir Cecil Herxeld, British Consul at Antwerp, in his annual report to the Foreign Office, just issued, writes:—Cement at one time formed a large and valuable trade, and large quantities were some years ago exported from Belgium to England. This trade has been steadily declining of late years. The exports in 1910 reached 50,354 tons, valued at 49,560*l.*, compared with 57,921 tons, valued at 55,600*l.*, in 1909.

THE APPROVAL OF PLANS.

At the meeting of the Farnham Urban Council on Tuesday of last week complaint was made against the practice of architects and builders proceeding with the erection of buildings before the plans have been approved by the Council. The Committee pointed out in their report that they thought it should be more generally known that it is an offence against the Council's by-laws for any person to commence the erection of a building without having previously given notice and submitted plans, etc., as required by by-law No. 94.

Mr. A. G. Mardon, partner of a local firm of builders, called attention to the difficulty of getting plans settled. He thought it would be rather hard to enforce the by-law. Most people submitted plans to the officials of the Council, who said whether they were or were not in accordance with the by-law, and proceeded with the work at their own risk.

Mr. E. Kempson said if a person deposited plans he had given the necessary notice, and could proceed with the building.

Mr. R. Preston asked how they could expect the Surveyor to know whether the by-laws had been complied with when the whole of the foundations had been covered up. Anything might have been put in the foundations.

The Chairman: In nearly all cases that fact is the case.

Mr. Preston: Then what is the use of a Plans Committee at all?

The Chairman said it would be a great advantage to architects if when plans were returned disapproved the reasons might be stated.

The recommendation was adopted.

LONDON MASTER BUILDERS' ASSOCIATION.

A CONVENT meeting of the London Master Builders' Association was held at Koh-i-Noor House, Kingsway, W.C., on Thursday, the 9th inst. The President (Mr. G. Bird Godson) presided.

The Council received the report of the Bricklayers' Trade Committee re overtime payments, and gave instructions with regard to it.

Many matters of trade interest were considered, and the necessary instructions were given in connexion with the various questions under consideration.

The following were elected members of the Association:—

1. Ordinary member—Mr. A. E. Symes, Stratford, E.

2. Associate members—Messrs. John Russell & Co., Ltd., 145, Queen Victoria-street, E.C.

The Patent Rapid Scaffold Tie Company, Ltd., 124, Victoria-street, Westminster, S.W., were nominated as Associate members of the Association.

ACCURACY IN BUILDING.

At the annual meeting of the National Association of Apprenticeship, held on the afternoon of Wednesday, November 1, at Fishmongers' Hall, London, the Mayor of Hampstead (Mr. W. Woodward), in moving the re-election of the retiring members of the Council, said that, from the point of view of an architect, sincere congratulations were due to those who initiated and supported such a magnificent institution. From an artistic point of view, and from that of the craftsman, the exhibits of the apprentices showed diligence, skill, aptitude, and, in many instances, decided artistic feeling. He did not care what the calling, the art, or the profession was, it was impossible to be master of it unless the young man underwent the training which, for the moment, he would call an apprenticeship. He counselled the apprentices to cultivate as far as possible accuracy of hand and of eye—two features of their future calling which they should find of the utmost importance. Speaking again as an architect, he very much regretted to say that he found on buildings being erected under his own supervision a decided want of accuracy of eye and of hand, which led to enormous trouble and expense to everyone concerned. His advice to apprentices was: Don't think you can attain to eminence in your business by any slapdash imitations of what has gone before. Study well the great masters, look to the precedent in all your work, study these, and try to emulate them. Then try to import into these as much originality as you possibly can.

GENERAL BUILDING NEWS.

KING EDWARD MEMORIAL, FLYMOUTH.

A new pavilion for consumptives is to be erected at Diaworthy as a memorial to the late King. The estimated cost is 500*l.*, and the plans have been prepared by Mr. C. Bartlett, architect. The builder is Mr. F. Bartlett, NEW INSTITUTE, SLOUGH.

The St. Mary's Church Institute has been erected at a cost of about 1,000*l.*, from the designs of Mr. E. W. Wimperley. The building includes a hall which will provide seating accommodation for 400. The contractors were Messrs. Burfoot & Butler.

TRADE NEWS.

The London Drawing and Tracing Office, which has been carried on for over a quarter of a century by Mr. John B. Thorp, has opened a new City branch at 48, London Wall, opposite Salisbury House, where architects, engineers, surveyors, etc., whose business is in the City will find it more convenient to send their work than the Head Office, 98, Gray's Inn-road.

Our attention has been called to a new insect-destroying appliance which can be obtained from Messrs. R. Sumner & Co., Ltd., 50A, Lord-street, Liverpool. The instrument takes the form of a compressed-air hand sprayer. The liquid is placed in a copper receptacle, and a few strokes of a little piston compresses the air. The spray can then be turned on and sent in any direction. If insects are known to be behind paneling, or in cracks from which they cannot be dislodged, the instrument can easily be pressed into service. The liquid does no harm to woodwork or cabin upholstery.

The new Workhouse Infirmary, Christchurch, is being supplied with Shorland's double-fronted patent Manchester stoves with descending smoke flues by Messrs. E. H. Shorland Brothers, Ltd., of Failsforth, Manchester. The Nelson Hospital, Wimbledon, is being supplied with the firm's patent Manchester stoves with descending smoke flues.

Under the direction of Mr. S. Dobell, architect, Exeter, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "pump" ventilators and air inlets, has been applied to the Sailors' Home, Teignmouth.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 TO 1909.

At Tuesday's meeting of the London Council, the following applications under London Building Acts were dealt with, names of the applicants being given in parentheses:—

Lines of Frontage and Projections.
Holborn.—Erection at a new theatre abutting upon Shaftesbury-avenue, Broad-street, Grape-street, Holborn, of a projecting feast next to Shaftesbury-avenue, and project balconies and ladders next to Grape-street (B. Crewe).—Consent.

Holborn.—Projecting illuminated sign front of the Kingsway Theatre, Great Queen-street, Holborn (Mr. A. Penley).—Consent.

Islington, North.—Erection of an iron glass hood over the entrance to "Eymers" No. 45, Anson-road, Tufnell Park (Messrs. O'Brien, Thomas, & Co., for Mr. V. Sutherland).—Consent.

Islington, North.—Projecting one-story sign in front of No. 59, Highgate-hill, Isling (Mr. G. Carter).—Consent.

Kennington.—Three one-story shops on southern side of Lansdowne-road, Kenning (Messrs. Hulbert & Haysman for Mr. Roskilly).—Refused.

Kennington, South.—Erection of a projecting iron balcony at No. 18, Crosswell-place, Kenning (Mr. W. Withers for Mr. J. M. W. W.).—Consent.

St. George, Hanover-square.—Erection of porch at No. 21, Grosvenor-square, abutting upon the eastern side of North Audley-street (Mr. R. G. Hammond for the Right Hon. I. Furness).—Consent.

St. Pancras, South.—Iron and glass addition in front of No. 27, Charlotte-street, St. Pancras (Mr. J. Vernon for Mr. Bruschweiler).—Refused.

Width of Way.

Kennington, South.—Erection of a steel storage tank and tower with a boundary fence at less than the prescribed distance from the centre of the roadway of Holland-way, Kennington (Mr. R. D. Batchelor for the Right Hon. the Earl of Ilchester).—Consent.

Width of Way and Lines of Frontage.
Hammer-smith.—Erection of a building the northern side of King-street, Hammer-smith, to abut also upon the western side

u-road (Temperance Billiard Halls, Ltd.) sent

th of Way, Lines of Frontage, and Construction.

Paneras, West.—Three wood and iron erected on the roof of Nos. 386 and 388, n-road, St. Pancras (Messrs. Dunk & eld for Messrs. G. Wailes & Sons).—nt.

ines of Frontage and Construction.

ington, East.—Retention of a wooden sign-front of No. 106, Elmore-street, Isling- (Mr. E. Bent).—Consent.

ham.—Erection of a temporary wood on motor cycle-shed in front of No. 10, elier-road, Peckham (Messrs. W. R. Hill for Mr. L. Alexander).—Consent.

Space at Rear.

ington, North.—Addition at the rear of 6, Ladbroke-grove, Kensington (Mr. S 6).—Consent.

ington, South.—Additions upon the space ar of Nos. 114, 114A, and 116, West- grove, Paddington (Mr. G. A. Sexton r. G. Gauthurst).—Consent.

ildings for the Supply of Electricity.

Paneras, East.—Iron boiler-house of the city generating-station, Pratt-street, on Town (Mr. S. W. Baynes for the aneras Metropolitan Borough Council).—nt.

Paneras, East.—Iron chimney shaft at the city generating-station, Pratt-street, on Town (Mr. S. W. Baynes for the aneras Metropolitan Borough Council).—nt.

Cubical Extent.

enwich.—Building exceeding 250,000 cubic extent upon a site approached out of the side of Woolwich-road, Woolwich A. Roberts for Messrs. G. A. Harvey & Consent.

Uniting of Buildings.

of London.—Uniting of Nos. 10 and 11, te, with No. 4, Jewry-street, City, by of an opening at the ground-floor level, at requiring the removal of the bond in the walls of Nos. 10-11, Aldgate, or wood and iron buildings on the roof I, Chateaufort Clarke for Messrs. Wiggins, & Co.).—Consent.

of London.—Uniting of Nos. 9 and 99, court, Old Broad-street, City (Messrs. R. Harrison, & Son, for the City Offices ay, Ltd.).—Consent.

of London.—Formation of an opening in rty wall at the first-floor level between 1 and 6, Princes-street, City (Mr. A. eld for the Grocers' Company).—Consent.

of London.—Window openings in the wall at the first and second-floor levels n the staircase of the Saracen's Head Snow-hill, and Nos. 1, 2, and 3, King- where such windows light into the en- passageway at the first and second-floor of Nos. 1, 2, and 3, King-street (Mr. Le Fanu for the Governors of Queen ounty).—Consent.

of London.—Openings in the party wall basement and first-floor levels between 1 and 33, Snow-hill, and to the widening existing openings in the party wall at ound and first-floor levels between Nos. 32, Snow-hill, Holborn Viaduct (Mr. Clifton for the Holborn Viaduct Land y).—Consent.

on.—Opening at the basement level n Nos. 107-108, Hatton-garden, and Nos. 108-109, Hatton-garden, for Messrs. Gamage, Ltd.).—Consent.

on.—Doors of special construction in iron doors to openings in the division at the premises of Messrs. Brown s, Ltd., Great Eastern-street, Hoxton oot Doors, Ltd.).—Consent.

George, Hanover-square.—Uniting of 9 and 20, Grafton-street, St. George, r square (Mr. W. A. Lewis for Mr. D. ald).—Consent.

George, Hanover-square.—Uniting of Nos. 46, Grosvenor-road, Westminster, by of (i) a fire-existing staircase from the nt of No. 46 to the ground floor of and (ii) a party wall opening at the or level (Messrs. Blow & Billerey).—

id.—Additional opening in the party wall the White Horse Theatre, Aldwych, and joining office block at the first-floor r. W. G. R. Sprague for Mr. F. C. y).—Consent.

6.—Openings at the second and third evels in the party wall between Nos. 12, Savile-row (Messrs. Miller, Vardon, r for Messrs. I. Walker, P. J. Vardon, B. Miller).—Consent.

recommendation marked + is con- the views of the Metropolitan Borough concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERYSTWYTH.—Workmen's dwellings; Mr. R. Jones, Engineer, Aberystwyth Urban District Council.

Aston (Birmingham).—Brewery premises; Mr. J. Meredith, architect, Frederick-street, Aston.

Avonmouth (Bristol).—Sugar refinery for the Bristol Sugar Company, Ltd.

Barnsley.—Day school, (4,000l.); Vicar, St. Mary's Church, Barnsley.

Barry.—Day school, between James and Rupert streets; Vicar, St. John's Church, Barry.

Barton-on-Humber.—School; Mr. S. M. Grant, Secretary, Education Committee, Lindsey County Council, Lincoln.

Bath.—Proposed parish hall; Vicar, St. Stephen's Church, Bath.

Birmingham.—Factory, Freeth-street; Mr. E. Harper, architect, Corporation-street, Birmingham. Mr. F. Whittall, builder, Lister-street, Birmingham. Telegraph stores, Messrs. R. Fenwick, Ltd., builders, William Edward-street, Birmingham. Factory, Barr-street; Mr. M. Type, architect, Edmund-street, Birmingham. Messrs. B. Whitehouse & Son, builders, Parkhouse Works, Monument-road, Birmingham.

Bishop's Stortford.—Picture theatre, South-street; Messrs. Houston & Houston, architects, 81, High Holborn, W.C.

Blackrock.—Thirty-five houses (1,000l.); Surveyor, Cork Rural District Council.

Bootham (Stoke).—School; Mr. B. Ashworth, Town Hall, Hanley.

Bournemouth.—Thirty-six bungalows; Mr. F. W. Lacey, Surveyor, Bournemouth Town Council.

Canterbury.—Alterations to all church schools, except one (8,500l.); Architect, care of the Committee of Joint Managers of Voluntary Church of England Schools.

Cardiff.—Rebuilding, Theatre Royal; Mr. Bertie Cwce, architect, 75, Shaftesbury-avenue, W.C.

Chelmsford.—Additions to fire-station; Mr. C. Brown, Surveyor, Chelmsford Town Council.

Chertsey.—Children's home (1,250l.); Mr. H. E. Paine, Clerk, Board of Guardians, Chertsey.

Cheshunt.—School (120 places); Mr. U. A. Smith, Surveyor, Herts County Council, Hertford.

Creek.—School; Mr. J. G. Burrell, architect, Market-place-chambers, Durham.

Dawley Parva.—Sunday-school; Vicar, St. Luke's Church, Dawley Parva.

Denbigh.—Offices; Messrs. Porter & Elcock, architects, Colwyn Bay.

Doncaster.—Church (7,000l.); Messrs. Mullins & Richardson, builders, 5, Shotton-street, Doncaster.

Edinburgh.—Adaptation of buildings, Chalmers-street, into Model Nursing Home; Mr. T. D. Rhind, architect, 23, Rutland-street, Edinburgh.

Fazakerley.—School, Barlow-lane (650 places); Mr. J. Legge, Secretary, Education Committee, Liverpool Town Council.

Finedon.—Extensions to works for Messrs York Brothers.

Forsbrook.—Proposed enlargement of St. Peter's Church (1,500l.); Vicar, St. Peter's Church, Forsbrook.

Glasgow.—Buildings, Stanley-street, for Messrs A. & J. McLeellan, carting contractors.

Grangemouth.—Stables and depot buildings; Mr. A. Donald, Engineer, Grangemouth Town Council.

Grimby.—Proposed paint factory, Corporation-road, for Messrs. Bonshor & Scretion, 11, Cleethorpe-road, Grimsby. Proposed soap factory for Mr. E. Goschalk, Hull.

Halifax.—Improvements at central stores (15,000l.) for the Industrial Co-operative Society.

Histon.—School (5,000l.); Mr. Austin Keen, Secretary, Education Committee, Cambridgeshire County Council, Cambridge.

Hoole.—Extensions and improvements to All Saints' Church (2,000l.); the Vicar.

Honiton.—Alterations at workhouse (560l.); Architect, care of Mr. E. W. Hellier, Clerk, Board of Guardians, Honiton.

Hull.—Hospital; Mr. T. B. Atkinson, architect, 11, Trinity House-lane, Hull.

Keighley.—School (8,000l.); Mr. J. Stuart, Wakefield.

King's Heath (Birmingham).—Theatre; Mr. A. Fielder, architect, 43, Woodville-road, King's Heath.

Kinsley.—Enlargement of school; Mr. J. Stuart, Wakefield.

Wolverhampton.—Memorial wing at general hospital (6,185l.); Messrs. H. Wilcock & Co., builders, 53, Darlington-street, Liverpool.

THE SURVEYORS' INSTITUTION: PRESIDENTIAL ADDRESS.

THE opening address of the new session of the Surveyors' Institution was delivered by Mr. W. Edgar Horne, M.P. (President), at the ordinary general meeting of the Institution on Monday. In the course of his remarks the President said:—

"Touching first upon domestic matters, I must congratulate members on this our initial meeting in this enlarged Lecture Hall. The Council would perhaps not have entered upon an extension of the Institution buildings at the present moment had it not been for the rearrangements of the Government, County, and other buildings around Princes-mews. The opening out, however, of the extension at the back of the Institution for the extension of the County of Middlesex Guildhall practically necessitated their extension up to the frontage of the new street. Advantage has been taken of this to enlarge the Lecture Hall and Council Chamber, and to rearrange more conveniently the offices of the Secretary and the clerical staff, all the rooms at the front of the building now being made available for arbitrations and for the use of members.

Another subject which calls for some comment is the Conference with the Surveyors-General of the Colonies, which took place here in June last. One of my first duties as President was to welcome our fellow-surveyors from overseas and to take part in their discussions; and I am glad of this opportunity of bearing witness to the tolerance and readiness to listen to the other side which were exhibited by those taking part in the Conference. It is to the cordial relations which existed between the delegates that we must attribute the unanimous report which they made to the Secretary of State on a subject upon which a number of conflicting opinions undoubtedly existed.

Land Tax Valuation.

Turning now to more general matters, we cannot, as surveyors, overlook the criticisms which have arisen during the past year in the debates in the House of Commons on the subject of the administration of the land taxes and the valuations in connexion with them. Cases have been quoted which, although the speakers have usually disclaimed any intention of casting aspersions upon the conduct or integrity of the valuation staff, have indirectly had that effect by holding up for public condemnation the methods employed by them.

Those of us who have had experience in valuations know the difficulty and care needed in collecting all the data necessary in order to come to a sound conclusion, and the indefinable period of assimilation of those data before we can state the result with any confidence; and even then allowance must be made for errors of judgment. When, therefore, we take into consideration the youthfulness of the Government staff, their enthusiasm and anxiety to make progress in the formidable task that lies before them, we may ascribe such cases as have been the subject of complaint, and as should not more correctly be attributed to the hard-and-fast methods of valuation laid down by the Act, to haste and to that ignorance of material factors affecting value which is almost inseparable from haste.

I would beg those who have control of this body of young surveyors to urge their staff to be deliberate and cautious in forming their opinions, but beyond this when errors have been made, as made they must be, to give them an opportunity of adjusting them without delay, and thus avoid the risk of exposing these young professional men to public censure.

While on this subject I may perhaps be allowed to address one word of warning to my professional brothers against even an appearance of taking up too conservative an attitude with regard to proposals of change. We are all willing to admit that, in the main, the propagandist of advanced theories is actuated by a desire for the good of the community, and we shall therefore be acting most in the national interest by attempting to direct into practical channels such parts of his doctrine as contain the germ of public advantage.

The Small Landholder.

A measure which is now being pressed through the House of Commons has not, I think,

attracted the attention which its importance would seem to warrant. I refer to the Small Landholders (Scotland) Bill, under which it is proposed to extend the provisions of the Crofters Act (at present limited in their application to certain defined parishes in the Highlands and Islands of Scotland) to holdings in any part of Scotland of an annual value of not more than 50*l.*, or if exceeding that sum not greater than 50 acres in extent; to set up a Land Court to fix rents and carry out the duties which previously fell upon the Crofters Commission; and to establish a separate Board of Agriculture for Scotland.

The Crofters Acts, I need not remind you, were originally passed to meet the case of the crofters in the Western Highlands and islands who occupied holdings inconsiderable in area, small in annual value, and usually rescued, by the personal labour of the occupier, from the surrounding heather and rocks. Such holdings approached the conditions prevailing in Ireland more closely than those which are more commonly found in other parts of agricultural Scotland and England, and it was, therefore, perhaps not surprising that an attempt was made by the Act of 1886 to place the crofter in a somewhat similar position with regard to rent and security of tenure to that held by his fellow on the other side of the Channel. It is true that he was not empowered to assign his tenancy, but few would be prepared to deny that the elements of a dual ownership were contained in this Act.

It is now proposed to extend these provisions to holdings in all parts of Scotland, and the conditions in England or Scotland outside the crofting districts being practically the same, these proposals, if adopted by the Legislature in respect of Scotland, could not logically be rejected in respect of England and Wales. This can only mean that within a few years of the national credit being pledged to the extent of many millions in the attempt once for all to do away with that system of dual ownership which has been the curse of Ireland, a definite move is being made which threatens its introduction into Great Britain.

Compulsory Purchase.

Another subject which has pressed itself upon my notice is the position which has gradually grown up in connexion with the compulsory purchase of land by means of powers obtained under Private Acts of Parliament.

Much has happened since the railway boom in the first half of last century necessitated the passing of the Lands Clauses Consolidation Act—a measure which still stands as a memorial to the thoroughness and care expended by our forefathers upon legislation of this class—and I should be one of the last to suggest that by these changes some amendment in the pro-

cedure there laid down had not become both inevitable and desirable. We all recognise that property which is needed for public purpose should be acquired readily and on terms fair both to the community and the owner, and the provision of small holdings, the planning of our future centres of population, and the laying out of thorough routes of transit, the Legislature has decided that the national need has justified the adoption of special powers. But the acquisition of land by Private Bill comes under a different category. It is not uncommon to find in some innocent-looking Omnibus Bill promoted by a local authority a clause inserted which by a seeming mere verbal alteration would give powers considerably in advance of those previously granted. Within the last three or four years attempts have been made in Private Bills by Corporations to alter the provisions of the Lands Clauses Consolidation Acts in three important particulars, viz:—

- (1) In enacting that any enhanced value accruing from public works executed within five years from the date of the notice to treat should be excluded from any question of compensation.
- (2) In enacting that, where the particulars of claim are insufficient and not delivered within sufficient time, the claimant should pay half the costs of the proceedings; and that, where the award of a verdict was for a sum less than or the same as the offer, all the costs of the proceedings should be paid by him.
- (3) In enacting that a single arbitrator should in certain cases determine compensation.

These attempts, with one slight exception have not as yet proved successful.

The Growth of London.

Leaving these more general questions, it has occurred to me, as a surveyor whose business has been mainly a London one, and as having been connected with one of the largest rating authorities in the kingdom for many years, that it might be both interesting and instructive if placed before you tables containing figures which might enable us to appreciate the growth of London during the last forty years; for the growth of the various parts of London and the percentage of increase from quinquennium to quinquennium provide material for thought. The fact that the Quinquennial Valuation came into operation this year, when the last census was also taken this year, enables me to bring the figures up to a recent date.

TABLE GIVING THE INCREASE AND DECREASE OF POPULATION IN THE SEVERAL METROPOLITAN BOROUGHES AS SHOWN BY THE 1901 AND 1911 CENSUSES.

Metropolitan Boroughs.	Population.		Increase or Decrease of Population in Inter-censal Period.

People are apt to consider that increases in the assessable value of London must be due either to the improved value of the land or to the new buildings erected upon it. Both these factors may, and indeed generally do, contribute to it, but the rates also benefit very largely by the assessment of hereditaments, which owe little to either land or buildings, and whose value is determined by their profit-earning capacity; and the growth of these, as I shall presently show, has been the means of materially swelling the gross values for rating purposes.

Examining, then, the three classes of property which contribute to the rates, I would offer for your consideration various problems which I think are worthy of examination.

1. *The Land*.—The increase in the value of land, when the whole of London is being considered, is probably inappreciable, and certainly not at the rate imagined by many. The various imperial and local taxes to which it is exposed, and which each year we see becoming more onerous, must be held responsible for this. Of course, there are appreciations in value in some parts, but they are accompanied by depreciations in other localities, and if we adopt the simile of the waves of a nearly tideless sea we shall not inaptly describe the phenomenon of the varying values as recorded from year to year.

2. *Buildings*.—The additional rating values which new buildings afford are counterbalanced

* Including the rateable value of the Queen's Park Ward, transferred from Chelsea to Paddington, by the operation of the London Government Act.

Kensal Town transferred to Paddington and

to a very large extent by the depreciation due to wear and tear of existing buildings, and the varying requirements of fashion and trade which are continually operating to render these structures obsolete. This is particularly noticeable in the case of private residences.

3. The peculiarity of the third class of rateable hereditaments is the naked and unblushing way in which their value as profit-earning concerns form the basis of their contributions; and the fact that the rates are becoming in London a species of income tax chargeable on the profits of trade is one which I think merits your serious attention. Of course, shops and other trading businesses suffer in the same way to some extent, but the figures in their case are masked by other considerations.

The growth in rateable value of this third class of property is so remarkable that I have thought it worth while to place before you the following table showing the progress of the more important divisions during the past forty years:—

RATEABLE VALUE OF MONOPOLY SERVICES, 1871 TO 1911.

Class of Special Property	Rateable Value.				
	1871.	1891.	1896.	1906.	1911.
	£	£	£	£	£
Railways	688,192	1,879,834	2,074,120	2,307,864	2,314,803
Tramways	140,575	348,583
Gas	241,280	737,062	925,142	923,924	976,412
Electricity	202,728	379,186
Water	202,434	476,690	537,680	634,206	699,691
Hydraulic	30,018	38,738
Docks	268,609	327,516	288,942	226,770	238,808
Canals	30,963	19,192	14,398
Telephones and Telegraphs	3,041	16,985	21,000	31,602	101,923
Government Telegraphs	854	845
	£1,369,499	£3,337,467	£3,866,984	£4,517,734	£5,074,096

To this class we may, I think, well add licensed premises, which generally owe much more of their value to the possession of a licence than to their structure or to the land on which they are built; the figures in their case are interesting, and in the following table I would draw your attention to the great increase in 1901 owing to the boom, and to the depreciation, due to other well-known causes, in the rateable values exhibited in 1906 and 1911, amounting to a total of 468,733£:—

RATEABLE VALUE OF PUBLIC-HOUSES, ETC., IN FORCE ON APRIL 6, 1895, 1896, 1901, 1906, AND 1911.

	1891.	1896.	1901.	1906.	1911.
	£	£	£	£	£
Public-houses	922,972	1,082,068	1,459,324	1,357,635	979,448
Beer-houses	102,111	113,253	130,589	135,228	107,002
Hôtels	224,016	238,565	371,267	344,676	369,578
Restaurants	180,771	185,942	140,313	153,848	152,732
	1,369,870	1,560,827	2,071,493	1,991,407	1,602,760
	—	+190,957	+510,666	-80,086	-388,647

It is worthy of note that the rateable value of the monopoly services, given in the foregoing table, has increased by 270 per cent. since 1871, while the percentage of increase of the remainder of the metropolis apart from these has only been 113.

The foregoing facts and figures lead me to offer several points for your consideration, which it seems to me may justifiably be put forward in view of the facts brought to light by the last quinquennial valuation and the decennial census.

To begin with, it would appear that not only has the population of London ceased to grow, but also that the character of the ratepayer is changing from year to year. I would suggest that the ratepayer must be placed in one or other of three classes. First, that of the person who lives in London for the purpose of enjoyment and expends his money there; second, that of the person in London for the purpose of making money; and third, that of the great joint-stock concerns and companies, yearly becoming more numerous, which have no direct voice in the expenditure of the rates or the election of those who are responsible for their expenditure. The second and third classes, those who use London for the purpose of making

money, are yearly becoming an increasing percentage of the whole, and it is to their enterprise and speculation that we owe most of the increased rateable value for which we take credit.

If we adopt the suggestion that London is becoming entirely a trade centre, and that rates which are levied represent a proportion of the gross profits created by these trade concerns, it is arguable that so long as these rates produce

Greater London.

Before abandoning the fascinating pursuit of delving among figures, and attempting to deduce correctly the lessons to be learnt from them, may perhaps be allowed to lay before you two more short tables, the first showing the increase in the population of that Greater London which is comprised within the City of London and the Metropolitan Police Districts, and the second giving the figures for the Home Counties:—

GREATER LONDON.

	1871.	1881.	1891.	1901.	1911.
Administrative County of London	3,261,395	3,830,397	4,227,954	4,536,267	4,523,931
Outer Ring	624,245	833,364	1,405,852	2,045,135	2,730,002
Greater London	3,885,641	4,766,661	5,633,806	6,581,402	7,253,933

HOME COUNTIES.

	1891.	1901.	1911.
Middlesex	543,223	792,476	1,126,694
Essex	788,374	1,082,908	1,331,103
Kent	830,390	961,139	1,045,601
Surrey	521,844	533,661	845,544
Sussex	547,931	602,255	693,416
	3,226,462	4,069,529	5,032,417

These figures would seem to corroborate the views I have endeavoured to place before you. The vast increases shown can only be attributed to proximity to London and its importance as centre of trade, finance, and amusement.

I should like here to express my obligation to Mr. J. Calvert Spensley, the statistical officer of the London County Council, and to the representatives of the municipal authorities and business concerns for the assistance they have so freely and courteously given in supplying and checking the data on which I have relied in writing this paper.

Methods of Assessment.

From the discussion of rateable values and the different classes of persons who pay rates it is but a short step to consider methods of assessment, and no apology therefore seems necessary for allotting a few paragraphs of my address to that subject.

At any time during the past generation suggestions in favour of an alteration in our method of assessment have not been infrequent. A Royal Commission has sat upon the subject, a Landed Majority and minority reports have been published, and apparently have proved mutually destructive. At any rate, no Government since their issue ten years ago has made an effective attempt to deal with this important but intricate subject.

When this matter is taken in hand I think it would also be desirable to substitute a different tribunal of appeal to that which now exists. The affliction of paying rates is only mitigated if the sufferer is able to assure himself that he is bearing a fair share with his neighbours, according to the true rental value of the premises which he occupies, and that he has not been saddled with charges which they ought to bear. In some cases it is not easy to arrive at the right amount; only by weighing the views and opinions of trained surveyors, who have knowledge of the matters in dispute, can a just conclusion be arrived at. To appreciate the importance of their arguments, and to understand their methods of calculation, a court needed which is both trained and experienced in the work.

In this connexion I should like to add my opinion that small and poor properties are usually rated more nearly up to their full rental value than larger and more valuable ones. There are many reasons for this. First of all the poor being poor are unable to appeal against their assessments; secondly, these properties being so much more numerous their true rental values are more accurately estimated; and thirdly, rich owners are able to have their case put eloquently forward, and thus to secure sympathetic hearing from their judges, who indeed are probably anxious to retain in London as long as possible, the first class of ratepayer to which I have previously alluded.

an increasing prosperity and induce to a larger and more profitable trade, the arguments against their expansion fall to the ground. It is true that the comfort and enjoyment of any community must depend upon the lowness of the rates, if the ratepayers are confined to those who only spend their money in the locality and acquire it somewhere else. But in business concerns, expenditure on advertisement for attracting custom, and in the attempt to meet efficiently the growing demands and tastes of

clients, is both expedient and justifiable if conducted on business lines.

This argument clearly must not be held to justify the ever-increasing amounts which are exacted from the ratepayers towards the cost of services more national than local in their character.

London Improvements.

I cannot help feeling that London is now suffering from a want of the activity formerly shown in providing new thoroughfares and improving old ones to cope with the necessities of traffic and commerce. The corn and coal dues in former days provided the means of carrying out these enormous and much-needed improvements, but these were given up, as I think foolishly, and were it not for the resources of the Bridge House Estates I doubt whether London would have any chance of being provided with the new bridge, which we have been promised and which is so much needed.

The spirit of parsimony, which is not true economy, puts off from year to year the work which is so necessary if London is to keep pace with the requirements of the people, and the interminable wranglings between the boroughs and the County Council as to what are local and what county improvements never come to an end.

There is, all are aware, a large body of people who think that capital value rather than rental value should form the basis. There are others who think that land only should be taxed, and again others who would collect rates in respect of empty premises. In New York, I see, furniture and works of art are laid for contribution, and in Berlin, so far as I have been able to follow the rather obscure system, the municipal authorities issue a land note which is to all intents and purposes a replica of that sent in for income tax by the rental authorities.

Reviewing these in detail, so far as my own experience goes, I think the immediate rental value is a more satisfactory basis for assessment than a problematical capital value. I am unable to concede the claims of those who would rate the land only. It opens the door to a large number of imaginary values which may have no basis of fact, and suggests that the present users have no regard to economic value. I agree, however, that ratepayers have a grievance in some cases where the land is put to some altogether worthless use (using the word "worthless" in its commercial sense), and I do not think it would be unfair if the law were so altered that the authorities should be allowed as an alternative to assess the land only, disregarding the structure upon it.

In conclusion, may I address a few words to younger members more particularly? We have seen the continued growth of our Institution, and have noted with satisfaction the proved status and prosperity of its members. These results must not be attributed to our efforts having been devoted primarily to the institution or to our own well-being. They are the inevitable consequence rather of a single-minded devotion to the interests of the clients whom we have the honour to serve, and I believe that if we keep this object as clearly before us in the future as in the past we may see the Institution and its members in the sure belief that their prosperity will not wane."

WESTMINSTER CITY COUNCIL.

At the fortnightly sitting of the Westminster Council on November 9 the following business were dealt with:

Reconstruction of Millbank.—A plan was received from the London County Council of the proposed reconstruction of Millbank from Wood-street to Horseferry-road. The new street will be 70 ft. wide, with foot-ways 10 ft. wide on the west side and 10 ft. on the east side.

Widening of Horseferry-road.—The same Committee reported on the widening of Horseferry-road between Carpenter-street and Tufnell-street to 50 ft., and a widening of the street between Horseferry-road and Tufnell-street to about 33 ft. It was decided that the Council should contribute one-fourth of the cost of the improvement.

Piccadilly Widening.—The same Committee reported on the delay which has occurred in the rebuilding of Nos. 19 and 20, Piccadilly. It was stated, was due to negotiations with the Crown, the Piccadilly Hotel Company, and Messrs. Denman as to whether the frontage is to be erected in accordance with the elevation of the Piccadilly Hotel. The Committee now understood that it is intended to adopt the Piccadilly Hotel elevation.

LEGAL COLUMN.

Water Supplied to Trade Premises.

The House of Lords have affirmed the decision of the Court of Appeal in the case of Metropolitan Water Board v. Colley's Patents, (noted *The Builder*, March 10, 1911). This case is of very great importance to all who are in trade in the area supplied by the Board, as the decision amounts to this—namely, in addition to the charge for water by the Board used for trade purposes, where consumers are supplied to the workpeople employed on the premises for washing lavatories, the Board can also levy a charge based on the rental value of the premises, as the Board is supplied for those purposes has been supplied for "domestic purposes." It is subject to a rebate in certain cases under sect. 9

This case has illustrated the difficulties of interpreting this private Act of Parliament relating to a prime necessity of life. The County Court decided that the Board were not entitled to charge as for a supply for domestic purposes; the Divisional Court were divided in opinion, so the decision remained undisturbed. The Court of Appeal were divided, but the majority reversed the decision, and the House of Lords unanimously affirmed the decision of the majority in the Court of Appeal. Their judgment is only at present very shortly reported, but the Lord Chancellor is reported as saying that the material definition contained in the Act was "couched in barbarous or certainly slovenly language."

It is not necessary for us at present to analyse the various sections of the Act, as this decision is conclusive, and we have already touched upon them (see *The Builder*, December 31 last). The interpretation placed upon the Act by the House of Lords is that adopted by a Judge of the Chancery Division in *South Suburban Gas Company v. Metropolitan Water Board* (the *Builder*, October 23, 1909); but it may be noted that under the decided cases water supplied to a railway company for the public is treated as standing on a different footing, as this was held to be supplied for "railway purposes" (see *Metropolitan Water Board v. London, Brighton, and South Coast Railway Company*, the *Builder*, March 25, 1910). The present decision has disposed of the view adopted by the Courts in some of the decided cases, that some degree of restriction is necessary for the water to be deemed to be supplied for domestic purposes, as it now appears that the purposes for which the water is used are alone regarded; but, as we have already pointed out in former articles, its effects may be most serious. In undertakings where there is no statutory obligation to supply workpeople with washing and other conveniences on the premises, these facilities may be withheld in order to avoid incurring the extra rate, and at a time when cleanliness and sanitary conditions are being encouraged and fostered it is to be regretted that a reading should be placed upon an Act which may deter employers from providing extra conveniences on business premises. The finances of the Metropolitan Water Board are hardly in such a condition that there would be ground for hope that legislation can be obtained to relieve consumers of any portion of the charges now imposed upon them.

Liabilities of Road Authorities.

The case of *McClelland v. Lord Mayor of Manchester*, which has recently been argued at length, raises questions of considerable interest to the public. The Corporation, acting under their statutory powers, had made up and lighted a thoroughfare which they had taken over. At the end of the street was a natural ravine some 125 ft. deep. The plaintiff, passing down this thoroughfare, had suffered an accident, his motor car falling into the ravine, and he brought the action against the Corporation for negligence, alleging that they had neglected properly to fence the street, had allowed one of the gas lamps to remain broken, so that it gave insufficient light, and also that, owing to the way this street was lighted, the two streets appeared to be a continuous thoroughfare, and thus formed a trap.

The jury found (1) the road as made was dangerous to persons lawfully using it; (2) the unfenced ravine was a hidden trap; (3) the defendants, in opening the road to the public after making it up and in maintaining it, did not take proper care to warn the public of the danger, and that the plaintiff had not been guilty of contributory negligence. A fourth answer, as to invitation to use the road, was held immaterial.

The defence practically amounted to denial of any negligence, a plea under the Public Authorities Protection Act, and a plea that if there was any omission on the part of the Corporation it was one of non-feasance and not misfeasance, and the Corporation were not liable.

As regards the point as to mere non-feasance, the Court held that this doctrine had no application here, as it was not a case where the highway had merely been allowed to get out of repair (as to such a case see *Maguire v. Corporation of Liverpool*, the *Builder*, February 25, 1905). Here the authority had done something to the road and had omitted some precaution, and thus it was misfeasance.

Another point of greater difficulty arose out of the defendants' contention that as the road was dedicated in the condition it now was, and the ravine was a natural existing condition, the defendants could not be liable for leaving it in the same condition, especially as they had statutory authority merely to pave, etc., any part of it.

The learned Judge held that as the defendants had undertaken a duty with regard to the road they were bound to exercise due care, and as their statutory powers were not imperative but merely permissive (i.e., as it was not imperative that the road should be made up to the very brink of the ravine), by creating, as the jury found, a trap, the defendants had exercised their powers negligently.

As regards the lighting, the finding of the jury was held to mean that the system of lighting was insufficient, and not merely that a lamp was giving insufficient light owing to a defect, and on this point the defendants were again held liable for having negligently performed a duty which they had undertaken.

From the decision as at present reported it would appear that even had the lamp alone been defective there would have been misfeasance, for which the defendants would have been liable, but this is not absolutely clear. The defence under the Public Authorities Protection Act also failed, the "act and neglect" being held not to have been concluded when the street was made up in 1904, but to continue to operate at the time of the accident. The above is only necessarily an incomplete summary of a decision which involves points of much complexity and importance.

Nuisance from Noise.

Dwellers in towns have some difficulty in maintaining actions for nuisance from noise; therefore we may note the recent case of *Becker v. Earl's Court, Ltd.*, in which an artist claimed an injunction against the defendant company in respect of the noise created by three forms of entertainment provided at Earl's Court—The Dragon's Gorge, the "Cake Walk," and the "Merry-go-Round." The nuisance complained of was the thud of the engines in the Cake Walk, the passage of the cars through the Dragon's Gorge, with the raucous voices of the attendants, and the shrill shrieks of the passengers, and the blare of the organ on the Merry-go-Round. One important point in such cases was found in the plaintiff's favour, as the neighbourhood was held normally to be a quiet one, and the plaintiff's house was in a cul-de-sac. It was also found that the above noises reached the plaintiff's house. The Judge, however, seems to have borne rather hardly on the artistic temperament of the plaintiff. He said he would not consider whether the artistic temperament was more sensitive than others, but on the ground that the plaintiff was "run down," so that the noise got on his nerves and caused a kind of mental paralysis, he held that the plaintiff himself was not entitled to relief. Fortunately for the plaintiff there were, besides himself, in the house persons who were neither artists nor invalids, namely, his wife and child, and both these persons suffered in health from the noise, and their sufferings caused the noise to be pronounced a nuisance, and an injunction was granted and 25s. damages.

No doubt the real finding was that the plaintiff's condition was not directly traceable to the noise, but as the case is at present reported it makes it appear that artists and invalids are placed under severe disabilities if they reside in quiet neighbourhoods in London, and that it is as well to keep an artistic and healthy person residing on the premises as a kind of gauge to register what is a reasonable or excessive amount of noise.

LAW REPORTS.

KING'S BENCH DIVISION.

DIVISIONAL COURT.
(Before Mr. Justice DARLING, Mr. Justice HAMILTON, and Mr. Justice BANKES.)

Minter v. Waldstein.

THE court was informed on Friday by Mr. Clavell Salter, K.C., that an appeal had been entered by the defendant in this case against the decision of the Official Referee, Mr. Muir Mackenzie. The action, the hearing of which occupied thirty-eight days, was by Mr. F. G. Minter, a building contractor, of Putney, who sued Professor Waldstein, a professor of fine arts at Cambridge University, on a contract for enlargements and alterations to Newton Hall, near Harston, Cambridge. The professor counterclaimed, alleging that the work was not carried out according to contract.

In the result, the Referee awarded the plaintiff 3,283s. on his claim, while Professor Waldstein obtained 2,115s. on his counterclaim, so that the set-off in favour of his counterclaim was 1,168s. Mr. Clavell Salter asked the court to relieve the parties of the responsibility and expense of procuring copies of the transcript of the Referee's notes, which filled eight bulky volumes. The transcripts of such notes were usually obtained for the use of the court when

* All these applications are in the state which opposition to the grant of Patents them can be made.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. THOSE WITH AN ASTERISK (*) ARE ADVERTISED IN THIS NUMBER: Competitions, iv. vi. viii. x.; Public Appointments, xix.; Auction Sales, xxviii. Certain conditions beyond those given in the following information are imposed in some cases, such as: that the advertisers do not make themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary. The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisement; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

NOVEMBER 17.—**Nottingham.**—BAPTIST CHURCH PREMISES.—Limited to Nottingham architects. Assessor, Mr. H. W. Willis, A.R.I.B.A., 10, King-street, Nottingham.

NOVEMBER 30.—**Gardiner.**—TECHNICAL INSTITUTE. Architects and surveyors invited to submit plans and estimates for a technical institute. Advertisement in issue of August 18 to carry out particulars. Successful architect to carry out. Premiums of 125*l.*, 75*l.*, and 50*l.* to competitors. Mr. J. S. Gibson, F.R.I.B.A., 10, King-street, Nottingham.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or send a drawing for publication, is given subject to the approval of the Editor, who retains the right to reject received, by the Editor, who retains the right to reject if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100, unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

Ewelme Down, Wallingford: The Entrance Court and Part of the Terrace. (See page 598.)
Mr. Walter Cave, F.R.I.B.A., Architect.

DIVIDED CONTROL.

THE necessity for the creation of a central authority having undivided control over the whole of the streets of the Metropolis is again most aptly illustrated by the latest performance of the City Corporation with reference to the proposed widening of New Bridge-street. Taking advantage of a rebuilding at Aldgate-hill Station, and of the fact that the leases of the houses on the one side of the road are now falling in, the London County Council suggested the widening of this side of the street. According to the *Times*, there is, however, a belief among members of the Corporation that the desire of the London County Council to see this widening carried out is bound up with the policy of uniting the Embankment tramways with the North London system, one minus of which is at Farringdon-street station. This is, no doubt, the reason

which has led the Improvements and Finance Committee to recommend the Corporation not to undertake the continuation of the widening of New Bridge-street, and to suggest that the station improvement only be agreed to.

We are told that there is a feeling against a tramway in New Bridge-street, and that this refusal to widen the road is supposed to remove any immediate danger of such a scheme being carried out; but we are not told upon what grounds either this feeling or this action is justified.

However much we may regret this incident, we cannot pretend to be altogether surprised to learn that the Corporation has refused to carry out a beneficial improvement for fear that it may lead to one more beneficial still.

It is just possible that if anyone should see a connexion between this incident

and the difficulties that have arisen over St. Paul's Bridge, no great injustice would be done to the Corporation, although, no doubt, it would be an injustice to attribute this conduct solely to a feeling of resentment at the action of the London County Council in referring back St. Paul's Bridge for further consideration, and so "shamefully breaking faith with the City." It is sufficient to recognise that even the City Corporation may sometimes think it advisable to be consistent. Having put forward St. Paul's Bridge and tunnel as a good enough through traffic route for the trams, the consistency of sticking to their guns is apparent. It is equally obvious that if the trams are linked up by way of New Bridge-street and Farringdon-road there will not be the same need to take them over St. Paul's Bridge. Where, then, would be the necessity for the

viaduct over Queen Victoria-street, and what would become of the arguments in favour of many other details of the scheme as it now exists? It seems perfectly evident that in the interests of St. Paul's Bridge any alternative route must be severely discouraged even at the cost of local improvements.

The only encouraging aspect of this regrettable incident is the evidence it affords that the London County Council is beginning to realise that the Blackfriars route is the inevitable one, and that this feeling is so apparent and is growing so strong as to alarm the City Corporation for the ultimate success of the St. Paul's Bridge negotiations.

There may perhaps be cause for alarm, for if as time goes on the London County Council comes to the definite conclusion, as we firmly believe it will, that the Blackfriars route is from every point of view the best one for the trams, its obvious duty would be to select the best and not waste public money on an inferior one. It certainly would find it rather difficult to justify its action if with the wider outlook which comes of a fuller knowledge of the necessities of the case it deliberately ratified tentative arrangements discussed from what proves to have been a limited point of view which failed to take into account the whole of the possibilities of the situation.

We notice that it is reported in the City that the Corporation will proceed with their scheme, relying on the probability of a change of party at the London County Council in the near future. Be this as it may, we apprehend that the same consideration will apply to the action of either party, and that in the end this question must be settled on its merits. But whether it can ever be properly settled while two different authorities are allowed to wrangle over it, with still another—the Home Office—putting in a word or two when it sees an opportunity, is certainly open to doubt. One authority or the other should be supreme, and that one, judging by their past record, should not be the City Corporation.

LONDON'S STANDING GRIEVANCE.

MR. RICHARD WHITEING, while acknowledging in the columns of the *Daily Chronicle* that London grows better worth looking at as time goes on, complains that no one has a proper chance of "taking it sitting down" owing to the lack of outdoor seats.

Realising that the few now existing are mostly occupied by unclean and unwholesome people, to the prejudice of the clean and wholesome, he proposes a remedy.

"If," he says, "there were more seats, there would soon be not enough tramps to go round for the misuse of them." Then, "If a few corpulent persons of the first social or intellectual importance . . . could be induced to sit on the pavement for a few hours every day, the thing would soon be done."

There may, we admit, be something in this idea. Obviously there must be a definite limit to the number of tramps in

the country, while the supply of seats, unless the political economists have mislead us, is only limited by the demand. We must not, however, forget that although the supply of tramps may be strictly limited, so is the available space in the streets and the financial resources of London.

Perhaps the subject is not so simple as it seems. Without venturing to do more than express a doubt as to the capacity for martyrdom of corpulent persons of importance, we might perhaps be permitted to point out that Mr. Whiteing appears to have overlooked the fact that the final solution of this problem does not depend so much on the number of tramps to go round as on the number of seats that a single tramp, or any ascertained number of tramps, can go round in a given time—misusing them all as he goes.

The tramp, as Mr. Whiteing suggests, may be a professional loiterer, but if there is anything in a name, if practice makes perfect, and inherited aptitudes count, then he should be a past-master in the art of going round. A little tramp goes round a long way and so defiles many a seat.

In the absence of official statistics we hesitate to express an opinion on the precise extent of his capabilities in this direction. We should not, however, be altogether surprised to find that even though every street was lined with seats, our present supply of able-bodied tramps—kept up to the mark and continually moved on by an efficient and intelligent police—might still be enough to go round for the misuse of them all, while corpulent persons of importance might still remain seatless and still be obliged to live, as Mr. Whiteing expresses it, "down to the tastes of our most forlorn."

This, indeed, is what we all have to do, and not only in the matter of seats does our social outcast influence our towns and the arrangement and details of our buildings.

Nothing perhaps in the history of architecture is more interesting to the sociologist than the provisions made for or against the outcast, and the way in which they are gradually relaxed as the general up-lift of society lessens his numbers and his power for evil. But even in this year of grace no one can yet build entirely to his own tastes, but, perforce, must build and live down to those of the most forlorn. Numerous details of arrangement and of structure in all our buildings are dictated solely by this necessity. But although they might not all be obvious to Mr. Whiteing's "harvester of the quiet eye," even he could hardly fail to notice how eloquently this disagreeable necessity is expressed by the row of broken bottles so often to be seen on the garden walls.

From this, as from every other point of view, the tramp is an expensive luxury. Again, in the absence of statistics we should hesitate to say how many miles or hundreds of miles of brick walls and iron railings owe their existence to his presence, or what the capital outlay and annual upkeep of the same might be. More than the tramp is worth, of that we may be sure. But if Mr. Whiteing is not afraid to suggest that our most forlorn are not so objectionable as we are apt to think, we will not shrink

from suggesting that neither are they dangerous or so destructive, and that might well save the cost of the annual upkeep of miles of iron railings in London alone, and devote it instead to remedy what Mr. Whiteing considers is London's standing grievance.

NOTES.

The British School at Rome.

THE generosity of the Municipality of Rome in presenting the site of the British Building at the

year's exhibition, and of Colonel Charles Humphreys in giving the structure, which the façade was designed by J. Lutyens, will enable a good start to be made in extending the activities of the British School at Rome. Up to the present the School has mainly devoted itself to archaeological study, but the future of the arts generally will come within its scope. It can hardly be said that the present building is in every way suitable for a school; the galleries are spacious, but do not afford much protection against extremes of temperature, so that they will demand improvement in this respect as soon as funds are available for the purpose. Perhaps the most interesting feature in the programme is the selection on the Council of representatives of the Royal Academy, the Royal Institute of British Architects, and the Royal Society of British Sculptors, which seems to point to a recognition of the true face of the case in regard to the position of the first-named body. To all intents and purposes the Royal Academy is a painters' society controlled by painters with but an occasional side-glance at the other arts. We all like to picture it as the glorious head of the three arts, nominally represents, even while we know in our hearts that it is nothing of the sort; but such make-beliefs are dangerous, and it is well that at last we see it understood that there are other bodies better qualified to take charge of the arts of architecture and sculpture. Professor Reginald Blomfield in a letter in the *Times* of November 23 makes some cogent remarks on the aims of an Architectural School in Rome, and in view of the importance of a correct appreciation of these, we shall return to this question in a future issue.

Permanent v. Temporary Schools.

THE question of cheap buildings for school purposes seems to resolve itself into whether it is a better policy to build, say, a period of twenty or thirty years at half the cost or to provide a building that may be regarded as structurally permanent. Looking at the question from the economic standpoint and taking into consideration the fact that our views on educational methods are present in a very plastic state, there can be no doubt that the verdict must go in favour of the temporary building. But there is another and more important aspect than this. Is not architecture itself an important factor in what may be termed unconscious education? A temporary building can make no appeal to the æsthetic instinct a valuable aid in the work of the teacher is thrown

The "Monument aux Morts," Père Lachaise Cemetery, Paris.
M. Bartholomé, Sculptor.

ay. We are more and more recog-
ing the necessity of contact with
utiful and interesting surroundings
cultivating the taste of our future
izens, and if the whole work of educa-
n is to be conducted in a group of
fected sheds, but little is to be hoped
from occasional excursions to scenes
"atural beauty and historic
erest." Of course, if our architects
skilful enough to design temporary
ldings that are beautiful in their own
y, and are encouraged to do so,
s objection will be satisfactorily
posed of.

Minter v. Waldstein. The long-drawn-out case
of Minter v. Waldstein
having been taken, we
derstand, to the Court of Appeal, the
erits of the case are not yet subject
comment, but the judgment of the
ocial Referee appears to emphasise
ne points of law to which attention
ght well be drawn. Clause 3 of the
stitute form of agreement provides
at, in the event of the original architect
using to act, the architect for the pur-
oses of the contract shall be such other
erson as shall be nominated for that
urpose by the employer. It is now laid
wn that, although the employer may
harge the architect during the progress
the works, and so terminate his
thority under the contract, this clause
es not permit the employer to termi-
ate the architect's authority to issue
ificates for work already carried out
der his control while he still held
thority under the terms of the contract.
is judgment seems to be in accord
th the general meaning and spirit of
e last sentence of Clause 3, but it is
st as well to have the point definitely
ared up in a court of law.

Variations that prejudice the Building. ALTHOUGH by Clause 12
of the Institute Schedule
of Conditions of Contract
the contractor shall, when
thorised by the architect, or as
rovided by Clause 5, vary by way of

extra or omission from the drawings
or specification, yet this does not
authorise the contractor to depart from
the terms of the contract so as to pre-
judice the strength and stability of the
building. The acquiescence of the archi-
tect as to variations in structure or
quality of materials does not absolve the
contractor from his contract to carry out
the specification on these heads. As
the Institute Conditions of Contract
appear to direct the contractor, not
merely to permit him, to vary the
drawing and specification as the archi-
tect may desire, the position seems to
be an anomalous one, and the con-
tractor appears to have no other course
open to him but to take the risk of
throwing up his contract when directed
to vary it in a way which, in his
opinion, will prejudice the structure.
It is evident that before entering into
any contract he must satisfy himself
that it is possible to carry it out in every
respect.

Designer and Producer. ARCHITECTS are accus-
tomed to the neglect of
the popular Press, and it
does not take them by surprise when
one of their buildings is described, and
perhaps illustrated, to find that the man
who says a few words as he taps the
foundation-stone or turns the ceremonial
key is regarded of more importance than
the designer of the work. We note,
however, that architects are not alone
in this respect. Many of the daily
papers have been giving illustrations of
Royal Christmas cards, and, in the
majority of cases, they have evidently
considered the man who prints and sells
the card as of far more consideration
than the one who is responsible for the
design. That the character of these
works is not better than we find it is
obviously due to the popular disregard
of the personality of the designer and the
exaltation, at his expense, of the firm that
produces, sells, and presumably adver-
tises, the wares that are based on his
imaginative conceptions.

A MEETING of the Royal Institute of
British Architects was held on Monday at
No. 9, Conduit-street, W., under the Chair-
manship of the President, Mr. Leonard
Stokes.

The Chairman called attention to the fact
that the next business of the Institute was
a business one which was supposed to give
opportunities for the ordinary members to
bring forward any questions they wished
ventilated. The agenda paper for the next
meeting on December 4 was empty at present,
and therefore the meeting would afford
members an opportunity to bring forward
any matter.

Deceased Members.
Mr. H. T. Hare, Hon. Secretary, said he
had to announce the decease of Mr.
Edwin Austin Abbey, R.A., Hon. Associate,
elected 1905. Mr. Abbey's work was such as
particularly to appeal to architects, inasmuch
as it was work more or less of a decorative
nature, and the Institute had sustained a
very great loss in his death. They had also
lost Mr. D. G. Driver, Secretary for the last
twenty years of the Architectural Associa-
tion. A great many of their members had
been associated more or less intimately with
the Architectural Association, and they would
realise how serious was the loss sustained,
and how difficult it would be to fill Mr.
Driver's place adequately. The death had
also occurred of Mr. W. Forrest Salmon,
Fellow, elected 1876, who was Past-President
of the Glasgow Institute of Architects and
for some time a member of the Council of
the Institute.

A vote of condolence to the relatives of the
deceased gentlemen was carried.
Mr. Hare further announced the decease
of Mr. W. H. Hill, elected a Fellow in 1888;
Mr. James Pigott Pritchett, elected a
Fellow 1865; Mr. G. Ransome, elected an
Associate 1880 and Fellow in 1906; and
Messrs. J. Davidson and H. E. East,

"Architecture": Statue for the Tomb of the Architect Guérinot.
M. E. L. Burrias, Sculptor.

Licentiate. Obituary notices of these gentlemen had appeared in the *Journal*.

Gift to the Institute.

Mr. Hare further announced that Mrs. Arthur Cates had presented to the Institute a handsome mahogany cabinet, containing a large collection of photographs, particularly of buildings in Italy. He had had the privilege of looking over the photographs, and could assure them that it was a most valuable collection.

A vote of thanks was accorded the donor.

MODERN FRENCH SCULPTURE.

Mr. H. H. Statham then delivered a lecture on this subject, and showed a large number of excellent lantern slides in illustration. In the course of his preliminary remarks he said:—

"When my friend Mr. Spielmann gave us his interesting illustrated paper, three or four years ago, on modern English sculpture, it occurred to me that it might very well be followed, at a convenient season, by an illustrated paper on modern French sculpture. Perhaps this paper would have come more suitably, as it was first intended, at the close of the session, since it is not a strictly architectural subject; but I was asked to read it now to take the place of another, the author of which could not be ready in time; and, after all, sculpture is the art most closely connected with architecture, being, as I heard a sculptor once remark, 'only a higher form of masonry.' But this was said at a meeting of architects.

That some notice and illustration of modern French sculpture is not uncalled for is evident from the fact that, as a general rule, I have found that the only name that any one knows in England is that of Rodin. I went into a well-known art photographer's to ask if they had any photographs of modern French

sculpture, and was told—"Rodin? Oh, yes, we have a number!" And the same was the result at the London branch of a French art photographer's; in each case they had a whole portfolio of Rodin's works, and of all the other eminent sculptors of France only some half dozen stray photographs; and why that was, the usual law of supply and demand of course explains. As to the origin and the reasonableness of what I call "the Rodin craze" I have something to say just now; in the meantime I would merely remark that, if people on this side of the Channel really believe that French sculpture of to-day is summed up in the works of M. Rodin, it is high time they were told differently. I wonder sometimes whether those who profess to be interested in contemporary art, but who never take the trouble to visit the Salon—whether they realise what the annual Sculpture Exhibition at the Salon means. It means that for at least a quarter of a century back, first in the great central court of the old Palais de l'Industrie (originally built for the 1878 Exhibition); then in the vast space covered by the roof of the *Galérie des Machines*; lastly in the great central court of 1900, there has been seen every year a collection of between eight and nine hundred new works in sculpture; some of them no doubt commonplace in conception, some of them perhaps rather *outré* and violent in composition; but all, I think, up to a high standard of technical execution; and a considerable number of them, every year, representing both in conception and execution the highest style of sculptural art. I do not think the whole history of art can show such an extraordinary evidence of artistic energy and

* The Old Salon this year contained 868 works, the New Salon (in which sculpture is less prominent) 354, making a total of 1,222 works produced for one year's exhibition only.

vitality as is displayed in these successive annual exhibitions of French sculpture. I should like to quote a few words that I wrote in closing a review of the Salon of 1890:—

"Taking this as a representation of French sculpture for one year, and comparing it with our little show at the Royal Academy, the contrast is extraordinary enough; and the evidence of mental vigour and power of invention, as well as of execution among French sculptors, is equally extraordinary. We are confronted by new ideas, new treatments, and new force and meaning imparted to old subjects; we are gaining new poetic conceptions of those subjects; and this not only in isolated instances, but in the case of a large proportion of the works exhibited."

If there has been a certain degree of decline in French sculpture the last few years—and I am afraid there has—still, I think the impression here recorded as to its intellectual interest would be true in the main up to the present moment. It must be admitted, however, that 1890 was rather an exceptional year; that 1894 are the two greatest years I remember in Salon sculpture. But I think I shall be able to show you enough illustrations to-night to justify the feeling expressed in my record of 1890.

Now, what do we look for in sculpture? First and pre-eminently, perfectly modelled form, sculpture being the art dealing with form only, without the assistance of colour and perspective; for even relief sculpture is not so much perspective as the superposition of two or more planes of delineation. And hence the nude figure will always be the highest effort and ambition of the sculptor, first, because there alone it is that form has to be refined to the utmost; and, secondly, that the figure, delivered from the conventional bondage of costume, becomes an abstract thing, not tethered to time or place. And though mere beauty in a figure is in itself enough to justify sculpture, this abstract figure may also be made the means of symbolising an abstract idea, so that sculpture may in that sense become, what Matthew Arnold said poetry ought to be—"a criticism of Life." And it is for the frequent recurrence of this effort to symbolise thought that French sculpture of the modern period is, among other qualities, especially remarkable. And to furnish such a material to be prostituted to the carving of tailoring and millinery.

The expression of abstract idea through abstract form is then the highest mission of sculpture. Beyond or below that, what possibilities are there? The actual form and presence of memorable personages, in their habit as they lived, can be commemorated in bronze, though not suitably in marble; or which is far better, the portrait head alone can be represented, in bronze or marble, accompanied by figures symbolical of the character and career of the person commemorated, which is the favourite way with the French; and here we come round again to the abstract ideal. Sculpture may represent, also, significant facts and forms from the life of its own day, especially those which are typical rather than merely incidental; though this is a function of sculpture to be used with caution and reserve, lest it should degenerate into mere realism and playing to the gallery. Of all these various functions of the art of sculpture you will see examples in the illustrations I have to show you."

Mr. Statham proceeded to exhibit above a hundred illustrations of the works of modern French sculptors, the first being the dance scene of Carpeaux on the front of the Paris Opera House, which the lecturer did not altogether admire, but thought it illustrated the intensity which the French threw into such

Clairon Monument — Condé-sur-Escaut.
M. Gasquid, Sculptor.

ds of things. Dealing next with some of men who were no longer amongst them, said the greatest was Charpentier, with figures of "Courage" and "Jeanne rc." There was also the monument of Reg- M., in the Ecole des Beaux-Arts, by Henri upu; the monument of Victor Hugo (a le bombastic), the monument to the de- ce of Paris, and the symbolical figure of architect done for the tomb of an archi- t by E. L. Barrias. He liked the last t. From Dalou they had the very spirited ed of Jeanne Darc, "A Peasant Woman rsing Her Infant," "Triumph of the public" (a colossal group standing in the ce de la Renaissance), and the monument Delacroix. He thought Dalou rather over- ed, as he was too boisterous in his sculp- e. Falguère was a much greater man. He produced the "Woman and Peacock," a later in life painted a picture of the man and called it Juno. J. L. Gérôme. o took to painting in his later years, repre- ted a type of genius which was rather uliarly French—the genius of absolutely ect technique without the slightest senti- nt. Everyone was impressed with the nique, but nothing appealed to the feel- s. One of his best works was the figure of ernal Bonaparte. Coming to the men who re still alive, Mr. Statham said he thought y must consider Antonin Mercié as at the ad of French sculpture—he could do every t of thing, and do everything well. The t thing he had produced was "Liberty" this year's Salon. "Souvenir" represented hing he had done largely, viz., figures for eeral monuments. His statue of Louis ilippe and his Queen was not good. His tne of Alfred de Musset stood close to the rement of the Rue de Rivoli, and looked y much out of place. He had lately taken producing subjects of peasant life, of ich the "Old French Dance" was an

illustration; but one of his finest things was the working "Gloria Victis," which was hidden in the courtyard of the Hôtel de Ville. When the Hôtel de Ville was being rebuilt after the war it was difficult to represent victory, and so the sculptor conceived the fine idea of representing victory bringing home a wounded soldier. Gustave Michel was responsible for "Dans la Réve" and "La Pensée." Then he came to two men of the same name. Alfred Boucher and Jean Boucher, who were not relatives. In 1907 Alfred Boucher did "La Pensée" and "A Girl in the Fields." M. Puech was one of the most erratic of sculp- tors and produced a bas-relief of a "Youth carried off by a Siren." Jean Hugues was responsible for "Les Danaïdes" and "Muse de la Source." M. Moreau's "Exiled" was, he considered, a fine expression of modern feeling in sculpture. M. Vital Cornu had been very successful in the treatment of the nude figure, and that of a sleeping girl, in the Salon of 1888, was much admired. Very different sculpture from this was that of M. Frémiet, who was a sculptor of a great deal of power, but, like Gérôme, with no senti- ment whatever. In one of the Salons about fifteen years ago he had a most powerful but horrible thing—"A Gorilla carrying away a Woman." His portrayal of Jeanne Darc was very good. In 1893 he was going through the sculpture court of the New Salon, and came across Bartholomé's work, showing a man and woman looking into a tomb, and he came at once to the conclusion that here was a new

sculptor of genius. In 1894 the work of the "Monument aux Morts" at Père Lachaise was finished, and it was one of the finest productions of modern days. In 1898 the com- mittee for erecting the marble statue to Balzac commissioned Rodin to make a study, and he produced the thing which was on the screen. People joked about it for a few weeks, and then said it was one of the greatest works of the day. Journalists scented copy, and Rodin became the craze, with the result that a committee of gentlemen bought his "John the Baptist" for this country, which was not fair to either the sculptor or the public, as it was not a good specimen of his work. He was glad to say it was kept in a dark corner at South Kensington. A full- sized clay model of it was exhibited in Picca- dilly thirty years ago, but people did not rush then to see it, for there was no Rodin craze. He thought Rodin was a remarkable sculptor long before the Rodin craze, but he com- plained that his ideas were not elevated. In his opinion the finest thing Rodin ever did was his statue of Victor Hugo. The lecturer proceeded to show Hector Lemaire's "Offer- ing at the Altar of Love"; Peyre's "Offering to Venus" and his bas-relief of "Har- monies"; Monod's bas-relief group, "La Revue du Poète"; Gasq's "Hero and Leander"; Felix Charpentier's "Adieu d'une Hirondelle"; Felix Sicard's "Eve," and other imaginative works. M. Hippolyte Lefebvre was the foremost man at modern costume, and gave in 1905 "A Paris Lady,"

"The Triumph of the Republic," Paris.
M. Dalou, Sculptor.

The Victor Hugo Monument, Paris.
M. E. L. Barriss, Sculptor.

which was cleverly done, although sculpture did not lend itself to that kind of thing. This was followed in 1907 by "Winter." His portrait of Cardinal Richelieu showed he could do other work. M. Blondat thought it permissible to be humorous in his work, as was shown in his fountain, where three girls are laughing at three frogs. Other monuments exhibited were Auguste Maillard's statue to Fragonard, Dalou's statue to Le-laire, Mercie's statue of Armand Silvestre the poet; Verlet's statue of Maupassant; and, as examples of architectural sculpture, Theunissen's four figures of the Seine and its tributaries. The lecturer proceeded to deal with a group of works representing extract ideas, including Blondat's "Grief"; Longepied's "Immortality"; Gustave Michel's "Form Disintegrating Itself from Matter" and "Contemplation of the Infinity of Space"; Champell's "Exiled Muse"; Jean Boucher's "Antique and Modern"; M. Seyss's "La Soir de la Vie." In conclusion he asked his hearers to remember that these were but a few of the works of French sculpture during the past twenty years. There were three reasons for this development in France. First, they had got a building where sculpture could really be exhibited; secondly, the French public cared for sculpture; and, thirdly, the Government did all they could to reward and encourage it. If English sculpture was to develop with the freedom and richness of French, one of the first things was that the Government should spend public money on it.

Sir W. Goscombe John, in proposing a vote of thanks to the lecturer, said they had been able to see the tremendous richness and wealth of modern French sculpture, and it was almost bewildering. Everyone who loved French sculpture would probably make a different selection, but Mr. Statham had enabled them to see enough to realise what it meant, for many of the works shown were epoch-making things which sculptors all over

Europe had looked upon as inspirations. He looked on French sculpture as the third great school. There were, of course, first the Greeks, whose mantle fell upon the Italians, and from them it came to the French. All other European schools were more or less echoes of French sculpture with a certain national bias. There never had been a period when France was without great sculptors from the time of the great cathedrals of Chartres, Amiens, and Rheims, and others, down to the present day, and, what was more, they had never been tied by conventions, or, at least, those conventions were paralysed. The mere mention of Rodin's name was a challenge, but all sculptors, whether they admired him or not, would agree that he was an epoch-making sculptor. No one had made sculpture so much talked about as Rodin, who had had a tremendous influence. He agreed with what Mr. Statham said about Rodin's statue of Balzac, but was entirely opposed to what he said about his St. John, for he did not think that he knew anything more remarkable between Donatello's time and not than Rodin's St. John—nothing which had been so dynamic in its force. Looking at French work one was wonderfully impressed with the importance of the nude in sculpture, and it was perfectly true that in dealing with abstract things one was compelled to go to the nude. In things dealt with costume they were at once tied to a certain period. In England they were in a pathetic condition. Many of their sculptors were full of enthusiasm and strongly desirous of making beautiful things, but they were stopped by the committees who commissioned them. In America they found the same thing. One of the greatest of modern sculptors was the late Mr. St. Gaudens, but they rarely saw a nude figure from his hand, because the committees would not have it. Then in France they got State patronage and the patronage of the Paris municipality, and of many of the other municipalities of the country, and that was why they got the Salon filled with a mass of revival work. In this country the State was indifferent, and all the sculptor got from the municipalities was a commission to execute a bust of a mayor or local alderman. The only thing only in England which helped to keep alive ideal sculpture was the Chantry bequest. They knew also what the Sculpture Gallery

La Pensée.
M. Alfred Boucher, Sculptor.

Academy was. It was only possible to small things. If a work beyond a certain was shown it was out of proportion and not to be seen. People could rub their against it, and the British public loved that. Unless a thing was smooth and polished they did not like it.

Colton, endorsing the motion, said that Mr. Statham set down that one of the greatest qualities of sculpture was its perfect form, but to-day hardly seemed to think so much of that. They knew, the Greeks, whenever they did a thing to decorate a building, however far away it was to be fixed, modelled it perfectly, and it was only seen until they came to the British Museum. To-day it was said that this was no necessary, and some people seemed to think that the roughest-hewn blocks had a beauty which beautiful rendered work had not, therefore, the higher they went in inverse they got less money for such work. That one thing which rather discouraged sculpture in England at the present moment. He had the greatest admiration for French sculpture, there was a good deal of fine English sculpture, and he thought at the Franco-British Exhibition the English sculpture not competed, but competed very forcibly with French sculpture. A French sculptor said that the English had the right nature for sculpture, as they had nothing to unlearn.

There was a natural reticence which lent itself to sculpture, and they did not have to think of those limitations which sometimes showed the cloven hoof in French sculpture. Mr. Colton proceeded to give instances of modern French sculpture that bear out his contention, and made some scathing references to Rodin's manner of exhibiting his various works, who apparently found eccentricity pay. After all, in modern times they had done wonderful sculptures; but it seemed to be striving to express too much. The finest sculpture was done by the Greeks at a time when thought was easily crystallised.

The President

remarked that if only the public appreciated sculpture they would soon get a gallery to exhibit it in and the State to buy it, but as the public was so unappreciative the other two things followed. He was rather surprised Mr. Statham had not dragged the architect rather more into sculpture and shown, at any rate, that an architect was essential to some of the work. Mr. Statham had told them of sculptors becoming painters and painters becoming sculptors, but had not told them of any architect becoming a sculptor.

The motion was carried, and

Mr. Statham,

in reply, said he was conscious, as Mr. Colton had said, that each year in the Paris Salon there was vulgar realistic sculpture. That, of

course, was perfectly detestable. His opinion was that the progress of English sculpture in the last twenty-five years had been wonderful, but he was not dealing with English sculpture that night. He would like to add that about two-thirds of the slides were from photographs which the French sculptors had sent him.

ARCHITECTURAL SOCIETIES.

Royal Institute of the Architects of Ireland.

A special meeting of the Council of this Institute was held at No. 31, South Frederick-street, Dublin, on Monday last. The President, Mr. A. E. Murray, R.H.A., F.R.I.B.A., was in the chair. Also present:—Messrs. Frederick Hayes, W. Kaye-Larry, R. Caulfield Orpen, J. H. Webb, H. Allberry, Frederick Batchelor, G. P. Sheridan, and C. A. Owen, Hon. Secretary. Some correspondence having been dealt with, the ballot list for the new Council was passed. It was decided that the Institute certificates should bear no agnomens.

The President reported that an informal Conference had been held between some of the members of Council and the Professors of Architecture and Engineering of the National University. A Sub-Committee was appointed to meet the Professors and to arrange, if possible, for a public meeting.

"Antique et Moderne": Plaster Group.

M. Jean Boucher, Sculptor.

Architectural Association of Ireland.

The Architectural Association of Ireland held their opening meeting of the winter session at their rooms, South Frederick-lane, Dublin, on the 7th inst. The President (Mr. Page L. Dickinson), in the course of his opening address, said they had good reason to be satisfied with the work done by the Association since its birth. When the Association was started it was for all practical purposes the only body offering an architectural education to the student. Since that time the technical schools had improved out of recognition, and construction was better taught in these than was possible in a body such as their own, where the instructions were, of necessity, honorary. The long-talked-of National University, which was now an accomplished fact, had a Chair of Architecture, the first in Ireland, and it was greatly to be congratulated on having recognised architecture as one of the learned professions, and its students as worthy of receiving an academic training. Discussing the internal affairs of the Association, the President went on to say that last year a resolution was passed desiring the incoming Committee to reconsider the question of a proposed amalgamation with the Royal Institute of Architects in Ireland. Directly it came into office this Committee gave its most careful attention to the subject, and decided that the idea of amalgamation should be postponed for the present, feeling strongly that so long as there were any junior members in the Association, and until the entrance examination to the Institute had been given a trial, and the new School of Architecture was in working order, the lectures and design class in that Association should be continued. Whether the future of the Association lay in amalgamation with the Royal Institute of Architects in Ireland or independently the Committee believed that it should continue for the present carrying on its policy of past years in a manner modified to suit the altered educational conditions in Dublin. Proceeding, the President said that the work being carried out by the Georgian Society had aroused a keen and quite unlooked-for interest in the arts and crafts of eighteenth-century Ireland. He found that a great many men outside their profession knew the names of Gaudon and Cassels, and their lesser brothers, and the works which they carried out. They saw this work every day; it was all in a few acres of ground, and not scattered over vast areas, as in London and Paris, and after they had read of this their seeing the buildings made them remember what they had read. This even slight knowledge of the work of the past would, he believed, tend to make the ordinary citizen notice and criticise the work of the present. As architects they had a most important duty to perform towards the general culture of their city. That sketching and measuring form one of the chief parts of architectural education was a platitude that need not be emphasised, but he often heard Irishmen lamenting that there was nothing to be found in Dublin, and wishing that they could more easily get to the Cotswolds, Normandy, or elsewhere. He had often pointed out the wealth of Dublin in this respect, and he ventured to say that there were dozens of houses, and remains of houses, all over the city which were virgin soil to those who wished to measure or draw.

Manchester Society of Architects.

The sessional papers meeting on the 8th inst. was held on somewhat novel and distinctly interesting lines. Mr. J. J. Burnet, F.R.I.B.A., who was the Visitor for the evening, instead of reading a formal paper led what was announced as an informal discussion mainly upon points arising from an exhibition of drawings of his own work which had been on view for a few days. In opening the discussion, Mr. Burnet said that they were there that evening in a spirit of camaraderie. He would say that his works there shown represented genuine pleasure in solving problems placed before him by his clients. It had been his privilege to work for clients themselves highly trained technically—shipbuilders and mechanics, who clearly enunciated the problems set before him. He also spoke of the pleasure which he had always found in travelling in pursuit of knowledge to equip him for his work.

In the course of the conversation which followed Mr. Burnet outlined the inception

of the scheme of extension of the British Museum. The splendid drawings of the work provided fruitful ground for discussion, and the way in which the minutest details had been thought out was in many ways a revelation.

Besides the drawings of the Museum, photographs and details of many other works of Mr. Burnet were exhibited.

ENGINEERING SOCIETIES.

The Junior Institution of Engineers.

A number of members of this Institution, with the permission of the Chairman and Directors, visited the works of the Tottenham and Edmonton Gas Light and Coke Company on the 18th inst. Under the guidance of Mr. A. R. Broadberry, Engineer, assisted by members of the staff, they were shown No. 1 Retort-house, containing eighteen beds of eights, 22 in. by 16 in., through retorts, which are operated by a Fiddes-Aldridge machine, and the coke is removed by a De Brouwer hot-coke conveyor. A setting of verticals is now in order, and when complete the total capacity of the house will be 3,000,000 ft. per diem. No. 2 Retort-house, containing at present twenty-four beds of tens, 22 in. by 16 in., through retorts, with regenerative heating. The charging and discharging is effected by De Brouwer's projectors and pushers. The coke arrangements are similar to No. 1 House. The total capacity of the house is 3,750,000 ft. per day. The water-gas plant, which was first put in operation in 1894, when Beekton was the only other works in England using the system. The two original sets have been scrapped, and one larger set (1½ millions) put in their place. The plant now consists of:—

Two sets,	500,000 ft. each—1,000,000
cubic ft.	
Two sets,	1,000,000 ft. each—2,000,000
cubic ft.	
One set,	1,250,000 ft. each—1,250,000
cubic ft.	

The growth of the output since Mr. Broadberry received chief control in 1899 has been from 575,658,000 to 1,687,811,000 cubic ft. in 1910, and clear indications show that this year's output will be at least 1,770,000,000 ft.

At the conclusion of the visit the members were entertained to tea, and the Chairman, Mr. Walter T. Dunn, expressed their appreciation of all that had been done to render the occasion so interesting and enjoyable, Mr. Broadberry responding.

CONTEMPORARY ARCHITECTS AND THEIR WORK:

MR. WALTER CAVE, F.R.I.B.A.

SPECIALISATION is becoming quite a prominent feature in architecture as in all other branches of human activity, and the delights of an all-round practice are nowadays enjoyed by the comparatively few. Though this development is not remarkable, considering the complexity of modern building, it is none the less regrettable, as an architect specialising in one branch of his art is apt to get into a groove and to find himself differently equipped for dealing with a problem outside his adopted sphere. The old-time recipe for an editor demanded that he should know something about everything and everything about something. In the matter of design the modern architect is often forced to follow along similar lines, and it need hardly be added that the artist who is condemned to an eternal succession of town halls, or libraries, or theatres, or houses, or public baths, or factories, as the case may be, must find his powers of invention heavily taxed.

Mr. Walter Cave, the subject of this note, is one of the fortunate architects whose practice is not restricted to one particular branch of their art, and who find a succession of new and interesting problems to work out. Though much of his work has been of

Mr. Walter Cave, F.R.I.B.A.

[Portrait by Reginald Haines.]

æsthetic character, the list of his principal buildings includes many other types of design. Mr. Cave is the son of Sir Charles Cave, Bart., of Sidbury Manor, Sidmouth, and was born in 1863. He was educated at Eton, spending some six years of his boyhood there. His technical training began as a pupil of the late Sir Arthur Blomfield. In the following year he entered the Royal Academy Schools, pursuing his studies in office and school concurrently. In 1889 he started practice in London. Mr. Cave held the position of Honorary Secretary to the Art Workers' Guild for nine years, and he is also on the Committee of

the Arts and Crafts Society. Specimens of his own craft work have been exhibited at the latter Society's exhibitions, these including metal work, furniture, and a piano case for Messrs. Bechstein. Mr. Cave originated the idea of placing candlesticks at the ends of the keyboard of a piano, and this arrangement has since been extensively copied.

As a member of the Council of the Royal Institute of British Architects, and as President of the Architectural Association in 1907-8, Mr. Cave has had his share of work on architectural bodies. The Architectural Association Athletic Club owes its inception mainly to his efforts and advocacy.

This is not to say that athletics were unknown to the Architectural Association members previously, but it was during Mr. Cave's Presidency that the existing athletic coteries were co-ordinated and fresh sections set going. Mr. Cave's interest in athletics arises naturally from his own considerable achievements in that field, for he played cricket and football for Eton in the years 1880-1882, and was captain of the football team in the last-named year. He also won the 100 yards, the quarter-mile, and long jump in the college sports. In the season of 1883 he played cricket for the Gloucestershire County eleven.

Though Mr. Cave is chiefly known for his

The Æolian Hall: The Staircase.

A Shop Front (now demolished) in Dover-street, Piccadilly.

Mr. Walter Cave, F.R.I.B.A., Architect.

excellent domestic work, this having been more frequently illustrated, his practice, as has been stated, is a varied one. Among his general works may be mentioned the Orchestrelle Company's premises in New Bond-street, London, including the Aolian Hall; Messrs. Bechstein's premises in Wigmore-street, London; a cottage hospital at Sidmouth; the extension of Somerville College, Oxford; the Church of the Nativity at Watlington; tanks at Bristol and Clifton for Messrs. Prescott & Co.; the Chappell Galleries, New Bond-street, London; the present entrance hall at the Adelphi Theatre, London; and a large factory at Hayes.

For many years Mr. Cave has filled the office of Surveyor to the Gunter Estate, covering a large portion of South Kensington, and has been responsible for much of the new work thereon, including Coleherne Court (a large block of flats built round a delightful centre garden), a row of houses in West Kensington, and the laying-out and designing of a large estate of some 500 houses, shops, and studios. This estate is worth a visit as showing what may be done by controlling the speculative builder. The houses, which are quite small, are close to the North End-road, Fulham, and Mr. Cave recalls that the various builders were not always amenable to the restriction of the general design. But as the houses have sold and let exceedingly well their views on the matter have probably changed considerably in the meantime.

Of domestic work the list includes, among many others, a house for Lord St. Aldwyn; a house near Northampton; "Ravenshill," East Leach; Cueden Hall, Preston, Lancashire; "Little Court," Farthingstone; alterations and additions to Coombe Bank, Sevenoaks, for Dr. Ludwig Mond. This last contains a very fine Adam gallery, 90 ft. by 25 ft. and 20 ft. in height. Ewelme Down (p. 591), which Mr. Cave considers one of his best houses, is a large house on the brow of a hill near Wallingford. The situation was rather bare, but very great progress has been made with the gardens, to which Mr. Cave has recently added some garden houses. These, built in harmony with the main structure, are placed on the bastion-like ends of the terrace, which is upheld by an immense retaining walls on the side of the hill. Some idea of this wall may be obtained from our view, which illustrates the forecourt and part of the terrace. In addition to the gardens at Ewelme Down,

Mr. Cave has designed gardens at Hatherop Castle, Oxon; Sidbury Manor; and "Kneesworth," Royston.

Coming now to the buildings we illustrate in this issue, the interesting little shop-front in Dover-street, designed for a costumier, is now but a recollection revived by our view; for the whole building has been demolished recently to make way for a more ambitious structure.

Roche Court, Farnham, may be described as half new and half old. Originally the house had an L-shaped plan, and Mr. Cave, in his alterations and additions, added another L-shaped wing, making the house square on plan with a centre courtyard. The house is of brick to the first floor, the upper part being weather-tiled, with bays in half-timber. The casements are of wood, painted white, and the roofs are covered with old tiles.

Lock House, Beaulieu, is a picturesque dwelling on the banks of Beaulieu River, on Lord Montagu's property. All local materials were employed, the roof tiles coming from Lord Montagu's tile-yard. The

walls are of brick, roughcast, and the casements are of wood. A feature of the house is the deep verandah, or stoep, which makes a good-sized room.

Bengeo House, Hertford, is a new house on the site of one destroyed by fire. Our illustration of the exterior shows the garden front, on which are placed, on the ground floor, the drawing-room to the left, the hall in the centre, the dining-room to the right, and the servants' hall to the extreme right. The library and the kitchen are placed in the projecting bays on the front of the house. On the two upper floors are eighteen bedrooms and dressing rooms, three bathrooms, boxes, rooms, and a nursery. The walls are faced with purple, mottled Luton bricks, with red brick dressings, and the woodwork is painted white. Old tiles are used for the roofs. The floors and staircase are of oak, and Gilmour doors have been used. The general contractors were Messrs. H. Martin, Ltd., of Northampton; and Mr. James Gibbons, of Wolverhampton, supplied the door furniture.

St. Austins, Lymington, represents additions and the remodelling of an existing house. The older part is seen in the square block to the right of the view, and this dictated to a large extent the design of the new wing. The house looks solid and comfortable, and is an instance of the successful extension of an old dwelling without much pretensions to style.

The Orchestrelle Company's premises in New Bond-street originally comprised the Grosvenor Club (the old Grosvenor Gallery), and a library, and had to be extensively altered for their new occupants. The whole of the ground floor was made into one large hall panelled in oak, with verde-antique marble columns and pilasters. Four of the columns are monoliths which help to carry the weight of the upper part of the building. The original staircase remains, but has been panelled, and divided according to the requirements of the London County Council. An open arcade has been formed on the right-hand side. This staircase gives access to the Aolian Concert Hall at the back, which seats an audience of just over 400 people. The original skylight over the hall has been masked by an inner panelled ceiling, and windows have been opened on the west side with corresponding niches on the east wall. The panelling is of mahogany, stained dark brown, with inlaid pilasters. The stage and organ case are of oak, stained dark. The doors are covered with leather. A new exit staircase has been built at each end of the hall in conformity with the fire regulations. The rest of the

Lock House, Beaulieu.

Mr. Walter Cave, F.R.I.B.A., Architect.

after death than when he was actually living and working, and he (Lord Plymouth) imagined that the reason for that was very largely the fact that the public were ignorant only and not unappreciative. It was very difficult to see or to realise any work of Stevens, except the Wellington Monument, which in the days he was speaking of was so wrongly placed in St. Paul's Cathedral that it was almost impossible to appreciate its merits. But times, he was glad to think, had changed, and they now were ready to do all in their power to present to the public the work of Alfred Stevens, so that he might be, as far as in them lay, appreciated in this country.

Cambridge University.

In announcing to the Vice-Chancellor his resignation of the Slade Professorship of Fine Art, Dr. Waldstein makes proposals for the organisation within the University of the studies of architecture, art, and archaeology, and the establishment of Professorships of Architecture, Egyptology, Assyriology, Medieval Art, Renaissance and Modern Art, and Aesthetics. In his appeal for subscriptions to those ends he undertakes, with Mrs. Waldstein, to contribute 1,000*l.* and to promote the study of architecture, with a further 500*l.* subscribed by a friend. Mr. Waldstein, Litt.D., Ph.D., Fellow of King's, was Slade Professor, 1895-1901, and when University Reader in Classical Archaeology, which post he had held since its creation in 1880, was re-elected Slade Professor in 1904 and again in 1907, when the Professorship was made a permanent appointment. He carried out excavations on the site of Plataea, is a prominent member of the American Archaeological School at Athens, was joint author, with Mr. Leonard Sponbridge, M.A., of "Herculaneum, Past, Present, and Future," 1808, and was formerly director of the Fitzwilliam Museum. He edited, and contributed to, the two volumes "The Argive Heraeum," 1902-5, upon the excavations (1892-5), on the site of the Heraeum conducted by the American School at Athens. Mr. E. O. Villiamy, M.A., of King's, has been appointed Hon. Keeper of the Pictures, Fitzwilliam Museum, and his appointment as Assistant Director has been extended to December 31, 1912.

Church Building Society.

The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels held its usual monthly meeting on the 16th inst. at the Society's House, 7, Dean's-yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Caversham, St. Andrew, Oxford, 50*l.* (making in all 150*l.*); Copnor, St. Alban, Portsmouth, 120*l.*; Plymouth, St. Mary the Virgin and St. Mary Magdalene, 160*l.*; and St. Budeaux, St. Boniface, Devon, 100*l.*; and towards enlarging or otherwise improving the accommodation in the churches at Bethnal Green, St. Simon Zelotes, Middlesex, 10*l.*; Chessington, St. Mary the Virgin, Surrey, 15*l.*; Chillington, St. James, Somerset, 10*l.*; Fertiniog, St. Michael, Merioneth, 15*l.*; Grove Park, St. Augustine, Kent, 50*l.*; Penrhyswibr, St. Winifred, Glam., 30*l.*; and Westhorpe, St. Margaret, Suffolk, 15*l.*. Grants were also made from the Special Mission Buildings Fund towards building mission churches at Abersoch, St. John, Carnarvon, 25*l.*; Bispham, St. Stephen, Lancs., 40*l.*; Bridgmay, Elson, Hants, 25*l.*; and Pont-y-Gwyddel, St. John the Baptist, Denbighs, 10*l.* The following grants were also paid for works completed:—Balby, St. John, near Doncaster, 100*l.*; Deptford, St. Nicholas, Kent, 250*l.*; Brotherton, St. Edward, Yorks, 25*l.*; Spitalfields, Christ Church, Middlesex, 40*l.*; Higham Hill, St. Andrew, Essex, 150*l.*; Worcester, St. Martin, 200*l.*; The Bourne, St. Thomas, near Farnham, Surrey, 70*l.*; Norton, St. Peter, near Malton, Yorks, 100*l.*; Newquay, St. Michael, Cornwall, 150*l.*; Haxby, St. Mary, near York, 25*l.*; Walney Island St. Mary, near Barrow-in-Furness, 80*l.*; Bermondsey, Christ Church, Surrey, 40*l.*; Aterberg, Christ Church, Mon., 130*l.*; Bramhall, St. Michael and All Angels', Cheshire, 75*l.*; Bow, North Devon, 20*l.*; New Haw, All Saints' Addlestone, Surrey, 25*l.*; Bearwood, St. Dunstan, Edgbaston, 25*l.*; Plumstead, St. Francis, Kent, 40*l.*; and Burstow, near Horley, Surrey, 20*l.*. In

addition to this the sum of 625*l.* was paid towards the repairs of twenty-five churches from Trust Funds held by the Society.

Southwark Cathedral Improvements.

At a recent meeting of the General Committee of the Southwark Cathedral Maintenance and Endowment Fund, held at Bishop's House, Kennington, among those present were Mr. J. Oldrid Scott and Mr. C. M. Oldrid Scott, the architects superintending the work of restoration and repair at the Cathedral. Mr. C. Oldrid Scott reported that the works in hand were nearing completion, and it was expected that the new approach to the Cathedral from London Bridge would be completed and ready for opening soon after Christmas. It was resolved that upon the completion of the new approach arrangements should be made for a public opening.

St. Mark's Church, St. John's Wood.

It is proposed to build a baptistry at the south-west corner of St. Mark's Church, in Upper Hamilton-terrace, at an estimated outlay of 500*l.*, as a memorial to the late Canon Duckworth, formerly Vicar. The church was built in 1846-7, after the designs, in the Gothic style, of Messrs. Cundy.

Kirkby Stephen Sewerage.

The Local Government Board have sanctioned the first portion of the loan for the construction of a complete system of sewers and sewage disposal works for the little market town of Kirkby Stephen, Westmorland. The engineer for the scheme is Mr. Harry W. Taylor, A.M.Inst.C.E. (Messrs. Taylor & Wallin), of Newcastle-upon-Tyne and Birmingham. The estimated cost of the works is about 4,500*l.*

BOOKS.

The Essentials of a Country House. By R. A. BRIGGS, F.R.I.B.A. Containing 218 pages and 71 illustrations from photographs and drawings. (London: B. T. Batsford, High Holborn. 7s. 6d. net.) This book must not be taken too seriously. It opens with the candid statement that it is not a "manual of practice" for the architect, but neither does it quite justify its title as a treatise on the "essentials" of a country house. Its aim is, as far as we can gather, to interest those who are thinking of building in the various details that make for the amenities and convenience in a home, and to give them a general idea as to what is and what is not possible with the means at their disposal.

No attempt is made to deal with the subject on a comprehensive basis, but we find gathered together numerous useful hints on situation, materials, planning, etc., picked up in the course of an obviously extensive architectural practice in this type of work, and occasionally flavoured with just those little personal prejudices that every artist is entitled to as a mark of his individuality.

The author's division of the houses he designs into two styles—the Manorial (with iron casements); the Georgian (with sashes) is delightful in its simplicity, and may be commended to harassed students in the throes of the R.I.B.A. Examination.

The book is well illustrated with photographs from numerous examples of the author's work, which is, however, rather unequal in quality, at its best exhibiting breadth and refinement in treatment, but sometimes appearing fussy and overloaded.

The Practical Design of Reinforced Concrete Beams and Columns. By W. NOBLE TWELVETREES. With labour-saving diagrams and numerous illustrations. (London: Whitaker & Co., White Hart-street, Paternoster-square, E.C. 4s. net.)

This practical little manual deals clearly and explicitly with the principles of design in reinforced concrete construction as required for buildings of the more usual types, such as factories, warehouses, and offices. It makes no pretensions to cover the whole field of reinforced construction, but within the range adopted by the author the subject is handled fully and comprehensively.

The section on beams starts with the simplest formulae and practical data, and goes on to apply these to beams of various types, including rectangular beams, beams including a proportion of the floor area, and both these

as modified by the addition of top reinforcement. The problem of vertical or web reinforcement against shear is also dealt with. Columns and struts are next treated, a further chapter being devoted to column bases, and another to the designing of and calculation for complete floors. The working stress advised by the R.I.B.A. Committee, the American Joint Committee, and the French Government are compared and criticised, and a brief table gives the author's recommendations based on these reports. The numerous diagrams which are included at the end of the book should save the designer a good deal of time and trouble.

A Manual of Civil Engineering Practice.

By F. NOEL TAYLOR, M.Inst.Mun.E. (London: Charles Griffin & Co., Ltd. 1911. Pp. 399, with 1,179 illustrations. 25s. net.) This manual is in no sense of the word a competitor of the classical treatise by Rankine. It is conceived on a different basis, being free from the essentially mathematical treatment which tends to obscure to some people the teachings of that master, and, besides, it is written and arranged specially for the use of municipal and county engineers, and may be usefully employed as being supplemental to the work of Professor Rankine.

A mere glance through the pages of the present manual is sufficient to demonstrate the wide range of subjects with which the modern municipal engineer is expected to be familiar. In addition to subjects forming the foundations of an engineering education the treatise deals with the design of structures in brick, stone, steel, and reinforced concrete, chimneys, hydraulic and mechanical engineering, roads, tramways, bridges, rivers, work, land drainage, waterworks and water supply, sewage purification and disposal, sanitation, refuse disposal, and many others. I can hardly be expected that one mind will be able to retain every detail of so numerous a collection of subjects, and for this reason such a work as the present should be generally welcomed. The volume has additional scope as a text-book for students preparing for the examinations of the Institution of Municipal Engineers and kindred bodies. Its preparation must have involved an enormous amount of labour, the author and the publishers being worthy of the highest praise for the manner in which their respective tasks have been accomplished.

CORRESPONDENCE.

Official Architecture.

SIR, Your correspondent, "Medius," although claiming to speak from personal experience of the Office of Works, is not correct when he writes, "Most of the competent architectural men have passed to the permanent staff."

Permit me, in the interest of truth, to again trespass on your space.

As previously mentioned, the architecture work was done for many years by men who had proved their ability by years of office work. They were classed as "temporary." A few years back it was decided to make a number of temporary men "permanent," if they passed an examination. The clerical officials, contrary to the advice of the architectural heads, fixed the age limit so low as to admit only comparative juniors, and kept out the seniors, who had been doing the important buildings for many years, who had been instructing the juniors in their work, and in some cases had taught them all the knew.

those senior men are still "temporary," and consequently paid less than the men they are trained, and are treated in many ways inferior to them. Sometimes a man over the usual age is especially recommended for transfer, without examination, by an architectural head, on account of his exceptional ability and the services he has rendered to the Department; these recommendations are usually blocked by clerical officials, who are, apparently, so indifferent as to whether men of added ability, who have devoted many of the best years of their lives to the service of the State, are treated in an honourable manner. An obsolete regulation is brought in to stop what justice, common sense, and efficient administration demand should be. Some officials are sympathetic, but nevertheless. One remarked, with regard to a recommendation, "In a private business use it would be done at once!" Now, not only is a temporary man understood, but the best use is not made of his services, as was formerly the case when the work was given to those best able to do it. This is partly the cause of the great increase in the cost of the work which Mr. Stokes incurred to, and does not lead to

EFFICIENCY.

Balliol College Chapel.

Sir,—Butterfield's work requires a considerable experience of architectural aesthetics to appreciate, and it is natural that the amateur of to-day should not be equipped with sufficient tolerance and knowledge to judge its merits.

Imagine that the authors of the scheme for the destruction of Balliol Chapel acted at the first instance with a full belief that the present building had little to recommend and that a modern successor would be welcomed by everyone. It is a very difficult thing to suggest to really well meaning people cultivation and taste that they are not in a position to judge, or in possession of sufficient experience to enjoy a work of art which the details are patently unattractive. I do not think, however, that such laymen should attempt for a moment to criticise any finer of the fine arts with the readiness which they display in condemning or praising architecture.

If it were proposed to remove Butterfield's chapel and replace it with a building as characteristic of the year 1911 as the former had been of the year 1856, it would be another matter altogether. A masterpiece would fall perhaps to give place to another masterpiece. Though highly speculative, it would be a logical proposal. But men of Butterfield's calibre are no longer to be found in the practice of ecclesiastical design; the arch-building enthusiasm which bred them has waned with the need for it, and we can do no better than reproduce the picturesque, but unscholarly and illogical design of the building which he removed. No architect of position could undertake such an act without feeling that position, and it is safe to say that no competent architect will be preposterous enough to take that risk. We no longer have such men as Butterfield, Street, Rogers, Godwin, White, Brooks, Pearson, and others, Scott, jun., nor do we yet realise the loss.

It is not to be supposed that the would be destroyers, if they realise that the ugly and the clumsy woodwork, the violent patterns and the hard texture of the present building are the accidents and not the essence of the design; if they realise that the essence of the design is the precious quality of genius in its creator, of mass form and outline moulded as only a great man can mould—if they realise this, it cannot for a moment be supposed that they will persist in tearing down the masterpiece and putting in its stead a specimen of fashionable sham antiquity.

The length of this letter calls for apology; the importance of the subject is that apology, and an ample one it surely is.

H. S. GOODHART RENDEL.

Nemesis of Butterfield.

Sir,—It seems that Mr. Butterfield's sins, they say, are coming home to roost. We have always understood that he considered

his work as good as that of any of his medieval predecessors, and that therefore he did not hesitate to pull down such work in order to put good, sound work of his own in its place.

Surely such a man would be among the first to applaud the pulling down that is proposed at Oxford, provided the pullers down have a confidence in what they propose to put up, similar to that which Mr. Butterfield had in his own work. The latter left, as I understand, his impress on the fabric of the church whose bells are ringing opposite to me as I write. At any rate, there was a great "restoration" at an expense of 5,000*l.* in 1867, etc., under him, and at that time, I understand, the south porch and parvise were knocked together and thrown into the body of the church to gain a few sittings, and a miserable little south door put in as a substitute. Also, I understand, that the windows, etc., were thoroughly restored at the same time, the present state of things being that there is not a single foot, I believe, of medieval tracery or moulding to be seen outside the church; or inside either, for that matter, if you confine your attention to the windows.

I write, therefore, in view of the objections that are being raised to the demolition of Mr. Butterfield's Chapel at Balliol College, to protest against what I feel sure Mr. Butterfield would have considered sickly sentiment, and to encourage those good gentlemen at Oxford who have the confidence in their architect (who he is, I know not) that Mr. Butterfield had in himself, to go on and prosper, and to pull down the chapel that Mr. Butterfield built, and to put up something better in its place, as Mr. Butterfield would certainly have done had he been in their position.

W. B. HOPKINS.

The R.I.B.A. Examination.

Sir, Mr. Ernest Dixon, in his letter to you of November 10, has called attention to a point which deserves, and which he may be quite sure will receive, very careful consideration from the Board of Architectural Education. I may, however, at once assure him that the last thing that the Board has had in view was to let in the amateur and the dilettante.

The object has been, as it must be with all architectural educationalists, to provide a course which will have an educational value in itself, and shall contain all that is requisite to qualify a young man to enter on the practise of architecture, and in order to make this as thorough as possible the Board has, on the one hand, contracted the area of examinations to what is essential, throwing the lumber overboard, and, on the other hand, have given greater opportunities for that design which is, after all, the final end of those studies, including, as it does, construction, materials, and applied science as necessary elements of good design.

If Mr. Dixon consults my note in the R.I.B.A. *Journal* again he will see that I said, "It is impossible to tighten up all round," but this does not mean that there is to be a slackening all round. What is intended is that, in consideration of the more liberal provision for students' idiosyncrasies, a higher standard will be insisted on in the subjects that the students do select.

I am entirely in agreement with Mr. Dixon on this point, and am grateful to him for having stated it so clearly in his thoughtful letter. I gather also from his letter that he is in full sympathy with the effort made by the Board to give to the examinations a genuine educational value.

REGINALD BLOMFIELD.

Licentiatehip R.I.B.A.

Sir,—I understand that this class is to be closed on June 30 next, and that no further applications will be considered after May 31.

In view of the serious effect this will have upon many well-qualified men who have not yet attained the qualifying age, or have not been the necessary five years in practice, might one suggest to the "powers that be" at the Institute that it would be well to seriously consider the advisability of further extending the time during which applications may be received?

Personally, I know cases of those who will be within a few days or weeks of the

qualifying period of five years or the age of thirty, and yet apparently the gate will shut, and such cases will be left outside.

Have the Institute any power to accept those who have not quite reached the specified period of age or practice on June 30? In other words, is there or should there not be a reasonable amount of elasticity about the rule in the case of men who are otherwise well qualified?

ENQUIRER.

Cooking Apparatus.

Sir,—A letter by Mr. H. A. Davis, which appeared in your issue of November 3, has just been brought to my notice. There is one sentence in particular in this letter which seems to me to be likely to cause grave misapprehension on the subject of electric cookery to those of your readers who have had no practical experience of it.

The sentence to which I allude is this:—"There is one point particularly worthy of note—it was impossible on the particular oven tested to obtain a temperature of less than 410 deg. Fahr., a temperature somewhat in excess of that required for most cooking operations, and a point which clearly demonstrates the want of control over the heat in electrical ovens."

Unfortunately, Mr. Davis does not mention the name of the oven with which he made his tests, but I think it must have been a very antiquated pattern, or possibly the tests were made some years ago, before electric cooking had been brought to the point of perfection at which it now stands.

I am a practical cook, and I quite agree with Mr. Davis that it would be impossible to do any successful baking with temperature of 410 deg. Fahr., 350 deg. being the highest, ever required. The point of my letter is this, I have been using electric stoves for the last seven months, and have three electric ovens under my charge (including the one alluded to by Mr. Gray), and I have never had the slightest difficulty in controlling the heat of any one of them. It is perfectly easy to keep the temperature as high or as low as required.

AMY CROSS.

First Class Diplôme National Training School of Cookery, Demonstrator to the Westminster Electric Supply Corporation, Ltd.

The Cost of Joinery.

Sir,—Recently, on a flimsy pretext of "want of work," I had to "finish up" in a certain cabinet joinery workshop. Briefly, this is how the shop is run by the foreman:—

Certain young "bull-rushing" cuts of half-and-a-quarter-baked, raw, inexperienced, so-called "joiners," paid at standard rate of 10*d.* per hour, are kept in regular employment because they pay the foreman weekly tips. The booking-up of timesheets of jobs is so "mangled up" and "cooked" that the duffer's expensive job is covered up by other jobs, to which the time is booked wrongfully. Now, the expert, practical, and thoroughly-experienced workman does not pay for his job by bribing the foreman, directly or indirectly.

Consequently, on the least slackness of trade, this man is told that "he must be stopped"; but, of course, the raw, half-baked cuts of workmen at full-wage rate are kept on.

London builders wonder why their joinery-work is so expensive. The reason is only too obvious and clear to F. M.

INTERCOMMUNICATION COLUMN.

Lime Mortar.

Sir,—I beg to ask will any of your numerous expert readers give me a reliable recipe for a lime mortar to be used for external plastering work, such as is seen on the exterior of many old churches and houses in the country?

I want the mortar for use on both brickwork and lathing to the exterior of a country house.

Portland cement will not do, as the class of bricks I have to use will not take it; they are full of salt and have a very greasy surface.

N. W. CAMBS.

EDITORIAL SUMMARY.

"Divided Control" is the title of our leading article, dealing with street improvements and the necessity for a central authority.

"London's Standing Grievance" is the title of an article on p. 592, dealing with the lack of public seats.

"Notes" (p. 592) include comments on: "Designer and Producer"; "The British School at Rome"; "Minter v. Waldstein"; "Permanent v. Temporary Schools"; "Variations that Prejudice the Building."

A meeting of the Royal Institute of British Architects was held on Monday, when a lecture was delivered by Mr. H. E. Statham entitled "Modern French Sculpture," a large collection of interesting photographs of French sculpture work being shown (p. 593).

Architectural Societies (p. 597) contain short reports of: "The Architectural Association of Ireland"; "The Royal Institute of the Architects of Ireland."

An illustrated article on the life and work of Mr. Walter Cave, F.R.I.B.A., is given on p. 598, under the heading of "Contemporary Architects and Their Work." Our inset plates are all devoted to examples of Mr. Cave's work.

A notice of the exhibition of "The New English Art Club" appears on p. 601.

Book notices (p. 602) include: "The Essentials of a Country House"; "The Practical Design of Reinforced Concrete Beams and Columns"; "A Manual of Civil Engineering Practice."

In our Correspondence columns (p. 602) will be found letters on: "The R.I.B.A. Examination"; "Nemesis of Butterfield"; "Licentiate-ship R.I.B.A."; "Balliol College Chapel"; "Official Architecture"; "Cooking Apparatus"; "The Cost of Joinery."

The illustrated Monthly Review of Civic Design (p. 605) contains: "Vandalism at Sheffield"; "Art Commission, New York"; and Notes.

The Building Trade Section (p. 609) contains: "Land Tax Valuation"; "Recent Workmen's Compensation Cases"; "Builders' Benevolent Institution"; "Government Contracts"; "Projected New Buildings in the Provinces"; "Applications under the Building Acts, 1894-1909," etc.

An article on "The British Schools of Rome and Athens" is given on p. 613.

The opening meeting of the new session of the Society of Architects was held on November 16, when the President, Mr. G. E. Bond, J.P., delivered his address, an abstract of which is given on p. 613.

The annual dinner of the Institute of Sanitary Engineers was given on Wednesday last week. A brief report appears on p. 614.

Some notes on the magazines of the month are given on p. 615, under the heading, "Magazines and Reviews."

In Legal Column (p. 616) will be found comments on: "Water for Domestic Purposes"; "Private Street Works."

Law Reports (p. 616) contains a report of: "Wheeler v. Stratton" (builder's claim for compensation).

MEETINGS.

FRIDAY, NOVEMBER 24

Glasgow Technical College Architectural Conference's Society.—Mr. T. G. Gilmour on "Town Planning." 8 p.m.

MONDAY, NOVEMBER 27.

The Architectural Association.—Mr. Arthur T. Bolton on "Thoughts on Jacobean Architecture." 7.30 p.m.
The Surrey Institution.—Discussion on Mr. J. J. Dones' paper on "The Development of Building Laid," adjourned from last session. 8 p.m.
University of London (Victoria and Albert Museum).—Mr. Banister Fletcher on "A Comparative Analysis of French and Italian Renaissance." 8 p.m.
Royal Society of Arts (Lecture).—Professor Vivian B. Lewes on "The Carbonisation of Coal"—I. 8 p.m.

TUESDAY, NOVEMBER 23.
University of London (British Museum).—Mr. Banister Fletcher on "The Parthenon." Lantern illustrations. 4.30 p.m.
The Institution of Civil Engineers. Mr. R. T. Smith, B.Sc., on "Electric Lighting of Railway Trains: the Brake-Vehicle Method." 8 p.m.

WEDNESDAY, NOVEMBER 29.
University of London (King's College). Mr. G. McN. Rushforth on "Christian Mosaics." 5 p.m.
Edinburgh Architectural Association. Mr. Ramsay Traquair on "The Appreciation of Art." 8 p.m.

THURSDAY, NOVEMBER 30.
London County Council School of Building (Forcadale-road, Brixton, S.W.).—A special lecture on "Constantinople," by Professor Beresford Pile. Illustrated by lantern slides. 7.30 p.m.
Society of Antiquaries.—8.30 p.m.

FRIDAY, DECEMBER 1.
Institution of Civil Engineers (Students' Meeting). Messrs. J. and W. Legg on "Brake-lining Coefficients of Friction." Dr. W. C. Unwin, F.R.S., President, will occupy the chair. 8 p.m.

COMPETITION NEWS.

Head Offices for the Port of London.
The conditions of this competition offer a particularly interesting problem. It is seldom that a site of some 5½ acres is available to be dealt with in the City of London, and though the proposed offices will not take up more than about a third of this area, the promoters have very wisely left it to competitors to arrange the whole site, and to suggest on which portion the offices shall be placed, and how the remainder shall be laid out in building sites.

The conditions are very clear, and at the same time leave great freedom to competitors in the conception of their schemes. The drawings required are not elaborate, comprising plans, two sections, and three elevations to a scale of 20 ft. to the inch. A perspective view with the building not more than 12 in. wide, and a block plan of the whole site to a scale of 30 ft. to an inch. All drawings to be finished in pencil with flat tints.

The promoters are advised that the cost of the building should not exceed 300,000., which seems a reasonable sum for a building providing (as set out in the conditions) 25,000 sq. ft. in the basement and on the ground floor, and 22,000 sq. ft. on each of the four upper floors.

We note two points on which competitors might make inquiry. The treatment of the perspective drawing is not defined, and as it is stated that ancient lights should be respected it should be made clear whether those on the west wall of Trinity House are to be regarded as such.

Parliament Buildings, Winnipeg.

We understand from the *Daily Mail* that the Manitoba Government Cabinet Council has decided to ask British architects to tender plans for Parliament buildings at Winnipeg, the cost of which is estimated to be 400,000.

Stafford Library Competition.

Some architects have written for particulars of this competition without enclosing a deposit of 11. as required. The Borough Engineer would be glad if this condition were observed. We understand that a large number of applications have been received.

Stained Glass Window, Groningen.

The competition for the commemorative window to be erected in the University at Groningen has been adjudicated as follows:—

1. (750 fr.) Rudolf & Otto Linnemann, Frankfurt.
 2. (500 fr.) D. J. van der Laan, Rotterdam.
 3. (250 fr.) H. Rosse, The Hague.
- Twenty-four designs were received, including three from England.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. E. White (Chairman) presiding.

NEW SCHOOL.—It is proposed to erect a new school to provide accommodation for 300 children on a site adjoining the Kingsgate-road School, Hampton.

CENTRAL SCHOOL OF ARTS AND CRAFTS.—It was also stated that Professor W. R. Lethaby had resigned his position as Principal of the Central School of Arts and Crafts, but is being retained as art adviser to the School. Mr. F. V. Burridge, Principal of

the Liverpool School of Art, has been appointed full-time principal of the Central School of Arts and Crafts at a salary of 1,200l. a year.

PLAYGROUND SHELTER.—The managers of the Burdett Courts and Townshend School, Westminster, propose to erect an iron shelter in the girls' playground at the school.

DRAINAGE AT GOLDEN'S HILL. Various pairs and drainage works have been carried out at the mansion in the park at Golden's hill, at a cost of about 65l.

CINEMATOGRAF HALL.—It is proposed to erect a cinematograph theatre on a site at Bowman's-mews, Holloway-road, N. The architects are Messrs. Lovegrove & Partners.

ARCHITECT'S DEPARTMENT.—Owing to the pressure of work in this department of the Council during the Christmas holidays when various repairs and painting works are carried out at the Council's schools, it has been found necessary to employ nine additional clerks of works, each at a rate of pay not exceeding 3l. 3s. a week.

CHIEF FIRE STATION.—A sum of 140l. is to be spent in providing messroom accommodation and a cycle store in the stable block of the chief fire station.

HOMERTON FIRE STATION.—The floor of the appliance room at this station is to be repaired with ironstone tiles in lieu of the existing wood blocks, at an estimated cost of 143l.

WORKS AT SCHOOLS.—The Craven-park School, Hackney, is to be enlarged at a cost of about 2,400l., and it is proposed to erect a new elementary school in the neighbourhood of Upper Clapton. The floors of the halls in the following schools are to be covered with corticine:—Cator-street, Clapwell; Cubitt-town, Poplar; and Merton-road, Wandsworth. The estimated cost of the work is 120l.

ILLUSTRATIONS.

The Work of Mr. Walter Cave, F.R.I.B.A.
THE whole of our illustration plates this week are devoted to the work of Mr. Walter Cave, F.R.I.B.A., on whose life and work an article, with other illustrations, appears on page 598.

FIFTY YEARS AGO.

From the *Builder* of November 23, 1861.

The Sewage for the Soil.

For some years we have occasionally pointed attention to the deodorizing power of earth and clay as a hopeful element in the solving of the great sewage problem; and in a like spirit, have done justice even to the much-abused mud of rivers, such as the Thames itself. Within the last two or three years a "dry closet" has been patented, an account of which, as we saw it at Glasgow, we have also given. It now appears that apart from other sanitary reformers, Rev. Henry Moule, M.A., vicar of Fordington, Dorset, has accidentally rediscovered the deodorizing power of earth (of which, however, every gamekeeper who rubs his hand with earth after defiling them with rotten game must be aware, as are also farmers and gardeners who use night soil as manure) and the same reverend gentleman has also invented and patented a "dry closet," in which earth is mixed with night soil, which it completely deodorizes, even though the same earth be used five or six times over after being dried at each time; thus yielding, as he finds, a most potent manure.

GIDEA PARK.

Gidea Park, Ltd., have also made the following special awards:—Class X.—Fittings special award for merit, The Peerless Heater Company, 70, Bishopsgate-street E.C.; The Richmond Gas Stove Company, Ltd., 132, Queen Victoria-street, E.C.; and the list of awards we published last week the Coalbrookdale Company exhibit, to which the silver medal was awarded, was described as the "B. K." This should have been the "K. B." kitchen range (Gibson's patent).

MONTHLY REVIEW · of · CIVIC DESIGN.

The Hunt Memorial, New York.

"A well-placed Monument, as it is placed in such a position that it can be seen only from the front and has a suitable background."

THE ART COMMISSION OF NEW YORK.

THE need of proper consideration being given to the placing of statues and other public monumental decorations in streets, gardens, or parks was referred in our issue of September 29, in an on "Sculpture in Civic Art."

But consideration, of a sort, must even be given to this question by the Office of Parks and other authorities concerned. It is presumed from the fact that their decision has to be obtained before a monument can be erected; but if we are to judge by the results as we see them in the parks and gardens of London to-day, common-sense artistic advice is not at their disposal, and, if available, is not usually followed. The Commission has no central authority competent to deal with the position of its monuments and other decorative features on broad public lines.

In this respect New York has taken a considerable step in advance by the creation of the Art Commission of the City of New York. This Commission consisted in 1909 of the Mayor, the President of the City Public Library, one trustee of the Metropolitan Museum of Art, the President of the Brooklyn Institute of Arts and Sciences, an architect, one sculptor, one painter, and three laymen.

Under the terms of its Charter the Commission has jurisdiction over all works of art acquired by the city and over their alteration, removal, or relocation. It appears to have fairly extensive control over all buildings and structures of every kind erected on land belonging to the city, for the erection of which its approval is necessary. In particular it is enacted that no work of art become the property of the city unless the work itself and its location be approved by the Commission.

Proposals to the number of 172 were submitted to the Commission during 1909,

ranging from the tablets to be placed in public schools, or statues and fountains in public squares, to such complete structures as a bridge, a police-station, or a hospital.

As the Commission points out, the location of monuments is one of the most difficult subjects with which it has to deal.

"These difficulties are due chiefly to the fact that in most cases the monument is not

designed for a specific site. When completed it is submitted for a definite spot which, in most instances, is selected not because it suits the character of the monument, but because it is conspicuous; as, for instance, at the junction of two or more important streets or in a prominent place in one of the chief squares or parks.

It is self-evident that the character of the monument should determine the nature of its setting. The all-important question in

Washington Arch, New York.

"A well-placed Monument, forming a fitting Gateway to Fifth Avenue; but its appearance is largely dependent on preserving the old Colonial dwellings on North Washington-square."

Franz Sigel Monument, New York.

"This Statue is well placed. It fits into its surroundings and forms a part of them."

selecting a site is that it shall be of a character suited to the monument; but usually, in order to satisfy the desire for a conspicuous place, other considerations are ignored, and, as a consequence, many monuments stand in unsuitable locations. That so many monuments stand in unfortunate locations is due not to carelessness or lack of deliberation but to failure to recognise the fact that a *well-placed* monument forms an integral part of its surroundings."

The general attitude of the Commission on this question is fairly well summed up in the remark that it is "in full sympathy with every effort to honour those to whom honour is due, but is solicitous not to dishonour them by honouring them in an unsuitable place." Its point of view is further explained as follows:—

"While definite rules cannot be laid down for the location of monuments, any more than rules can with finality be given for the composition of a picture or of a group of sculpture, yet certain fundamental principles are very

evident. A monument should be so placed that it is in proper relation both architecturally and sculpturally to the spot in which it is located, be it street, square, or park; that its commemorative or particular character is in harmony with its surroundings, and that it is and will remain a distinct adornment to the locality in which it stands. The probable permanence of appropriate surroundings should also be considered, for changes in the character and occupancy of adjacent buildings have frequently turned harmony into discord."

We notice that the Commission considers colossal busts on pedestals unsuitable for sites where lawns, shrubberies, and trees are the principal and natural features.

The views we give, with the comments of the Commission on their location, illustrate the application of the Commission's point of view to individual cases.

There is no doubt this Commission is doing valuable work and that the same sort of work is sadly needed in London and our other large cities. True it is that our

authorities have been known to rise to the height of realising that there should be some connexion between the idea or the character of the memorial and the site provided for it. The statue of the Duke of Cambridge, for example, is placed between the Horse Guards and the War Office. The connexion of ideas is obvious and, so far as perhaps correct, but the statue itself has no special relation to these buildings or to other surroundings. It is left stranded in the middle of the road, where it produces little more effect on the spectator than would a broken-down motor-bus.

If we could always be sure that those in authority would rise even to this height it would be something to be thankful for, but one has only to go to Tooting Broadway to see the latest statue of King Edward VII placed at one angle of a triangular space in the middle of the road entirely occupied by an underground convenience. The statue has its back to the convenience and its face to a cab-rank. It is a pity that the Art Commission of New York was not hand to point out to those responsible for selecting this site that it is possible to dishonour those worthy of honour by honouring them in an unsuitable place."

VANDALISM AT SHEFFIELD

THE sort of absurdity too often perpetrated by our civic authorities is exemplified by a tram shelter lately erected in front of the Crime Memorial at Sheffield. This monument was designed by the late George Goldie in the early sixties, and sculptured by the late Thomas Earp. It is a competent and characteristic piece of work of the period.

Until its place was usurped by an upstart tram shelter this monument, flanked by a couple of old Russian guns and backed up by St. Paul's Church, with its cupola, formed an interesting termination to one of the few well-designed streets in Sheffield.

The island site on which this monument stands had already been invaded by an underground lavatory, now comes a tram shelter. We can only wonder what next. An ambulance station, a fire-alarm, a telephone call-box, horse-trough, an orderly-bin, a cabmen's shelter—all these are objects of public utility for which this central position should be suitable.

Schiller Monument, New York.

"A well-placed Bust as it is a part of its surroundings, and these are suitable to a poet."

But they will all arrive in time, or, at any rate, as many as there is room for, when the Memorial, instead of calling attention to the heroism of a past generation of our soldiers, will call attention to the zeal but hardly to the intelligence of the present generation of public officials. At present it undoubtedly has the very useful purpose of calling attention to the tram shelter—not to mention the underground lavatory.

It is more surprising that this lack of consideration of the meaning and object of a monument of this nature should be shown in Sheffield, as this city has lately shown an interest—almost, we might say, an enthusiasm—for town planning, and is now engaged in working out a scheme which we have been given to understand is to be handled in a broad and comprehensive lines.

But, at any rate, it will not be possible to have such minor conveniences as tram shelters, lavatories, or the various objects of public utility to scramble for prominent situations without regard to the general effect.

Probably as the scheme develops the relative importance of tram shelters and their relation to public monuments will be fully realised, when this particular one will find its proper place.

"The Still Hunt" Statue, New York.

"This is an ideal location for this particular Statue."

CIVIC DESIGN NOTES.

Borough. The Corporation are negotiating to purchase the undercliff from the Spa grounds along the front to Holbeck, and will make a road and steps. A scheme is formulated to lay out the outlet 7,000 ft. in the course of the next months upon the laying-out of the undercliff facing the South Bay, to be bought by the Corporation, and to include bathers' bungalows, a children's public shelter, etc. The entire scheme extends to a bathers' pool, buildings for refreshment, a café, lounge, and so on, an outlay of about 40,000l.

Housing and Water Supply in Florence.

A GREAT development in the building of cottages and workmen's dwellings has of late years taken place in Florence. Since 1909 211 new buildings have been erected and fifty-one enlarged, giving a total of 580 dwellings with 3,547 rooms. They are mostly situated outside the gates in the San Barvasio, Rifredi, and San Salvi quarters. The rents were fixed at 8l. for apartments with two rooms; three rooms, 12l.; four, 16l.; six, 24l.; seven, 28l.; eight, 32l.;

nine, 36l.; ten, 40l.; eleven, 50l.; twelve, 60l. They were built for the most part by co-operative building societies, which number forty-one. The price paid for the land was from a minimum of 1s. 2½d. per metre (San Salvi) to a maximum of 14s. per metre (Via Giotto). In addition to the foregoing, 425 new houses (for the most part cottages) were to be ready in November, 1910. In 1909 the Communal Council decided to create a Board (*Istituto Autonomo*) for the building of workmen's dwellings, assigning for this purpose 20,000l. Three blocks have already been built

How Sheffield fills its Squares.

(From the Sheffield Telegraph.)

in three different localities. They consist of 160 small apartments, thirty-six with two rooms, sixty-four with three rooms, and sixty with four rooms. Each apartment has a small plot of ground, separate water-closet, water supply, and a loggia. There are also large lavatories, and a special room reserved for medical examinations. The State railways have by a special law assigned 600,000*l.* for the building of houses for railway officials whose salaries do not exceed 140*l.* per annum, and their construction has been begun in the most important railway centres. A large block will be built in Florence, for which the sum of 32,000*l.* has been sanctioned. The houses will be built on land given gratuitously by the Commune in the St. Jacopino quarter, and will consist of 200 apartments of about 600 rooms, some being of two and some of four rooms.

The important question of the water supply of Florence has not yet been settled. The last Communal administration wished to develop the present system, which consists in obtaining the water from the Arno, prolonging the present tunnel by boring new wells along the Arno, and especially by the adoption of the *Avvenamento*, which consists in obtaining directly and from the surface of the river a certain quantity of water to be injected by special drainage through the soil, which will serve as a filter. It is, however, objected by many competent persons that the water so obtained will not only be of doubtful purity, but also will be unequal to the wants of the population, as there is very little water in the Arno during the summer months. In any circumstances it is thought to be much safer and more economical to have the water of the river passed through proper scientific filters instead of through the natural sandy deposits.

A SUGGESTIVE report by Mr. Town Planning George Bell, the Borough Engineer and Estate Agent for Swansea, to the Swansea Corporation, deals in a well-considered manner with the possibilities of controlling the growth of the city so as to make newly-developed districts healthful, convenient, and pleasing to the eye, and also makes a bold appeal for the improvement of the city as it now exists. Mr. Bell hopes that the latter will not be regarded as the advocacy of reckless extravagance, and points out that there is such a thing as reckless economy in civic administration. He rightly believes that there is far more to be gained by measures calculated to attract manufacturers, trade, and population than by short-sighted economy prompted simply by the desire to reduce the burden of rates.

At a recent meeting of the Tarred Roads. Institution of Municipal Engineers Mr. W. Astley Norris gave some useful hints on tarred roads. In the course of his remarks he stated that the most successful system is that of tarring furnace slag, introduced by Mr. E. P. Hooley. The method of preparing this road material, as in most cases of tar-macadam, is to thoroughly dry the stone by heating, and then to apply hot tar and mix thoroughly. Limestone was very extensively used at first, and selected for tar-macadam, on account of its absorbent properties, while dense, blast-furnace slag of better quality, a harder and comparatively better wearing material, has since been largely adopted. Where roads have a good face, and it is possible to tar-wash the surface at least once every four months, tar as a surface binder will undoubtedly be a success. It will not, of course, make a weak road subject to disintegration from below a strong one. A road compound throughout of thoroughly tarred material will do all that surface treatment cannot do. The failure of tar-macadam has been in a great measure due to inability to get the tar to adhere to the material to be tarred. Moisture on the material or cooling of the tar means failure of adherence, and the use of soft materials which would adhere quickly means failure through the road giving way owing to inferior material.

In order to construct a good tar-macadam road it will be necessary to have an ordinary road as a bottom, or to form as good a foundation as possible. If a waterproof road is desired, then it must be of tarred macadam. The bottom layer can be 4-in. gauged material, laid and rolled, with the interstices filled up with finer tar-macadam, and the whole steam rolled. The second layer should be about 2-in. in thickness of 2-in. tar-macadam, and left

unrolled; on this should be applied a layer of 2-in. gauge tar-macadam, and rolled into the 2-in. and when rolled 2-in. tar-macadam should be swept with a brush into every crevice or open joint. As a last coating, in order to join the face, a perfect layer of 1-in. tar-macadam should be applied, and after the roller has passed twice each way over its face, 2-in. tar-macadam should again be swept into each crevice, so that a perfect surface is obtained.

Thrale-road, Streatham.

THE corner of Thrale-road, at Tooting Common presents difficulties to vehicular traffic which could be minimised, and the slight alterations needed would be welcomed alike by drivers and pedestrians; but the proposal of the Wandsworth Borough Council to give work to the unemployed by projecting Thrale-road across the Common does not commend itself. The present roads do not need to be supplemented, and if the intention of the local authority is realised one of the most picturesque places of recreation near London will be spoilt. Lady Amherst once described the trees in the neighbourhood as quits patriarchal, "with nothing suburban about them," and, indeed, everyone who knows that part of the Common is attracted by its rural character. It is a health centre for children especially, and to destroy natural beauties for doubtful utilitarian ends would be a municipal error. It may be hoped that the London County Council will not surrender the land for the purpose.

Hillside Planning.

WE are interested to notice in the particulars of the competition for workmen's houses held in connexion with the Royal National Eisteddfod of Wales that competitors are earnestly requested to have special regard to Welsh physical conditions, not only in building on the flat, but also on hillsides. A good solution of hillside planning is much desired.

This certainly is the case elsewhere than in Wales, and we are glad attention has been drawn to the subject. We hope the competition will have the desired effect.

Cambridge Housing Problem.

THE action of the Corporation of Cambridge in demolishing insanitary houses, combined with a rise in the rents of those that remain, appears to have brought things to such a pass that it is impossible for unskilled labour to afford a roof over its head. According to the special correspondent of the *Daily News*, whole families are driven to the workhouse, while outdoor relief is afforded to others simply to pay the increase in rent. Cambridge must be a paradise for the landlords. It is said that the Corporation is taking steps towards putting the Housing Act in force. It does seem almost time that they did so.

Garden Suburb, Haslemere.

A SCHEME for a garden suburb at Haslemere, upon 6 acres of land, comprises the erection of fifty houses, the tenants becoming shareholders and receiving 5 per cent. interest on their money invested, with division of profits. Mr. Williams is Chairman of the local Committee for carrying out the project.

Wimbledon Common.

THE Corporation of Wimbledon and the Borough Council of Wandsworth have been in communication with the Commissioners of Wimbledon Common with reference to the provision on the Common of sanitary conveniences and of facilities for refreshments. This opens up the whole question of the right attitude to adopt towards all rural tracts of common land as they gradually become surrounded by the building area. Is it desirable to retain their rural character? If so, is it possible to do this and at the same time make proper provision for their full enjoyment by those who most need the benefit to be derived from them? No doubt, most people would wish Wimbledon Common to remain as it is, but, all the same, there is little doubt that large tracts of it are comparatively useless to any but local residents or the more leisured and well-to-do classes from a distance, owing to the lack of these facilities. If, then, their absence tends to lessen the benefits to be derived from the Common, it must tend to defeat the very object for which the Common is preserved. There are already several buildings and enclosures on the Common,

notably at the Windmill, which would make capital refreshment-rooms and tea gardens without interfering with the general aspect of the Common. In any case, we feel sure that the Conservators will not permit anything to be done except in accordance with the architectural advice.

A Progressive Canadian Town.

THERE has been a settlement for a long time at Prince Albert, Saskatchewan, but not until the advent of the railways and the opening up of the farming areas around did the city itself start to increase in size to any great degree. In 1891 the population was only a few hundred isolated settlers, while to-day, just twenty years later, it is fully 8,000. The rateable value of the city has increased from 500,000*l.* in 1906 to 1,500,000*l.* in 1910. The last two years have seen a wonderful growth. The value of buildings started in 1909 was only 30,000*l.*, while in 1910 it was 130,000*l.* Other statistics, such as Customs returns and traffic receipts at the railroad, point to an equally healthy state of affairs.

An International Highway.

THE vogue of the motor in the North American continent seems destined to be more than any other movement to help forward the provision of good road communication, a feature which is sadly in arrears. It has been decided to construct a "meridian" road or main highway between Winnipeg and the Gulf of Mexico, a distance of 1,600 miles. The road will follow the line of the Red River Valley, and traverse the following six American States:—North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, and Texas. The project is supported by grants made by the provinces of Manitoba and the Governments of the States referred to, and by the municipal authorities of the principal towns lying along the route.

New Town-Planning Authority for Berlin.

AN authority to be created by a new Prussian Act of Parliament, taking effect from April 1, 1912, will have jurisdiction over traffic facilities, street design, city planning, and public parks, in the special metropolitan district, which may be termed "Great Berlin," including the city proper, Charlottenburg, Lichtenberg, Niederschönhausen, Rixdorf, Schöneberg, Spandau, Teltow, and Wilhelmsdorf.

The authority will consist of 100 members elected by the local Councils and a Council of nineteen members elected by the general body both under the Presidency of the Burgomaster of Berlin. Contributions will be levied from the local Councils to pay for works undertaken by the new authority, the scope of whose duties are briefly stated below.

Traffic Facilities.—The purchase, construction, or operation of railways, either directly or leasing the right of operation, with the right to use the public streets for railways subject to payment of compensation. Existing municipal railways may be acquired without the usual consent being asked, existing private railways will come under the jurisdiction of the new body, and all new railway projects must be sanctioned by the authority before construction.

Street and City Planning.—Street lines must be settled by the authority as necessary for improving or creating thoroughfares, for railway purposes, and for the creation of central open spaces. In districts not yet built up arrangements of streets and city planning generally will come within the province so as concerns traffic facilities, housing, sanitation, thus for the first time providing official control over city planning in Great Berlin.

Parks and Open Spaces.—The power to create parks and recreation-grounds and control the use, maintenance, and improvement of all such open spaces, with power to delegate maintenance to the local Councils at rates of remuneration to be settled in every case.

It is stated that the Local Government Board have given their authority to the Bournemouth Corporation to prepare a town planning scheme under the Act of 1909, in the matter of 200 acres in the Boscombe East and Southbourne Wards, inclusively of the Wentworth Lodge and Boscombe Manor Estates.

THE BUILDING TRADE.

RECENT WORKMEN'S COMPENSATION CASES.

Recent decisions of the Court of Appeal in cases under the Workmen's Compensation Act have involved the consideration of some points of unusual and importance.

Out of and in the Course of Employment": Sunstroke.

In the case of Davies and Gillespie an officer on a ship, whilst superintending the cargo in Hayti, suffered a sunstroke. He was exposed to the sun in the line of his duty for some hours, standing on the deck, and was compelled to enter the hatchway. The Court held that there was sufficient evidence to justify the decision of the County Court judge that the injury was by the nature of his employment exposed to special risk, and that the injury arose out of and in the course of his employment.

The facts in this case seem to fall somewhat between those in *Warner v. Couchman* (The *Builder*, February 3 last), and affirmed (House of Lords November 10 this year), where a baker's man in the course of his rounds was frost-bitten, and *Andrew v. Falls* (The *Builder*, May 14, 1904), where a man working on a scaffold was struck by lightning. In the former case it was held that if frost-bite were an "accident," employment involved no special risk outside that incurred by all persons working outdoors; but in the latter case the man's exposed position was held to be a special risk from lightning.

Wasp-sting.

In the case *Amys v. Barton* the engineer of a thrashing machine died, as it was from a wasp-sting, which set up blood poisoning. He was engaged in thrashing at the time, but the Court held that there was no risk from wasps specially connected with his occupation, and that the injury did not arise "out of the employment."

A decision may also be usefully compared with others, so that a principle may be deduced. In *Bowland v. Wright*, a stableman was bitten by a cat, and this was held to be an accident to his employment; but in *Wigan v. Wigan*, a lady's maid, frightened by a cat, injured her eye, and this was held to be an accident to her employment.

Asphyxiation.

In *Immonds v. Owners of Ship Peterson*, a ship engineer had rigged up a makeshift stove which he had permission from the chief mate to use in the daytime, but not at night. The cold was intense at Odessa, and he used his stove one night and was asphyxiated. The majority of the Court and dissenting of the Rolls, with hesitation, held that there was evidence that some heating was absolutely essential in the circumstances the accident arose out of and in the course of the employment. In this case, at present reported, no point appears to have been made of disobedience to orders. He may be accounted for by the fact that his contributory negligence nor serious misconduct, when the consequences of the accident are death or serious and permanent disablement, affords any defence for the employer to the claim.

II.—Incapacity.

Cases relating to the causes and duration of incapacity are becoming more and more difficult to reconcile.

In the recent case *Noden v. Galloways*, 1902, a riveter sustained an accident which necessitated the amputation of his right finger. He was paid compensation for the loss of the finger, and in 1903 was taken on by his old employer as a caulker, and he continued to work until 1910. In 1910 a pneumatic riveter was introduced, and the extra weight

and vibration caused the man's hand to inflame. He then claimed a renewal of compensation as from the original accident in 1902. The County Court judge held that the accident of 1902 was one of the contributory causes to his incapacity, and awarded compensation. The Court of Appeal held this decision to be erroneous, both on the facts and the law. The Court laid it down that it was not sufficient to show that a former accident was a contributory cause, and instanced the case of two accidents, one in 1902 and one in 1910, the man being engaged by different employers on each occasion. In such circumstances, it was said, the 1910 employer would be alone liable, and the former accident could not be shown to have contributed. It must be confessed that this decision, satisfactory as it appears, is very difficult to reconcile with the principles applied in former cases. The Courts have held that employers are liable for incapacity, and that the burden of showing it has ceased is laid upon them. In the case of *Cory Brothers, Ltd., v. Hughes*, a case we commented upon, *The Builder*, September 15, a man engaged upon light work, which he had successfully performed for two years, was prevented from continuing it by heart disease entirely disconnected with the accident, yet the employers were held liable again to pay him compensation.

The fact is that the Act has been construed in a manner which creates great difficulty. It has become extended by a continuous series of decisions little by little until a Chinese puzzle has been created. The liability imposed upon employers is cumulative. If an employer engages a man with a diseased heart, a strain which would not injure a sound man is held to be an "accident" in the case of the diseased man (see *Hughes v. Clover, Clayton, & Co.*, *The Builder*, March 26, 1910); similarly, it is presumed, if an employer engages a man suffering from disability caused in a former employment which renders the man more liable to accident, the new employer takes over this risk. When the man is once incapacitated the employer has to show incapacity has ceased.

We dealt with this latter question in the *Builder*, June 2 last, and it will be seen that the decision in *Noden's* case, as at present reported, is difficult to reconcile with the decisions there noted.

III.—Compensation.

The eight-hours' day has already caused a question to arise in connexion with the amount payable to workmen incapacitated by accident.

In *Bevan v. Energlyn Colliery Company* a collier injured by accident in 1907 was then earning 2*l.* 1*s.* 1*d.* When he resumed work in 1911 he was earning 1*l.* 12*s.* 7*d.* It was proved that, owing to the Coal Mines Regulation Act, 1908, wages had fallen considerably, which to some extent accounted for the difference in the man's earnings. The County Court judge held that he could only regard the amounts earned, and on this basis assessed the sum due to incapacity at 1*l.* 6*s.* 6*d.*, but he intimated that, if the effect of the Eight Hours Act had to be taken into consideration, then the amount would be 2*s.* a week.

The Court of Appeal held that the judge had misdirected himself, that he was bound to regard the reduction of wages brought about by the Act, and assess the amount accordingly, and the amount awarded was therefore the 2*s.* This decision is very important, as, under the Workmen's Compensation Act, 1897, a contrary decision was given in the case of *James v. Ocean Coal Company* (the *Builder*, May 28, 1904).

The reason for this decision is an alteration of the wording of Schedule 1, par. 3 in the Act of 1906.

In the case *Victor Mills, Ltd., v. Shackleton* a workman permanently incapacitated had received in weekly payments the sum of 17*s.* 6*s.* 7*d.* The employers applied to have the weekly payments redeemed by the payment of a lump sum. The County Court judge assessed an imaginary sum of 300*l.* as

what would have been awarded originally, and, deducting the sums paid as weekly payments from this imaginary sum, he awarded the balance. This was held erroneous, and the Act is now explicit as to how such lump sums shall be assessed (see Schedule 1, par. 17).

On this paragraph of the first schedule the Court of Appeal on November 7 have again given a very important decision in the case *Calico Printers' Association, Ltd., v. Higham*. The paragraph declares that where a weekly payment has been continued for not less than six months the employer may apply to have it redeemed by payment of a lump sum "of such an amount as, where the incapacity is permanent, would, if invested in the purchase of an immediate life annuity from the National Debt Commissioners, through the Post Office, purchase an annuity equal to 75 per cent. of the annual value of the weekly payment, and as in any other case may be settled by arbitration."

In the first place the Court held this to apply to both partial and total incapacity as long as either can be said to be "permanent." "Permanent" in this connexion the Court defined as "stable." If the man's condition is not stable, if he may grow worse or better, then the 75 per cent. rule does not apply, and the amount of the lump sum must be determined by arbitration; if it is "stable" or "permanent," then the lump sum must be the amount defined by the paragraph.

In the case in question the man had lost the first finger of his right hand, and his thumb had become stiff, and he was no longer able to pursue his trade as a cotton spinner. He was, however, earning something, and the County Court judge, in December, 1910, had estimated he was capable of earning 1*l.* a week, and had awarded a weekly payment of 9*s.* 8*d.* On the application in June, 1911, to fix a lump sum the judge had applied the 75-per-cent. rule to this sum, and had awarded 312*l.* The case was sent down for rehearing, the permanence of the incapacity to be determined.

It may be noted in this connexion that, although it is often assumed under the Workmen's Compensation Act that the maximum liability is 300*l.*, the amount fixed when death ensues upon an accident, this assumption is by no means correct. Where a man is permanently incapacitated, the liability may far exceed what would be incurred in a fatal case, as the weekly payments must either be continued for life or commuted on the 75-per-cent. basis. Thus a man of twenty-one permanently injured while earning 1*l.* a week would represent a liability in the purchase of an annuity of some 438*l.*

IV.—Medical Examination.

In *Morgan v. William Dixon, Ltd.*, the House of Lords (November 13) decided that where a workman under Schedule 1, par. 4, was required to submit himself for examination by the employer's medical man he could not as of right demand the presence of his own doctor. The House intimated, however, that this was a question to be decided by the arbitrator, and that in most cases such a course would be reasonable.

V.—Public Authorities Protection Act.

The last decision we need refer to is *Fry v. Mayor, etc., of Cheltenham*, in which it was held that the limits of time prescribed by the Public Authorities Protection Act, 1895, have no application to proceedings under the Workmen's Compensation Act.

NEW PAVILION, PENZANCE.

A new pavilion is to be erected in the Alexandra Grounds, adjoining the Western Promenade, from the designs of Messrs. Cowell & Drewitt, Lics.R.I.B.A., architects, of Penzance and Newquay. The pavilion will include a winter garden, 73 ft. by 50 ft., and a concert hall, 50 ft. by 45 ft., fitted with a stage. When required, the winter garden and concert hall can be converted into one, providing accommodation for about 1,000.

LAND TAX VALUATION.

We have received the following communication from Mr. E. G. Pretymann, M.P., the President of the Land Union:—

"The decisions of the Court of Appeal in the actions 'Burghes v. The Attorney-General' brought under the auspices of the Land Union, and also Dyson v. The Attorney-General,' confirm the judgments of Mr. Justice Warrington and Mr. Justice Horridge that the inquisitorial demands known as Form VIII. and Form IV. are 'unauthorised.' The issue of these forms is typical of the attitude adopted by the Commissioners of Inland Revenue, and it is to be hoped that these decisions of the High Court and the forcible comments of his Majesty's judges will check the growing tendency of Government Departments to extend their powers and construe Acts of Parliament to suit their own purposes. These illegitimate methods have for their first and easiest victims those who, from lack of means or information, are slow to exercise the right they have possessed for centuries of appealing to the Courts of Justice against the arbitrary action of the Executive.

But these decisions have settled only two out of many points upon the provisions of the Finance Act, where the interpretation placed on them by the Commissioners is open to grave doubt. The Land Union, acting upon the advice of Counsel, has prepared a detailed statement of some further important questions which have already arisen, and I wish to take this opportunity of notifying these to property owners, and to their professional advisers, and to strongly urge them to make a formal objection to every provisional valuation where any of these questions arise until it has been settled by the referees or by the Courts.

The following are a few of the points at issue:—(1) Whether the Commissioners are right in refusing to make any allowance for the value attributable to land appropriated for roads? (2) What is the proper method of deducting the value of tithe? (3) What is the true interpretation of the phrase "value attributable to buildings"? (4) Whether, in the case of agricultural land, deductions are allowable for expenditure on drains and fences? (5) What is the method of arriving at the agricultural value of undeveloped land? (6) When does duty become payable on undeveloped land which is let? (7) Whether the Commissioners are right in claiming mineral rights duty on arrears of rent accrued before, but received after, the passing of the Act? (8) Whether "surface rights" are liable to mineral rights duty? The Commissioners have appealed against the decision of the referees that they are not liable. (9) Whether the Commissioners' contention that increment duty is leviable upon value attributable to a builder's general scheme of development is correct, having regard to the Chancellor of the Exchequer's statement that value due to "skill, brains, and expenditure" should not be taxed? (10) Whether, when a property is sold above its market value, such excess should always be taxed as increased site value is correct? (11) Whether substituted site value can be claimed where ground rents have been purchased or leases granted? (12) Whether the fact that an owner has not stated the value of his minerals on Form IV. debars him from placing a value upon them subsequently? The detailed and specific statement can be obtained by applying to the Secretary, Land Union, Westminster."

NEW CHURCH, RHYMNEY.

This church has been erected at a cost of about 1,400l. from the plans prepared by Messrs. Habershon & Fawcaker, architects, of Newport, and the seating accommodation of the building is 500. The contract was carried out by Messrs. Williams & Son, builders, of New Tredegar.

ST. MARGARET'S NEW CHURCH.

Messrs. Austin & Paley, of Lancaster, are the architects for this church, which is being erected at a cost of about 7,000l. The contractors for the work are—Messrs. R. Rathbone & Son, Atherton; joiner—Mr. J. Dickinson, Bolton; plumber—Mr. J. W. Witter, Bolton; slaters—Messrs. J. & T. Till, Lancaster.

THE BUILDERS' BENEVOLENT INSTITUTION: ANNUAL DINNER.

THE sixty-fourth annual dinner of the Builders' Benevolent Institution was held on Thursday last week at the Whitehall Rooms, Hotel Metropole, Charing Cross, W.C. Mr. F. G. Rice, President, in the chair, supported by 167 friends of the Institution, including Messrs.

James S. Holliday, President, Institute of Builders	Ch. A. Harman
James Carmichael, J.P., Past-President	C. Devereux Harman
Frank May, Treasurer	L. H. S. Stanbrough
H. H. Bartlett, Past-President	J. F. Hamlyn
Fred. Higgs, Past-President	H. Barnacott

	And others.

The loyal toasts having been suitably proposed by the President and honoured,

The President proposed the toast of the evening, i.e., "The Builders' Benevolent Institution," and in doing so made an eloquent appeal on behalf of an excellent institution. He said they were there to think of and to relieve the cares, troubles, and necessities of their less fortunate brethren—men who have had to fall out of the stern march of business, men who had fallen by the wayside through sickness, want, and despair and whose only bulwark between them and the yearning gulf of poverty and hunger and, save the word, the workhouse, was the Builders' Benevolent Institution, whose claims to the beneficence and generosity of the company he wanted to make an appeal for. He was appealing for funds for an Institution that had been in existence sixty-four years, had given relief and sustenance to over 500 pensioners, poor and distressed builders and their widows, and now, week by week, afforded the sustenance to sixty pensioners, and, when the time came for them to shuffle off this mortal coil, gave them a decent burial. To carry on this work required a large income, and although there were a number of friends who, year by year, and all honour to them, contributed to its funds, it was to the annual appeal for donations and to this dinner that one had to look for the great bulk of the money required—

1,200l. being the sum. Many numerous friends, builders and members of the allied trades, already generously contributed to his list to the lists of those stewards who had so kind so unselfishly, and so cheerfully undertaken that work, but the amount so far subscribed did not reach that amount. The Institution was most carefully managed by a committee and carried on with the minimum of expense. The committee, year by year, selected a gentleman to act as President, and in past years choice had been most commendable. Sir household names in the building trade, William Cubitt, Alderman Sir James Lawrence, and the late William Higgs, and, twenty-six years later, his son, the present William Higgs, Herbert H. Bartlett, William Shepherd, Joseph Randall, Henry Hollow Benjamin L. Greenwood, Benjamin Ham Frederick Higgs, William Willett, and last, not least, Mr. Frank May, who had succeeded to the Treasurership, and who maintained interest in all he undertook. Throughout literature, whose character was that which filled us with enthusiasm, interest, and emulation. It was the one whose kindness, sympathy, whose tear was for the misfortune of the falling brother. Of whom had we more sweetly sung than of the cheerful giver. Of what subjects had our great painters portrayed more eloquently than that of acts of mercy. Whom had the sculptor's cunning depicted more boldly than the Good Samaritan? These were the thoughts more lofty, the eloquence more irresistible than when the greatest of his age, John Bright, was appealing for the distressed, the destitute, and the suffering, the result of his (the speaker's) appeal for the Builders' Benevolent Institution he had to there were yet in this world those whose hearts were always open to the cry of the sufferer and the destitute, and to them he tendered, behalf of the Institution, his heartfelt thanks. He could not conclude without reference to the loss of Mr. Howard Colls, whose work in cause of the Institution had been most consistent, generous, and unselfish, and who remembered the claims of his less fortunate brethren, must he omit the devotion to the cause of Stirling and Mr. Bolding, nor the able work of the Secretary, Mr. Costigan.

The toast having been honoured,

Mr. James S. Holliday.

President of the Institute of Builders, proposed the toast of "The Architects and Surveyors and in doing so he said that during the thirty years a great change had taken place in the art of building. He remembered when he went into the trade about thirty years ago chief construction was brick, stone, and we with an occasional iron stanchion or girder, then we came to an iron and steel age. He remembered the remark of a very distinguished architect to the effect that iron and steel had become so prevalent that we could practically do without the carpenter. He felt sorry for the carpenter, but there were great hopes for still, because with reinforced concrete it appeared that he often had to put a building up before it was filled in with concrete. In his speaker's early days they looked for strength from thick walls, heavy beams, while now the thinness of the walls and the light construction seemed to be the order of the day with reinforced concrete construction, he sometimes thought that the margin of safety was very small. In those past days, too, he had a reasonable time to do the work, while now it seemed to be a case of the quicker did it the more likely one would be to get a job that was if one were the lowest tenderer. During all these changes the successful architect to play many parts, and he was clearly a man of many talents. He had had very close relations with architects, and had seldom to refer to the arbitration clause in the specification—the result which was, as a rule, not satisfactory to either side. It was the earnest desire of most builders to co-operate faithfully with the architect and the surveyor in an attempt to put up buildings worthy of the generation. As to surveyors, builders depended on the bills of quantities being a fair representation of the work in the specifications and on the drawings, and he would like to bear testimony to the efforts of quantity surveyors to bring about uniformity of quantities.

Mr. C. Fitzroy Doll,

in responding for the architects, said that architect he was entitled to, though a g

said that the first thing an architect study was quantity surveying, for if he stood quantity surveying he would under- construction. So he was sent by Sir an Tite to an eminent quantity surveyor, I. F. Critten, who would be regarded by as the father, almost, of quantity survey- and he learnt a great deal about construc- but the construction was very different that of to-day. Forty years ago he was led to look upon builders and all their ways great suspicion, and perhaps at that time justified to a certain extent, as the builder then to control everything in the con- of a building. But what was he now? He had done the digging, concrete, and work, and provided the plant, in most cases merely the organiser and paymaster of a lot of contractors. He was sorry to see the condi- the building trade had got into—Italians, asphalt and mosaic floors, Germans doing work, Italians, Belgians, and French dabbling and rag work, and all the poor had to do was to find the money on day, for he had very little control over the that was being done. He thought that wrong from more points than one. When architect got a job all sorts of people came to specify their goods, and he did not think was the way to treat the trade, and archi- would like builders to take all this responsi- off their shoulders. As to the architect- profession, if a man took to it he loved it much indeed, for it was one of the greatest passions, and one of the most extraordinary was that it had been recognised so little the British public. Much was made of all other great professions—the Army, the Church, Law and Medicine—but why? It did not really do much for the State, architects and builders provided buildings, produced the whole of the municipal and a large proportion of the Imperial one of the country, to say nothing of their value. Yet what was their treatment, really by the daily Press? When a founda- stone was laid the architect, as a rule, led the trowel and the builder the mallet the level, but how often did the Press on the names of those responsible for the? But if anyone stole a handkerchief it did not come brought up at Bow-street, defended by Mr. B. Brown, not only would be stated, but the day after there would be a paragraph mentioning that the Mr. Brown led to was Mr. Beucephalus Brown. Men who spent years of thought on the of a building were ignored, and yet they, the help of builders, did so much that of advantage to the State and the people. Architects and builders had many interests in; the architect's business was to see the client was well-treated and that he received a proper and reasonable on his work.

Sec. Corderoy, F.S.I.,

ponding for the surveyors, said he supposed never was a time when accounts were complicated or when the construction of building was more complicated than it is now; but while he sympathised with the surveyors' point of view as to sub-contractors or lists he did not see how the practice of having them could be altered, for with the of knowledge and science building con- was likely to become more complicated ever. As to the vexed question of the standardisation of quantities, there had been in this direction in recent years, but it had been entirely for good or not an open question. There were those who had given attention to the subject who said that there was danger in pushing standardisation too far, and whatever happened could not dispense with the trained pro- fessional mind which must determine the point which standardisation should cease and free be given to inventive ingenuity, and, therefore, to progress. If there had been a deal of standardisation in the past there would not have been the progress we have had; and should not forget the ancient Egyptians, who standardised things to such an extent that individual initiative in design died out. He did a gentle protest against the attempt to standardise too closely professional work of kind.

I. H. Bartlett

proposed the toast of "The President, Residents, Trustees, Committee, and

Stewards," and said that the Institution was administered with the minimum of cost. Even with the 1,200, which the President hoped to raise they would, he was afraid, find their resources unequal to the demands they had. He would be willing to subscribe another 150, or 200, if ten others, say, would do the same. With the toast he coupled the name of Mr. J. T. Bolding, a very old friend of the Institution, who had worked for it for many years and gave his time to the Institution for pure love.

Mr. Bolding

suitably replied, and thanked the President and others for what they had done for the Institution. The Committee took very great care of the money entrusted to them, and he could not believe there was any Institution in the country managed with as little expense or more care than the Builders' Benevolent Institution.

The last toasts were, "The Visitors," proposed by Mr. Ben Carter, and acknowledged by Mr. Alexander L. Howard; and "The Secretary, Mr. T. G. Costigan," proposed by Mr. Bolding, who referred to the excellent way in which Mr. Costigan managed the affairs of the Institution and the personal interest he took in the work, and briefly responded to by Mr. Costigan.

During the evening it was announced that as a result of the President's appeal the sum of 1,078. 8s. had been received or promised, including one hundred guineas from the President himself and 1000, from the Institute of Builders. The President mentioned that the Duke of Bedford had promised a contribution, and that Lord Kinnaird and Sir H. Samuel, M.P., had written to him expressing sympathy with the objects of the Institution and their regret at their inability to be present.

GOVERNMENT CONTRACTS.

The following tenders have been accepted during the past month by the Government departments named—*Admiralty, Works Department:* Works services, construction and erection of steel-framed brow at No. 3 Slip, Devonport Yard—Messrs. Redpath, Brown, & Co., Ltd., Riverside Works, East Greenwich, S.E.; erection of new coastguard station at, Sennen Cove—Mr. James Crockerell, Richmond-walk, Devonport; erection of new signal-station at Andover-hill, Lerwick—Mr. A. B. Douglas, Market-street, Lerwick; erection of new signal station at May Island, Firth of Forth—Messrs. J. Jackson & Son, Burntisland, Fifeshire; erection of residence for electrical supervisor, Portland—Messrs. Jesty & Baker, Castletown, Portland; penstocks for H.M. Dockyard, Rosyth—Messrs. Sir W. G. Armstrong, Whitworth, & Co., Ltd., Elswick Works, Newcastle-on-Tyne; supply and erection of No. 4 circular oil tanks, etc., Devonport Yard—Messrs. Horsley Company, Ltd., Tipton, Staffs. *War Office:* Works services, alterations and additions to Army Service Corps Canteen, Aldershot—Messrs. Martin, Wells, & Co., Ltd., Victoria-road, Aldershot; additions and alterations, Yeomanry Block, Duke of York's Headquarters, Chelsea—Messrs. G. Godson & Sons, Pembroke Works, Kilburn-lane, N.W.; additions to Sergeants' Mess, Richmond, Yorks—Messrs. G. R. Wade & Sons, Wellington-place, Richmond, Yorks; alterations, etc., to Government House, Chatham—Messrs. G. Gates & Sons, Frindsbury, Rochester; brick flats for huts, Kildare Barracks—Mr. R. L. Warren, Merville-avenue, Fairview, Dublin; enlargement of Bindleaves Barracks, Weymouth—Messrs. Jesty & Baker, Castletown, Portland; erection of exercising shed, Arbourfield Cross—Messrs. W. Bain & Co., Ltd., 122, Cannon-street, E.C.; erection of riding school, Longmoor—General Building Company, 45, Chandos-street, Charing-cross, W.C.; erections of veterinary hospital, Wellington Lines, Aldershot—Messrs. Martin, Wells, & Co., Ltd., Aldershot; improvements to married quarters, Newcastle—Mr. E. Weatherley, Westgate-road, Newcastle-on-Tyne; installation of electric light at Gaudeloupe and Martinique Barracks, Borden—Messrs. J. B. Saunders & Co., Ltd., 91, York-street, S.W.; installation of electric light at St. Lucia Barracks, Borden—Messrs. G. E. Taylor & Co., 8, Bush-lane, Cannon-street, E.C.; overhead conductors, supports, feeders, etc., for electric light, Borden Camp—Messrs. J. B. Saunders & Co., Ltd., 91, York-street, S.W.; periodical works services, Aldershot (North)—Messrs. A. Bagnall & Sons, Ltd., Shipley; Dover—Messrs. Skevington Brothers, Bateman-street, Derby; Bordon, Hounslow, and Shorncliffe—Mr. F. Holdsworth, 32, Saltair-

road, Shipley; Tamton—Messrs. R. W. Fitcher & Son, 6, Marlborough street, Devonport; Royal Engineer Mobilisation Stores, Longmoor—Messrs. Playfair & Toole, Southampton; sinking borehole and erection of pumping plant, Shoeburyness—Messrs. Perkins Macintosh Petroleum Tool and Boring Company, Ltd., 79, Bishopsgate, E.C. *Crown Agents for the Colonies:* Bridgework—Messrs. Head, Wrightson, & Co., 5, Victoria-street, S.W.; Messrs. Horsley Company, Ltd., Tipton, Staffs; Messrs. F. Morton & Co., Ltd., 17, Victoria-street, S.W.; Messrs. J. Westwood & Co., Ltd., Napier-yard, Millwall, E.; cement—Messrs. Barrons Cement Company, Ltd., 6, Lloyd's-avenue, E.C.; Messrs. Peters Brothers, 72, Victoria-street, S.W. *Office of Works:* Builders' work, alterations and additions to Aldershot Royal Pavilion—Messrs. Cesar Brothers, Hale, Farnham, Surrey. *H.M. Stationery Office and H.M. Office of Works Stores:* Erection—Messrs. Perry & Co. (Bow), Ltd., 56, Victoria-street, S.W.; alterations and an additional staircase at the Hampstead Telephone Exchange—Messrs. E. Lawrence & Sons, Ltd., 15 and 16, Wharf-road, N.; extension, Leamington Spa Post Office—Mr. Arthur J. Colborne, County Building Works, Swindon; painting Chelsea Royal Hospital—Messrs. George Trollope & Sons and Colls & Sons, Ltd., West Falkin-street, Belgrave-square, S.W.; General Post Office, electric lighting, Belfast—Head Post Office—Messrs. Craig & Paton, 2 and 4, Great Victoria-street, Belfast; local telephone exchange equipment, North Shields Head Post Office—British Insulated and Helsby Cables, Ltd., Lennox House, Norfolk street, W.C. *Metropolitan Police:* Demolition of Woolwich (Old) Police Court—Mr. B. Thomas, 121, High-street, Deptford, S.E. *Commissioners of Woods:* New cottages for Holland County Council at Whaplode, Lincolnshire—Messrs. J. R. Bateman & Sons, Sutton Bridge, Wisbech; erection of three pairs of cottages at Cannop Dean Forest, Gloucestershire—Mr. C. J. Miles, care of Mr. V. F. Loose, Whitmead Park, Parkend. *Commissioners of Public Works, Ireland:* Erection of Bunbeg wireless telegraphy station and torpedo instructors' house, Co. Donegal—Messrs. Hugh McManus & Sons, Randalstown, Co. Antrim.

GENERAL BUILDING NEWS.

CHURCH, SWANSEA VALLEY.

St. Mary's Church, Ynysuendaf, is being erected from the designs of Mr. Cook Rees, architect, of Neath, at an estimated cost of 2,000. The contractors for the work are Messrs. Price Bros., of Cardiff.

SCHOOL, LEYTONSTONE.

Mr. W. Jacques, A.R.I.B.A., is the architect for this school which has been erected at a cost of about 12,500. The building, standing on a site of about three acres, provides accommodation for 300 girls, and the design of the building is in the Tudor style of architecture. The contractors were Messrs. Clark & Sons, of Cambridge.

PREMISES, MAIDSTONE.

The new premises which are being erected for Messrs. Dennis Paine & Co., on the site of their old premises, which were destroyed by fire last year, are expected to cost about 10,000. The architects are Messrs. Ruok & Smith, F.R.I.B.A., of Maidstone, the contractors being Messrs. G. E. Wallis & Sons, Ltd., of Broadmaid Works, Maidstone, and London; the asphalt work by Messrs. Engert & Rolfe, Ltd., Poplar; the shop-fronts by Messrs. E. Pollard & Son, 29, Clerkenwell road, E.C.; electric lighting by Messrs. Oswald Jones & Co., of Maidstone; gas lighting by the Maidstone Gas Company.

CONVENT, KEITH.

This building has been erected at a cost of about 1,500, from the plans prepared by Mr. W. F. Stewart, architect, of Keith. The contractors were: Mason, Mr. William Cruickshank; carpenter, Mr. J. Cormack; slater, Mr. A. Strachan; plasterer, Mr. George Hume; plumber, Mr. Angus Joss; painter, Mr. John Symon.

HALL, CHUDLEIGH.

The accommodation of the Chudleigh Liberal Club has been increased by the erection of a hall at a cost of 2500. The architect for the work was Mr. Charles Geon, of Newton Abbot, and the contract was carried out by Mr. W. Shapley, of Chudleigh.

LIBRARY AND ART GALLERY, BLACKPOOL.

These buildings, which adjoin, were opened on October 26. The library is the gift of Mr. Andrew Carnegie, and the art gallery of Mr. John R. G. Grundy, R.C.A., and Mr. Cuthbert C. Grundy, R.I. In the competition assessed by Mr. G. H. Willoughby, F.R.I.B.A., Messrs Cullen, Lochhead, & Brown, of Glasgow, were successful. Mr. Samuel Aromus was appointed quantity surveyor, and Mr. T. A. Connelly acted as clerk of works. Messrs. Dryland & Preston, of Blackpool, were the general contractors. The building, situated at the junction of May Dell-avenue and Queen-street, is of Accrington brick, with stone dressings from Greetland Quarry. (It was illustrated in the Builder, February 13, 1909.)

TRADE NEWS.

The Church of the Holy Family, Southport, is being ventilated by means of Shorland's patent exhaust roof ventilators, supplied by Messrs. E. H. Shorland & Brother, Ltd., of Falsworth, Manchester.

Under the direction of Messrs. Coussens & Rothwell, architects, Hastings, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to Mount Pleasant Congregational Church, Hastings.

Having purchased the goodwill of his late father's name, and obtained the premises and address, Mr. Alfred E. Nightingale, Albert-embankment, London, S.E., wishes it to be known that he is continuing the business, and he hopes to secure the confidence and trust extended to his father, Mr. B. E. Nightingale, builder and contractor, for over fifty years.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 TO 1909.

At Tuesday's meeting of the London County Council, the following applications under the London Building Acts were dealt with, the names of the applicants being given in parentheses:—

Lines of Frontage and Projections.

Deptford.—Erection of a one-story shop in front of No. 120, New Cross-road, Deptford (Mr. J. H. Waterworth for Mr. S. J. Clegg).—Consent.

Hackney, North.—Projecting porches in front of Nos. 162 to 170 (even numbers only), inclusive, Holmleigh-road, Stamford Hill, and in front of four houses abutting upon the eastern side of Eastbank (Mr. C. G. Duell).—Consent.

Hampstead.—Two two-story bay windows, a projecting porch, and an arched window to a house on the southern side of Ardwick-road, Hampstead, to abut also upon the western side of Fortune Green-road (Messrs. G. Wiggs & Son for Mr. C. H. Burton).—Consent.

Hampstead.—Erection of two houses upon a site on the north-western side of St. Cuthbert's-road, Hampstead, abutting also upon the north-eastern side of Shoot-up hill (Messrs. Rix & Wilkins).—Refused.

Holborn.—Projecting illuminated sign at the Holborn Tavern, along the frontages next to Gray's Inn-road and Holborn (The Durlite Company for Messrs. J. Robertson & Son, Ltd.).—Refused.

Holborn.—Erection of a wood and glass porch in front of Nos. 35-37, Alfred place, Holborn (Mr. G. Vernon for Messrs. Teofani & Co.).—Refused.

Kensington, North.—Erection of bay windows to thirteen houses on the eastern side of Latimer-road, Kensington (Mr. W. L. Trant Brown for Messrs. W. H. Eyles & Co.).—Consent.

Lewisham.—One-story addition in front of a proposed electric theatre building on the eastern side of Silverdale, Lewisham (Mr. E. S. Barr for Messrs. Sheffield Brothers).—Consent.

Paddington, South.—Erection of a water closet addition at the rear of No. 106, Inverness-terrace, Paddington, next to the southern side of Porchester-gardens (Messrs. William Gibbin & Son).—Consent.

St. George, Hanover-square.—Projecting pulley arm in front of No. 21, King-street-mews, Westminster (Messrs. Ralph Knott & E. S. Collins for Mrs. Bevan).—Consent.

St. George, Hanover-square.—Erection of a porch and balcony in front of No. 1, Upper Grosvenor-street, St. George, Hanover square (Messrs. Ralph Knott & E. S. Collins for Mr. G. P. Kent).—Consent.

St. Pancras, North.—Erection of buildings on the southern side of St. Alban's-road, St. Pancras (Mr. R. J. Sinerdon).—Consent.

St. Pancras, South.—Projecting clock in front of No. 73, Tottenham Court-road, St. Pancras (Greenwich Time, Ltd.).—Consent.

Southwark, West.—Erection of a pediment over the projecting shop in front of No. 59, London-road, Southwark (Messrs. Stanley Jones & Co., Ltd.).—Refused.

Strand.—Projecting clock in front of No. 45, Great Marlborough-street, Westminster (Greenwich Time, Ltd., for Messrs. C. Jarrott & Letts, Ltd.).—Consent.

Wandsworth.—Erection of buildings on the north-western side of Balham High-road, Wandsworth, between Nos. 170 and 176 (Messrs. Gilbert & Constanduros).—Consent.

Width of Way.

Southwark, West.—Addition to No. 7a, Bowling-green lane, Southwark, at less than the prescribed distance from the centre of the roadway of the street (Messrs. H. Langston & Co. for the Governors of the Newcomen Foundation).—Consent.

Lines of Frontage and Construction.

Hampstead.—Temporary wooden building at the rear of "Hurdleale," Hollycraft-avenue, Hampstead, abutting upon Platt's-lane (Mr. A. Hughes).—Consent.

Width of Way, Space at Rear, and Alteration of Building.

Whitechapel.—Alterations to No. 40, Chick sand-street, Whitechapel (Mr. W. A. Lewis for Mr. H. Puckman).—Consent.

Formation of Streets.

Greenwich.—Formation or laying-out of a new street for carriage traffic to lead from Park street to Hoskins-street, a new street for carriage traffic to lead from Park-street to Creed-place, a new street for foot traffic only to lead out of the western side of Park-street, and the widening of Park-street, Old Woolwich-road, Trafalgar-road, Creed-place, and Hoskins-street, in connexion with a scheme for the redevelopment of the Greenwich Hospital Crombie Estate, East Greenwich (Capt. W. Warburton, R.E.).—Consent.

Woolwich.—Formation or laying-out of two new streets for carriage traffic in continuation of Gourock-road and Blunts-road, Eltham (Messrs. D. Watney & Sons for Mr. C. H. Polhill).—Consent.

Cubical Extent.

Newington, West.—Additional cubical extent in connexion with extensions of the premises of Messrs. Waygood & Co., Ltd., Falmouth-road, Newington (Mr. M. E. Collins).—Consent.

Uniting of Buildings.

Finsbury, East.—Opening between Nos. 63 and 65, Banner street, Finsbury, at the basement level (Mr. C. Watkins for the City and Westminster Properties, Ltd.).—Consent.

Woolwich.—Doors of special construction in lieu of iron doors to two division wall openings, 9 ft. 4 in. high by 7 ft. wide, between blocks 10 and NO at the premises of the Western Electric Company, Henley-road, North Woolwich (Messrs. Mather & Platt, Ltd., for Mr. B. Dawson).—Consent.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ASHFORD-UNDER-LYNE.—Alterations to Old Shop Inn, Wellington-road, for the Cornbrook Brewery Company.

Birstall.—Alterations to offices, College Mills, for Messrs. W. Holton & Sons, Ltd.

Bonsall.—Limekilns for the Bonsall Wood Bonsall Company.

Byfleet.—Completion of St. John's Church (4,000); the Vicar, St. John's Church, Byfleet.

Catcath.—Workshop and offices, Muirend-road, for Mr. R. Paul.

Chatham.—School (8,365); Messrs. D. Godden & Son, builders, Ham-street, Chatham.

Colne.—Enlargement of Dottle weaving shed (500 extra looms) for Messrs. Duckworth & Co.

Coseley.—Extensions to Mount Pleasant Schools (1,975); Mr. Wm. Roe, builder.

Coventry.—Ward block at Coventry and Warwickshire Hospital (21,575); Messrs. Kelly & Sons, builders. Mortuary and extensions to workhouse laundry; Mr. J. Arch, Clerk, Board of Guardians, Coventry.

Cwmcrn.—Thirty-seven houses for the Welsh Garden City Company.

Dartford.—School (8,350); Messrs. Friday & Ling, builders, Northend Works, Erith.

* See also our list of Competitions, Contracts, etc., on another page.

Doncaster.—Liberal Club, St. James's-street (2,000); Mr. G. Stevenson, builder, 2, Shott's-street, Doncaster.

Durrington.—Mission-hall; Trustees, Free Church, Durrington.

Edinburgh.—Entertainment hall, Laurieston-street, for Messrs. M. & H. Footet.

Ena Wunning.—Painting works for Mr. M. D. Elliott & Son.

Etheray.—School (4,490); Mr. J. A. Robson and Mr. A. J. Dawson, Joint Secretaries, Education Committee, Durham County Council, Durham.

Felling.—House, etc., at police station (1,430); Mr. J. M. Wright, builder, Sheddolds, Sunderland.

Foleshill.—Extensions to workshops for Messrs. Kelly & Sons.

Gainsborough.—Enlargement of baths, Leam-road; Mr. S. W. Parker, Surveyor, Gainsborough Urban District Council.

Gilfach.—Twenty houses for the Gwerthen Building Club.

Glasgow.—Proposed additions to the Chambers; Mr. A. B. McDonald, Surveyor, Glasgow Town Council.

Great Burstead.—Three pairs houses (130 each); Mr. H. R. Bird, architect, St. Thomas's-road, Brentwood, Essex.

Hayes.—Factory, Blyth-road, for the Gramophone Company.

Hayward's Heath.—Additions and alterations at school and provision of cookery oven (1,668); Mr. A. J. Bessant, builder, Keston, Leamington.

Hetton.—Extensions to hospital; Mr. J. Harding, Surveyor, Hetton Urban District Council.

Kettering.—Baptist Chapel, corner of King and Nelson streets; Messrs. Cooper & Williams, architects, 13, Market-place, Kettering; Messrs. A. Lewin & Son, builders, 25, Lindsay-street, Kettering.

Kilbourne.—Additions to offices for the Singer Sewing Machine Manufacturing Company.

Loth.—Grain silos, Swanfield Roller Mill, Bonnington road, for Messrs. J. Wilson & Co.

Liandrinod Wells.—Proposed enlargement of school (1,000); Mr. H. V. Vaughan, Secretary, Education Committee, Radnorshire County Council, Liandrinod Wells.

Llys-fren.—School (5,000); Mr. E. R. Davies, Secretary, Education Committee, Carnarvonshire County Council, Carnarvon.

Luton.—Infirmary and nurses' home at Watlington (8,122); Messrs. T. & E. Nevill, builders, 30, Castle-street, Luton.

Maldens and Coombe.—Proposed five-story main London road; Mr. R. H. Joffe, Surveyor, Maldens and Coombe Urban District Council.

Mansfield.—Primary school (100 places) Trustees, Leeming-street, Primitive Methodist Church, Mansfield.

Market Harborough.—Bank, St. Mary's-road for the Northampton Union Bank, Ltd.

Pontardawe.—Twenty-eight houses (5,544); Messrs. Rogers & Sons, builders, Cardiff.

Runcorn.—Proposed conversion of Dulver House into Children's Home; Mr. G. F. Atton, Clerk, Board of Guardians, Runcorn.

St. James (Isle of Grain, Kent).—School (100 places); Mr. F. W. Crook, Secretary, Education Committee, Kent County Council, Oxted House, Westminster, S.W.

Salthouse (Barrow).—Adaptation of building Raglan-street, into ice factory; Mr. Philip Fisher, promoter, Salthouse-road, Barrow.

Sheffield.—Church; Trustees, Carbonyl Wesleyan Reform School, Surbiton-street, Sheffield.

Stafford.—Electrical engineering laboratories and offices, Cherry-street; Mr. G. Balfour, Secretary, Education Committee, Staffs County Council, Stafford.

Sturminster Newton.—School (1,685); Messrs. H. & J. Hardy, builders, Swanage.

Sutton-at-Hone.—Enlargement of Heston Church of England Schools; the Managers.

Tipton.—Two schools, etc. (420 and 100 places each), Tibbington-terrace; Mr. Richards, Secretary, Education Committee, Tipton Urban District Council.

Tonington.—Additions to Two Brooks Works for the Bleachers' Association, Ltd.

Walker and Benwell (Newcastle).—Proposed baths (20,000); Mr. W. J. Steele, Engineer, Newcastle-on-Tyne Town Council.

Wotton.—Church (6,000); Mr. W. B. Wood, architect, 12, Queen-street, Gloucester.

Yarmouth.—The following plans have been passed:—Four houses for Mr. John B. solicitor; premises, South Dene, for Messrs. Bloomfield's, Ltd.; rebuilding premises, South Dene, for Messrs. Sussans. A plan has been lodged for rebuilding Nos. 59 and 61, King-street, for the Great Yarmouth Company.

Ynysyhir.—Penal English Congregational Church; Mr. C. P. Jones, architect, Pontypridd.

Mr. W. Spratt, builder, Trealew

THE BRITISH SCHOOLS OF ROME AND ATHENS.

have received No. IV. of the *Papers of the British School at Rome* and No. XVI. of the *Journal of the British School at Athens*. Former has been in our hands for some time and it is only through an oversight that it has not been noticed earlier. The value of scholarly publications is too well known to be evenly sustained to need dwelling upon. Interest in both is extremely varied, and many articles whose scope is that of a topographer or ethnologist, the classical or the topographer, are several which are more strictly artistic or architectural.

No. II. of the Roman papers Mr. D. Nizze gives an account of the "Nuraghi" or "Tombs of the Giants" of Sardinia, edited by the British School in 1908-9. These are the fortresses of a prehistoric race, and later their family sepulchres. The word "nuraghi" in its simplest form is a rounded dome of more or less roughly-wrought masonry, forming a corbel-domed central chamber, surrounded by approximately semicircular walls, and approached by a straight passage from which diverge other passages round the central chamber, and by steps to similar upper chambers. All of such structures are sometimes found in one mound, or connected by a wall. The "Tombs of the Giants," as they are believed to be a developed form of the nuraghi, consist usually of an elongated corbelled cell with lean-to aisles, so constructed that the outline of a section through the entire structure forms a single curve. The aisle runs along the inner end of the cell in a semicircular band on each side of the outer end, and is entered from the entrance, the total plan resembling a Y.

No. III. Mr. T. L. Peet combats the theory that the false (i.e., corbelled) vaults of Malta are due to Egyptian influence, and in them an independent development, based in the similar structures of Spain, Italy, and Ireland.

Ashby contributes a further instalment of his erudite and minute survey of the topography of the Roman Campagna, in which he traces the Via Latina from the Xth to the XIIth century. An article by Mr. A. J. B. Wace discusses the artistic affinities of the mosaics in the Palazzo Spada, which are illustrated by photographs, and another by Mr. H. Jones, the historical interpretation of the reliefs of Trajan's Column.

Architecturally the most interesting are Mr. Newton's fine measured drawings of the barium of Pomponius Hylas, which is described by Dr. Ashby. It was built about the middle of the first century A.D. by a freedman, who sold the site to himself, and it remained in use until the reign of Antoninus Pius. The material is brick, faced with brick. The walls and vaults retain their polychromatic decoration, and are of which are reproduced in colour. The vaults are carried out partly in mosaic, partly in stucco, and partly in painting. The scheme comprises architectural, floral, and mythological motives, and is of great charm.

Coming to the Greek *Annual*, we find three articles of considerable interest to architects. The first is the concluding account by Mr. Dawkins of the results of the excavations at Sparta by the British School from 1910. Among the most recent finds are remains of some Mycenaean houses, constructed of "rudely-dressed stones without mortar," whilst for the upper part of the walls a more clearly used. Fragments of the wall show the usual Mycenaean manner of painting the interior. Of more importance is the re-tracing of the stages in the history of the sanctuary of Artemis Orthia, whose temple, dating from the IXth century B.C., as rebuilt about 600 A.C. and again about 400 B.C. In Roman times such was the custom of visitors to witness the rites of the temple, which included the trials of endurance by the altar, that the sanctuary was finally enclosed in an amphitheatre to accommodate them, the temple facade forming a stage. Built into its substructure have been found many objects throwing light on the stages of the sanctuary, such as the remains of the statues of the boy-heroes or

Bomoniak (though no statues have survived) and fragments of terra-cotta and stone reliefs. Some of these are believed to represent the archaic temple, whose pediment would appear to have been occupied by figures of two crouching lions facing each other. Paper No. III, by Mr. F. W. Hasluck, on the "Latin Monuments of Chios," is a survey of the remains left by the Second Genoese occupation (1346-1566), during which Chios was governed by a Genoese mercantile company. These consist of the citadel and other portions of the fortifications of the city and various architectural fragments, principally sculptured doorways, generally "associated with the name and school of the Gaggini, a family of Lombard artists," who also worked in Genoa. Many of these, which are illustrated by photographs, are of great beauty. In addition are many tombs, retables, and inscription tablets.

The last article to which we shall call attention is that by Mr. A. M. Woodward on "Some New Fragments of Attic Building Records." Two of these form part of the *stèle* inscribed with the accounts of the Parthenon, and a third belongs to the Propylaea records. The former, as now reconstituted and taken in conjunction with a newly-interpreted papyrus record at Geneva, throws light on certain portions of the career of Pheidias. It is now clear that "the pediment sculptures were being made in the twelfth year of the work on the Parthenon, namely, 436-5 B.C." This was two years after the charge had been brought against Pheidias for misappropriating the ivory (not the gold) of the great statue of Athena, at a period when in all probability he was living at Olympia and working on the statue of Zeus. It would thus appear that the pediment sculptures, though doubtless from his design, were carried out in large measure by other sculptors in his absence, and little more than nominally under his supervision. It will be remembered that the Eleans paid his bail to secure the continuation of his services, and it is not likely that he could have taken his long journey backwards and forwards very frequently, or that he could have carried to be much in Athens in an atmosphere of suspicion and unpopularity during the years preceding the trial which resulted in his condemnation in 432. For fuller information on these and other topics we refer our readers to the annuals themselves.

THE SOCIETY OF ARCHITECTS: PRESIDENTIAL ADDRESS.

THE opening meeting of the Society of Architects for Session 1911-12 was held on Thursday, November 16, at No. 28, Bedford-square, W.C., when the President, Mr. Geo. E. Bond, J.P., delivered an address, in the course of which he said:—

"It is with great diffidence that I appear before you for the fourth consecutive year as your President, and I feel that some explanation may be desirable in case there are any members who are not acquainted with the reasons which led to my again occupying this position.

The negotiations between the representatives of the Society and the Royal Institute (in which I have taken a prominent part) being still incomplete, I felt it would be unfair to my colleagues on the Council to desert them at this moment, though I assure you that nothing but this fact would have induced me to have accepted renomination, and I am aware that the circumstances to which I have referred are the principal reasons which influenced the Council in renominating me and you in re-electing me.

At present only the general principles of a Registration Bill have been considered and agreed between the representatives of the Society and the Royal Institute, and much arduous labour and thought will be entailed before its details are ready for presentation, but if the members of the Joint Committee to whom the duty of drafting the Bill has been delegated can be fully assured of the sympathetic and reasonable support of the members of their respective general bodies, they will be encouraged to proceed and to devote their best energies to the drafting of such a measure as will, when completed, satisfy a very large majority of the profession.

In regard to the effect which the negotiations with the Royal Institute during the past twelve months have had upon the Society, you will already have gathered from the Council's

Annual Report that, notwithstanding the difficulties of our position, due to the unfortunate delay in the completion of these negotiations, the progress and development of the Society has been phenomenal, and but for the fact that we considered ourselves in honour bound to observe the spirit of the agreement tentatively entered into between the Councils of the Society and the Royal Institute (which at the time we anticipated would be at once concluded) and which compelled us to close the list of applications for membership, many more members would have been added to the Society.

I ought in fairness to say that the Council of the Royal Institute were not intentionally responsible for the delay referred to. You will remember that the negotiations culminated in the terms of an agreement being approved by the Council and general body of members of the Royal Institute, which agreement it was arranged should be executed by the Presidents on behalf of their respective bodies, and only at the last moment was it found by the Royal Institute that under their Charter the Council had no power to enter into such an agreement.

The only way that the Royal Institute could get over the difficulty was by drafting a Supplemental Charter which would give the Council the power to enter into this agreement.

It is anticipated that this proposed Supplemental Charter and the new by-laws will shortly be submitted for the approval of the general body of the Royal Institute, who, having already endorsed the principles involved, will, it may be hoped, feel bound to facilitate to the utmost of their power a settlement on the lines of the agreement previously referred to. Subject to the approval of the Royal Institute and ratification by the Privy Council, the whole matter will be submitted in detail to the members of the Society, in which case I feel convinced that they will in the same spirit recognise the wisdom we gave it on a previous occasion.

The first effect, therefore, of a Registration Bill will be to prevent any further addition of the unqualified to the ranks of those already practising, and the latter will by the natural process of elimination gradually die out, and this will necessarily be a matter of time.

The second effect will be that none but those who have been properly educated and who possess the necessary qualifications and are able to prove them will be admitted to practice, and as this is a matter which will affect the younger generation of architects it is obviously chiefly a question for them.

It is therefore pertinent to inquire whether they desire Registration by Act of Parliament. A plebiscite instituted by this Society and by the *Builder* have proved that eight out of nine members of the architectural profession desire Registration, and it is fair to assume that very few young men voted with the minority, and that of these there were none who had spent years of arduous study and preparation for passing qualifying examinations; for these, speaking generally, are the chief sufferers under the present system, or rather want of system. There are many young men on whose education and architectural training considerable sums have been spent, and who possess every qualification to practise architecture, who are obliged to remain in the position of assistants at about the average wage of a bricklayer, or who are even unable to obtain regular employment simply because the profession is overcrowded and there is consequently keenness of competition, so that the remuneration of the competent is kept down by the competition of the incompetent.

You may further have observed that the more incompetent a young man may be the more likely he is to commence practice for himself at the earliest possible moment.

If he has been found worthless by his principal during the period of his apprenticeship, the result is that he is advised to try a change immediately the time expires, and if other architects find him equally incompetent as a junior assistant, his only course is to open an office of his own. It then frequently happens that some indiscriminating member of the general public (who has no conception of the duties of an architect), actuated by a desire to do the young fellow a good turn, or more probably because he hopes to get his work done for a small fee, gives him some small commission, and, generally speaking, the completed work is so unsatisfactory that the client resolves never again to trust a young architect, and his reasons are made known very freely to his friends and neighbours. The

competent therefore suffer with the incompetent, and the small commission which the qualified young architect would like to have an opportunity of carrying out, and which he could do in a manner calculated to secure himself, and more important commissions, is withheld, and probably given to a builder's clerk or foreman, who, although he may not have any knowledge of art or even draughtsmanship, will generally give his client what he expects at a reasonable price. It sometimes happens, however, that these incompetent young men have wealthy connexions, or it may even be that their incompetence is the direct result of the knowledge of the fact that they will not be entirely dependent on their work for a livelihood, which knowledge makes them careless and negligent in their student days. I know instances where such young men, having been given good opportunities, have, with the aid of "ghosts," whose services they could afford to pay for, further assisted by good builders whose general foreman has been subsidised, turned out creditable work which has earned for them fair reputations, and they are now able to employ qualified assistants who are practically responsible for every detail of the practice, except when it becomes necessary to exhibit a figure-head, and they will no doubt continue on these lines for years, securing remuneration which rightly belongs to better men. I have two such cases in my mind at the present moment.

The presence of such persons in the acknowledged ranks of the profession is a grave injustice to the earnest and thoughtful young architect who has devoted much time in acquiring a thorough knowledge of every branch of his profession.

There are probably some thousands of young men in the United Kingdom serving their articles at the present time not an eighth of whom will ever attempt to pass any qualifying examination, and of whom a large proportion will go to swell the ranks of the incompetent, and thus depreciate to a great extent the general standard of ability and discredit the profession generally in the eyes of the public.

A preliminary entrance examination would reduce this number by at least one-half, while another fourth would be eliminated by an intermediate examination, and I am confident that every young man who has, after years of study, proved his efficiency by successfully passing a stiff qualifying examination must feel that the time has arrived when his competitors must be compelled to submit themselves to a similar test before being allowed to practice.

My personal observations and experience have shown me that the overcrowding of the profession and the unfair competition to which qualified men are forced to submit is the direct result of the large influx of incapable and incompetent persons into the ranks of the profession through the ordinary portals of pupillage, rather than the presence of those other undesirable who combine the practice of architecture with some other callings. If they are dependent on architecture for their livelihood and are without means or influence, their only chance of securing even that class of work which does not call for either great skill or artistic merit is to offer inducements by way of reduced fees, by this means obtain employment, and frequently to compensate themselves for this they will further stoop to the acceptance of illicit commissions.

To sum up, I would point out that it is the fully-qualified young men commencing practice who have to bear the brunt of unfair competition; therefore it is obvious, for reasons already stated, that it is presumably the young men who will specially desire to support the Registration policy which, if successfully carried through, will check such competition, and at the same time raise the status and general standard of practice in the profession.

This will be effected by the institution of examinations so graded as to first of all test a candidate's general knowledge and aptitude for acquiring 'professional' qualifications, followed by a further examination, by which means the unfit would be eliminated, leaving only the capable, to hope that, by the exercise of their talents, combined with strenuous and persistent study, they may pass the final test and thus qualify themselves for practice. Such examinations will not merely shut out the incapable in the early stages of their attempts in finding a career, but the knowledge that such examinations have to be passed would have the further effect of compelling the idle and careless but

talented young men to diligently apply themselves in their early days to the task of making themselves proficient, and would encourage all those qualities at that time in their lives which would tend to the ultimate benefit of themselves and their clients.

Assuming, therefore, that the young men are convinced that the Registration policy is a really practical attempt to solve their difficulties, and that its success is extremely desirable, I venture to point out that the only possible chance of carrying it through will be by earnestly supporting the combined Registration Sub-Committee and approving the agreement to be entered into between the Society and the Royal Institute.

There is another point to which little reference has been made, and one to which all our leaders attach even greater importance than to that of Registration, viz. that the consummation of the suggested arrangements will be the first real step in the process of attaining complete unity in the profession. The well-being of a great profession cannot be considered merely as a question of to-day, or to-morrow, or even ten years hence; there is a long future before it, and it is with this thought ever in our minds that legislation is proposed. Looking ahead, your leaders see a vista of long years of useful work, progress, and development, under the banner of one great institution, including within its ranks all *bona-fide* architects in the United Kingdom, strong enough to legislate within itself for the ultimate benefit of its members, and with sufficient power to compel their obedience to its moral edicts and code of professional honour, and by these means be able to enforce its reasonable regulations upon those outside, with regard to competition conditions and other matters affecting the honour and interests of the profession. Your present leaders are but laying the foundations upon which their successors (that is to say, the more able, earnest, and thoughtful of the young men of to-day) will raise and maintain the superstructure.

Is the attainment of such an ideal worth a little present self-sacrifice? I simply ask the question, hoping it will be well considered by all before a definite opinion is expressed.

The meeting was preceded by the annual meeting of the students for the election of the Committee and officers for the year. The Chairman of the students' section, Mr. H. V. Milnes Emerson, A.R.I.B.A., presided at the students' meeting, and was re-elected, as were also the members of the Committee. The President of the Society, Mr. G. E. Bond, J.P., then took the chair, and the minutes of the previous meeting having been confirmed, the proceedings opened with the nomination of twenty-six candidates for membership and five for the register of students. The ballot for new members and students resulted in the election of twenty-nine members and nineteen students. The President then handed to Mr. J. R. Leathart, the winner of the Society's Travelling Studentship, 1911, the silver medal and a cheque for 10*l.*, the latter being the balance of the award of 25*l.* The Hon. Auditor, Mr. Ellis Marsland, presented the Auditor's Report and balance-sheet for the year ended October 31, 1911, and stated that there was an increase in the revenue over last year of 666*l.*, due principally to the increase in the membership, the Membership Examination candidates, and on the revenue from publications.

The general expenses had naturally increased somewhat owing to the maintenance of the establishment and new premises, but there was nothing to call for particular comment in regard to the expenditure, and the net result was a surplus for the year of 626*l.*, which was a record for any year.

The total surplus of assets over liabilities was 2,626*l.*, and the loan from the bank had been reduced during the last fortnight from 1,500*l.* to 1,100*l.*

In comparing one year with another they had to take into account the varying character of the work which the Council was called upon to undertake, and it was satisfactory to find that the first year of the Society in its new home had been the most successful of its existence, and the action of the Council in thus providing for the needs of the Society in the way of accommodation had been justified.

Mr. Marsland proceeded to refer to the progress of the Society during the past thirteen years as shown by a chart which had been prepared by the Secretary. This showed that the annual income had risen during that period

from 710*l.* 10*s.* to 3,222*l.*, the subscriptions from 359*l.* to 1,896*l.*, the entrance fees from 8*l.* to 285*l.*, and the membership from 530*l.* to 1,076*l.*

The Auditor's Report and balance-sheet having been unanimously adopted, the President addressed the members.

THE INSTITUTE OF SANITARY ENGINEERS ANNUAL DINNER.

THE annual dinner of the Institute of Sanitary Engineers was held on the 15th inst. at the Holborn Restaurant, W.C., when the President, Mr. A. J. Martin, M.Inst.C., occupied the chair, supported by Sir J. McCall (Agent-General for Tasmania), Professor Bostock Hill (President Society of Medical Officers of Health), Mr. H. P. Boulnois (Chairman of Council Royal Sanitary Institute), Professor G. Coker, M.A., Mr. W. Whitaker, Mr. A. D. Grotorex (President Institution Municipal and County Engineers), Mr. H. Vakilam, Lieut.-Colonel Melville, Mr. Cuthbert Brown, Mr. E. T. Hall, Dr. Wynter Blyth, Mayor of Richmond, Professor H. Adams, F. E. Fremantle, Dr. J. H. Crocker, Mr. P. Hasluck (Secretary), and others, including ladies.

The loyal toasts having been proposed by the President and honoured,

Mr. H. Percy Boulnois proposed "Our Public Health Authorities coupled with the names of Alderman R. Simpson, J.P., Mayor of Richmond, and Professor Bostock Hill. Mr. Boulnois said there were sixty-two county councils in England and Wales, twenty-eight metropolitan boroughs, 1,155 town councils, and urban district councils, 657 rural district councils, and 74 parish councils, and these bodies with their members and officials were concerned with the well-being of the peoples. As he knew a good deal about Liverpool, he might refer to the large slum areas there, but he could add that the Liverpool Corporation had set to work to do away with them. At a meeting of the Liverpool City Council the question of slum areas came up. An Irish member spoke warmly against a proposed demolition, and concluded:—"Every house you pull down this magnificent city leaves a hole in it which is a standing monument of disgrace to it."

Alderman Simpson said that local authorities had been interested in good deal with legislation in recent years, and under the Housing Acts a good deal had been done in Richmond. Under the Town Planning Act, Richmond had come to a very desirable agreement with their friends across the river to attempt to preserve the amenities of the Thames flowing through Richmond and Twickenham for they wished to preserve the amenities of the district.

Professor Bostock Hill alluded to the youth of the science of health which had been born since 1875, but which had developed so quickly. The great work of sanitary engineers was to educate the public in what could be done if it took matters into their own hands. The public should become educated in the possibilities of hygiene, and he thought that was an important work, and that no very big advance was possible until the public were quite sure what hygiene could do for them. He looked forward to the formation of another health authority, i.e., the health authority well-informed public opinion.

The Hon. Sir John McCall (Agent-General for Tasmania), in proposing a toast of the evening, i.e., "The Institute of Sanitary Engineers," said he noticed that they were established in 1905, and had been doing good work in educating the people responsible for the public health of the country. He thought that the members of the Institute should be their qualifications recognised by the people of the country. All sorts of people described themselves as sanitary engineers, and a good many "professional" people called themselves what they liked here. While in Tasmania they protected the public by Registration, here it was possible for a man who did not know one end of the tape from the other to call himself a sanitary engineer because he dealt in property. He suggested that men should not be allowed to represent themselves as sanitary engineers unless they possessed

qualification. The public had as much a right to protection in the case of a man who had himself a sanitary engineer as it had when called himself a lawyer or a doctor.

President, Mr. J. McCall as to the necessity of protection people who represented themselves to be they were not. He was glad to say that statute was succeeding, and a very good had been made again this session. It was said that there were too many as, and he agreed, but there was a great work for the Institute of Sanitary Engineers to do. A society like theirs had functions to fulfil; it had to consider the interests of its members; it sought to advance technical knowledge and to increase the number of its members to the country at large; above all, it was a society like this which school of citizenship in which they learnt practised the duties of loyalty, of hard discipline, and self-repression, by which our country could retain her place in the front of the nations.

or E. G. Coker, M.A., D.Sc., proposed the toast of "Kindred Institutions." Mr. W. Whitaker, B.A., F.R.S., and D. Creatore, President of the Institution of Municipal and County Engineers, responding to the toast was: "The Visitors," proposed by H. T. Wakelam, Past-President, and welcomed by Lieut.-Colonel Melville, Mr. T. Brown, and Mr. Edwin T. Hall; and "Press," proposed by Dr. A. Wynter

GAZINES AND REVIEWS.

Art Journal is a larger number than some of the articles are of special interest to architects. For instance, the old Drayton, Northants, the fine gates which we illustrated last week (p. 577); the decoration of the dining-room probably date about 1770. The work is an example of the late XVIIIth-century style and similar in general style to that of Adam, but as yet untouched by the mannerism. The ornament on both the ceiling and the Drayton dining-room is leafy, and has a happy freedom which does not get in Adam's rearrangement of decorative motifs, graceful as these are. The ceiling has the central fan of the type used by Adam, but here again the detail is formal." Another article, fully illustrated, refers to De Voort, erected by III. and presented to his favourite, Joost Van Keppel, the first Earl of Drogheda. The planning and decorating of the house of De Voort was the means of showing King William's taste for architecture, gardening. At Dieren and at the time he had already shown examples of his while the alterations to Kensington Palace and the vast work at Hampton Court, he began soon after his arrival, and what he could do in England. He came from Paris the services of the highly capable designer, Daniel Marot, who had been associated with various decorators for Louis XIV., and who was the architect Jean Marot, one of the great decorators for the completion of the Louvre. Marot accompanied the King to England, but appears to have acted more as an architect than as an architect. An article signed by Mr. Guy Francis concludes the number. The subject is the new London Museum in Kensington Palace, which will be opened soon. "In the museum devoted to costumes efforts will be made to give life to the various acquisitions. Just as in the Wallace collection, the whole suits of armour for man and woman are shown in realistic poses with every detail in proper place, so at the London Museum figures will be dressed and placed in the vitrines equipped to receive them in some cases with furniture, fittings, and domestic appliances of the day. Scenes of daily life will be reconstructed as truthfully as possible, and the antique will be suggested." Editorial in the *Burlington Magazine* orders to prevent the loss to the nation of masterpieces now in the hands of the Government should

arrange for a reversionary interest in these at an agreed price, the scheme being that the owners should retain and transmit to their heirs, but sell only to the nation. The Salting Collection has come in for considerable attention lately, but Mr. Mitchell's article on the Limoges enamels is of exceptional value, and most excellently illustrated. Elsewhere, Mr. D. S. MacColl deals with the exhibits now arranged in the Stevens Room at the Tate Gallery.

In the *National Review* Sir Arthur Griffith-Boscawen brings forward the question of national aid for housing reform. He claims that the influence of the slum on health and character brings the matter within the scope of Government control, and suggests that it should form a part of the programme of the Unionist Party, basing this contention on the part they have played in the past in this movement. Apart from the political aspect the article is full of interest, as will be seen from the few paragraphs we quote hereunder:—

"Of course attempts to get rid of the slums have been made in most towns in the last forty years, and much excellent housing reform has been carried out by enlightened local authorities and landowners. Here and there we see bordering on existing slums huge barracks, 'block dwellings,' as they are called, not ideal residences for the poor by any means, for there is nowhere for the little ones to run about and play, but at least they are clean and airy, with good sanitation and consequently a low death-rate, and these mark where even more pestiferous rookeries than any we have now existed a few years ago. But when all is said we have acres and acres of horrible slum property in most of our towns, the like of which exists nowhere else in the world that I know of."

Under the Act of 1890 clearance schemes of slum areas or groups of houses so structurally deficient as to require complete replanning, which formed the subject-matter of Cross's Act, are dealt with under Part I., the power to compel owners to repair individual houses or to close and demolish them is dealt with under Part II., while Part III. enables local authorities to provide housing accommodation voluntarily (i.e., not in order to fulfil a rehousing obligation) whenever they are of opinion that there is a dearth of such accommodation in the district.

The London County Council and other local authorities have been deterred from an extensive use of their powers under Part I. by the excessive cost. Liverpool, indeed, is an exception; thanks to the progressive policy of the City Council, a number of Part I. schemes have been successfully carried out in recent years, and the work is still going on, but the authorities admit that but for the cost much more might have been accomplished, and there is much yet to be done. The Birmingham authorities, on the other hand, have preferred to rely chiefly on their powers under Part II., compelling the owners of individual houses to put them in order, and they have been fairly successful in their efforts. Similar action is now being taken extensively by some of the metropolitan boroughs in London, but much more might be done by them. I do not myself see, however, how the procedure under Part II. makes it possible to deal with large slum areas, where several acres must be cleared and the whole requires replanning, though it is certainly a useful and inexpensive plan for dealing with single houses, or even a single row or court. In any case the process must be a very slow one, and in the meantime our slums go festering on, a danger to the whole community.

The first thing to do, in my judgment, is to recognise that the decent housing of the people is a national question, which can no longer be left exclusively to local authorities and private enterprise. Indeed, to unregulated private enterprise in the past we owe the slums. We must go boldly to the State and demand State assistance of a very material character. By the recent Development Act large sums are contributed annually for various objects of public utility, such as afforestation and the straightening out of main roads. These objects are all good in themselves, but how much more important it is to get rid of these horrible courts and alleys and houses unfit for human beings than to improve roads chiefly for the benefit of motorists! We ought to ask the Government for at least one million a year for housing reform, and no money could be better spent.

At the same time various amendments should be made in the existing Acts to remedy ascertained defects. It cannot be denied that notwithstanding the drastic provisions of the Act of 1890, the slum-owner gets a rule far too much for his property when acquired compulsorily by a local authority for the purpose

of an improvement scheme. The valuation is generally based on rental, and the rents are swollen by overcharging; thus the slum-owner is rewarded for doing that which is most detrimental to the community. Nothing, indeed, pays so well as to own a slum. The owner gets abnormally high rents so long as it exists, and he does as little in the way of repairs as possible in the hope that before long his property will be condemned as an "insanitary area" or part of one, and that then a beneficent local authority will come along and buy him out at a high figure."

The *Studio* has a copiously illustrated article on the Austrian Schools for Weaving, with a very full description of the methods of teaching decorative design in relation to its employment in this craft. The article on Japanese screens gives some very fine examples of well-balanced design.

In the *Nineteenth Century* Mr. L. A. Atherley Jones, in an article entitled "A Servile War," gives a brief history of the conflict between capital and labour, and considers some of the salient points in the problem at present confronting us.

The Rothschild Tenement Houses for the working classes of Paris, described in the current issue of the *Englishwoman*, show to considerable advantage in comparison with those erected under the Peabody and other similar bequests in this country. Not only are the actual tenements thoroughly up to date in their fittings and appointments, but the whole organisation is carried to a pitch to which we are unaccustomed. In the well-appointed washhouses washing is undertaken for tenants at a very low rate, in the extensive kitchen on the ground floor both tenants and outside customers can purchase hot meals, and the bath establishment provides showers as a penny and baths at twopenny-halfpenny. There are rooms for medical consultation, where a doctor and two nurses attend twice a week, advice costing the modest sum of five pence; the nurses live in the building, and are at the beck and call of residents at all hours; as may be expected, there is a crèche where the children are carefully tended during the absence of their parents, the attention including proper feeding and amusements and occupations suited to their years. Children attending school have at their disposal classrooms, with teachers in charge at certain hours, for preparation work, and short popular lectures are given when work is finished. Cooking and other domestic subjects are taught, and electric sewing machines help the women and girls with their work. The charge for all these aids is but 2s. a month for one member of a family, and half this sum for each additional one. This list by no means exhausts the various activities centred in the Rothschild building, which, it is estimated, will return 3½ per cent. on its cost. The income will be funded by the trustees for the provision of similar accommodation and for other enterprises aiming at the improvement of the material condition of the working classes and their families.

In *Harper's Magazine* Mr. Richard le Gallienne discourses on the old colonial village of Kingston-on-the-Hudson. In his favourite vein of happy paradox he claims that mere antiquity without the graces of architecture and historical associations impresses him the more deeply. Castles and cathedrals, he avers, leave him cold, while a simple, unpretentious village, living its old-world life, rouses a keen emotion in his heart.

METROPOLITAN ASYLUMS BOARD.

At the fortnightly sitting of the Metropolitan Asylums Board on Saturday, the following matters were dealt with:—
Receiving-rooms for Measles.—The Hospital Committee recommended that arrangements be made to provide receiving-room accommodation for measles at the Western, North-Eastern, Brook, and Grove Hospitals. The structural alterations required are estimated to cost about 700l.—Agreed.
Culterham Asylum.—A report was submitted on the arrangements for sewage disposal at this Asylum, and it was stated that as the result of negotiations the Caterham Urban District Council had agreed to lay a new drain and make connections to take the sewage, on the condition that the Board contribute 900l. towards the cost. It was resolved to ask the Local Government Board to sanction the proposal.

LEGAL COLUMN.

Private Street Works.

An important point to householders has been raised in the case of *Newquay Urban Council v. Rickard and Another* (current "Law Reports"). Under sect. 10 of the Private Street Works Act, 1902, in making a provisional apportionment of the expenses, power is given to the urban authority to include "any premises which do not front, adjoin, or abut on the street or part of a street, but access to which is obtained from the street through a court or passage, or otherwise, and which, in their opinion, will be benefited by the works." In the case in question an apportionment had been made against the owners of certain building lands. There was access to these lands from the streets, which were to be repaired, over two partly-made roads belonging to the owners; but in each case there were besides other means of access to the lands. The owners objected to the provisional apportionments, and the Justices held that the lands in question had not a means of access "through a court, passage, or otherwise."

The Divisional Court sent the case back to the Justices, as the case stated by them gave no indication of the grounds upon which they based their finding. The Court intimated that if the Justices considered that no means of access of greater width than that of a court or passage was within the section, that view would be erroneous, whereas, on the other hand, access by a public street would not be included in the terms "court or passage." If the roads were public streets in process of development, then the apportionment would be wrong. The decision lays it down that the interposition of a public street between the street being repaired and the premises to which access is obtained prevents the section applying; the access must be from the street, not down another street.

Water for Domestic Purposes.

In a recent case before a Judge of the Chancery Division, *Bristol Guardians v. Bristol Waterworks Company*, the Guardians were claiming to have the water supplied to a workhouse at a rent calculated on the annual value of the premises, instead of as heretofore by meter. The question turned on sect. 68 of the Bristol Waterworks Act, 1862, which provides that "the company shall, at the request of the owner or occupier, furnish to every occupier of a private dwelling-house a sufficient supply of water for the domestic use of every such occupier at annual rents or prices." The Court held that it was impossible that an institution of such a character should be deemed to be "a private dwelling-house" within the meaning of this section, and that the claim of the Guardians failed.

In some cases workhouses, and schools in connexion with such institutions, have been held entitled to the supply of water for certain purposes under "domestic purposes" conditions—see, for instance, in *South-West Suburban Water Company v. St. Marylebone Union* (the *Builder*, June 18, 1904), and *Chester Waterworks Company v. Guardians of Chester Union* (the *Builder*, February 15, 1908); but these decisions have turned upon the words of different Acts of Parliament. The Waterworks Clauses Acts, under which the first case was decided, and the Chester Waterworks Act, which governed the second case, only contain the expression "dwelling-house."

Even if the building itself is not strictly defined, other considerations often arise as to the character of the use the water is put to, and also the purposes for which the building is used. Thus in the *Chester* case some members of the Court of Appeal questioned whether the Guardians could be said to run such institutions for "business purposes," which in the Act were differentiated from "domestic purposes," and a supply on a double basis was allowed in that case.

It is such considerations and the different terms of the various Acts of Parliament which make water supply, even when intermittent itself, a constant source of litigation.

LAW REPORT.

KING'S BENCH DIVISION—DIVISIONAL COURT.
(Before Mr. Justice HAMILTON and
Mr. Justice BANKES.)

Builder's Claim for Compensation:
An Unfortunate Speculation.

On Friday, the 17th inst., the Court heard arguments in the case of *Wheeler v. Stratton*, which came before their Lordships on the appeal of plaintiff from a decision of Mr. Muir Mackenzie, the Official Referee.

The plaintiff was Mr. John James Wheeler, a builder, who resides at Woodford, Essex, who claimed from the defendant Mr. Richard Stratton, of Duffryn, Newport (Mon.), the sum of 800*l.* for work done and materials supplied, damages, etc., in connexion with a building partly completed.

It appeared that the facts found by the Official Referee were as follows:—

Mr. Wheeler was a builder, and the defendant was the owner of the site of a warehouse at Hammersmith. Plaintiff claimed compensation for work done and materials supplied and put on the defendant's land. Mr. Worley, an architect, originated the scheme by which the work was to be carried out, and, briefly stated, it was that Mr. Worley's son was to obtain the site, and a builder was to erect a building according to approved plans, and when complete, or at some particular stage, was to be a long lease at 500*l.* a year and the building was to be sub-let to tenants at rents to produce 500*l.* a year. The original scheme was for a warehouse, and on part of the ground floor a biograph theatre. Under that scheme the warehouse was to be let at the rent of 400*l.*, and the biograph theatre at 100*l.* On April 10, 1910, at an interview, Mr. Worley mentioned the matter to plaintiff as a matter to take upon speculation, and suggested that he should build the warehouse and biograph theatre. Plaintiff was shown the plans, as well as the drawings for steel work prepared by Messrs. Dwyer, Bear, Perks, & Co., and it was also stated that the estimated cost of the steel work was 415*l.* No specification was handed to plaintiff, but he was invited to start the work at once. It was part of the scheme that he should obtain an advance from a moneylender up to 3,000*l.*, and the amount which the scheme was estimated to cost was 4,000*l.* Plaintiff took away the plans and eventually agreed to enter into the speculation. A draft of the building agreement was prepared, in which the parties were to be Mr. Worley, Mr. Storey (the intending lessee of the warehouse), and the plaintiff, and the draft stipulated that the building was to be erected according to plans and specifications approved by the freeholder and intending tenant. In June the project of having a biograph theatre was abandoned, and the further plans necessitated an increase of steelwork. The weight that the steelwork would have to bear was stipulated in the draft agreement as being 2 cwt. to the square foot. Now Mr. Stewart, an architect acting in Mr. Storey's interests, insisted that that weight should be altered to 2½ cwt. In July Mr. Stratton took the place of Mr. Worley as freeholder. On July 28 plaintiff arranged to begin building, and that was before he had seen the specification and signed the agreement which defined the rights of the parties. He commenced the work on August 2, and three days later the Surveyor to the London County Council received notice from plaintiff. He went to the place and set out the building line. On August 17 the plaintiff mentioned to Mr. Stewart (who was acting for Mr. Storey) that he had no specification, and that was sent him on August 27. Then plaintiff noticed that it contained matters which were different from the plans and drawings originally shown to him. In particular, the weight of the ironwork was increased. The plaintiff at once stated that he would have to put in more steelwork if he complied with it, and later Mr. Stewart came on the scene, and said he would not allow the use of the steelwork procured by plaintiff according to the original plans. Plaintiff at once communicated with Mr. Worley and said he would have to stop work until the matter was settled. On October 1 Mr. Worley wrote to plaintiff and said if he would retire from the job he would do his best to obtain payment to him for the work he had completed. On October 9 the parties saw Mr. Worley, and said that he would retire from the job, and Mr. Worley promised in a letter to have the job measured up. Plaintiff did no more work, and defendant, by his agents, proceeded to negotiate with some other builder to take over the matter. Later defendant's solicitors wrote to plaintiff repudiating any liability, but saying that they were willing for a builder to take over the plaintiff's work. A new builder was obtained, but plaintiff had not been paid, and he claimed the value of his work, etc.

The Official Referee priced the work for the purpose of the case at 660*l.* He found that there was no specification produced at the first interview between plaintiff and Mr. Worley, and he also found that whatever specification Mr. Worley had, it contained a clause to the effect that the steelwork should bear 2 cwt. to the square foot. The other half, he decided, was put in afterwards.

He could see no breach of agreement, whether equitable or legal, which defendant had committed which could give the plaintiff

any right to pecuniary compensation. This was not, he thought, any unequivocal promise by Mr. Worley that plaintiff should be paid for his work, but all that there was was that Mr. Worley would do his best to the plaintiff and the succeeding builder. He, therefore, confessed, with no limitations, that he would have to direct plaintiff to be entered for the defendant.

He could not but regard it as a somewhat deplorable state of things, he said, that the result of the law was that the defendant, the benefit of the whole of plaintiff's work, and did not pay a single penny for it, and had, however, to decide according to the law, and briefly his decision was that, although found for plaintiff on most of the facts, did not think plaintiff had established in a right to recover pecuniary compensation from defendant.

Mr. Meyer and Mr. Blacklock were for appellant, while Mr. G. A. Scott and Mr. W. represented the defendant.

After the Court had heard Mr. Meyer some length, Mr. Scott contended that original speculation in this case was between the builder and Mr. Worley, and was not the present defendant came into the matter. Therefore, plaintiff's claim should have been against Mr. Worley. Could it be said that even if the defendant did make a promise to get what he could from the new builder, and put himself under legal obligation to the money in any case?

Delivering his judgment, Mr. Justice Hamilton said Mr. Stratton came into this case because he acquired the freehold after negotiations had been commenced. They referred to the evidence and correspondence at some length, and in their opinion the evidence before the Official Referee supported the conclusions to which he had arrived, was, therefore, only necessary to go briefly into the story of the proceedings. It appeared that at the first interview which Mr. Worley had with the plaintiff the latter was of the opinion that it would be worth his while to build on this site under terms which could be arranged with the freeholder, and the plaintiff was subsequently obtain a lease and then to go to sub-lease to a party at a rent which would show a substantial profit. From the month of April to July, 1910, no work was done on site, but steps were being taken to settle building agreement. It was quite plain there was no ground for the suggestion of any kind of completed contract was entered into during that time. It was clear that the contract was under consideration, and a certain amount of discussion was going on as to details and plans. Defendant came into the matter on July 16, he taking the place of the intended freeholder, and after that Mr. Worley was for him. On July 27 the draft agreement approved of by plaintiff and the other party and at that time it was contemplated that it would be a specification. On July 28 it suggested that plaintiff should commence building, and he, in fact, entered on August 2, and thereafter proceeded with his execution and brickwork. For some considerable time was evident that the signature to the building contract on plaintiff's part was contemplated and down to the middle of August he was engaged in building under the direction of Worley. Then the architect for the proposed tenant came upon the scene and raised the question of the strength of the steelwork which, he said, should be greater, seeing only one building was to stand on the instead of two. Thereupon, on September plaintiff intimated that he would have to stop the work because he could not comply with new demands. He did not, however, stop but built the walls, until the building ready for the steelwork. Then he stopped. The parties met and discussed the situation and plaintiff determined to go no further with the work. It appeared to be clear that plaintiff had been doing work on that which he knew belonged to somebody else, the only reason why he did not execute agreement and carry out the work was the specification, which, in the nature of things, would be required, was being altered against his will, and his grievance was thus imposed a greater burden upon him. Inference which it seemed impossible to draw was that he did commence work for representation of anyone acting for Stratton, and that from any such representation it could be implied that defendant was to pay the plaintiff on quantum meruit. It was an unfortunate instance of a builder commencing work in the hope of securing adequate payment.

The next contention was that in the month of October a transaction took place by which the defendant was bound to pay the amount of an express promise by an agent of the defendant that if the plaintiff would stop work he would be paid for the work he had been measured up, and that the

d be obtained from the subsequent builder. letters which passed, however, amounted to more than this, that Mr. Worley excluded his willingness to do what he could do for somebody—possibly the substituted order—to make plaintiff an allowance for the which had been done. It seemed to his ship quite impossible to spell out the action as a promise by the defendant that the plaintiff should receive a reasonable or specific sum, and he saw no evidence at all to the effect that in making these expressions of will Mr. Worley was acting for Mr. ton in any way.

Meyer had tried to impress upon the that his client had been shabbily treated, that he should get his money from somebody. While the Court sympathised with him, could not unsettle settled law, and could disregard the rules which bound them, but they could not deal with the matter to redress the plaintiff's wrongs.

Justice Bankes concurred. It had, he said, been a very disastrous speculation for the plaintiff, and he had endeavoured to find some upon which he could come to the decision that the law allowed him to find in the plaintiff's favour, but he had not succeeded. was bound to affirm the decision of the first Referee.

The appeal was accordingly dismissed with

LONDON COUNCILS.

Westminster.—The Sub-Committee appointed by the Public Health Committee to prepare a plan for the improvement of the Malthouse has submitted a scheme for carrying out the work, the cost of which, it is estimated, will be £12,500. The scheme includes the repair of the Malthouse, the repaving of the Malthouse, and the making of new roads. The Committee put forward a recommendation that this scheme should be approved and adopted, and that the Surveyor be instructed to prepare the necessary detail maps, plans, and estimates. At the meeting of the Council, the recommendations were deferred, and it was pointed out that if the Local Government Board did not approve the scheme, all expense and trouble involved in the preparation of the plans, etc., would be thrown away. It was further decided at the meeting, on the motion of Councillor Waterman, as seconded by Council Kitley, "That a Committee be appointed to consider the question of the provision of a swimming-bath and of a school, to bring up a report as to the cost and to suggest a suitable site for the same." The offer of the Linmer Asphaltic Company, Ltd., has been accepted to lay 2 in. Lithomac on the roadway on the railway crossing and High-street, and to maintain same for five years at 40 per cent. per annum, and for a further period of three years at 40 per cent. per annum. An offer has also been accepted from Roomac, Ltd., to supply "Roomac" on the roadway between Richmond-road and the level crossing, to maintain same for five years at 15 per cent. per annum. A plan has been submitted for Mr. A. Harvey for seventeen houses on Rosslyn avenues.

Greenwich.—The carriageways of Lavender and Meyrick-road are to be repaired with macadam at estimated costs of £2,442 and £2,442, respectively. The footways of both sides of Winsham-grove are to be laid with the Council's artificial paving, the kerbs reset and channelling adjusted, at an estimated cost of £134. Electricity mains are to be extended at an estimated cost of £120. **Wandsworth.**—The portion of Rotherhithe by the Union Oil and Cake Mills is to be repaved at an estimated cost of £700, and the raising of the south path of the Newway. This will necessitate certain alterations to the entrances of houses owned by P.L.A., and this is to be done at a cost of £75.

St. George's.—A recommendation of the House-Committee to the effect that an architect be appointed for the purpose of preparing specifications, and estimates of cost for the proposed extension of the Board of Guardians. In connexion with this, was agreed on a motion from Mr. that the names of six competent men, residing within the County of Middlesex or the administrative County of London, should be named and submitted to the Board for selection.

St. George's.—The work of making up Spring-road is to be proceeded with. The Surveyor has been instructed to prepare plans, and make up Spring-road. Plans have been passed for Mr. G. Jaggard for four King George's-avenue and Chiltern-

avenue, also for Miss Lucy Kemp-Welch, for additions to the Working Men's Club, Rudolph-road.

Chelsea.—Application has been made by the New Patent "Mostpowerful" Motor Spirit Company, Ltd., to lay a 4-in. iron pipe under Cheyne-walk, in connexion with the company's proposal to acquire a block of land at the corner of Milman's-street and Cheyne-walk, for the purpose of manufacturing motor spirit. A reply is to be sent to the effect that the application would be favourably considered in the event of the company acquiring the land in question.

Croydon.—The Rural District Council has accepted the tender of Mr. E. Yewen, St. James's-road, Croydon, at 58s., for making up Hall-road, Watlington. Kerbing is to be laid on both sides of the road leading from Acro-lane to Wright's-row, and for a short length in front of the Duke's Head public-house, at an estimated cost of 50l.

Fulham.—A letter had been received from the London County Council stating that the Buildings Act Committee had considered the Borough Council's suggestion as to advisability of formulating a town-planning scheme in connexion with the development of the late Miss Sullivan's Estate, but that they would not recommend the County Council to take any action in the matter. In view of this, and a report with reference to the disposal of the estate at a recent auction, the Law Committee have instructed the Town Clerk to again approach the London County Council, suggesting the expediency of adopting a town-planning scheme on the portion of the estate now unused, and which would, in all probability, be used for building purposes. The Surveyor has been instructed to obtain and fix iron fences in South Park at an estimated cost of 130l.

Greenwich.—Portions of Westcombe-hill and Shooter's Hill-road are to be repaved with granite at estimated costs of 161l. and 120l. respectively. The margins of the roadway of Blackwall-lane and Tunnel-avenue, from Trafalgar-road to the tunnel entrance, are to be repaved with granite, except where wood paving is laid; with redressed second-hand granite setts. Plans have been passed for Messrs. J. Chesson & Sons for additions to the Greenwich Inland Linoleum Company's premises, Blackwall-lane.

Hackney.—The work of paving, etc., Holm-bury-view and a portion of Hewwood-mount is to be put in hand forthwith at estimated costs of 684l. and 332l. respectively. Electricity mains are to be extended at an estimated cost of 90l. Plans have been passed for additions to premises, Brunswick-place, Farleigh-road, West Hackney, for Messrs. J. Douglas Mathews & Son, on behalf of Messrs. H. E. Davenport, Ltd., also for a proposed frontage line of buildings, Leweston-place, Stamford Hill, for Edmondsons, Ltd.

Ham.—At the last meeting of the District Council it was decided to remove a few more masons if the services of additional tool-smiths could be obtained. Any blacksmith having previous experience of sharpening masons' tools may be placed in communication with prospective employers on application at the Labour Bureau. Work is also available for a monumental mason and lettercutter.

Plumbing.—Very quiet. Rainy weather causing leakages afforded a few men opportunities of employment, otherwise there was little work in progress.

Painting and Decorating.—Somewhat brighter, a number of small contracts being in course of execution, including the painting of the Drill Hall and Public Offices. Regular employment is, however, difficult to obtain even at low rates of wages.

Fibre-Plaster and Cement Working.—Dull, with no demand for labour.

Bricklaying.—Moderately busy. Opportunities of employment on good-class work appear to be increasing.

Joinery and Woodworking Trades.—Quiet. There appeared to be a slight decrease in the amount of work in progress, and several hands, as well as bench hands, were paid off. A few timber ships arriving caused the employment of many temporary labourers. Little is being done for the present in the box-making section, and some of the hands were working on short time. The demand for journeymen in the building trade showed a slight improvement.

Polytechnic School, Zurich.

The *Feuille Fédérale Suisse* of November 8 contains a decree providing a sum of 11,430,000 francs (488,600l.) for the purpose of enlarging the Federal Polytechnic School at Zurich.

Hospital, Lieben, Prague.

Plans have been submitted to the Prague city authorities for the erection of a hospital in Lieben. It will consist of sixteen sections, and will have accommodation for some 500 beds. The cost is estimated at 6,000,000 kronen (250,000l.).

granite setts, in lieu of wood-paving, as desired by the Borough Council. Plans, etc., are to be prepared for paving and forming Arran-road as a new street.

Maldens and Coombe.—The Chief Officer of the Fire Brigade has been instructed to consider the advisability or otherwise of providing a sub-fire-station for Coombe on the main London road.

Southwark.—Alterations to cost 75l. and renovations 506l. are to be carried out at the Central Library, and tenders are to be obtained for the work. It has been decided to offer no observations to a communication received from the London County Council asking whether the Borough Council approved or disapproved of a proposal by Messrs. H. Langston & Co., 1, 2, 3, and 30, The Exchange, Southwark-street, S.E., for additions to a warehouse in Bowling Green-lane.

Tottenham.—The Engineer has been instructed to carry out the work of reconstructing the culvert passing under Hermitage-road at an estimated cost of 400l. Tenders are to be invited for carrying out the work of constructing an underground conventional at Bruce-grove. The following plans have been passed:—Mr. Arthur Keen, factory, Tariff-road; Mr. J. S. Alder, Vicarage, St. Benet Fink, Walpole-road; Mr. J. H. B. Foss, additions to St. Ignatius School, St. Ann's-road; Mr. S. Clifford Tice, additions to Messrs. Gestetner's Cyclostyle Factory, Fawley-road.

FOREIGN AND COLONIAL.

The Labour Market, Cape Colony.

We take the following from the labour reports of the Inspector of White Labour, Transvaal, and the Government Labour Bureau, Cape Town, for the month of September, 1911.

Cape Town.—During the period August 1 to 31 twenty-three plans were submitted to the City Council, of which six were returned to the architects, one withdrawn, four remain under consideration, and twelve approved, the approximate cost of the proposed work being 21,575l.

Engineering.—The amount of work in hand varied very considerably at different factories and at various periods during the month, but on the whole there is little doubt that a considerable "set-back" was experienced, the only work of any importance in progress being in connexion with repairs to shipping. Only very few local contracts were in course of execution, and the direct consequence of this decrease of activity is that about thirty-five men have become unemployed.

Stone-dressing.—Very brisk. It is possible that work could be made available for a few more masons if the services of additional tool-smiths could be obtained. Any blacksmith having previous experience of sharpening masons' tools may be placed in communication with prospective employers on application at the Labour Bureau. Work is also available for a monumental mason and lettercutter.

Plumbing.—Very quiet. Rainy weather causing leakages afforded a few men opportunities of employment, otherwise there was little work in progress.

Painting and Decorating.—Somewhat brighter, a number of small contracts being in course of execution, including the painting of the Drill Hall and Public Offices. Regular employment is, however, difficult to obtain even at low rates of wages.

Fibre-Plaster and Cement Working.—Dull, with no demand for labour.

Bricklaying.—Moderately busy. Opportunities of employment on good-class work appear to be increasing.

Joinery and Woodworking Trades.—Quiet. There appeared to be a slight decrease in the amount of work in progress, and several hands, as well as bench hands, were paid off. A few timber ships arriving caused the employment of many temporary labourers. Little is being done for the present in the box-making section, and some of the hands were working on short time. The demand for journeymen in the building trade showed a slight improvement.

Polytechnic School, Zurich.

The *Feuille Fédérale Suisse* of November 8 contains a decree providing a sum of 11,430,000 francs (488,600l.) for the purpose of enlarging the Federal Polytechnic School at Zurich.

Hospital, Lieben, Prague.

Plans have been submitted to the Prague city authorities for the erection of a hospital in Lieben. It will consist of sixteen sections, and will have accommodation for some 500 beds. The cost is estimated at 6,000,000 kronen (250,000l.).

of those willing to submit tenders, may be

NOVEMBER 8.—**Leicester.**—**HALL.**—For the
tion of a public hall, proposed to be erected
and adjoining Victoria Park and Regent
Specifications, quantities, and form of
from the Borough Treasurer, Town Hall,
point of 21. 2s. Plans seen at the office of
Messrs. Messrs. Stockdale Harrison &
7, St. Martins East, Leicester.

NOVEMBER 9.—**Essex.**—**ADDITIONS.**—For altera-
tions and additions to South Ockendon Schools,
sect. Mr. Frank Whitmore, 73, Duke-street,
Essex. Deposit of 21. 2s. Plans and speci-
fication and form of contract at the school.

NOVEMBER 11.—**Cambridge.**—**SCHOOLS.**—Erec-
tion of schools on ground adjoining Melbourne-
Road. Plans and specification seen, and quanti-
ties from the Borough Engineer and Surveyor,
Town Hall, Cambridge. Deposit of 11. 1s.

NOVEMBER 11.—**Glasgow.**—**ALTERATIONS.**—For
alterations at Partick Depot. Plans seen, and
form of tender from Mr. Jas. Dalrymple,
Rail Manager, 66, Bath-street.

NOVEMBER 12.—**Croydon.**—**DISINFECTING-
MACHINE.**—The Croydon B.C. invite tenders
for the construction and erection of a disinfec-
tory-lane. See advertisement in this issue
for further particulars.

NOVEMBER 12.—**Kilkeel.**—**COTTAGES.**—Erection
of two labourer's single cottages, seven
cottages, and fencing plots. Plans, speci-
fications, and tender forms from Mr. W.
J. Clerk, Board-room, Kilkeel. Deposit of
11. 1s.

NOVEMBER 13.—**Willesborough.**—**SCHOOL.**—
The Kent Education Committee invite ten-
ders for the construction and alterations to
school premises. See advertisement in this
issue for further particulars.

NOVEMBER 14.—**Spworth.**—**ADDITIONS.**—For
alterations and additions to the Council school.
Plans and form of tender from Messrs.
R. & Gamble, architects, Bank-street,
Spworth. Deposit of 11. 1s.

NOVEMBER 15.—**Haslington.**—**HOUSES.**—Erec-
tion of nine single dwelling-houses and nine set-
tling buildings, on the Haslington Estate,
near Haslington. Plans seen, and specifica-
tions and forms of tender from the Surveyor
of the C.C. Land Agent, County
Office, 49, Northgate-street, Chester, on
16. of 11.

NOVEMBER 18.—**Wimbledon.**—**ADDITIONS.**—
Wimbledon Corporation invite tenders for
the construction and alterations to school
premises and for alterations to
school premises. See advertisement in this
issue for further particulars.

NOVEMBER 21.—**Newbury.**—**CLASSROOM.**—Erec-
tion of a new classroom, cloakroom, etc., at
the school. Plan and specification with
forms of contract from Mr. William J.
Andrews, Architect to the Committee, Bid-
court, St. Austell.

NOVEMBER 23.—**Ballyvaughan.**—**RECTORY.**—For
erection of a rectory. Plans, specification, and
forms of contract from Mr. William J.
Andrews, F.R.I.B.A., architect, 2, Wellington-
Road, Belfast.

NOVEMBER 23.—**Coleraine.**—**IMPROVEMENTS.**—
Improvements and improvements at the harbour,
Coleraine. Drawings and specification from
Mr. W. Henry, Secretary to the Commissioners,
Public Works, Coleraine. Office, Coleraine.
Deposit of 11. 1s.

NOVEMBER 15.—**Bangkok.**—**POWER-STATION.**—
Construction of an electric power-station, capacity
of 1000 kilowatts, at Bangkok. Plans and speci-
fications from the Bangkok Electric Power-Station, Local Sanitary
Department, Bangkok. Specifications, etc., at
the Commercial Intelligence Branch of the Board
of Trade, 73, Basinghall-street, E.C.

NOVEMBER 15.—**Birkenhead.**—**HOUSES.**—Erection
of houses. Plans from Mr. J. M. Garrod,
sect. F.S.I., Birkbeck-chambers, Holborn.

NOVEMBER 15.—**Birstall.**—**EXTENSION.**—Proposed
extension at the Infectious Diseases and Small-
pox Hospital, Birstall. Plans from Mr. W. B.
Birtwell, architect, Birstall. Deposit of 11. 1s.

NOVEMBER 15.—**Cherbury.**—**PREMISES.**—Erection
of premises at Cherbury. Drawings
and specification seen, at quantities, on deposit

of 31. 3s., from Mr. W. H. Shute, Corn Exchange-
chambers, Newport.

NOVEMBER 15.—**Dinas Powis.**—**HOUSE.**—Erection
of a house. Quantities from Messrs. Teather &
Wilson, F.R.I.B.A., architects, Andrews-
building, Queen-street, Cardiff.

NOVEMBER 15.—**Hull.**—**PAVILION.**—Erection of a
cricket pavilion, for the Hull Coal Exporters'
Cricket Club. Apply to Mr. F. Myers, Hon.
Secretary, Northern-chambers, Queen-street,
Hull.

NOVEMBER 15.—**Parc.**—**HOUSE.**—For building a
house at Parc, near Bala. Plans, specification,
and particulars from Messrs. Deakin & Howard
Jones, M.S.A., Plas Ynys, Borth, R.S.O.

NOVEMBER 15.—**Upper Bank.**—**HOUSE.**—Erection
of a house. Names to the architects, Messrs.
Richard Davies & Son, Lic.R.I.B.A., architects.

ENGINEERING, IRON, AND STEEL.

NOVEMBER 27.—**Birkenhead.**—**CYLINDERS.**—For
providing and fixing new copper cylinders, etc.
in connexion with hot-water supply in tower of
Workhouse Block, at the Birkenhead Union
Workhouse. Specification from Messrs. E.
Kirby & Sons, architects, 5, Cook-street, Liver-
pool. Deposit of 11. 1s.

NOVEMBER 4.—**Darlington.**—**DYNAMO.**—Erection
of a 500-kw. D.C. dynamo, coupled to a re-
ciprocating steam-engine. Specification from the
Borough Electrical Engineer, Electricity Works,
Haughton road. Deposit of 11. 1s.

NOVEMBER 4.—**London.**—**STEAM ROLLER.**—
The Surrey B.C. invite tenders for supply of a
10-ton steam roller. See advertisement in this
issue for further particulars.

NOVEMBER 14.—**Antrim.**—**WELL.**—For sinking
a well and erection of pump at Oldstone.
Specification from Mr. J. L. Clark, Clerk, Union
Office, Antrim.

JANUARY 15, 1912.—**Bosnia.**—**BRIDGE.**—For con-
struction of a bridge across the Neretva at
Mostar. Deposit of 10,000 kronen (about 417l.).
Commercial Intelligence Branch of the Board of
Trade, 73, Basinghall-street, E.C.

JANUARY 29, 1912.—**Christchurch (N.Z.).**—
PLANT. Erection at the pumping-station of a
suction-gear pumping plant, capable of lifting
700,000 gallons of water per hour to a height of
270 ft. Specification, etc., at the Commercial
Intelligence Branch of the Board of Trade, 73,
Basinghall-street, E.C.

FURNITURE, PAINTING, MATERIALS.

etc.

NOVEMBER 24.—**Portsmouth.**—**PAINTING.**—For
painting exterior of the Park-road depot. Spec-
ification from the Borough Engineer, Town Hall,
Portsmouth.

NOVEMBER 27.—**Birkenhead.**—**PAINTING.**—For
external painting at the Union Workhouse.
Tender. Specification from Mr. John Carter,
Clerk to the Guardians, Guardians' Offices,
Birkenhead.

NOVEMBER 29.—**Hull.**—**PAINTING.**—For painting
upper part of Stoneferry Bridge. Forms of
tender from Mr. A. E. White, M.Inst.C.E., City
Engineer, Town Hall, Hull.

NOVEMBER 29.—**Fool.**—**PAINTING.**—For painting
and decorating works at the Wesleyan
Methodist Church. Drawings and specifications
from Mr. Sampson Hill, architect, Redruth.

NOVEMBER 1.—**Lancaster.**—**PAINTING.**—For the
exterior painting of certain portions of the
County Lunatic Asylum. Particulars at the
Asylum. Mr. J. R. Wilson, Clerk and Steward.

NOVEMBER 4.—**Tipton.**—**DOORS.**—For painting
time-washing, etc., the High-street
West Washhouses. Specification from the
Borough Surveyor, Town Hall.

NOVEMBER 4.—**Tipton.**—**DOORS.**—For altering
the outer doors of Dudley Port, Burnt Tree
Tipton Green, Bloomfield, Great Breeze, and
Ocker Hill Council schools. Mr. E. Richards,
Secretary, Owen-street, Tipton.

NOVEMBER 4.—**Ashington.**—**FITTINGS.**—For
the fittings and furnishings in the new
Council offices. Names to Mr. Osborne Blythe,
architect, Ashington.

NOVEMBER 4.—**Haswell.**—**PAINTING.**—For paint-
ing premises, for the Haswell Co-operative Pro-
vision Society, Ltd. Specifications from the
Secretary

ROADS, SANITARY AND WATER

WORKS.

NOVEMBER 25.—**Bacup.**—**PAVING.**—For paving
Tadpole-street and Rose-street. Specifications and
quantities from Mr. W. H. Elce, A.M.Inst.C.E.,
Borough Engineer, on deposit of 11. 1s.

NOVEMBER 25.—**Edinburgh.**—**PAVING.**—For
construction of footpath along frontage of unsewed
ground at St. Clair-street, and fencing at Calton-
hill. Plans and specifications from Mr. J. A.
Willmott, A.R.I.B.A., City-chambers.

NOVEMBER 25.—**Ilford.**—**PAVING.**—For paving
of the High-road. Mr. Percy J. Sheldon,
M.Inst.C.E., County Surveyor, Chelmsford.

NOVEMBER 27.—**Andover.**—**DRAINAGE.**—For the
redrainage of premises at Winchester-street.
Specification from Mr. R. W. Knapp, Borough
Surveyor, Town Hall.

NOVEMBER 27.—**Hillmorton.**—**WATER MAINS.**—
For supplying and laying water mains. Plans
and specifications from Mr. T. W. Willard, Sur-
veyor to the Council, Rugby.

NOVEMBER 28.—**Neasden.**—**SEWERAGE WORKS.**—
The Willesden D.C. invite tenders for pipe
sewers and incidental works at Quainton-street
and Neasden-lane. See advertisement in this
issue for further particulars.

NOVEMBER 28.—**Swansea.**—**SEWER.**—For the
extension of the existing Fort Tennant sea outfall
sewer. Drawings, specifications, and form of
tender from Mr. R. H. Wyrill, the Borough
Engineer, Guildhall, Swansea. Deposit of 11. 1s.

NOVEMBER 29.—**Birmingham.**—**MATERIAL.**—For
supply of road material. Mr. J. Willmot, County
Surveyor, 6, Waterloo-street, Birmingham.

NOVEMBER 29.—**Dunvant.**—**MAINS.**—For fixing
and laying 200 yds. of 3-in. water mains, sluice
valves, hydrants, etc. Plans, quantities, and
conditions of contract from the Surveyor of the
Council, Mr. T. T. Williams, Alexandra-road,
Swansea.

NOVEMBER 30.—**East Linton.**—**WATER WORKS.**—
For constructing filters and clear water tank,
and providing, laying, and jointing cast-iron
pipes therefrom to East Linton. Plans seen,
specification and schedule of work from the
engineers, Messrs. J. & A. Leslie & Reid, C.E.,
72a, George-street, Edinburgh. Deposit of 11. 1s.

NOVEMBER 30.—**Fallowthorpe.**—**SEWER.**—For the
construction of a sewer in Roman-road and
Albert-street. Plans seen, and specification,
quantities, and form of tender from the Surveyor,
Town Hall, Fallowthorpe, on deposit of 21. 2s.

NOVEMBER 30.—**Greenwich.**—**PAVING.**—For
paving the roadway and footways of Bram-
shot-avenue. Specification and plan seen, and
particulars from the Borough Engineer, Town
Hall, Greenwich-road, S.E.

NOVEMBER 30.—**Swansea.**—**ROADS.**—For
construction of roads, sewers, surface-water
drains on the Parkview Estate. Drawings and
specifications from Messrs. Richard & Mathews,
civil and mining engineers and surveyors,
Crown-chambers, Salubrious-place, Swansea.
Quantities on deposit of 21. 2s.

NOVEMBER 30.—**Westbourne.**—**FLINTS.**—For
supply of clean hand-picked field flints. Mr. H.
Norris, Surveyor, West Ashling, Chichester.

NOVEMBER 4.—**Faversham.**—**SEWAGE.**—Con-
struction of sewage and storm-water tanks, set-
tling tank, percolating filters, sedimentation
tank, ash-bed, two outfalls, wharf, roads, paths,
and fences. Drawings seen, and specifications,

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointment, xvi.; Auction Sales, xxii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary. The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

** It must be understood that the following paragraphs are printed as news, and not as advertisement; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Asphalte.—The Seyssel and Metallic L. Asphalte Company (Mr. H. Glenn), Office, 4, Poultry, E.C.—The best and cheapest material for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milking rooms, granaries, gun-rooms, and terraces. Asphalte Contractors to the Forth Bridge Co.

WHAT!
 USE WHITE
LIME-SAND BRICKS
 (Of the Finest Quality)
FOR CONTRACT WORK?
WHY?
 B The Bricks are uniform.
 B Less mortar is required.
 A Closer joints can be made.
 C 15 per cent. more bricks can be laid per day.
 A Where light is required they need no whitewashing.
 B Saving of material and labour.
 B USED BY THE MILLION IN GERMANY, AMERICA, AND IN THIS COUNTRY.
 These Bricks are made by the
GODSTONE BRICK & TILE CO., LTD.,
 Oxed Road, Godstone, Surrey,
 and can be delivered in quantities of not less than 5,000 within 10 miles of the Company's Works at 27. per 1,000, net.

FALSE ECONOMY.

It might be thought that the decision as to when a building has become obsolete and demands to be replaced by one fulfilling modern requirements could legitimately be left to its owner, who may claim to be in a position to judge whether it will pay him or not to demolish or rebuild. There are, however, sound and sufficient reasons why the owner is in many cases not fitted to be the sole arbiter on the subject. The most obvious of these cases is in which the property is of a type essential to the health and character of the occupants—a state of things very

prevalent in our large cities. Attempts to deal with this have occupied their share of legislative effort for many years past, and, while a fair amount has been achieved, there is yet so much to be done that it has recently been proposed that improvement in this direction shall be transferred from municipal to national control.

We have previously expressed the view that there does not seem to be any logical reason for the change, which would certainly, according to past experience, not be likely to lead to increased economy or efficiency, and would, in most cases,

distribute the burden of cost less equitably than at present. Speaking of cost, this is apt to be excessive owing to the marked respect in which the rights of property are held. Only if a building is an absolute danger can it be legally destroyed; any minor degree of injury to the community may hardly be regarded as depreciating its value, based on the rents that the ignorant and necessitous pay for it. Consequently, the owner has to be bought out at a value that disregards any responsibility he should bear as the possessor of property admittedly a menace to the

community. The ethics of this form of compulsory purchase, interesting though they may be, and the proper fate for slum property, are questions that have long been fairly definitely before the public, and we can leave them for the moment to consider other cases in which the false economy of undue conservatism may be suspected.

That the matter is not solely one of economics will have occurred to many, and must undoubtedly have been brought home to all readers of H. G. Wells's book, "The New Machiavelli," in which, after describing a group of three gaunt, dilapidated, and obsolete houses, he makes their unfortunate owner exclaim: "I don't own these houses, the houses own me." How many a house owner has felt this mood, even though he may not have put it into words! How many a house owner is compelled to give an amount of time and attention to his obsolete and decaying possessions that might, devoted to another business or profession, secure him an almost equivalent income! If he carefully deducted a reasonable wage for time expended, how often would the balance left to represent the return on his capital show a ridiculously low rate of interest! Even admitting the popular taste for house property, we find a general feeling of disillusionment and a sense of burden weighing on a majority of those who have invested in any but good-class modern buildings.

In all parts of London there may be seen houses for sale at less than half what they originally cost, even when every allowance is made for the diminishing term of the leases. For, while street upon street is occupied in some way utterly different to that for which the buildings were originally planned, it is obvious that there must be more or less of makeshift by the tenants, and consequently some compensating reduction in rents. Thus from both the landlord and the tenant is an unnecessary expenditure of effort demanded, and it is this continual waste of energy that is so often disregarded in estimating the value of existing property. The tenant might, for example, be justified in paying 20 per cent. more rent if he could find a well-arranged home in the area to which he is limited, while the landlord would naturally be content with a lower rate of interest if his property gave him comparatively little trouble.

Much has been laid at the door of our leasehold system, and it cannot be denied that it often acts as a deterrent to a rational treatment of obsolete buildings; but, at the same time, the numbers that have passed through their first lease and are running through their second, third, or fourth indicate emphatically the instinct against re-modelling or rebuilding if tenants can possibly be found who may manage to adjust themselves to the inconveniences of a habitation built in entire disregard of their mode of life.

We would not desire to give the impression that all old property is necessarily unsuited to modern requirements. Many of the fine old houses of Mayfair and Bloomsbury are quite capable of adaptation to the needs of the present day, but further out in the Victorian suburbs there is a mass of

property, not too well built, that can only be kept in use by a disproportionate output of energy and expenditure. It is this class which demands careful investigation with a view to forming a decision as to whether it would not be far wiser to undertake extensive rebuilding schemes. Ground landlords might help in accepting reasonable terms for the extinction of existing leases, and in granting a new tenure, so that the present obsolete buildings may be replaced by convenient accommodation; while, if all the proper reductions are made for the futile labour now involved in occupying and maintaining these obsolete premises, it will be found that rebuilding would more often be justified than is at present imagined.

In the United States a building is "scrapped" without hesitation as soon as it is considered in the least out of date, and, though the conditions here are very different and preclude our following this example in its entirety, there can be no doubt that we incline to the other extreme and preserve our buildings when social and even economic considerations would justify their destruction.

The matter is one of grave import to London and our other great cities, and we commend it to the serious attention of our landowners and holders of property. Put in brief, our contention is that it has never been studied on a really broad and comprehensive basis, and that such a study might materially modify the general view as to what is worth keeping and what it would be politic to replace.

MODERN ARCHITECTURE IN THE EAST.

DURING Mr. John Begg's absence on leave the work of preparing the report for the year 1910-11 on architectural work in India has devolved on Mr. Crouch, who was well known in London before he took up the post of Consulting Architect to the Government of Bengal. In his report Mr. Crouch reiterates the complaint made by Mr. Begg that there was an insufficient allowance of qualified assistants to cope with the amount of work in hand.

It may be due to this that so much of the official architecture in India appears to be so trite and uninspired; but we very much doubt if this is the real reason. The present education of the European architect tends to alienate his sympathies from all modes of expression not based on the traditions of Greece and Rome, and it is very rare to find the man whose sympathies are broad enough to throw off the predilections that have been drilled into him and start afresh to absorb impressions coming from an entirely different source.

In a country so vast as the East Indies it is inevitable that the native traditions of workmanship and decoration must be relied on in the execution of the great majority of the buildings undertaken, and if these conflict with the conception of the architect the result cannot but be chaotic and unsatisfactory. We ought, therefore, to recognise native workmanship as an essential factor, and, as there is a strong and definite artistic tradition with numerous skilful exponents still in

existence in the East, the important architect will achieve far finer results by basing his conceptions on this than trying to impose alien and exotic forms on the native craftsman.

We might instance the recent acceptance of the Byzantine style as a vehicle for imaginative expression as an example of the architectural suitability of Oriental manner as a basis for the personal expression of the artist, and in like manner the very definite characteristics of the architecture of Southern Asia in no way preclude the note of personality so essential to modern architecture in its latest developments, provided the architect is the master and not the servant of the style in which he elects to work.

Mr. Crouch's report complains that many able designs have suffered in execution by undesirable alterations at the hands of the Public Works officers in charge of the work. This points to failure in organisation, but it also gives a hint that even at headquarters there may not be a full appreciation of the methods and traditions. In the administration of such an extensive area as that of our Indian possessions it is almost inevitable that there will be too much red tape, and that the mechanism of government, with all its rigid rules and regulations, will militate against freedom and the intimate study of local materials, workmanship, and conditions so essential to the production of really modern architecture.

NOTES.

The British School at Rome.

THE chorus of appreciation with which the scheme for the establishment of a British Centre of Study in Rome has been received colours the outlook of those who so long have been interested with optimism hitherto unknown. It seems that at length a way has been found and that a school not less worthy of our national prestige than the Commemorative School of Architecture will soon be inaugurated and on its way to the fulfilment of our desires. Professor Blomfield points out in a letter to the *Times* of November 23: "More than our generation will, of course, wanted to bring about such results, and as happened over 200 years ago when the French School at Rome, there are some [but must we be so sure?] mistakes—disappointments; but it will be a great thing to have made a start, and to have taken a step which may in the future have a far-reaching influence, steadying the erratic and disordered methods of our modern architecture."

Direction of Students.

THERE is one consideration which presents itself relevant to the proposals for a Centre in Rome, and that is of the precise extent to which students will, by statute or practice, be subject to authority and control as regards their work. We know that in the course of the Royal Institute of British Architects there has been growing a feeling that students do not contribute as much as they easily might (and with benefit

oneselves) to the common stock of hard and research. A student wins his—the Soane, maybe—and wanders to the accustomed shrines vowing to do much and see what he may, and turns with many, or not so many, related drawings and sketches, very pretty in themselves, it may be, but more than out of work which has been measured and remeasured (naturally, for is presumably the best), and, probably, of no real use as a contribution to our fund of exact and definite knowledge. How much better, it is said, that the student, instead of meandering the beaten track, or, if his temperament dictate, into the many blind alleys the bypaths of research, should, for part of his time at any rate, suffer restriction, or, more likely, gladly accept inspiration and assistance, to the end that he may do something which is of definite value to the architectural community as well as to himself! And it seems to us that, with the nucleus of control which the proposed School will provide, that there is considerable likelihood that this opinion will grow in strength and ultimately prevail.

Danger of Control. AND, seen from this point of view it seems right enough. Under intelligent co-operation, organisation, and management, there would soon accumulate such a store of record that the student of a little while hence would search in vain for something really worthy of a year or even a month of his young life. And there is this to be added—it is the crux of the danger—that by just so much as the student's task becomes useful for the aggregation of such a mass of knowledge, by just so much does it tend to become more irksome and consequently valuable to the student himself. At first undoubtedly it need not be anything of the kind. But it is not difficult to foresee developments that would reduce that state of affairs. For instance, the fund of record as it grew would come to have value for comparative purposes, and zeal on its behalf would consequently indicate that drawings would be to constant scales and in standard media. Again, stress would be reasonably laid upon the archaeological aspect, and so on. Finally, as we have said, the work which the student would find to be of value as sustenance to his individual temperament would become scarcer and, in cases, not to be found. In short, the tendency would be to lose sight of the fact that existing indentments were by their founders intended to help the keen men to the development of presumably hopeful and, as we hope, individual abilities and tastes. Precisely how far this tendency should be developed and exactly to what extent it could be enforced would depend on the interpretation which a court of law would place upon the terms of the founder's will in each instance.

Necessity of Freedom. THERE exists a type of mind—and we cannot say definitely that it is the most valuable—to which the mere presence

of control, however exercised and to whatever end it be directed, is so galling as to vitiate any efforts which it may be induced to make. There are individuals to whom it is a psychological necessity in their earlier years that they have some freedom just to "louge," in the phrase of Mr. Bernard Shaw concerning himself. It is really dangerous to admit this fact perhaps in public print, and we do so only in duty bound at the first scent of danger to its due recognition. It is by no means certain that the best method of piercing to the essentials of a period, or of the art of architecture as a whole, is to study in detail some one work or two, or even to grind hard at many. That method may produce a Cockerell, but not necessarily an Elmes—a Palladio perhaps—but consider the vagaries of Christopher Wren. And some of the better men to-day know this, and it is on them and their memories of a vagrant youth that the student in need will have to rely. A man may go about seeing with roaming eyes and get the spirit of the thing without so much as a sketch, though he may lack that ability to transfer detail which has been the bane of the architecture of our century. It is for this man as much as for those multitudes of others that open studentships are intended by their founders.

"Official Architecture" in Glasgow.

ARRANGEMENTS in connexion with the reconstruction of the old Tontine building referred to in our issue of November 10, page 538, were advanced a stage further at the meeting of the Glasgow Corporation on the 23rd ult., and we regret to notice that it is in the direction so vigorously condemned by the President of the Royal Institute in his recent address. The proposal before the Corporation was to appoint the City Engineer as architect for the reconstruction of the Tontine area affected by the recent fire. We presume that what is really meant is that the City Engineer will see that the buildings are properly constructed, while some unnamed subordinate on his staff will put in the architecture. Surely Glasgow architects must feel that this reversal of the normal order of things is in itself an insult added to their injuries. It is some small consolation to know that this proposal did not pass without opposition, but the old arguments of a "capable staff," and "why go outside and pay 5 per cent.?" carried the day against a counter-proposal to invite competitive schemes from city architects. The Lord Provost, while refusing to support either side, rightly pointed out that this was an important scheme, as it dealt with the old cross, the historic centre of the city, and everything possible should be done to secure the best result. We fear that the preliminary steps do not promise well.

PICTURE EXHIBITIONS.

At the Leicester Galleries there is an excellent collection of pictures, designed as illustrations for books, by three of at once the most popular and most able artists of to-day in this genre. The meticulous method and fancy of Mr. Dulac are well known; not less

so the quaint wit of Mr. Arthur Rackham. But we are perhaps mistaken in claiming equal popularity for the work of Mr. Cayley Robinson. There can, however, be no doubt the present exhibition will bring him into line in public estimation with his confrères of the adjacent rooms. It is fortunate in many ways that Mr. Cayley Robinson was chosen to illustrate "The Blue Bird" of Maeterlinck. His pictures do not possess the elements of ready wit and impish gaiety which are so immediately attractive in the illustrations of Mr. Dulac or Mr. Rackham. He is, to begin with, not a humorist, and his personal way of seeing things, his delicate poetic fancy, no less than his grasp of abstract decorative design, are not qualities likely to be immediately apprehended. Appreciation of art of this type is a matter of somewhat slow growth and personal discovery, liable to develop, when it is found, almost into a cult. His illustrations of "The Blue Bird" will lead the popular mind as well as that of the collector in the right direction; and they will initiate a younger world, among whom the illustrated book will have a wide circulation, in a charm not less convincing than that conveyed by the play itself. But the qualities of Mr. Cayley Robinson's art are shaped to larger issues than book illustration. The decorative form, balance of design, and spacious disposition of tones, as well as the knowledge indicated in his work of architectural features, will appeal particularly to architects. It would, indeed, be pleasant to find an artist of his decorative aptitude engaged upon some important mural scheme, instead of seeing the rare opportunities of this kind which are offered surrendered to a type of pictorial expression better adapted to book illustration or the anecdotal easel affair. Mr. Cayley Robinson, it is true, has his mannerisms, but so had Puvion de Chavannes and the majority of past masters, who interpreted a generalised and delicate apprehension of things in terms of colour and considered forms.

The exhibition of the London Sketch Club is as lively and as casual as usual. Mr. Frank Reynolds, Mr. John Hassall, and Mr. Lawson Wood are pleasantly humorous in their various drawings designed for the illustrated weeklies or for the books of Charles Dickens or Mr. Kipling. Mr. Edgar Downs's animals are interesting, but his play of sunlight through a lacework of leaves has scarcely arrived beyond experimental study. The pastels and other paintings of Mr. George Sheringham are among the most successful on the walls, illustrating a pretty fancy and attractive colour schemes. Mr. Dudley Hardy is admirably represented in his later and more serious mood; while the pictures of Mr. Montague Smyth, Mr. Edgar Pattinson, Mr. Joseph Harker (whose scenery for "Kismet" and other plays has often enough suggested a gift for the more circumscribed medium of water colours), and Mr. Lionel Edwards deserve to be signalled out in this modest, tentative sort of show.

KING JOHN'S PALACE, SOUTHAMPTON.

At Southampton strenuous efforts are being made to preserve the historic Tudor house and King John's Palace, one of the best existing specimens of Norman domestic architecture, the owner of which has offered the property to the Southampton County Borough Council at a much lower price than could be obtained were the property taken down and re-erected in America. The Council have accepted the offer, and a Local Government inquiry is being held as to a proposed loan of £200 to purchase the buildings. There are many points of interest in the ancient palace, not the least being the chimney of the old fireplace, which consists of a flat projection on four corbels just beyond the beautiful double window. The rough chestnut beams of the roof have remained since the time when King John stayed in the building during his many visits to Southampton.

CONVERSAZIONE.

The annual Conversazione of the Architectural Association was held on Thursday, November 23, at Tuf-ton-street, and was a complete success.

The guests, numbering upwards of 500, were received by Mr. Gerald C. Horsley (President) and Mrs. Horsley on the first floor gallery of the Museum. Mr. Gordon Craig had lent for the occasion four models for stage scenes for "Macbeth," and about thirty drawings for stage scenes, which were on exhibition. The models, which were illuminated, proved one of the greatest attractions of the evening. Mr. Craig, who for the last eight years has travelled and worked in Germany and Russia, has done much to influence theatrical productions in Europe generally, and in view of his proposed new theatrical school, his exhibits were of interest.

There were some excellent drawings on exhibition by Messrs. W. S. George, Charles Gascoyne, Philip Hepworth, W. J. Palmer Jones, W. Valcott, and H. F. Waring, and the quality of the work shown more than compensated for the limited number of exhibitors.

The following exhibits were also kindly lent—Jewellery (Mrs. Margaret de Castro), jewellery and enamels (Mr. and Mrs. Arthur Gaskin), silver and repoussé work (Mr. Harold Stabler), silver and jewellery (Mr. J. Paul Cooper), old Chinese bronzes (Mr. Matt. Garbutt), bronzes (Mr. Arthur T. Bolton), candlesticks (Mr. Ernest Gimson), pewterwork (Messrs. Walter Churcher and Mr. George Jack), art metalwork (the Artificers' Guild, Ltd.), tapestries (Messrs. Martin van Straaten & Co.), embroidery and silks (Messrs. Warner & Sons).

The Camera, Sketch, and Debate Club filled the first floor gallery with work by members of the club. The club exhibits were of a very comprehensive character, including water-colours, oils, photographs, and some etchings by Mr. George Vey, jun.

The Museum and adjoining rooms were tastefully decorated, and music was provided during the evening by Pitman's Blue Imperial Orchestra. Refreshments were served on the ground floor by Messrs. Harrods.

Amongst those present were—Mr. Leonard Stokes, F.R.I.B.A., Sir Ernest George, A.R.A., Mr. Gordon Craig, Mr. T. E. Colcutt, Mr. Arthur Keen, Mr. W. Curtis Green, Professor Baresford Pite, Mr. H. P. G. Maule, Mr. Arthur T. Bolton, Mr. H. A. Hall (Hon. Secretary), Mr. W. J. Tapper, Mr. F. W. Pomeroy, A.R.A., Mr. H. V. Lancheester, Mr. A. N. Prentice, and many others.

ORDINARY FORTNIGHTLY MEETING.

An ordinary general meeting of the Association was held on Monday at No. 18, Tuf-ton-street, Westminster, S.W., Mr. Gerald Horsley, President, in the chair.

Mr. Hall, Hon. Secretary, announced that the Athletic Club Dance will be held in the Wharfedale Rooms on December 8, at 9 p.m. Tickets, including supper, price 7s. 6d. each.

The following gentlemen were then elected as members—i.e., Messrs. W. Allison, Wandsworth Common; G. B. Booth, Bayswater, W.; and M. H. C. Doll, Much Hadham, Herts.

The President announced the following reinstatement—i.e., Mr. G. A. Humphreys, Mostyn Estate Office, Llandudno.

The President also announced that there is a vacancy on the Council, and that the Council

will nominate a member to fill this vacancy at the next ordinary general meeting, when it will be possible for members to make further nominations.

The President proposed a vote of thanks to Mr. Francis Sills, for kindly presenting to the A.A. a copy of "Ye Solace of Pilgrims" (description of Rome in 1450). This was agreed to.

Mr. Arthur T. Bolton then read a paper, entitled "Thoughts on Jacobean Architecture," which is given on pp. 639-650, accompanied by some of the illustrations shown by the lecturer.

The Chairman announced that the next meeting would be held on December 11 (combined meeting with the Camera, Sketch, and Debate Club), when a paper by Mr. Alan E. Munby, M.A., A.R.I.B.A., would be read, entitled "Is the Texture of Materials a Fetish?" The meeting then terminated.

ARCHITECTURAL SOCIETIES.

Leeds and Yorkshire Architectural Society: Annual General Meeting and President's Address.

The annual general meeting and smoking concert of this Society was held at the Queen's Hotel, Leeds, on November 16. The President (Mr. Sidney D. Kiteon, M.A., F.R.I.B.A.) occupied the chair, supported by the Lord Mayor (Mr. Wm. Nicholson). The proceedings opened with the President's address to members and Associates of the Society, followed by the distribution of prizes to the students.

The President, in his address, said:—"Firstly, a few words about ourselves. The Society has lost this summer the services of its Secretary, Mr. Ralph Thorp, who has gone to Canada. Short as the time was in which he served as Secretary, he won the good opinion of all our members by his courtesy and efficiency, and our good wishes follow him. Mr. Whitehead, who has done such good work for the Sketching Club, has kindly consented to take his place. I believe he will not fall below the high standard of achievement set by his predecessors.

The year that has just passed has not been an important one in the history of our Society. But happy is the Society which has no history, and the object of this Society is not to make history, but to go quietly on its way as a permanent and unpretentious guardian of the interests of architecture and architects in this province. It is in no sense detrimental to the Society that its name has not been in evidence in the newspapers, and I assure you that it has done a considerable amount of quiet, unseen, but none the less useful work during the session.

There are points, however, of a more public nature which our Council might well take in hand in the near future, such, for instance, as a firm protest against the increase of official architecture, which is becoming a menace to practising architects, and which is costing the ratepayers and taxpayers—as was so ably pointed out by Mr. Leonard Stokes in his Presidential address at the R.I.B.A. the other night—considerably more than if the work were put out in the fairer and more reasonable way to rate-paying and tax-paying architects. The public ought to be made to realise that they are paying more for what we may be pardonably permitted to term a worse article.

Another point which has been discussed by our Council more than once is the growing evil of builders who make their own plans with one hand and hold out their caps with the other to architects to give them work. It is a cardinal fact of elemental justice that a man cannot eat his cake and have it, and if a firm and united attitude were to be adopted by members of this Society it is reasonable to suppose that those misguided builders could be made by practical means effectively to see the errors of their ways. And this brings me to the time-worn subject of Registration, a subject which requires no arguments in its favour here. I own that in my early days I was opposed to Registration, but experience has taught me to be a thorough-going advocate of that policy. It is unnecessary at this time of day, when every trade and profession has formed itself into a trade union, to point out the advantages which would accrue to our profession by a

closer union and a sterner discipline. I ought to be impossible for an employer to bargain for a less remuneration than the modest minimum prescribed by the Institute or for an architect to agree to such an arrangement. It ought to be impossible that architectural work should be done—and ill done—that—by builders, plumbers, rent-collectors and undertakers.

The Institute is moving slowly but surely towards this achievement. The policy was ably advocated more years ago than probably he cares to remember by one of our ex-Presidents, Mr. J. W. Connon; and it has been endorsed, I think, by everyone else who has occupied this chair. Nearly 2,000 Licentiate have already been enrolled in the ranks of the Institute. Thus a most useful element of solidarity has been obtained in furtherance of the policy of Registration.

The amalgamation of the Society of Architects with the Institute seems likely to be accomplished in the near future. This state of man-like arrangement has meant self sacrifice and the exercise of much tact and common sense on both sides. The fact that such qualities have been so fully shown in these negotiations is a guarantee for the successful termination of the campaign for the statutory recognition of architects.

The most important thing of all in connection with the profession is the provision of education. Twenty years ago architectural education outside the usual office routine of pupillage hardly existed. Much progress has been made since then, and the proposed establishment of a British School of Art and Architecture at Rome is another step in advance. Hitherto the winners of student ships have wandered, sketch-book in hand, over Europe, filling up their time, doubtless very pleasantly, but with little or no direction or continuity in their efforts. Whether Rome at the present day is the best place for the study of living architecture is, I think, open to doubt. But if we cannot go to Rome, it is open to all students in this province to attend the architectural school at the Leeds School of Art, where, under the direction of Mr. Coombs, a very thorough and sympathetic teaching is to be obtained.

This year the work of our students is of a high quality, but there is not enough of it. Consequently, the competition has been poor although the work which has been submitted has in nearly every case reached a sufficiently high level as to demand and to obtain a prize.

The silver medal for measured work goes to Mr. Kruckenburg. The competition in Design Class has been very keen. The subject of the prize for construction was a difficult one, and elicited two very elaborate designs for a staircase and door in reinforced concrete. The prize goes to Mr. Voeckel for a carefully-constructed and well-worked-out set of drawings. Mr. Chadwick's measured sketches form a very fine record of work ably rendered, and the series of details from the interior of Kirkstall Grange are particularly good. There was only one competitor for the essay prize. The subject was "Yorkshire Building Stones and Their Influence upon Design." The work of Mr. Palmer, who is the author of the only essay sent in, has been adjudged to be of sufficient merit to obtain the prize.

A review of the state of employment among our members during the past year is not an inspiring one, and we have to record the departure from the province of some of our number. Several firms of contractors, with honourable records behind them, have ceased business. The feeling of confidence that was in the air up to a few years ago seems to have died away; people are marking time and hesitating to invest money in building enterprise. Nor are the census returns of the current year for Leeds of an inspiring nature. It is not good news to hear that the population of the city is increasing now at a less rate than it was this time a hundred years ago. There were then probably not five architects practising in Leeds, while now there must be ten times as many. There is, however, no reason why a manufacturing town should grow indefinitely, and there are many reasons why it should not. And, after all, a city which contains nearly half a million of inhabitants is a respectable unit. Athens at the height of her artistic achievements, Florence, in the Renaissance, never

lined so many inhabitants; and it is full if the London of Sir Christopher Wren counted many more. It must be added that in artistic matters Leeds has progressed during the past year. The opening of the Art Gallery, the suppression of Curatorship, and the abolition of municipalities may save a few hundreds of rates, but one is tempted to think that ere economies bought at too dear a price. No care for the few remaining buildings in older Leeds will deeply regret the treatment at present being portioned out to Red Hall. As usual, the literary men have not spared us. In an ode to the statue of the Black Prince the poet alludes to Leeds as "a haunt of misery loom," while a sonnet in the *Spectator* does hard things to say on the ugliness of the city. In a recently published guide-book *West Riding* I find the following passage:—"It is questionable whether other city, except perhaps Sheffield, is to the railway traveller such a scene of hideousness as is offered to those descending from the Bramhope tunnel, leaving left only a few minutes behind the green and open valley of the Wharfe, out towards the east along the filthy Aire, from the summit of the viaduct, to cross the Kirkstall-road." These things do not make pleasant reading, but we all see ourselves as we are. It is inevitable that the visitor who approaches Leeds expecting to find a Vienna or a Paris should be disappointed. Nor has the claim yet been made of this city that it is a health or pleasure resort. But it is a great manufacturing city, where nearly half a million people live and work probably as hard as in any other city in the world. And by reason of the closeness of their lives sunshine and pure air could be all the more necessary to their need. Only recently a professor, speaking of Sheffield, told his audience that smoke was vital for the production of the best steel. Surely, as Mr. Gladstone once said with nice touch to another matter in a place not far yards from where we now are, "the best of civilisation are not yet yet." And it is difficult to believe that we could not produce the best steel by a cleaner method if it was made worth while of science to do so. People have been so used to what is really a reproach to civilisation, or they are so busy in making it, that they have come to regard our laden atmosphere with regret, certainly, but with resignation. The architect is from this nuisance perhaps more than other member of the community, for they are disinclined to put up good buildings which they know they will be shrouded in within a year after erection.

Planning in our province has not yet got out of the region of talk into that of action. A very generally expressed wish has been, however, shown that the new city districts so rapidly growing up round the city should be something better than the old mining villages to which we are accustomed.

Halifax a competition, with prizes given to a local member, has been held for the plan for improving the laying-out both of town and suburbs. It is much to be desired that a similar competition should be held in Leeds. There seems an opportunity when additional municipal accommodations so urgently needed, and when the city is embarked upon an extension scheme, that the approaches to the Town Hall stands in its inky cloak as a sort of blot among the buildings of the world, and by its own surroundings—should be cleaned and improved. No street alteration of kind has taken place here since the Town Hall was built, and surely it is high time that the setting to the fabric which our eyes wrought so well should be taken in hand.

There is now the chance for the correlation of some of the more important of our buildings. The obvious truth cannot be often repeated that one fine building does not make a fine city; but the wise grouping of fine buildings not only doubles the value of those buildings themselves, but provides the only elements out of which a fine city is made. In an interesting paper which the City Engineer, Mr.

Lancashire, read to the Association of Municipal Engineers last summer upon the development of Leeds he said, "Although recent improvements have resulted in the possession of many streets and buildings of which Leeds is justly proud, it cannot be argued that reconstructions are more, if as satisfactory as construction properly planned in the first instance, even apart from the extremely heavy extra cost. One is bound to realise that, in some cases, there has been no design beyond street widening for better travelling facilities, no motive beyond the wider streets and the better buildings which have followed the widenings; and some of the fine new buildings have been erected where it is impossible to appreciate properly the full beauty of the architect's creation."

Probably the most important building enterprise in this neighbourhood at the present time is the City of Leeds Training College and its fleet of attendant hostels. There every care has been taken with the disposition and grouping of the various buildings, and this forethought will, I think, result in an interesting and satisfactory layout. There is every chance, too, that the suburb which will grow up around it will be carefully and effectively planned.

For the first time there is a Lord Mayor of Leeds who is connected with the building trades, and we may rest assured that Mr. Nicholson, who is an hon. member of our Society, will do what he can to promote its best interests during his term of office.

Now nothing remains but to wish you a pleasant and prosperous year. The happiest life that a man can lead is an architect's life if his interests and sympathies lie that way. And, I would add, the happiest architects are the provincial architects, for they usually have a greater range and variety in their work, and have more varied lay interests than is possible to Londoners. And, to crown all they have the open country at their back with all that it means to a man's health and spirits. Nor does it seem needful now that a traditional style is once more beginning to emerge from the chaos of clever eclecticism, and now that opportunities for study are so much greater, that the design of provincial architects should be measurably inferior to that of their London brethren.

Although it is quite certain that we cannot all be men of genius, we can, at any rate, see to it that our buildings shall fulfil the sound and common-sense requirements of Inigo Jones and be "solid, masculine, and unaffected." We can put the best that is in us into our work, play the game, and mind our own business, and thus ensure happiness not only to ourselves, but to those who come in contact with us."

The Lord Mayor proposed a vote of thanks, in which he remarked upon the necessity for the development of the city upon more broad and architectural lines. It was as easy, he said, to build well-designed buildings as to build "mere structures."

Mr. J. W. Cannon seconded the resolution, which was carried unanimously.

An entertainment, arranged by Mr. E. C. Spruce, followed.

Manchester Society of Architects: Paris and Vienna.

On November 22 Mr. P. Abercrombie, of the Liverpool School of Town Planning, gave a lecture on the contrasted development of Paris and Vienna. Speaking of Vienna first, he gave plans showing the development from the old medieval town which still remains in the centre. He explained how the old line of fortification was adapted to form the Ringstrassen, and how, in laying out this street, open spaces were arranged opposite to and between their public buildings. With maps of the district he showed the open belt of country, well wooded and picturesque, which surrounds the town, and which is to be left unbuilt on for ever. The factories were placed on the south-east of the town; the prevailing north-west wind thus carrying away the smoke.

Turning to Paris, the Roman cross roads had formed the basis of the modern town. In all the modern improvements, both of Napoleon and Haussmann, the vista had been the principal motive. In obtaining this the individual buildings were of necessity subservient to the general lines, and in this way

Paris had always been more fortunate than Vienna.

Mr. Abercrombie had many excellent slides of the buildings and streets. A discussion followed, in which Messrs. Barker, Agate, Worthington, Corbett, and others joined.

Liverpool Architectural Society: XVIIIth Century Architecture of Bath.

A paper on "XVIIIth-Century Architecture of Bath" was read on the 20th ult., before the Liverpool Architectural Society by Mr. Mowbray A. Green, of Bath, Mr. A. Thorneley presiding. Describing the condition of Bath in the end of the XVIIIth and the early part of the XVIIIth century, he said it was cramped, dirty, and ill-fitted to receive the gentle and noble people who came so willingly to submit themselves to the drastic treatment which the doctors prescribed. The city, standing upon an area of about 37 acres, was scarcely larger than it had been in medieval days, but it was full of interesting houses of the Elizabethan and Jacobean periods.

Of the builders of the early years of the XVIIIth century little was known, but in 1707 George Trins began to build just outside the north wall of the city, and there still remained some interesting houses, in one of which General Wolfe was staying when he received, in 1759, orders to proceed to Quebec. John Wood, a Yorkshireman, born in 1704, came to Bath at the age of twenty-one, with large ideas as to rebuilding Bath, and the description of many and various buildings involved in the lecture showed how much Bath owed to him architecturally. Speaking of Wood as he was in 1764, some three months before his death, the lecturer said, he had been a busy man, commercially successful, but one who left behind him such a record of buildings as few could boast of. Twenty-seven years previously he had found Bath emerging from the squalor of a mediæval city, and in the interval named he had seen erected some of the most palatial groups of which any city could boast. The planning of the part of Bath to which he devoted much attention marked the genius of a man who had laid out his schemes with a sense of nobleness and fine effect. Masterly and bold in design, he grouped up the façades of his buildings so as to produce harmony and a feeling of proportion, and he added to the interior that ingenuity of planning and decorative design which had made them so full of interest to people of the present day.

Aberdeen Architectural Association: Structural Ironwork.

Mr. Harbourn MacLennan delivered a lecture on "Structural Ironwork and Steelwork for Architects" before the Aberdeen Architectural Association in the Northern Arts Club, Aberdeen, on the 10th ult., Mr. James B. Nicol, President of the Association, occupying the chair.

Mr. MacLennan said:—"Before turning to the practical part of my lecture dealing with details of construction, illustrated by diagrams and working drawings, it may be interesting to give a brief outline of the rise of iron and steel construction (some might like to add to this the decay and fall thereof), as, if we are to believe the concrete-steel designers, the art of steel and iron construction as applied to buildings is on its last legs. I do not agree with this view. Concrete-steel construction has undoubtedly a great future before it, but I would venture to say that in the space of sixty years or so since iron construction was introduced there has not been sufficient time to develop this latter method either as regards the scientific disposition of material or as regards the strength and nature of the materials at command. Our knowledge of the proper proportioning of steel materials is as yet far from complete, as witness the recent disastrous failure of the Quebec Bridge, where the best engineering skill in America proved insufficient. With respect to the improvement on our present materials, signs of this are already to hand in the increasing use of nickel steel, which is some 50 per cent. stronger than ordinary medium steel, while retaining in great measure the qualities which have rendered mild or medium steel so adaptable to the needs of the engineer in the past.

I am not concerned to uphold or belittle steel construction as against steel-concrete, or ferro-concrete, as it is usually called, because, I think, there is plenty of room for both: but

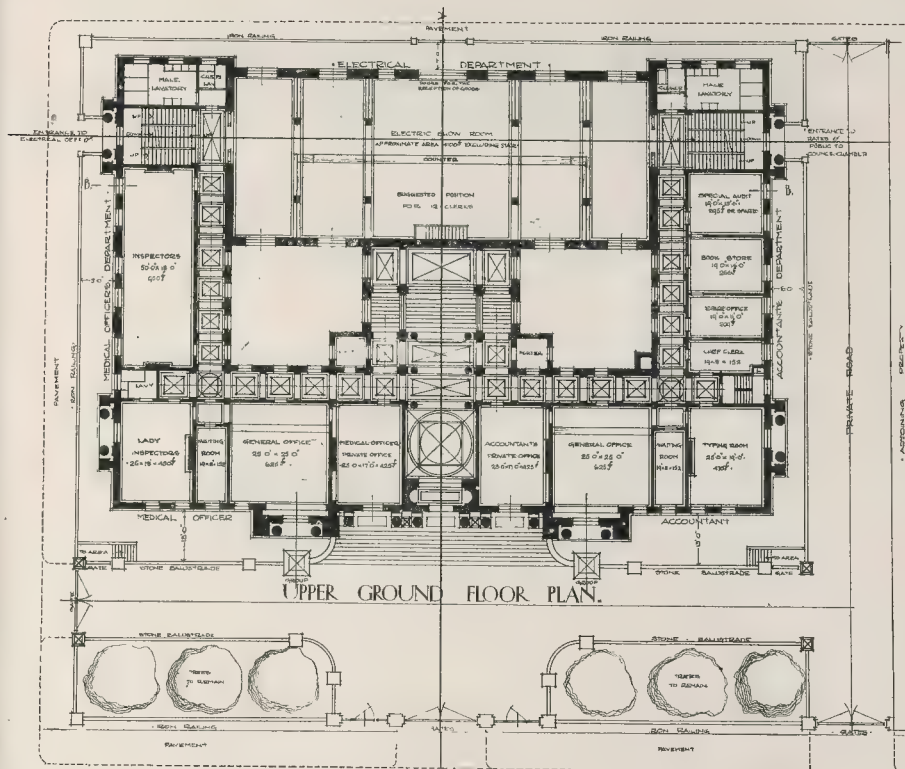

Present-day students who have innumerable handbooks to choose from do not realise the difficulties which architects had to contend with twenty-five years ago, when, as a rule, the best information to be had was a table of "safe" loads on iron beams, the safety of such being an elastic factor due

American designers, having new problems to tackle, have gone about their work in a manner somewhat different from that which obtains in our country, and their methods differ from ours in many details; but signs are not wanting that a certain similarity is growing up between the steelwork executed in both countries, and this is to be ascribed in some measure to the many excellent American textbooks on steel construction lately put on the market. The English text-book writer has to some extent neglected the architect's requirements, who has been compelled in consequence to turn to the engineer for aid. This is a matter which I hope will soon be remedied; the engineering profession owes a great debt to such Englishmen as Hodgkinson and Fairbairn, and such Scotsmen as Gordon, Rankine, and Clerk Maxwell, whose

In the discussion which followed the Chairman, Mr. Clyne, F.R.I.B.A., Mr. Barr A.M.Inst.C.E., and others took part.

It is easy to deplore such a state of things but more profitable to seek a cause and possibly a remedy that is within our power to adopt. It appears to us that this position is largely created by those who are not sufficiently competent or sufficiently mature and experienced to deal with the problem in a really satisfactory manner.

Design Placed First. By Mr. T. Edwin Cooper, F.R.I.B.A.

in the total number of competitors we eliminate all those who never had a chance of success the reader would, we fancy, be found a sufficient reasonable number against which no complaint could be made.

the acknowledged masters with so good a chance of success? Would the average young painter challenge Sargent to paint a head or the ambitious young professional billiard player challenge Stevenson on equal terms? And if he did, how

often would he win? Would he think the chance was good enough? Possibly he would if the judging of billiards or of the painting of a head was conducted on the same lines as the judging of architecture. As long as the present uncertainty prevails

Second Premiated Design, by Messrs. Wallis & Bowden : North Elevation.

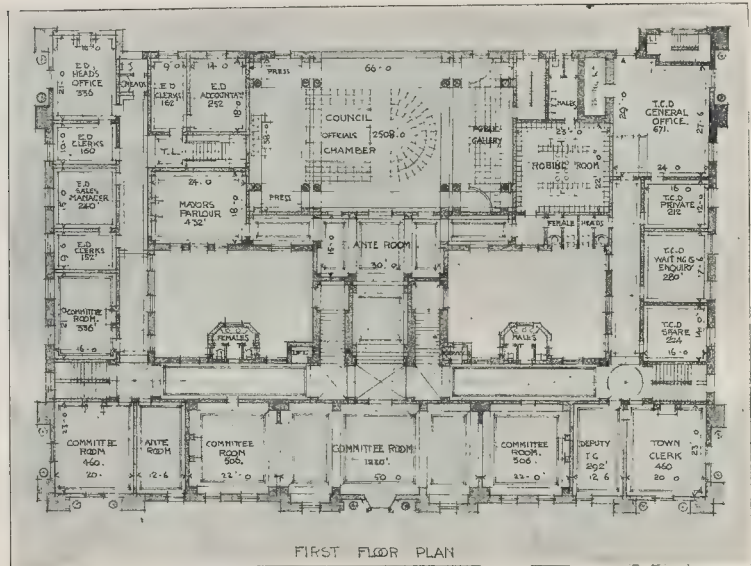

ough there are many causes of the failure of immature or incompetent designs, it is probable that the element of chance is the greatest. So many unsatisfactory awards have been made in recent years, so many bad designs have won, that the whole thing has to be regarded as a lottery in which one may one day draw a prize if he competes often enough. "You never know your luck!" is the usual way of expressing it.

The point is, you should know your own luck. You should be quite sure that you have no chance whatever unless you have one of the best designs.

The present state of affairs is little more than a scandal. In what other profession, art, or craft, or calling—does incompetence or inexperience daily challenge

made on some general consistent idea, with the result that quite one of the best designs has won.

Too often we see cases in which, even if the best design is selected for the first place, the other premiated designs appear to be selected at random and, at times, to contradict one another. Here we are pleased to see that the assessor has followed out his idea, apparently made up his mind as to the right treatment of the scheme, and then selected the best of those that adopt this general treatment, ignoring others which may possibly be more able designs in their way, but not in the way which the assessor thinks is the right one.

This is an intelligible position for the assessor to take up. It tends to emphasise the importance of obtaining the right idea, of concentrating on the general lay-out of the scheme; while it tends to discourage the useless elaboration of designs which have not been properly thought out in the hope of winning by the aid of attractive elevations or details.

We think that most of the competitors

after seeing the designs, will agree that the general treatment selected by the assessor is the right one. But, even though they have their own ideas as to the proper treatment of the scheme as a whole, we think they will all agree that out of those selected Mr. T. Edwin Cooper's is decidedly the best. It is not quite so easy, however, to see why the other premiated designs were placed in their particular order and why they were preferred to others on the same lines. Possibly there are determining factors which can only be appreciated after a more exhaustive analysis.

A point which appears to have governed the whole scheme was the need to provide adequate and equally distributed light to the unusually large electrical showroom with the clerks' office beneath it, and to do this without unduly sacrificing general convenience of arrangement. The most obvious way to avoid making these rooms too long and narrow, or too lofty, was to light them on both sides. One of the chief points of the winning design is that in this matter it has arrived at the most satisfactory

compromise between the claims of light and of the convenience of direct approach to the Council Chamber and direct communication between it and the large committee-rooms. This has been effected without unduly sacrificing the size of the stair to that of the lighting areas, while providing Councillors' robing-room and lavatory exactly in the right place.

It is interesting to note the different attempts to adjust these two conflicting interests of convenience and light. Messrs. Wills & Anderson, for instance, by disconnecting the front from the back block in the basement and ground floors obtain more equally distributed light to the large rooms, but, feeling the necessity of a direct approach from the entrance to the Council Chamber, they bridge over the central area on the first floor with a small ante-room.

The effect, however, is rather cramped, and it would perhaps have been better if they had definitely made up their minds one way or the other. This is what has been done in the design by Messrs. A. R. Jemmett & G. T. McCombie.

Fourth Premiated Design, by Messrs. Warwick & Hall : East Elevation.

Fourth Premiated Design, by Messrs. Warwick & Hall: North Elevation.

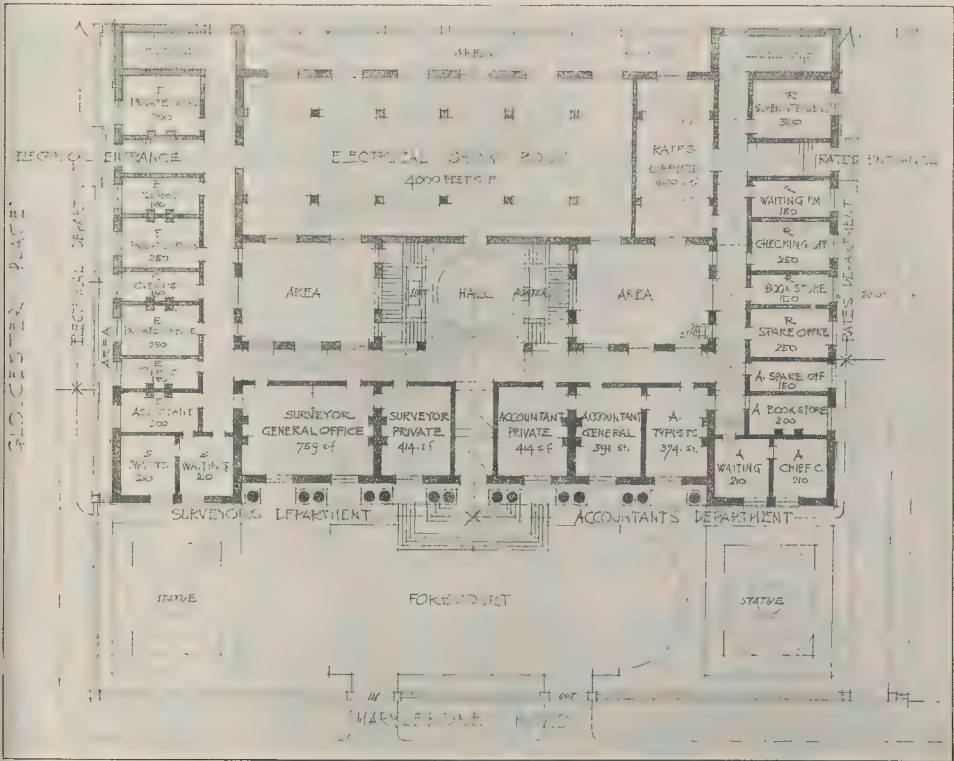

Here the desirability of light and air has evidently been thought more important than a direct access to the Council Chamber. The central block is therefore dispensed with and the two internal areas become one central service court with a drive in from the streets, giving access to boiler-house, stores, and housekeeper's apartments. This destroys the direct approach to the Council Chamber, though for reception purposes it still has an adequate connexion with the suite of committee-rooms.

No doubt it was considered that the interior light to the large rooms and the exterior of the building generally did not

justify so unusual a departure from generally accepted arrangements. One unsatisfactory feature of this competition is the absence of characteristic expression in so many of the otherwise most able designs. There seems to be a tendency to strive for the most imposing, almost we might say the most pretentious, effects, quite regardless of the fact that they may not be appropriate to the occasion and may not exactly distinguish the particular character of municipal offices as distinct from any other type of public building.

It may be one of the general disadvantages

of the competitive system that it encourages a tendency to shout in order to make oneself heard, but the more the essential elements of design are understood and acted upon by assessors the less this necessity will be felt. In this case the tendency leads to the production of designs which at first glance look more like the central halls of law courts or museums than municipal offices, with the result that they mislead and fail to express the characteristic sentiment of the subject. A building should not only impress the spectator, but impress him in the right way. Sheer size of columns or other features

Fourth Premiated Design, by Messrs. Warwick & Hall: Ground Plan.

not at all sure that there is any general fire on the part of those gentlemen who ought to be considered eligible to be placed on the established list, with the consequent sacrifice of income which would be demanded by regulations.

The Late E. A. Abbey, R.A.

Terms of his testamentary dispositions late Mr. Abbey has bequeathed Chelsea Lodge, Tite street, Chelsea, to the members of the Royal Academy for the use of the resident conditionally upon the house being named Abbey House, and that his bronze by E. Onslow Ford, his portrait of his wife and a work by Saint-Gaudens shall be placed there permanently, with the plate and effigy. He leaves to the Royal Academy Library at Morgan Hall, Fairfield, for the use of Abbey House or the Academy a sum of £6,000 for the maintenance of the house. Some of his own works are left to the British National Gallery, the Art Museum, Boston. The *New York Tribune* says it is stated that Mrs. Abbey will observe her husband's wishes, though the fact that she has survived him makes these bequests.

British Museum Appointments.

The Trustees have appointed Mr. Henry Beauchamp Walters, Bell Scholar in the Chancellor's Medalist, and Class I. Classical Tripos, Cambridge University, and author of many books upon Etruscan and Greek art, to be Assistant-Keeper in the Department of Greek and Roman Antiquities; Mr. George Francis Hill to be Assistant-Keeper in the Coins and Medals Department; Mr. Julius Parnell Gilson to be Keeper of Manuscripts. Mr. Hallett, the official guide of the Museum, has been appointed to conduct the conduct of parties of visitors at 3 o'clock daily.

London Museum.

A section of the Museum will be devoted to a permanent exhibition of models, drawings, and playhouses and theatres, with portraits, play-bills, and similar memorabilia. Mr. King has secured a copy of R. Morden and Lea's panoramic "prospect," 8 ft. in length, London and Westminster in 1715, as seen from intervals from the Surrey shore, and a section of curiosities of XVth-XVIIth centuries date recently discovered in Pater-noster-row; Mr. R. M. Walker, has lent his section of Battersea and Chelsea enamels china, where one case alone is valued at 25,000.

King Edward Memorial for London.

A meeting of the Advisory Committee of the fund for providing a memorial to King Edward in London has just been held at the Mansion House. The Committee had before it the suggestions and designs of Mr. Frank Mackenall, A.R.A. (sculptor), and Mr. Edward Lutyens (architect) for a memorial of his Majesty, in bronze and Portland stone, to be erected at the Piccadilly end of the Broad Walk in the Green Park. Mr. Lutyens explained by the two artists as to the site, cost, and extent of the memorial and their treatment of the work, the Committee unanimously expressed their general approval of the scheme. The Committee at their meeting also considered and rejected a proposal for a site at Hyde Park, which Professor Ashhead, of the University of Liverpool, had suggested as an alternative to the Broad Walk scheme. Sir Percy Strong was requested to see the Chairman of the London County Council and ascertain to what extent the Council would be prepared to co-operate with the Corporation and the Committee in dedicating the adwell Market site as a public garden and playground for the inhabitants of East London.

The Institution of Water Engineers.

The first (winter) general meeting of the newly-incorporated Institution of Water Engineers (established as the British Association of Waterworks Engineers in 1896) will be held at the apartments of the Geological Society, Burlington House, W., on Friday 4 Saturday, December 8 and 9. The proceedings will commence on Friday at 4 p.m. and on Saturday at 10.15 a.m. The following papers have been promised for reading a discussion, in addition to the other items in the programme, viz. :—(1) "Waterworks

Management," by Messrs. Easton Devonshire and William Matthews; (2) "Portland Cement on Public Works," by Mr. G. Thornhill Edwards; (3) "The New Waterworks for Skegness," by Mr. Percy Griffith.

The Institute of Metals.

The London Meeting of the Institute of Metals will be held at the Institution of Mechanical Engineers, Storey's-gate, Westminster, S.W., on Tuesday, January 16, and Wednesday, January 17, 1912. The meeting will commence on Tuesday afternoon, when the President-Designate (Professor W. Gowland, F.R.S.) will deliver his inaugural address on the subject of "Copper and Its Alloys in Early Times." The whole of Wednesday, January 17, will, if necessary, be devoted to the reading and discussion of papers. In connexion with the annual general meeting, the third annual dinner of the Institute will take place in the evening of Tuesday, January 16.

St. Peter's Church, Bethnal Green.

At a sitting in St. Paul's of the Consistory Court of London on November 16, Dr. Tristram, K.C., Chancellor of the Diocese, granted a faculty for the erection of a new choir vestry to communicate with the existing clergy vestry, and by means of a cloister or covered way, with the church, at an estimated cost of 500l. It is also proposed to expend 100l. in adapting a space between the choir stalls and lobby as a side chapel, and in setting up an oak screen or dwarf wall at the entrance into the choir, and also to make a new entrance on the north side of the church. The alterations will be carried out by the architect, Mr. E. T. Dunn, of Ilford, and in harmony with the present structure, which was built, in Hackney-road, in 1840-1, after designs by Vulliamy.

Cannon-street Terminus Hotel.

The South-Eastern Railway Company have taken over the terminus hotel, and intend to effect some extensive alterations and improvements of the structure. The project includes the redecoration, in a scheme of white and gold, and the re-lighting of the Great Hall and of the Pillar Hall, a masonic temple above the Great Hall, re-lighting of the corridors, and the addition of a restaurant and grill-room, with new entrances from the station and the forecourt. The Great Hall is reputedly the largest in the City.

Soho Works, Birmingham.

Mr. George Tangye, of Heathfield Hall, has presented to the Birmingham Corporation the unique collection of Boulton, Watt, and Murdoch relics, formerly in the Museum of the Soho Foundry, which he purchased some years ago. Amongst the models are Murdoch's rotary engine and pump, Watt's engine indicator, and the Newcomen engine in section; there are many drawings, letters, and MSS., including the letter-books of Boulton's and Watt's business correspondence, and an interesting letter written by Watt in 1787 to the Abbé de Calonne. The gift supplements many valuable presentations, of Wedgwood ware and pictures, to the Museum and Art Gallery, Birmingham, on the part of Mr. George Tangye and his brother, the late Sir Richard Tangye.

Craftsmen and State Aid.

Mr. C. R. Ashbee's new book, entitled "Should We Stop Teaching Art?" will be based on the recent findings of the Departmental Committee of the Royal College of Art. Mr. Ashbee will plead for the organisation of craftsmen throughout the country, and Rossetti, Sandys, Millais, and others.

COMPETITION NEWS.

New Municipal Buildings, Marylebone.

The following awards have been made by the assessor in this competition :—

1. No. 15, Mr. T. Edwin Cooper, F.R.I.B.A., 12, Gray's-Inn-square, W.C.
2. No. 79, Messrs. Thomas Wallis & J. K. Bowden, Queen Anne's-chambers, Westminster, S.W.
3. No. 39, Messrs. North & Robin, 99, Regent-street, W.
4. No. 13, Messrs. Warwick & Hall, 13, South-square, W.

An illustrated review of this competition appears on pages 628-634.

Nurses' Home, Bolton Infirmary.

This building will be a memorial to King Edward VII. The competition is confined to architects practising as principals within the borough of Bolton. Three premiums are offered, namely, 30l., 20l., and 10l. The assessor is Mr. John B. Gass, F.R.I.B.A., of Bolton, and designs are to be delivered to the Town Clerk by February 3 next.

Teachers' Training College, Glasgow.

The Provincial Committee have selected the following six firms to compete in the limited competition for the above :—

Messrs. H. & D. Barclay; Mr. Andrew Balfour; Messrs. John Burnet & Son; Mr. Henry Higgins; Messrs. Honeyman, Keppie, & Mackintosh; and Messrs. Macwhannell, Rogerson, & Reid, all of Glasgow.

We understand that they will each receive a honorarium for their services.

Public Hall, Leicester.

This competition was won locally by Messrs. Stockdale Harrison & Sons, architects, St. Martin's, Leicester, and tenders are now advertised to be in by December 8 next. The assessors were Mr. E. George Mawbey, Borough Surveyor, and Mr. S. P. Pick, County Surveyor, both of Leicester. We have received a circular letter convening a public meeting for last night (November 30) in opposition to the scheme, the principal objections taken to the present scheme being stated as follows :—

- (1) The unsuitability of the site.
- (2) The inadequate accommodation.
- (3) The objectionable acoustic properties.
- (4) The undesirable and out-of-date method of seating.
- (5) The safety of the public has not sufficiently been considered.
- (6) The hall, which is intended to be used for dancing, bazaars, exhibitions, etc., cannot be suitably seated for concert purposes according to modern ideas.
- (7) No estimate has been placed before the public showing the cost of maintenance and repairs, which will be unduly heavy owing to the temporary nature of the building.
- (8) The Corporation is exceeding its powers by depriving the public of open spaces.
- (9) That the present financial position of the town does not warrant the expenditure for such a purpose.
- (10) That there is no real demand from the general public for the hall."

BOOKS.

In the March and Borderland of Wales. By A. G. BRADLEY, with illustrations by W. M. Meredith, and maps. (London: Constable & Co., Ltd. 1.—Shropshire, Herefordshire, and Monmouthshire. 5s. net. 11. Glamorgan and Gower. 3s. 6d. net.) The author of these entertaining volumes explains in his preface that when the question arose of issuing a second edition of "In the March and Borderland of Wales" it was decided to divide the book, which consisted of two somewhat distinct districts. The lesser part dealing with Glamorgan has, therefore, been issued separately and concurrently with the Shropshire volume, and, in our opinion, wisely, the two volumes dealing with distinct districts and forming volumes easy to handle and peruse. These are not guide-books, but are the records of the "leisurely wanderings" of the author, and, though of more direct interest to local readers, they contain so much entertaining matter that they deserve to be read by a wider public. The author's method has been to visit various towns and villages in the districts dealt with and describe them topographically and from the point of view of the antiquary and archaeologist; and, in the hands of a careful and painstaking writer like Mr. Bradley, the method, provided the locality dealt with has sufficient history and character, cannot fail to have an instructive interest. The pages of these two volumes, describing now some architectural work, or some local historical fact, then some diverting experience or anecdote, bear evidence of considerable research on the part of the author, and we offer him our thanks for the

pleasure the perusal of his work has afforded us.

The illustrations by Mr. Meredith add to the interest and value of the volumes, though they are a little unequal in merit.

The Art of Polychromatic and Decorative Turning. By G. ASHDOWN AUDSLEY, L.L.D., and BERTHOLD AUDSLEY, Demy 8vo. With 21 plates. (London: George Allen & Co., Ltd., Rathbone-place. 4s. 6d. net.)

THIS volume is one of "Allen's Technical and Art Manuals," and is a "practical manual for the professional and amateur turner," the authors of which are architects by profession. They have written a clear and useful account of an interesting branch of the wood-turner's art, and the diagrams and illustrations are of practical value. Included in the volume are the following chapters:—"Coloured Woods Suitable for Decorative Turning," "Decoration by the Process of Studding," "Decoration by the Process of Lamination," "Decoration by the Process of Geometrical Inlaying," and the "Practical Application of Polychromatic and Decorative Turning."

The Principles of Planning Buildings. By PERCY L. MARKS. (London: B. T. Batsford. 12s. net.)

THAT this book has found an appreciative public is evident from the fact that a third edition, revised and enlarged, now makes its appearance. It contains much practical information as to the requirements, arrangements, aspect, and so forth, of different types of modern buildings that must be extremely useful to the general practitioner; particularly when he is suddenly called upon to display a knowledge of a class of building with whose requirements he happens to be unacquainted.

From this book he may obtain a general idea of what the author calls the "general scope of a building," its main characteristics, and the chief points which govern its general disposition. Such information being often most quickly conveyed to an architect by means of a plan which embodies it, the illustrations of plans of different classes of buildings are a useful feature which have no doubt contributed largely to the success of this publication.

It is this aspect of the book which we consider most valuable, for it is probable that there always will be a demand for such information, if reliable and up-to-date.

When, however, the author deals with general considerations, and such abstract questions as symmetry or axiality, his method and his results seem to us to be less satisfactory. Indeed it is a question how far this book may be said to redeem the promise of its title, which, after all, is a somewhat comprehensive one that might well lead us to expect a book of quite a different character.

The principles of planning are the principles of organic architectural design, and they have no necessary connexion with the requirements of any particular class of building. They are the guiding principles a designer follows, the method by which he works, the way he sets about it in order to obtain an architectural plan. An architect may be a most accomplished planner, without necessarily knowing the requirements and proper arrangements of a single modern building as built to-day. On the other hand, it is possible to have the requirements of every known class of building, down to the minutest detail, at one's finger-ends without knowing anything about architecture or understanding the most elementary principles of design.

The two things are separate and distinct, although often confused, and we frequently hear of architects being referred to as experts on some aspect or other of planning because they happen to know the arrangements of, say, a public bath or a brewery almost as well as does a bath superintendent or a brewer.

The requirements of a building are in reality the requirements of the people who inhabit it. They are formulated more by those who use a building than by those who design it. A knowledge of these requirements is not so much a knowledge of architecture as a knowledge of life and of human nature. However convenient it may be to have such information in a handy form in the bookcase, it cannot, after all, entirely take the place of information acquired first hand from the actual people themselves.

Such information must, of course, be obtained

before the architect can put his principles into daily practice, but it is more a matter of fact than a matter of principle, more in the nature of the material which we mould to our purpose by the aid of the principles of planning.

Our purpose is to create architecture, and the question of principles comes in when we ask ourselves how we shall proceed to use this material, this knowledge of life, in such a way as to produce it.

In this, which we hold is the crux of the whole matter, the author does not seem to afford us much help, or to be altogether in touch with the advance of modern thought. We cannot honestly say that we think his remarks are of any special value. With some we are unable to agree, while those with which we do agree must surely have been obvious truisms to all serious students for the last quarter of a century; although it is, no doubt, possible that there are still a few survivors from a former period to whom they may appeal with all the force of newly-discovered truths.

We do not wish to appear to quarrel with the author for not writing a book which he did not intend to write, but when he adopts so attractive, comprehensive, and ambitious a title, and states that "the leading idea is to show the principles of planning [the italics are the author's] in close theoretical and practical association," the title is only saved from appearing pretentious and misleading by assuming that the author attaches a different meaning to the word "principle" to that generally accepted.

The book, being published by Mr. Batsford, is all that can be desired in quality of paper, printing, and general get-up.

LEGAL COLUMN.

Land Valuation: Forms IV. and VIII.

The Court of Appeal have now delivered considered judgments in the two cases, *Dyson v. Attorney-General* and *Burghes v. Attorney-General*. The history of these two cases will be found in these pages—*Dyson's* case in the *Builder*, December 24, 1910, and November 10, 1911, and *Burghes's* case in the *Builder*, May 19, 1911. In *Dyson's* case objection was taken to Form IV. This form was issued under sect. 26, subs. (2), of the Finance Act, which provides that "Any owner of land, and any person receiving rent in respect of any land, shall, on being required by notice from the Commissioners, furnish to the Commissioners a return containing such particulars as the Commissioners may require as to the rent received by him and as to the ownership, tenure, area, character, and use of the land, and the consideration given on any previous sale or lease of the land, and any other matters which may properly be required for the purpose of the valuation of the land, and which it is in his power to give. . . ." and the section imposes the liability to a penalty if the return is not made within the time specified in the notice, not being less than thirty days.

In *Dyson's* case the points raised were threefold:

I. That less than thirty days were allowed him in which to comply with the notice.

II. That the returns were required to be made to some person other than the Commissioners.

III. That the requisition numbered (2) in respect of land, of which he was owner and also occupier, was *ultra vires*. This requisition was—"If the person making the return is also the occupier, state the annual value, i.e., the let to a yearly tenant, the owner keeping it in repair."

The Court unanimously held that the fact that at least thirty days had not been allowed rendered the notices invalid, and consequently that all the notices served upon

the plaintiff were merely wastepaper. This really disposed of the case; but the Attorney-General invited the Court to express an opinion on the other points. They held—in this respect reversing the Court below—that the order to deliver the forms to a specified officer did not invalidate the forms, but that the requisition contained in (2) was in the case of an owner in occupation, unauthorised, since it related not to information prescribed by the section, but was intended to extract an admission, and that its presence in the form when delivered to an owner in occupation rendered the whole form invalid.

The Court unhesitatingly held this to be a case in which the Court should exercise its discretionary powers to make a declaration that the forms were unauthorised, and they commented on the contract upon the inconvenience and expense imposed upon a member of the public, from the forms having been issued contrary to the Act.

Burghes's case turned on sect. 31 of the Act—"Every person who pays rent in respect of any land, and every person who as agent for another person receives any rent in respect of any land," shall furnish to the Commissioners the name and address of the person to whom he pays rent or for whom he receives rent. Burghes was a rent collector, and he was required to give the particulars in regard to "any land situate within or partly within the parish or place of Plaistow South." It was held by the Court of Appeal that, as the form related to no specific piece of land, this form was also mere wastepaper.

Two subsidiary points may be mentioned in connection with this latter case. The notice also contained a demand that the person should furnish "the descriptions and precise situation of the lands in respect of which rent is received." The Attorney-General admitted that the Commissioners had no right to demand this information, and the Court commented severely on the forms being allowed to issue by the Commissioners without the lands being specified. Secondly, it is to be observed that under sect. 31 the penalty is only threatened if a person "willfully fails to comply with the provisions of the section," not as in the case under sect. 26—"fails to make a return within the time specified."

The Master of the Rolls intimated that under sect. 31 he might have hesitated to make a declaration holding the form invalid, but the allowance of twenty-nine days in place of thirty being the only ground of complaint.

We have endeavoured fully to explain these decisions, as a very large number of property owners and land-agents are affected by these forms. It is, however, to be regretted that from the necessities of the case these judgments have come so late in the day, as some millions of notices, not in compliance with the Act, may have been issued involving owners of property in serious expense in obtaining professional assistance in answering questions which should never have been put. These two cases illustrate the importance to the public of access to the Courts being secured where Acts of Parliament have to be construed, and the dangers attending the uncontrolled action of officials.

Nuisance from Noise.

As very few cases are brought before the Courts in respect of nuisance from noise it is somewhat extraordinary that the case of *Becker v. Earl's Court, Ltd.*, which we noted in the *Builder*, November 17, should so soon have been followed by another case. Page and others v. Watt and others, heard before Mr. Justice Darling on November 24. The plaintiffs were the leaseholders and the occupiers of certain premises at Kingston-on-Thames, and they complained of nuisance from noise from a skating-rink next door. The nature of the noise complained of were somewhat similar to those in Becker's case, viz., a mechanical organ, the use of a siren and megaphone, and occasionally a brass band. On the granting of the license the defendants had undertaken to take certain precautions, and had done so, but it was alleged that these had not proved efficient in deadening the noise. The neighbourhood was not a very high-class residential district, the houses being small houses let to weekly tenants and having a railway and a tramway close to them; but the plaintiffs recovered damages, although an injunction was refused.

The damage to the leaseholder was the difficulty in securing tenants; but from the report of the case it is not clear what damages were proved by the tenants. In Becker's case, in the Chancery Division, it will be remembered, very strict evidence was required as to the injury to health complained of. It may be doubted whether noises of the character complained of in these two cases should be permitted at all in a residential district of any sort or description.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. Ward White, Chairman, presiding.

ENLARGING OF SCHOOLS.—It is proposed to enlarge the Berner-street School, to provide accommodation for an additional 348 places. At Brixton-hill Industrial School for Girls also to be enlarged, at an estimated cost of £500., to provide accommodation for 150 girls.

PARKS.—A sum of 100l. is to be spent in connection with the formation of an old English garden at Battersea-park, including drainage, water supply, and the formation of baths and a pond. The house known as "Higglewood" in Norwood-park is to be demolished and the site laid out as an addition to the park.

THEATRES, &c.—The following drawings have been approved by the Theatres and Public Halls Committee:—Hammersmith (King Rink, Brook-green-road—erection of a stand). His Majesty's Theatre—ventilation arrangements.

OFFICE AND GARAGE.—In a report of the Building Acts Committee it was stated that it is proposed to erect an office and a garage on the eastern side of Streatham-hill, Wandsworth, on the conditions that the building to be completed within eighteen months. **NEW TRAM BAYADE STATION.**—Owing to inadequacy of the accommodation at the station in High-street, West Norwood, it is proposed to erect a new station at an estimated cost of 15,000l. A site for this purpose is to be obtained, at a cost of about 500l., adjoining the tramways depot in Norwood-road.

CORRESPONDENCE.

The R.I.B.A. Examinations.

SIR,—In these times, when the desirability of registration of architects is more and more surely it is a pity that many unnecessary obstacles are presented to architects desirous of joining the Institute.

Being desirous of sitting for the direct examination for architects in practice, I inquired information and advice as to the Institute's requirements, and requested an interview with one of the head officers of the Institute. A message, however, was sent to the effect that the clerk in charge was quite competent to deal with all questions connected with the examinations. Surely this statement scarcely encourages practising architects to join an Institute whose officials hedge about by such circumlocution. Comparisons are odious, but one cannot help comparing this attitude with that of the Surveyors' Institution, where the humblest student may be sure of instant access to, and advice from, the Institution's officials.

F.S.I.

Licentiatehip R.I.B.A.

SIR,—The letter of "Enquirer" on the above subject and the necessary *ex qualifica* as imposed by the "powers that be" will, I am quite satisfied, appeal strongly to many of our younger practising architects, who would willingly join this Licentiate Class, and so have all the necessary qualifications and proved ability, yet are lacking in years.

I know of many instances, and, with your permission, will quote my own as an example, scribbling myself under a *nom de plume* that may be no indiscretion.

I have been in active practice as an architect for the last six years, and have carried several important public buildings, ranging in cost from 8,000l. to 13,000l. Within the last two years I have entered for seven competitions for various public buildings; I have won three out of these, being elected first in each instance, and have been pointed to carry out the work. I am told that three out of seven is not a bad rate.

I am at present engaged in preparing the working drawings, etc., for two public buildings of some importance, one of which I won the competition, the other was given to me on reputed merit alone.

Naturally readers will say, "Why not sit the examination?" My answer is this,

and I know there are many similarly situated, that I am forty-five minutes by rail from the nearest large town where I might expect to find the necessary tuition facilities; and I do not think the oldest and most experienced Fellow of the Institute will deny that to again pass the examination he would have to submit himself to careful and more or less prolonged study. Now, my time is fully occupied, and has almost always been with work which I carry out with the help of one junior assistant only; there are people who are dependent upon me and my efforts. How can I find the time or inclination for hard study, with the possibility of failure after several months' work?

I am twenty-eight, and very sore about it.

SECOND ENQUIRER.

Official Architecture.

SIR,—The injustice of the so-called temporary employment complained of by "Edenway" and other architectural assistants in H.M. Office of Works extends far beyond them. The Office of Works is riddled by temporary employees, many of whom have spent the better part of a lifetime there, and are entrusted with a large measure of technical and financial responsibility. In an Editorial Note you have already called attention to this so far as it relates to the clerks of works.

One would think that the First Commissioner of Works must be aware of this long-continued injustice. Ten years' service is better than any examination to determine if a man is suitable for permanent employment, and is also a fairly safe indication that there is sufficient work to warrant the Department in making a permanent appointment. The justice of this must appeal to the First Commissioner, so that the injustice of depriving men of well-earned pensions will be removed without resource to combinations and agitations.

With regard to the statement that official architecture is costly, I do not think that there would be much difficulty in proving that the Office of Works obtains better bargains in their buildings than the average outside architect; but I wish to emphasise the fact that this is largely due to the efforts of the men who are turned off at sixty without a pension.

X.

Cost of Joinery.

SIR,—I have read a letter signed "F. M." in your issue of last week with reference to the above. The statement "F. M." makes may or may not be so in London. This I do not wish to argue or discuss here, but, in my opinion, if the facts are as stated, would it not be fairer and more sportsmanlike for him ("F. M.") to privately and confidentially inform his late firm, with data, of these unscrupulous and dishonest transactions, to enable them to thoroughly thrash the matter out and put a stop to same?

I do not think in the long run that "F. M." would lose by this, and, undoubtedly, at the same time, building trade and joinery works' employers have to thank your correspondent for bringing this matter to light.

I only hope that should any of this kind of thing be happening in London (besides the case mentioned above) that "F. M.'s" letter may induce others, like himself, to go straightforwardly to the heads of the firms and inform them of these malpractices.

JAMES F. PARKER.

The Port of London Offices Competition.

SIR,—As one of those who, in season and out, both at the Institute and in the Press, have urged the limitation of unnecessary work in architectural competitions, may I be permitted to appeal to Sir Aston Webb in respect to the Port of London Offices Competition?

As the preliminary drawings will only be seen by those officially connected with the competition, there is no need for many drawings, and particularly for the perspective view, which will entail a collective expenditure of probably 1,000l. Further, one elevation and one section would be sufficient to indicate the external and internal treatment.

In the Marylebone competition Mr. Hare has gone on right lines in eliminating perspectives, but I venture to think he might have gone one further and spared the pro-

fession the 180 unsuccessful details which have probably cost their authors some 900l.

I would respectfully ask our assessors to bear in mind what I have before urged, viz., that for preliminary purposes plans alone are necessary.

L.

Shop Front in Dover-street, Piccadilly.

SIR,—In the article in your last week's issue on the works of Mr. Walter Cave, architect, I notice an illustration of a shop front designed by him in Dover-street, Piccadilly (now demolished). May I be allowed to point out that there is a very similar original old shop front, built in the George's time, still existing on the east side of the Haymarket, London, near Piccadilly-circus; it is now occupied as a tobacconist's.

Doubtless all *habitués* of the West-end know this delightful old shop, but many of your country readers may be unacquainted with it.

HORACE T. BONNER, A.R.I.B.A.

Memorial to King Edward VII.

SIR,—Amongst the various sites suggested I have not seen that one at present occupied by the statue of Achilles in Hyde Park as a likely one.

There could not be much objection or difficulty in removing that memento of the Crimean War to congenial surroundings, say, the War Office end of St. James's Park, and adapting the ground for a memorial to our "peace-loving King."

I venture to think the change would be welcomed and appropriate.

WM. RAINE SELWOOD,
Registrar, Wandsworth Technical Institute.

INTERCOMMUNICATION COLUMN.

Terrazzo Floor.

SIR,—A terrazzo floor laid in a large apartment a few years ago has recently risen considerably in the centre. An examination shows that the terrazzo and floating layer of cement and sand have parted from the concrete bed under, the surface of which appears to be in perfect order and not to have risen.

The concrete bed was composed of ashes and cement, and on breaking it up particles of coal were found in it.

It is alleged that the gases generated by the coal in the concrete bed have burst the terrazzo upwards, but it appears to the writer that any ordinary hair crack would be sufficient to allow any such gases to escape without lifting the floor, and that the effect of such gases—if any would be evident in the concrete.

Can any of your readers explain such a movement, and what effect particles of coal would have in the concrete itself? J.

Hot Water and Galvanised-Iron Cisterns.

SIR,—I should be exceedingly obliged to you or to any of your expert readers who would be kind enough to give me the benefit of their experience in connexion with the action of hot water on galvanised-iron cisterns.

My water supply is derived from a well and the hot water for the bath is collected in a galvanised-iron cistern. The constituents of the water are such that it has a deteriorating effect on the cistern, and in three years' time it works through. This is the length of life of a new cistern which I put in three years ago.

I am told by the builder that there is no alternative but to put in a new cistern, and, if such is the case, I must face the prospect of having to renew the cistern every three years.

I cannot but think there must be some other remedy, and, as I have said, I should be exceedingly grateful for any advice on the subject.

J. A. C.

LIBRARY OF THE VICTORIA AND ALBERT MUSEUM.

The Board of Education give notice that the Library of the Victoria and Albert Museum will be closed from December 12 to January 20 inclusive for cleaning, relighting, and general renovation.

EDITORIAL SUMMARY.

"False Economy" is the title of the leading article, which deals with the desirability both to the tenant and the landlord of destroying obsolete property.

A second article, on "Modern Architecture in the East," is given on p. 624, being a consideration of the factor of native craftsmanship in the design of modern buildings in India.

In "Notes" columns (p. 624) will be found observations on: "Official Architecture in Glasgow"; "The British School at Rome"; "Direction of Students"; "Danger of Control"; "Necessity of Freedom."

Some picture exhibition notices will be found on p. 625.

The Architectural Association Conversazione was held on Thursday last week, and a brief notice will be found on p. 626.

Under "Architectural Societies" (p. 626) brief reports are given of: "Manchester Society of Architects"; "Liverpool Architectural Society"; "Aberdeen Architectural Association"; "Leeds and Yorkshire Architectural Society."

An illustrated review of the Marylebone Municipal Buildings Competition Drawings is given this week (p. 628). In our next issue we shall have other observations to make and give further illustrations of some of the designs.

Book notices (p. 635) include: "In the March and Borderland of Wales"; "The Art of Polychromatic and Decorative Turnings"; "The Principles of Planning Buildings."

Legal Column (p. 636) includes comments on: "Nuisance from Noise"; "Land Valuation: Forms IV. and VIII."

In our Correspondence columns (p. 637) will be found letters on: "The R.I.B.A. Examinations"; "Licentiate R.I.B.A."; "Cost of Joinery"; "Shop Front, Dover-street, Piccadilly"; "Memorial to King Edward VII."; "Official Architecture"; "Port of London Offices Competition."

At the meeting of the Architectural Association on Monday a long and interesting paper was read by Mr. Arthur T. Bolton on "Jacobean Architecture," and a large number of lantern slides were shown. The paper is given in place of our usual Monthly Review (p. 639), where some illustrations in connexion with it will be found. One of our plates is also devoted to some of Mr. Bolton's illustrations.

The annual report of the London County Council in reference to school buildings is noticed on p. 650.

The Building Trade Section (p. 651) includes the following: "Allow or Provide?"; "Unemployment Insurance"; "Cement in Egypt"; "Forced Building Labour in the Middle Ages"; "Projected New Buildings in the Provinces"; "Applications under the Building Acts, 1894-1909," etc.

In Law Reports (p. 654) will be found a report of a case under the London Building Acts.

MEETINGS.

FRIDAY, DECEMBER 1.

Institution of Civil Engineers (Students' Meeting).—Messrs. J. and W. Legg on "Brake-lining Coefficients of Friction." Dr. W. C. Unwin, F.R.S., President, will occupy the chair. 8 p.m.

SATURDAY, DECEMBER 2.

Aberdeen Architectural Association.—Mr. G. M. Fraser on "John Smith, City Architect, and His Work in Aberdeen." 7.30 p.m.
Incorporated British Institute of Certified Carpenters.—Annual dinner, *Isologue Restaurant*, 27, Gornard-street, W. 7 p.m.

MONDAY, DECEMBER 4.

The Royal Institute of British Architects.—Business meeting. Exhibition of photographs of buildings in Italy, Greece, etc. 8 p.m.
Royal Society of Arts (Cantor Lecture).—Professor Vivian B. Lewes on "The Carbonisation of Coal"—II. 8 p.m.
Liverpool Architectural Society.—Mr. W. H. Ward, M.A., on "Renaissance Church Architecture." Illustrated by lantern slides. 6 p.m.

The Society of Engineers.—Mr. Henry Adams on "The Design of Tall Chimneys." 7.30 p.m.
Victoria and Albert Museum (University of London).—Mr. Banister Fletcher on "The Châteaux of the Loire and other French Renaissance Buildings." 5 p.m.

TUESDAY, DECEMBER 5.

British Museum (University of London).—Mr. Banister Fletcher on "Temples of the Ionic Order." Lantern illustrations. 4.30 p.m.
Institution of Civil Engineers.—Paper to be further discussed, "Electric Lighting of Railway Trains, The Brake Vehicle Method," by Mr. R. T. Smith, B.Sc. 8 p.m.

WEDNESDAY, DECEMBER 6.

Royal Archaeological Institute.—Professor T. McKenny Hughes on "Some Sources of Error in Assigning Objects Found in Sands and Gravels to the Age of those Deposits with Special Reference to the so-called Eolijths." With lantern illustrations. 4.30 p.m.
King's College (University of London).—Professor Elsey Smith on "Early Roman Churches." 5 p.m.
Manchester Society of Architects.—Mr. Paul Ogden on "Science and Proportion." 6.30 p.m.
Institution of Civil Engineers. Students' visit to the Liverpool Street Extension Works of the Central London Railway.

THURSDAY, DECEMBER 7.

Society of Antiquaries.—8.30 p.m.
Institution of Electrical Engineers.—Dr. R. Pohl on "National and International Standards for Electrical Machinery." 8 p.m.

FRIDAY, DECEMBER 8.

Aberdeen Architectural Association (in the Northern Arts Club).—Mr. G. M. Fraser on "A Historical Tour in Aberdeen." Illustrated by lantern slides. 7.30 p.m.
Glasgow Technical College Architectural Conference's Society.—Mr. John Crawford on "The Duties of a Foreman Mason."

SATURDAY, DECEMBER 9.

Incorporated British Institute of Certified Carpenters (Carpenters' Hall, London-east, E.C.).—Annual general meeting. 5.30 p.m.

ILLUSTRATIONS.

Church of St. Mary the Virgin, Dorchester.

THIS church has been in course of construction for the past eighteen months in a new district of Dorchester, and is now drawing near to completion, with the exception of the tower, which (but for its lower stage), together with the screens and reredos, has had to be postponed. It will be seen that the plan is cruciform, but without the obstruction to the interior which is inevitable with a central tower; the organ is placed in a spacious chamber over the larger vestry, while the heating chamber is below the lesser. The gallery over the screen is available for a band. The roof over nave and chancel has a continuous barrel vault, 132 ft. long by 40 ft. high, divided internally by the screen and externally by the flèche; the roof of the chapel is similarly vaulted, the arched passage between this and the chancel has a groined vault in stone. The archways of the tower are of the West-County pannelled type, while the jambs and pillars of all others are plainly splayed, the arches only being moulded; the walls are of brick faced externally with Swagone stone, and all dressings are of Monk's Park freestone, and the roofs are tiled. The chancel, which is a special gift, has black and white marble paving and steps. The floor of nave and aisles slopes upwards towards the east, thus making use of the foundations necessitated by the fall in the site.

Mr. C. E. Ponting, F.S.A., of Marlborough.

Church of St. Mary, Dorchester.

Mr. Charles E. Ponting, F.S.A., Architect.

is the architect, and the contractors are Messrs. Hoskings Brothers, of Newbury.

Our view of the interior is taken from the drawing hung in the Royal Academy this year.

The Red House, near Hitchin.

This is a sketch design by Mr. J. Algonne Hallam, representing a house with a good-sized living-room and a small dining-room. The intention was to design a quiet house not relying on detail for effect, and to reduce external paint to a minimum. The bricks would be 24 in. dull red, the roof covered with purple brown hand-made tiles, the casements iron copper plated with lead glazing. The front door would be of oak. The gables on garden elevation would be covered with oak weather boarding.

Jacobean Architecture.

Our illustrations of Bramshill, the Bodleian Library, Oxford, and the porch of St. Mary's Church, Oxford, are in connexion with Mr. Bolton's paper on Jacobean Architecture read before the Architectural Association on Monday (p. 639).

FIFTY YEARS AGO.

From the *Builder* of November 30, 1861.

Terrible Disaster in Edinburgh.

EDINBURGH has just been the scene of a horrible catastrophe. One of those gigantic turrets in the High-street—that grand old street which connects the Palace of Holyrood with the castle—has fallen, and in its fall has buried the bodies of its ill-fated inhabitants. Up to the period at which we write, twenty-nine lives have been lost, fourteen persons have escaped with injuries more or less severe, and ten or twelve are missing.

The house whose sudden fall occasioned such a fearful loss of life is supposed to have been nearly 300 years old. The timbers were decayed and rotten, particularly the joisting. To all external appearance, indeed, it seemed more substantial than many of the old houses beside it; for, by one of those modern refinements in shop alteration, the original plaster front had, to some extent, been replaced by a front of ashlar. But the general rickety condition had long been palpable.

NATIONAL GALLERY OF BRITISH ART, MILLBANK.

An exhibition will be opened on December 14 for three months of the collection of works by English Pre-Raphaelite artists belonging to the Corporation Art Gallery, of Birmingham, which is in course of being rebuilt. The collection comprises Millais's "Blind Girl," Holman Hunt's "Christ in the Temple," and "Two Gentlemen of Verona," and Ford Madox Brown's "Last of England," with drawings by Rossetti, Sandys, Millais, and others.

SOME THOUGHTS ON JACOBEBAN ARCHITECTURE.

At the meeting of the Architectural Association on Monday a paper was read by Mr. A. T. Bolton, entitled "Some Thoughts on Jacobean Architecture," which we are enabled to give in full together with some of the illustrations the lecturer showed.

Mr. President, Ladies, and Gentlemen, respecting to deal with so difficult a subject as Jacobean architecture I shall not have reverted to an original conclusion of A.A. meetings, which was, I think, that those who might know a little should endeavour to enlighten those who might be assumed to know even less. Unless I have always found the subject of Jacobean architecture very obscure. Though I have consulted a great variety of books in various libraries, I have rather ventured, as far as has been possible, to personally or revisit some of the chief things of the period. Houses in the line of their use cannot be very accessible. I am glad of this opportunity of making acknowledgments of some very kind lessons accorded to me. I have also to thank *Country Life* for a loan of sixty slides from their well-known illustrations of old houses, and Mr. Batford for the selection of thirty-five plates from Messrs. Gotch and Talbot Brown's book read here this evening.

Books a list might be made, but Mr. Field's lucid "History of the English Renaissance" and the great folio of Messrs. Talbot Brown have practically covered the older works by Nash, Addison, and Hall. To such authorities I can only express obligations, and differ necessarily at one's own risk. The researches of Mr. Wyatt Papworth between the foundation, and useful additions have been made by Mr. Harry Sirr in the *J.B.A. Journal*, and by Mr. Walter G. R. Lacey, the curator of the Soane Museum, in the useful notes he has compiled for students from Thorpe's book. I shall hope to set out all the available facts, and then leave it to form your own conclusions.

Following further discoveries, many points of discussion must remain open, but the evidence seems reasonably to support deductions that seem likely to be may well be drawn.

Domestic Architecture.

Domestic architecture is essentially a dated subject. Those of you who have entered into the history of a house extending two or three centuries will agree that the customary absence of records, either of original or reconstruction operations, renders

many common assumptions and historical deductions very unsafe. Broadly speaking, we shall find that each generation makes its own alterations, and that sales, with the accompaniment of new ownership, are pretty certain dates of successive upheavals.

As an example it is amusing to see a house classified as of an H plan if you happen to discover that the wings are additions to a house, originally square, by some later owner.

The hardest case of all is that of a house started on a basis of alteration or addition to an existing structure, and developing, in the course of building work, into a reconstruction so complete that the original house has been lost sight of and forgotten.

It has, however, lived on in the restrictions that it imposed on its successor.

There are also cases where the client has evidently not been satisfied, and reconstructions have taken place even before completion.

A good many facile deductions based on plans of old buildings rest, I am inclined

to believe, on similarly insecure foundations. It is as well to bear in mind our own experiences in house-building, and to allow for the prevalence of human nature in all epochs.

The compromises of to-day were certainly equally enforced in the past, but we run to extremes when we exaggerate the roll of the paymaster. I think various allegations as to the non-existence of architects and a good many fanciful theories as to the genesis of old buildings should be profoundly modified by considerations of this order.

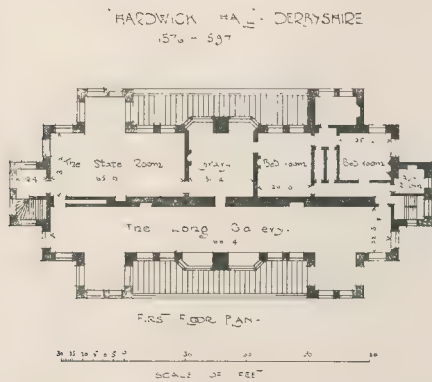

Arguments based on the correspondence relating to Burleigh House, for instance, should allow for the fact that no Elizabethan exterior is more incoherent or unsatisfactory. Burleigh, in fact, was exceptionally deficient in architectural control. The best feature remaining of the Elizabethan interior, the great staircase, an interesting variation of the Italian type of stairs with ascending vaults, shows that in parts, at any rate, architectural skill of a high order must have been enlisted.

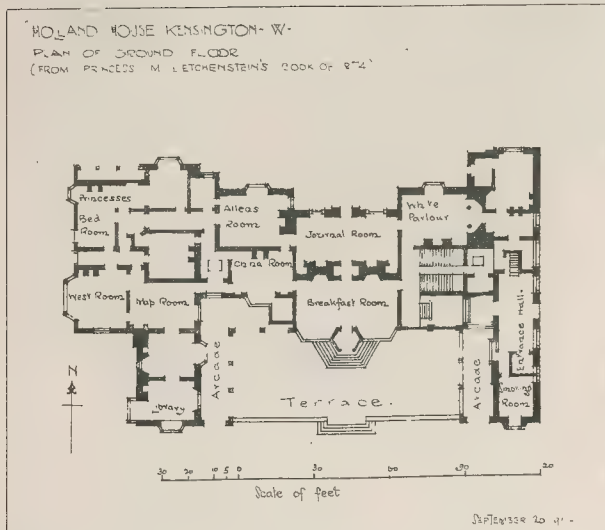

Let us keep in mind all through the point of view of the working architect, who knows very well the decisive influence of the architect's presence at his building.

We know that these ancestors had special riding allowances, and, as Mr. Blomfield puts it, "much of Inigo Jones's time must have been spent in the saddle." The same must have been true of the Thorpes and those others who so far are only names to us.

There is no sense in looking for our signed sets of contract drawings and details at that time of day. You will find the 280 pages of Thorpe's collection and the Inigo Jones's Burlington-Devonshire set of drawings very illuminating as to the methods of these men; but these documents are not the whole story. Even now we know how far-reaching are the decisions on the ground and the bearing of actual set-out and *viva-voce* instructions to men with whom we have worked before. Critics to command our attention must view their problems with the eyes of an architect and with that intuitive perception of style that springs from familiarity with a man's work.

You would, all of you, distinguish without hesitation the work of Inigo Jones from that of Wren, for instance, and the work of the Thorpes and others might in time be made equally distinct.

What is Jacobean Architecture?

What do we mean, then, by Jacobean architecture? I propose mainly to adhere to the reign of James I. and its sequel under Charles I., but in no case to cross the gulf of the Civil War. In view of this, I have with reluctance omitted to deal with the beautiful College of Clare at Cambridge. The Palladian work of Inigo Jones is also outside the subject.

The twenty years from 1640 to the Restoration made many travellers, and when the exiles returned a process of refashioning old homes began that only want of money could avert. Wren, who had stayed at home, found it expedient to go abroad, but, as is well known, his tour was cut short in France. I take that story of Charles II. ridiculing his ideas as to the height of rooms as a hint of the pressure put on architects to abandon the sound English ways of Elizabeth and James.

The Guildhall in "the ever-faithful city" of Worcester has always impressed me as striking evidence of the change forced on by the war.

In this frame of mind attention was concentrated on the purely Palladian work of Inigo Jones. This increased in strength in the following century, when his work began to be published in the light of current XVIIIth-century practice. It is only in the latter part of the XIXth century that efforts have been made to disentangle the work of the master from that of his disciples.

We ought to be able now to view the matter without bias, taking, perhaps, a further step in the direction of distinguishing his essays in the earlier manner. The complete portrait of Inigo Jones can only be arrived at by realising that he could not for all time be a bondsman in the house of Palladio.

Jacobean architecture for our purpose, therefore, is that from 1600 to 1649, just the first half of the fascinating XVIIth century. Apart, however, from that, I think all of us do distinguish between Elizabethan and Jacobean work that is, between the preceding half of the XVIIth and the following first half of the XVIIIth centuries.

Off-hand most architects would state a distinct preference for the former, and admit a belief that Jacobean work was a decadence from a more vigorous and interesting class of work.

Social History of the Times.

Possibly this may be unconsciously influenced by the political history of the time. The average Englishman thinks the reign of James I. stands in need of some apology, that it was a falling off from the glories of the Elizabethan age, a slackening of the

native pulse and a lowering of the national ideal. Certain actions, such as the execution of Sir Walter Raleigh, have become fixed in the public mind as disgraceful, and have been regarded as typical of the epoch as a whole.

Probably the truth may be found in recognising that it was a transition age, with all its accompanying difficulties, weaknesses, and occasional acts of baseness. Those of you who can read Green's "Short History" with pleasure and interest will recall the main outlines of the situation. Perhaps you will agree that after the vigorous personal government of Elizabeth, where the caution of the woman was aided by the astuteness of statesmen of exceptional powers, a man of unusual genius was needed to preside over this inevitable transition.

This is, of course, if you agree that "There's a Divinity that shapes our ends, rough-hew them how we will," and that the growth of England was bound to be in the main as we know it has been.

In that case you will admit perhaps that James I. could have with more reason than Hamlet exclaimed, "The time is out of

joint. O cursed spite That I was ever born to put it right!"

I seem to remember reading long ago some essay—I think by Professor Elmes, father of the architect of St. George's Hall—in which James was written of as the British Solomon, and an elaborate effort was made to establish his reputation for wisdom.

Common opinion, however, maintains that the seeds of future trouble were sown in his reign, and holds him responsible for a system of favourites at once showy and unreliable, and also for the education of his son Charles I. on lines which led him straight to the scaffold.

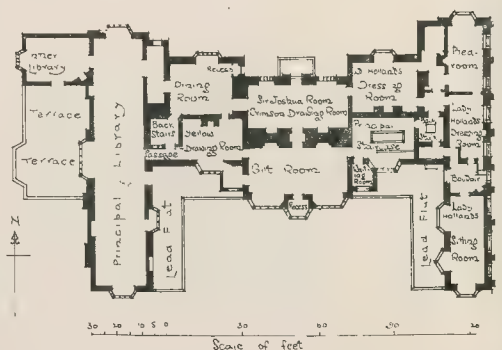

To James is assigned the origin of the proverb that "those who live in glass houses should not throw stones," the circumstances being that Villiers, Duke of Buckingham, had erected for himself a building so windowed as to be known as "the glass house." Having fomented a disturbance, and the mob retaliating by breaking his windows, he complained to the King, who countered him with this characteristic utterance. We cannot acquit James of fostering the pedantry that was the curse of his age. He should have come under that great schoolmaster who had the courage to declare in an age of classical quotation that he expected a gentleman to have forgotten his classics.

In Thomas Fuller's memorable account of the wit combats at the Mermaid you will remember that Ben Jonson figures as the heavy Spanish galleon and Shakespeare as the nimble English galley, such as achieved the defeat of the Armada. The truth seems to be that very few people struggle with the complicated, allusive writings of Ben Jonson. He entirely missed the sure touch of Nature that pervades the writings of Shakespeare, preserving and handing them on from one age to another, through a constantly-expanding audience.

Of the darker side of James's character we get glimpses in the literature of the period. To Laud accompanying Prince Charles on his madcap voyage to Spain in 1623 he gave instructions that, as the Spaniards might resent a recent Royal reference to the Pope as Antichrist, he was to set forth "that his Majesty had written nothing in that point conclusively, but by way of argument." His Chancellor, Bacon, knew what he was about when he wrote to the effect that dissimulation was allowed to kings as a part of policy.

Confronted with a real revolution of thought, as set forth in his Chancellor's "Novum Organum," James could see nothing more in it than that "it was like the peace of God, which passeth understanding."

HOLLAND HOUSE KENSINGTON - W.
PLAN OF FIRST FLOOR
(FROM PRINCESS M. LETCHENSTEIN'S BOOK OF 1874.)

two turning points of Bacon's life in the first quarter of the century—appearance against Essex, a former friend, and his abasement before Buckingham which preceded his impeachment and execution in 1621. A Jacobean Plutarch would have drawn Seneca and Bacon both to illustrate the failure of the highest intellectual gifts unbalanced by character. The pregnant wit of the "Essays" is made the reader. Imagine one of them dealing with the story of King Lear. The politics of the King would be illustrated best, the relations between fathers and sons touched on with the most pithy wisdom, the Edmund's moral, "Thus the just of our pleasant vices make whips to us," would be duly enforced. It is to assert, however, that the terror and of the tragedy would be wholly

is unquestionable that Shakespeare's underline passing events, that in "Lear," for instance, there are reflections on King James's Court; but it is very curious to identify passages without the very wide historical reading. Broadly speaking, the masques were for the Court and the plays for the people, but popular plays were commanded for performance at Court. Some of the duller historical details doubtless "walked" by means of a fine interpretation that is lost upon

There is an instructive portrait of James I., somewhat different from other contemporary versions to be seen in the great houses of this date. In spite of the, of the threatening storm-clouds hanging overhead during this half-century, the darker aspects of the life of the mind and other assumed signs of decadence, and this paradox, that in architecture, painting, and not to mention other arts and sciences, we stood, as it were, on the verge of a veritable golden age. You will find this most interesting in a close student of the XVIIth century, the late Mr. Shorthouse, whose novel "Inglesant" will be known to many

place could have been found which is more to interest and delight a man of less than Oxford did at the time. It was still at the height of prosperity which it had enjoyed under Henry and Laud for so many years, but it was soon to be so sadly overcast.

Aston Hall : The Great Gallery.

The colleges were full of men versed and intelligent in all branches of learning and science, as they were then taught. The halls and chapels were full of pictures and of rich plate, soon to be melted down; the gardens and groves were in beautiful order, and the bowling-grounds well kept. . . . Music was studied deeply as a science, antiquity and every foreign country being ransacked for good music, and every gentleman pretending to some knowledge of it. . . . Every kind of curious knowledge was eagerly pursued; many of the Fellows' rooms were curious museums of antiquities and relics, and scarce books and manuscripts. . . . The niceties of algebra and the depths of metaphysics were inquired into and conversed upon with eagerness, and strange inquiries upon religion welcomed. A violent controversy was going on among the physicians, and new schools had risen up who practised in chemical remedies, instead of the old-fashioned vegetable medicines. I must ask you to allow that the shifting direction of Tudor, Elizabethan, and Jacobean foreign and social policy has its reflection in our architecture. Italy, France, the Spanish Netherlands, the liberated Netherlands, Spain itself, and more transiently Germany, each and all were shifting centres of influence.

"To think an English courtier may be wise and never see the Louvre." As the course of the Reformation and counter-Reformation fluctuated, so importations of divergent tendencies came and went. It was not only by the diffusion of ideas and of books and prints, but also by the actual immigrants, largely workers and workmen, that these forces were felt. All the while, however, England was finding herself not only politically, but also artistically, and as a man grows, absorbing or rejecting those elements which the state of her development dictated. The English as a race being at once unaccommodating and assimilating, the alien artists were absorbed or pushed out. Once more we see William the Englishman taking the place of William of Sens, but it serves no purpose to doubt their existence or deny their influence. Architectural historians have been perfect pendulums on this question. At one time everything is ascribed to Italians, Spaniards, or Flemings, while at another all must be native, making it, I think, pretty clear where the truth lies. The fruit-grower is not concerned to deny that his trees have been grafted.

Architectural Position at Accession of James I.

We will now turn to consider the architectural position at the accession of James I. (1603). The flood tide of Elizabethan house-building was slackening, and we might call to mind the Shakespearean comment in the second part of Henry IV., which has a supposed reference to the transfer of the players to Bankside, and the building of the Globe Theatre in the winter of 1598-9:— "When we mean to build, We first survey the plot, then draw the model; And when we see the figure of the house, Then must we rate the cost of the erection; Which if we find outweighs ability, What do we then, but draw away the model In fewer offices; or at least do so: To build at all? Much more in this great work

should we survey The plot of situation and the model; Consent upon a sure foundation; Question surveyors; know our own estate, How able such a work to undergo, To weigh against his opposite; or else We fortify in paper or in figures, Using the names of men instead of men, Like one that draws the model of a house Beyond his power to build it, who half-through Gives over, and leaves his part created cost A naked subject to the weeping clouds, And waste for churlish Winter's tyranny."

This passage comes home to us when we remember that architect and surveyor were largely interchangeable terms. It gives us also an observer's impression of the abandoned Elizabethan houses to be seen in desolation and incompleteness.

By the end of the XVIth century a vast fund of experience had been accumulated. Able workmen abounded, and the need of the moment was for some directing mind to focus the confused and scattered elements into a lucid whole, formulating a line of action along which future progress could be assured. You all know how the need was met, and

that in Inigo Jones an architect appeared whose work was destined to bridge even the gulf of civil war and to determine the future course of English architecture.

Work of the Thorpes.

You ought not, however, I think, to regard the Elizabethan and Jacobean ages as unprovided with skilful architects. Quite a list of names of men, whose biographies we should be only too glad to have, has been collected. We may, however, deduce from the Thorpe collection of plans, drawings, and designs that in the Thorpes, father and son, we have a type of the high degree of zeal and intelligence that the age produced. Peacham's reference in the "Gentleman's Exercise," first edition 1612, is:—"John Thorpe of the Parish of St. Martin's in the fields, my especial

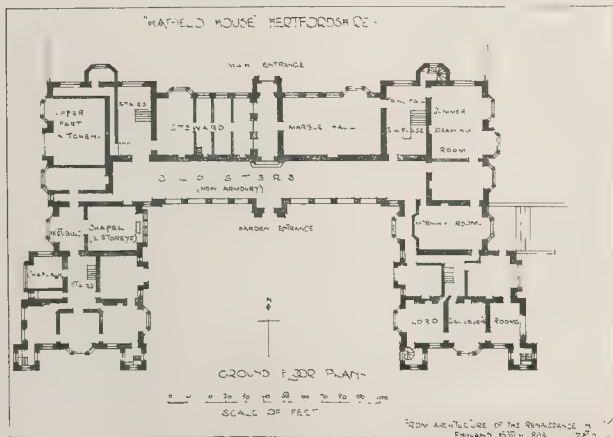

friend, and excellent geometrician and surveyor, whom the rather I remember because he is not only learned and ingenious himself, but a furtherer and favourer of all excellency whatsoever, of whom our age findeth too few. And lastly the aforementioned Master John Thorpe his sonne, to whom I can in words never be sufficiently thankfull."

The impression produced by a careful study of the Thorpe drawings is that in them we have the record of studies made and designs conceived in the true spirit of the working architect.

Thorpe was interested in many things, and, above all, desirous of extending his outlook. He seems to be groping after the development that Inigo Jones was to achieve. It seems possible, assuming, as is most likely, that we are dealing with two Thorpes,

that it was the son who was in Paris in 1600 and received Sir Henry Neville's recommendation for promotion in England. Drawings of Paris buildings, dated 1600 are in the collection. The tendency, however, is to look to Antwerp and Amsterdam rather than Paris. The older Thorpe's weakness is an undue love of ornament and profuse picturesqueness of features, such as is also seen in the books of Du Cerceau and most of all in those of Vriese, with whose works Thorpe seems to have been very familiar. Du Cerceau flourished between 1520 and 1584, but neither birth nor death are known. After a journey to Italy, he settled down, about 1549, as head of an atelier of engravers at Orleans, and, beside a series of books, probably issued quantities of prints for designers, such as those *taille douce* which Wren collected during his brief visit to France in the next century. Du Cerceau was a pirate so far as most of his books were concerned, but his *magnum opus* "Les Plus Excellents Bastiments," which was on hand from 1550-76 (when the first volume appeared, followed by a second in 1579), has, I think, some bearing on the question of the Thorpe collection. The châteaux and Royal Palaces are represented by a plan and an elevational perspective or bird's-eye drawing. Some of these are said to be drawings obtained at the building which Du Cerceau visited, on the ground that he could not have measured them in actual cases, and also because some of the drawings are evidently of an earlier date than others. May it not have been the case that Thorpe vaguely contemplated a similar book, and took some steps in the direction of collecting the materials, but that, being a working architect, and having no school of engravers behind him, his collection remained as mere data for his own use?

What we seem to want is that some representative body interested in architecture should undertake to facsimile for students and general use such collection of early drawings as those of the Thorpes and of Inigo Jones. With the best will in the world on the part of owners the must otherwise be largely inaccessible. You

undoubtedly aware that this has been
sively done in Italy from the drawings
great Italians, which are thus made
ble to all. It is beyond the resources
individual architect. It is essential
should be complete, and not partial.

Hatfield House, Herts (1607-11).

ends nor centre. Inside the house, the Great
Chamber, or Gilt Room, is of considerable
interest, as the white-painted and decorated
panelled walls remain as hastily prepared for
a ball to be given at the time of Henrietta
Maria's marriage with Prince Charles in
June, 1625.

We know that in 1623 Inigo Jones had
orders to prepare two chapels, one at Denmark
House and the other at St. James's for the
Infanta's use, and then he went to Southamp-
ton to prepare for her reception, being made
a Burgess of that city on the occasion.

From this and the fact of the unques-
tionable Inigo Jones character of the two well-
known gateway piers his connexion with this
work has been assumed.

Francis Cleyn, a painter and decorative
artist from Denmark, employed by Charles I.
as Designer of Tapestry at Mortlake,
seems to have been engaged upon it,
and he has produced a quaint and interest-
ing, if spotty, effect. The imitated
marbles, green, black, and red, of the wooden
mantelpieces and frieze are an interesting
indication of hurried preparation. The car-
touche shields in the angles of the cornice of
the room seem rather an Italian reminiscence.

The late Mr. Watts, R.A., has painted on
the large panels of the mantelpieces in the
shadowed gold work four figures in the style
of those existing in St. Catherine Cree.
Otherwise, the Gilt Room is said to be un-
touched, apart from the ceiling, which fell,
and has been replaced by a copy of one
from Melbury.

The staircase has been altered, and also the
Chapel, but there are some other oak mantel-
pieces of the period. The Gallery is now the
Library, and all lined with books. The ceil-
ing has been transformed into bays with top-
lights. Much of the interest of the fine and
historic interiors is naturally of a later date.

In forming an idea of London in the
Jacobean age, bear in mind that brick build-
ing did not become general till after the Fire
of London. Lincoln's Inn-fields and Covent
Garden Piazza were both novelties, and the
great stone and brick houses along the Strand
and Whitehall Palace itself were on the lines
of Hampton Court, Old St. James's, and
Lambeth Palace—country houses in town.

Sir Paul Pindar's House.

Sir Paul Pindar's house, the front of which
is familiar to you all, in the Victoria and
Albert Museum, is therefore of exceptional
interest. The Museum authorities, doubtless
for good reasons, have dated it 1600 instead
of "about 1625," as formerly. Sir Paul
Pindar is supposed to have been born 1565
and died 1650. A native of Wellingborough,
he was educated at the University, but pre-
ferred commerce, and, entering the city, was
sent to Venice at the age of eighteen as factor
for the firm. He was there eighteen years,
and in the crisis of 1601-2 is said to have
been Cecil's agent. For two years Consul at
Aleppo, 1609-11, he was Ambassador nine
years in Constantinople, but he was in
England in 1616, and again in 1620, when
he was knighted. His final return was
1623. A man of vast wealth, he had large
financial dealings with Charles I., and
was, besides, a generous contributor to the
work of St. Paul's. After his death his
affairs were found in hopeless confusion.
From this brief notice you will see that this
house front is of the greatest value, as one
which was considered adequate for a
millionaire at that epoch.

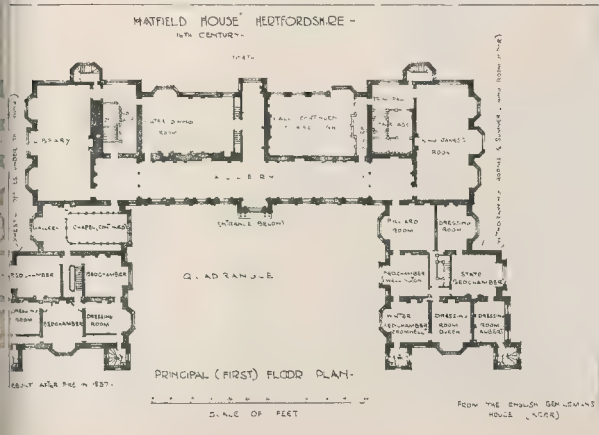

Aston Hall.

Aston Hall, 1618-35, and Chilham Castle
are near in date, but far apart in architec-
tural character. Aston, in feeling, is more
Elizabethan than Jacobean, particularly in
its interior work. It hangs back in the stage
of bossy, fretted profuseness from which the
new work of the century was freeing itself,
and, except in the gallery ceiling, shows little
assimilation of the lessons that were being
derived through the Italians from classic art.*

Inigo Jones's Work.

There are two plans of Aston in J. Thorpe's
collection. One would like to take Kirby Hall
as John Thorpe's masterpiece. We shall re-
turn to it later on. Turning now to the rising
sun, and taking the dates of Inigo Jones's life
as ascertained by the best authorities, we
get the following:—Born in 1573, on his
father's death in 1596 he proved the will on
April 5, 1597, and went to Italy up to 1604,
and may have been at the Danish Court in
the service of King Christian prior to that
date. He is known to have been in England
for the Masque of Blackness, presented by
Anne of Denmark, wife of James I., on
Twelfth Night, 1604-05. In August, 1605, he
took part in the production of three plays at
Oxford before the King. King Christian of
Denmark was a visitor to England in 1606.

* It is much to be wished the Birmingham
Corporation might realise their unique oppor-
tunity for creating a typical Jacobean Museum.
Stuffed birds are barely adequate exhibits in
such surroundings. The XVIIIth-century house
at Ypres is the model suggested.

Inigo Jones was a King's Messenger to France in 1609. He was appointed Surveyor to Henry, Prince of Wales, from January 16, 1610, up to his death on November 6, 1612, and was a good deal occupied in the production of the famous Court masques, supplying scenery and devices to Ben Jonson's librettist. Over the ordering of these performances a violent quarrel between them broke out, leading to much satire aimed by Ben at his former associate, and various deductions have been based on these libels.

Francis Bacon's account in the "Praise of Henry, Prince of Wales," contains the following:

"He had, by the excellence of his disposition, excited high expectations among great numbers of all ranks, nor had, through the slackness of his life, disappointed them."

He was much devoted to magnificence of buildings and works of all kinds, though in other respects rather frugal, and was a lover of antiquity and arts. He showed his esteem of learning in general more by the countenance which he gave it than by the time which he spent in it. . . . The instructors of his younger days (which rarely happens) continued high in his favour."

Jones, being neglected at Court between 1612 and 1621, went to Italy a second time in the summer of 1613, but was in London on a flying visit in January, 1614, and definitely returned home in the autumn of that year. He was appointed Surveyor-General of Works in 1615.

Bramshill.

Of the early Jacobean work attributed to this stage of his career, Bramshill is the most important. A little book by the late Sir W. H. Cope gives us all that he could collect about the house. It is certainly built over an old building to the extent of being tied in plan by the preceding structure. Begun in 1605, it was completed in 1612, according to the date on a stackpipe with the initials E. Z. There is no documentary evidence to connect the house with Henry, Prince of Wales. The Prince's helmet is in the hall, and the crowning feature of the frontispiece bears very much the appearance of the Prince of Wales's feathers.

The house is not in J. Thorpe's book, but the Zouches were allied with the Freshams, for whom J. Thorpe is considered to have done Lieveken new building.

It appears to be the case, however, that when the building was nearly finished and was proposed that the Prince Henry should occupy it, some one was called in who advised the reversal of the main entrance from one end of the plan to the other. So it is about that the famous frontispiece was seen as an afterthought and cutting across hall windows.

Now there are two ways for the architectural student of looking at this frontispiece and the easiest is to be shocked at the wild and barbarous detail. The second and more difficult way is to realise that it is a work of character, and would produce its effect, independent of the said detail.

After that you can settle down to find out how the effect is produced. In the meantime our friends the artists will continue to find a subject.

As regards frontispieces, a prevalent feature in Jacobean times, we may as well agree at once that they are the XVIIth century counterpart of the portico of the XVIIIth. After all, which is the most reasonable and least burdensome for English buildings? It is the sad case of the top hat on more. Why they do these things requires

of world-wide extent; China to Peru, it. Is there not a Chinese poem recording the heroic friendship that no shabby could dissolve? The further interest in the hill is that the back is a fine example of many-gabled, earlier treatment, as we call it, while the front is balustraded and the roof hidden. This façade is in long, thin lines and flat surfaces, with only two small masses, in the return of which are recessed loggia.

An intelligent student will be reduced to a choice between these two. The hill illustrates, as well as Hatfield, a tendency to discard entablatures and obtain effects independently, either by masses or by vertical breaks. We have this revived in our own day. When we pay the heavy price the succeeding century paid for their crowning cornices, our aesthetic interest is aroused. With the of Longleat, 1580-88, and Woolaton, in mind, we cannot doubt that this have been deliberate.

in, in Leicestershire, illustrated in

Country Life for October, 1911, is a miniature Hatfield in this respect.

Hatfield.

Hatfield, 1607-11, while far more coherent than Burghley, suggests that the worthy superintendent of the works had been supplied with a plan and only two elevations, and that in working out the other two as he proceeded he dropped into the gable style in which he had probably been brought up.

The Building Committee of the four noble lords, for one of whom Audley End was being erected, who met on the site April 15, 1607, may safely be assumed to have had some drawings before them to deliberate upon.

This is apparently the only work in which the previous holder of Inigo Jones's office of Surveyor-General of Works appears on the scene. In 1609 Cecil, growing greatly dissatisfied with the building operations, sent Simon Basil down to investigate, and it throws a considerable light on the matter to know that the building owner was specially desirous that two of the parties concerned should be made to set their hands to

a contract. This has a very familiar ring, and we can, from our own experiences, form a very fair idea of the situation.

Simon Basil must have been of some reputation, and yet nothing seems to be known of him or his work. Owing to the omission of Hatfield in Thorpe's collection, it is hazardous to express any opinion on the authorship of the design of the main façades. It does not appear to me that the omission in the building accounts for the period in respect of payments for architectural services is conclusive evidence against any architect being employed. There were various ways of acknowledging their services in those days.

The plan of Hatfield is of very great merit. It seems to be a development of Hardwick Hall, but while the latter is a more coherent design, it is in respect to Hatfield as a summer villa or casino compared to a house. The point about Hatfield was well put by an intelligent servant: "This house is not like old houses I have been in before, where there are rooms for show, which are never used, but here the whole house is in constant occupation."

Burford Priory: End of Chapel from House.

Unfortunately, the plan is not fully worked out architecturally; the chimneys illustrate it, rising up in long ugly lines like XIXth-century party-wall stacks, showing a want of that combination and grouping for which a skilful architect will always provide.

The worst injury after 300 years' occupation is in the reglazing of the two lower floors, including the unfortunate screenwork in the arcade of the cloisters. Naturally, to our notions of old work, there is too much paint, gilding, and polish; but in this I am not sure that we do not differ from the Jacobean themselves. Knole staircase painting, for instance, has the appearance of being original. They did not appreciate oak as we do, and they had at times a very naive taste in gold and crimson plasterwork.

Charlton, near Greenwich.

From a visit to Charlton, near Greenwich, I could not gather that there was much evidence of Inigo Jones's work. There was a hall mantelpiece which seemed to have some character. The idea seems to have arisen from the fact of the house being built for the Prince of Wales's tutor, Sir Adam Newton, 1607-12. Very able instructors were gathered round this promising and too short-lived Prince, as a brief note on Solomon de Caus, who was mathematical tutor, will show. Born 1576, in Normandy, he died in Paris, 1626. His book on perspective, dedicated to the Prince of Wales, and dated Richmond, October 1, 1611, states that he had been two or three years in his service. He seems to have excelled at gardens and waterworks, such as fountains, etc. An estimate for work of this character by him at Richmond was reported on by Inigo Jones and Francis Carter. He built a gallery at Richmond, 1611-13, completed at a later date, probably by Jones. The south front at Wilton, burnt 1647 and reconstructed by Inigo Jones, illustrates his style. He left England to lay out the gardens of Heidelberg Castle for James I.'s son-in-law, the Elector Palatine, and in 1620 published his designs of that work.

The leading idea at Charlton is the Great Chamber, then coming into favour and destined to supersede the older gallery, and, on the outside, a combination of a great mulioned bay with returned and mitred entablatures as a crowning feature.

Many of the numerous alabaster and marble mantelpieces in the house may have been directly imported.* English alabaster was exported, and brought back worked in combination with Black Belgian and other marbles. Some day an industrious person will compile an Eliz.-Jac. chimney-piece catalogue, and a good many replicas will then, I imagine, be discovered.

* Cf. contemporary complaints as to imported materials for Gresham's Royal Exchange; time of Elizabeth.

Knole, Kent.

The Jacobean work at Knole, Kent, 1603-05 (and later) is in the nature of an alteration of an older house, a refashioning to date of an old double quadrangular plan. As the work was for the Earl of Dorset, for whom, as Sir Richard Savile, John Thorpe had designed Buckhurst, and as it shows in the gables and treatment of the south side traces of his manner, it is fairly safe to accept that attribution.

The Venetian Ambassador's Room, lit by a single window of the Palladian motive, lined with white woodwork and having a chimney-piece of a well-recognised type, should, however, one would think, be ascribed to Inigo Jones. I could not at the time learn anything as to its date or authorship.

Chilham Castle.

Chilham Castle is known by the church registers and by the date 1616 over the doorway to have been occupied but not completed in that year. Two entries relate to workmen engaged on the new house. "Simon Rennet, one of the workmen under Mr. Smith in Sir Dudley Digges his work was buried here the 28th of August, 1616. His dwelling was at Chiswick, in Middlesex." "Humphrey Battle was buried the 30th Sept., 1616. He was a labourer with Mr. Smith." The third entry relates to the birth of a daughter—"Mistress Ann, the daughter of Sir Dudley Digges, Knt., baptised 3rd July, 1616." In deeds of that date Sir Dudley Digges is described as "of Chilham Castle." Sir D. Digges, knighted in 1607, was, it is worth recalling, an Ambassador to Russia, and was authorised to advance to its Emperor 10,000*l.* from the funds of the East India Company, which he founded in 1612.

Mr. Smith was doubtless the builder, and it looks as if he was from the neighbourhood of London. The workman from Chiswick is curious, in view of the mention of Putney on the monument of Sir Dudley Digges's sister, Margaret, wife of Sir Antony Palmer, "whose goodness where shee lived and died, since it cannot be buried in Putney, needeth noe epitaph." Her death at Putney, in the thirty-third year of her age, was on September 22, 1619. Allan Cunningham mentions a tradition that at one period of his life Inigo Jones had a house at Staines.

Sir Dudley Digges came from Digges Court, Barham, and his town house was in Philip-lane, St. Mary, Aldermanbury. Inigo Jones made designs for the Star Chamber in 1617, and tradition has also connected him with the Rolls Chapel, and he laid out Lincoln's Inn fields in 1618. Digges was made Master of the Rolls in 1638. The decisive stage of Jones's career began in 1619 with the White-hall designs, but the Star Chamber design of two years previous is quite Palladian. There is, however, in the Burlington-Devon-

shire collection an admitted drawing of semi-Jacobean character signed by Inigo Jones and dated 1616. It is a three-story narrow entrance bay, ending with a pediment abutting on a pierced balustrading, Jacobean in character. The ground floor has an arched entrance, and the windows of the first and second floors have mullion and transom closed by a kneed architrave with bracketed consoles. These windows being vertically connected, a certain French aspect is imparted to the design. It is decidedly an experiment in style.

As to Chilham Castle, if we now turn from scanty records to the building itself for evidence, we gather the following observations. The structure is differentiated from a simple tradition of house by a unity of conception arising from the deliberate adoption of a complicated hexagonal plan, having an evident intention of creating a court effect at the back, visible by means of the open sixth side of the hexagon. The plan, moreover, shows the study of the outcome of the use of the hexagon, because the extended front and the management of the right and left wings are calculated to obviate any defects of the bare geometrical form. We have here, therefore, something much more complex than the triangle of Longford Castle, or the symbolic trinity of Rushton Lodge, or the geometrical fancies of John Thorpe's book. It is certainly significant that the pentagonal fortress palace of Cardinal Alexander Farnese, which circumscribes a circular court, was completed in 1559. The position is between Viterbo and Rome, about 9 miles from the former, approached by a road overhanging the Lago di Vico.

Inigo Jones in Italy in 1604 would doubtless hear all about it, even if he never saw it, as one of the remarkable works of the last half-century, and many have been led to experiment with a further development of its plan. Vignola's masterpiece of Caprarola is, of course, a purely classical building, with level skyline and flat roofs, and the utmost connexion is only that of a geometrical suggestion of plan. In Du Cerceau's book a French pentagonal château, Mors, which seems a clumsy derivative from Caprarola. It is suggestive that the father and grandfather of Sir Dudley Digges were mathematicians, the latter with a taste for applied geometry. It may have been easy, therefore, to interest the builder in Chilham in such a unique plan.

The house has been extensively altered both inside and out, and the history of its requires to be traced with some care. The entrance doorway is untouched, and, apart from the tapering of the pilasters, fashionable in Elizabethan and Jacobean times, quite Italian in character and well proportioned. The original oriel over is, however, known now only by old prints, and an elevation of 1784, drawn by a Mr. C. Graves and bound up in T. Hearne's MSS. book "Antiquities of Chilham, 1791."

The accompanying plan and dimensions the book agree with the further particulars that the windows on the returns were, three lights each, but with one transom in height. Graves's drawing thus gives us completely Jacobean treatment—an English bay in plan and elevation, the centre oriel having moulded corbels that look, however, rather Italian in sectional profile, and start from a console or capital just above the present entablature of the porch.

At Bramshill the oriel is of five lights with a single light on each side—seven in all. It also has three lights in height, while the adjacent windows of the façade have only two tiers. It is difficult to avoid the conclusion that the entrance bay of Chilham is a faithful revision of the famous frontispiece at Bramshill.

The original bay windows throughout the house have all been altered, and all but one of the Jacobean stacks have been rebuilt. The Great Chamber has been divided up into three rooms, and its ceiling lowered. Ten feet has been added to the length of the drawing-room wing. The outline of the lead roofs of the towers has also been tampered with. The Gothic restorationists of 1862 had little mercy on Jacobean work, whether in houses or churches. Jacobean interior work still remaining at Chilham there are two ceilings on the first floor of the two end rooms of the house. One of them suggests that the craftsman was

bled with his pendants, unless we are to suppose that they have been subsequently clumsily repaired. In both rooms the niches are of oak. The two lofty chimneys in oak in the same rooms with marble used jambs to the wide openings below are in detail and free from the overdone character of so much of the woodwork of the period. This incised marblework is to be found in Sir Antony Palmer's monument in the church at Chilham, as already mentioned. There is a similar fireplace opening the present servants' hall, but in a bad condition.

Of other remaining Jacobean work there is the main staircase, which is, it must be confessed, of a puzzling nature. The arcade of three arches on the first floor is of a pleasing proportion for internal woodwork, having under Doric columns on very tall pedestals; mounting each capital is a caryatid figure in Jacobean fantasy, with the usual strapwork ornamentation filling up the spandrels of the arches. The enormous handrail cut of oak beams no less than 10 in. square is, however, moulded in a very crude fashion, and rakes awkwardly into the columns and their bases. The balustrades, 3 in. square, are also elementary in their turned section. At first sight it looks as if the staircase had been altered, as the upper flights to the second floor are curiously supported by a Doric pillar carried up from one of the lower newels, but this is found elsewhere in early staircases.

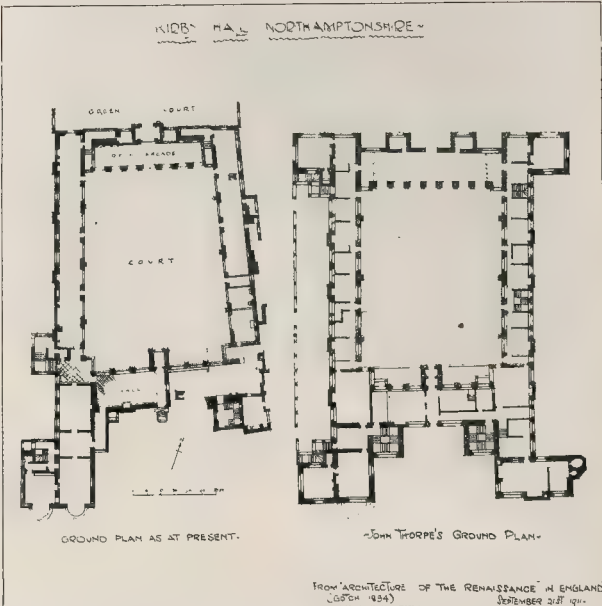

The monument in the adjacent church to Sir Dudley Digges, who died 1638, and to Mary Kemp, may, in conclusion, be referred to because it brings on the scene that familiar Inigo Jones's, Nicholas Stone. The relationship between these two men has not been fully unravelled, but we know that it must have been very close. There is a strong probability that Jones may have given a sketch for this monument, the idea of which expresses the sculptor's power of execution, as in the case of the famous Water Gate of York Palace.

St. John's College, Oxford.

To take next the case of the famous second quadrangle of St. John's College, Oxford, including the lovely garden front. There is, as far as I can find, no real grounds to doubt Inigo Jones's authorship. Messrs. Willis and Clark, in their "Collegiate History of Cambridge Colleges," accept it, as also Orlando Jewitt in his paper on late Oxford buildings, *Archaeological Journal*, 1851. The evidence, in fact, seems as close to the one as anyone can reasonably expect. Archbishop Laud had the work done in 1619, and his chaplain and biographer, Peter Heylyn, D.D., in his "Cypricus Anglicus," published in 1668, only sixteen years after Inigo Jones's death, describes the work as follows:—"Some have ascribed before enriched the College with public library, which made one side of his new building. That on the north consists together of several chambers for the commodation of the Fellows and other students. That on the east of a fair open walk below, supported upon curious pillars, and bearing up a beautiful gallery, opening out of the Library for meditation and discourse. Confronted on the other side with a like open walk below, and a suitable brick over that, raised up against the western wall of the ancient buildings. The whole complex fashioned in an excellent symmetry according to the exactest rules of modern architecture, not only graceful in itself and useful to that private house, but a great ornament also to the University.

On the 23rd of July in this present year 1631 he laid the first stone of this new building, and not intermitting it (but only during the unseasonableness of the following winters), till he brought it to an end according to the first design and proposition."

This account follows directly upon that of the works at St. Paul's, where Inigo Jones's name is twice given; first, with the title Surveyor-General to his Majesty's Works, and the second time with that of "Chief Surveyor of that Fabrick." He is recording that Inigo Jones laid the fourth of the foundation-stones of the great portico, which the king, in particular, paid for, as a substituted place of resort for the great nave, known as the Walk.

"The fair open walk below, supported upon curious pillars" at St. John's College has analogies with the arcades of the great Hospital at Milan by Filarete, and appears to be distinctly Italian. If you recall that St. John's is only eighteen years later than Wadhwan, you will be better able to estimate the personality of the designer. It is surely significant that the statues of Charles I. and Henrietta Maria in the centre niches of the frontispieces should be by Le Sueur, who also supplied the two Royal figures in the undoubted Inigo Jones screen, formerly in Winchester Cathedral. I have troubled you with this at length because of what follows. The Whitehall designs of 1619 are usually taken as marking out Inigo Jones as a pure Palladian, and from this standpoint other work attributed to him is judged. Eleven years later, however, he gives us this lovely creation, English, but with a fine shading of Italian ideals, as unique in its kind as some of Shakespeare's "sweetest wood notes wild." I expect you never find yourselves in Oxford without a visit, however brief, to see once again this beautiful garden façade, admittedly the finest that Oxford can show.

If you will reason out the design you will be struck with the boldness with which the apparent simplicity is reached. Much of the effect is certainly due to the large expanses of unwindowed wall. Practically the ground floor is given up to storage and to an internal cloister, and the long Gallery over is treated with a wonderful reserve, a concentrated strength on essentials, like the bays and gables, as foils to the rigid simplicity of roof and parapet of exceptional length of line.

Ecclesiastical Work.

There seems no reason to refuse the authorship of the Porch of St. Mary the Virgin to him as well. Purists may say what they like, the fact stares us in the face that this little work is a gem of its kind. One of those things that only a master can achieve with success. The chapel of Burford Priory, about 1635, seems to me work of an allied intention, but I have never heard of any attribution to Inigo Jones. The highly interesting church of St. John, Leeds, 1631-3, and St. Catherine Cree, 1628-30, illustrate the tendencies of the ecclesiastical architecture of the age.

The London church is much more advanced, having round arches with coffered soffits rising direct from the capitals of Corinthian columns, as is also the case with the cloister arcade at St. John's College. The clear-

story inside is divided into bays by pilasters, from which a vaulted ceiling of very slight rise springs. The outside of the church follows the usual lines of an old mediæval city church, but the semi-Perpendicular tracery windows are more or less framed by semi-classical mouldings having the character of architraves. As usual, the church is disfigured by bad colouring and glass, but to anyone freed from Gothic revival blinkers it will prove to be a highly interesting interior.

I could not find that Laud's biographer is definite on the subject of this church. On page 212, under date 1630, he says:—"St. Catherine Cree Church in London being ruinous and in great decay, had in some places been taken down almost to the ground, and rebuilt again by the parishioners at such time as Mountain was then Bishop, who suffered it to be made use of for religious offices without any new consecration of it, which, coming to the knowledge of Bishop Laud, he caused it for a time to be suspended from all Divine Service, sermon, or sacrament till it was reconsecrated by himself, which offices he solemnly performed on Sunday, January 16th." From this it does not appear that the popular idea that Laud was responsible for the church is correct. It does not affect Inigo Jones's authorship, however, as Bishop Mountain was in touch with him over St. Paul's, for whose recasing he had already obtained great blocks of Portland stone. The Royal Commission of 1620 for the repairs was, however, fast becoming a dead letter, and the Bishop being too sluggish for Charles I., was translated to Durham, to make room for his more active colleague of Bath and Wells.

Like the well-known doorway, however, to St. Helen's, Bishopsgate, the church of St. Catherine Cree seems to show the hand of Inigo Jones. The ecclesiastical policy of Charles and Laud, steering between Rome and Geneva, required precedents of a recognisable English character. These semi-Gothic churches are more typical of the age than St. Paul's, Covent Garden, where the design is related to that of the Piazza, in which it stood. In any event, we have in the chapel of Lincoln's Inn, 1617-23, existing, but added to, and in the church of St. Albans, destroyed in the Great Fire, examples of Inigo Jones's handling Gothic architecture. Please remember always that the splendid fan-vaulted staircase hall of Christ's College, Oxford, bears the date of 1640. Peshall says that Dean Fell with help of an artificer named "Smith of London" carried out the work.

Kirby Hall, Northants (1638-40).

A contemporary account of the capture of Basing House, where Inigo Jones was one of the prisoners of war, refers to him as contriver of the "Queen's dancing barn." Henrietta Maria's private chapel at Somerset House probably most closely reflected Inigo Jones's ideals of church architecture, it being, of course, well known that he was a Roman Catholic.

Part of the price paid for the Gothic revival has been ruthless destruction of the church fittings of this period. As a pupil I remember that, on being shown two choir stalls and canopies of Early Renaissance character in the library at Lichfield Cathedral, I innocently asked what had become of the rest of the stalls.

Crocombe Church illustrates the rich effect of a church still retaining work of this date. The Laudian font, now happily replaced in its original position in Canterbury Cathedral, is a highly interesting example. There is a fair number of pulpits with sounding-board canopies, and a few screens to be seen in our village churches, but they must be only a fragment of the church gifts of their generation.

Kirby Hall.

When we come to Kirby Hall, 1638-40, we find Inigo Jones completing the work of his predecessor, John Thorpe, 1570-72. Walking across the fields from Gretton Station we descend upon the house and see its long lines of grey walling, broken by masses of full-foliated trees, rising from grassy meadows, as a hare couched in bracken. There is a good deal yet to be learnt about the building process at Kirby. It looks very much as if Jones undertook there what he had already done in 1624 at Castle Ashby, i.e., to build a connecting block between two extended wings, completing a quadrangle in each case. Kirby, however, is the more extensive undertaking, and one that is more sympathetic to the older building.

If, as it seems reasonable to suppose, Jones built the entire side of the quadrangle, then he repeated the tall pilaster buttresses with only a changed proportion in the die of the pedestal, and a different system of ornamentation of the shaft. The carving of the caps and pilasters may well be local interpretations of a fine sketch.

I do not think that any drawings convey the effect of this quadrangular design. The impression it produced on me was very different to that which I had expected from its appearance on paper.

The pilasters are really buttresses 2 ft. 3 in. wide and 14 in. projection, and the wide spacing of about 39 ft. centres increases this effect. Also the sole connecting cornice is profiled with very square, strong projections, which give it an adequate emphasis, in spite of its elevational tenuity. This is an old Greek idea. Compare the architrave of the Temple of Diana at Ephesus, where no frieze intervened below the cornice.

I was not satisfied that Jones simply cut in the windows. There is a straight joint on the right-hand side at the angle running apparently straight up. Moreover, the outside elevation of this back block is clearly

all of this date, and is a very simple and strong piece of work.

The planning is an improvement on Thorpe, and the loggia with the stairs at each end must have been very effective.

In the garden court beyond are two quite Palladian doorways that only Jones could have done at that date. There are two side archways with niches in two tiers which are very interesting, recalling the so-called Arch of Janus at Rome. The well-known, highly-elaborated porch, leading from the hall into the quadrangle, presents an involved problem. The gable and ground-floor stages are clearly of the Thorpe date, but I am not satisfied again that Inigo Jones simply cut in the window. There are two points:—(a) The first-floor Orders do not line with those of the ground floor, and (b) the shaft of the column of this upper Order disengages itself from the wall in the same curious way as at Castle Ashby in the undoubted Inigo Jones's work. It is possible that the old gable was taken down and reset. Close examination of the masonry might clear up this point. A student could have a happy time measuring at Kirby.

Of Stanway Gatehouse, Gloucestershire, we have unfortunately no adequate record. On the evidence of the work it has been attributed to Inigo Jones. It is certainly very interesting in the photograph.

Inigo Jones's knowledge of Italian art can only be compared with that of Alfred Stevens, and in both cases it was a real absorption of the spirit and mastery of the principles, and, in both instances, the outcome was personal work and a lasting influence.

Essential Qualities in Work.

If, therefore, an architect of such profound Italian knowledge played with the current architecture of his own and the immediately-preceding age, we may well consider very carefully its underlying ideas. After all, no body of critical dogma has lasting value that is unrelated to actual examples. What we think we know derives from deductions based on works that have commanded admiration and retained it.

It behoves us to revise our creeds in the light of such examples, and see if by chance our exclusions are not becoming more important than our preferences.

Many years ago an A.A. visit led a student to take rough measurements, and then to draw up a more classical rendering of a certain fantasy of Jacobean date. On submitting the design to his learned master, he was told that such examples were incapable of refined treatment, because in so doing the essential picturesqueness was eliminated. You will, however, agree that this is a far-reaching dogma, because, if so, there is obviously a quantity obtainable only by a violation of the canons. Or, in the alternative, the canons are based on insufficient premises.

Whichever way you regard it, there remains this valuable conclusion, that we must search out the essential quality which charms in despite of our prejudice. In this spirit I suggest to you that much of the Jacobean fantasy in ornament is only a shading, or

texture, if you like that much abused word, over the surface of the architecture.

It plays the part of the apparently excessive lines of a mezzotint, preventing by a play of light and a fretted surface a severity of mass inconsistent with the fancy or gain of the general conception.

It is often asserted that the design of the Houses of Parliament lacks blank spaces of walling as a relief. If so built it would be a different, but not a better, building. The idea is borne out in all the great styles, by the Egyptian incised surface figuring, by Mexican and Indian and Far Eastern examples, quite as much as by the Saracenic geometrical patterning.

The Spanish plateresque is cousin to the Jacobean, and the Jesuit, in his way, was aiming at an expression of the same feeling.

I hope I shall not run too counter to your up-to-date ideals, but it is borne in upon me that as architects we may be too much led by the self-consciousness of modern schools of ornament.

The conditions of architecture are its own. Long training in actual handling of work in stones, bricks, and plaster, and other more or less rude materials, can alone give that instinctive feeling that differentiates old ornament from the clay-modelled decoration that we so often see stereotyped on our buildings.

After all, sun, wind, rain, and frost are our agents and our masters. In the long run Nature will have its way, and it lies with us to agree with forces that we can never escape.

Work at Oxford.

The architects of the Perpendicular work in England knew what they were about when they used throughout a system of panelling that we often hear unheedingly stigmatised as mechanical. I think the continued attempt at this effect in the rebuilt Jacobean quadrangle of the Bodleian at Oxford is most instructive.

The first stone of the west side of the Bodleian quadrangle was laid July 16, 1610, and it was finished 1612. The first stone of the other three sides was laid March 30, 1613. The tower, with its tiers of Orders, was entirely new, and the whole work seems to have been completed 1618. On this occasion King James came in for a compliment so golden that even his eyes blinked. The Royal image in the niche hands his recent book to Fame inscribed, "Hæc Habeo quæ scripsi," and another to Alma Mater, inscribed, "Hæc Habeo quæ dedi," the whole being solid gilt in its pristine magnificence. Thomas Holt, of York, who died in 1624, and was buried in Holywell Churchyard, is stated to have been the architect, the builders being J. Acroft, of Halifax, who died 1613, and J. & M. Bentley, who were also employed at Merton. Holt was entered in the University register as a private person, age forty, October 30, 1613, described as "Faber Lignarius." Col. Nov. His daughter married Dr. Sam. Radcliffe, Principal of Brasenose. It seems questionable to take the Latin as equivalent to a carpenter. The same desire to retain the Perpendicular panelling is found in the frontispiece of Merton, 1609-10, by the same architect and builders.

Wadham, which also boasts a sufficiently similar frontispiece, is an entirely new college, begun April, 1610, and completed July, 1613, and, as it has been little altered since, it best represents the collegiate ideal of its date. Mr. T. Jackson, R.A., in his very full and interesting account, discredits the attribution of the work to Thomas Holt, and believes that, William Arnold, probably a brother of the keeper of the building accounts, John Arnold, was the working architect. He heads the pay list with 1l. per week, which Mr. Jackson takes as equivalent to 5l. of our money. Nicholas Wadham and Dorothy, his wife, founders, were of Somerset, and masons were brought from that county for the work, probably owing to the rush of work at Oxford at the time.

The famous Dr. Wilkins was Warden during the Commonwealth, and entered Christopher Wren on June 25, 1649. The architecture of the College is somewhat dull, and the treatment of the Orders heavy and mechanical. It has none of the audacity and sparkle that distinguishes the work, only eighteen years later, at St. John's.

THE BUILDING TRADE.

"ALLOW" OR "PROVIDE"?

QUESTION that often arises in dealing with the settlement of accounts for building work is, how far the architect is justified in paying for items included in the contract and fixing the amounts allowed in the contract for these items.

Two words quoted in our heading, a bill of quantities have a difference in connexion that is not always fully appreciated, and this lack of appreciation is sometimes responsible for trouble that easily be avoided, and we are prompted with the matter from having had to do to our notice an instance of this, upon which our opinion has been asked. The bills of quantities for certain work in an item, "Allow for payment" of certain sums which were not mentioned, but necessitated inquiry (in this case a public body) on the part of the tenders as to what those payments were likely to be. Acting upon the information then given, the builder put sums opposite these items. When these items were due to be paid it was found in one instance in particular, the sum allowed was greatly in excess of the sum needed. The client, acting on the architect's advice, paid this sum himself, and the architect deducted the amount the builder allowed in his price from the contract, thus depriving the builder of the large amount of profit which the item carried. The builder protested that this was unfair, and demanded that he should be paid the difference between the sum paid by the client and that allowed in his priced quantity, or, in other words, to deduct only the sum paid by the client.

The item clearly states "Allow for payment" the onus of arriving at the sum to be paid rested with the builder, who thus placed upon himself the liability to pay for this particular item. He was, consequently, entering into a speculation, and as the client was concerned, and might be liable to pay a sum larger than the one he had put against the item in his priced bill. Had the item been put in as a provision and a definite sum mentioned, the usual procedure would necessarily have been followed, as by stating a definite amount, element of speculation would be removed, apart from the fact that this item is provided for in every building contract. To select a particular item, and with it in the way above mentioned, is obviously unfair, and we think the client has some difficulty in establishing a case to act by law. To our mind it is a question that should be looked at from a legal aspect, whatever the legal position be. Had the position been reversed the builder would have been equally justified in claiming an extra upon the item, but we do not think that the client would have gained such a claim, and we should hold that he would have been quite justified in making it.

The case certainly suggests that the client, when he mentions the client, it is clearly understood that he is acting through his architect or under his advice has looked at the bills, and, finding an item highly profitable, has taken advantage of the fact. The action is a justification for what is demanded upon by some architects as an objectionable demand on the part of a contractor. It is provided that a workman shall not be deemed to have failed to fulfil the statutory conditions by reason only that he has declined (i.) an offer of employment in a situation vacant in consequence of a stoppage of work due to a trade dispute; (ii.) an offer of employment in the district where he was last ordinarily employed at a rate of wages lower, or on conditions less favourable, than those he habitually obtained in his usual employment in that district, or would have obtained had he continued to be employed; or (iii.) an offer of employment in any other district at a rate of wages lower, or on con-

ditions less favourable, than those generally observed in such district by agreement between associations of employers and of workmen, or failing any such agreement than those recognised in such districts by good employers."

Thus, before one single workman can be held entitled to a payment of 7s. a week for a limited period an inquiry has to be set on foot in which the workman has to prove his employment for the statutory period, his unemployment since his application, the amount of benefit already received, his capacity for work, and his inability to obtain it. Whilst this latter point involves a consideration of the various offers of work made to him—as to which his *ipse dixit* is likely to be the only evidence—his habitual conditions of employment, or the standard of wages and conditions of employment prevailing in any district where he has attempted, or says he has attempted, to obtain employment.

Under Clause 63 there are certain disqualifications, but by whom the evidence of these is to be offered is not quite clear. These disqualifications are:—

(i.) That the workman lost his employment by reason of a trade dispute or lock-out directly affecting him.

(ii.) Losing employment through misconduct or through voluntarily leaving employment without just cause.

(iii.) Having been convicted of an offence punished by imprisonment without the option of a fine.

(iv.) Being inmate of a workhouse, etc.

Furthermore, it may be pointed out that if unemployed benefit is refused or stopped the matter may have to be considered by three tribunals.

May it not well be asked: Is this legislation of a practical character? The legislature nowadays sets up an expensive steam hammer to crush each individual walnut.

The setting up of a standard of wages for those whose services are required, and who may be ground down by competition, has become a recognised principle of late years, but the setting up of a standard rate of wages and conditions of employment in the case of unemployed workmen is undesirable when recognised by statute. It is a gigantic system of protection devised in the interests of those who desire to abolish competition of any sort in the labour market, and it is likely to have as unfortunate influence on the unemployed themselves. In other walks of life persons thrown out of employment take what occupation they can get to tide over evil times, and are thankful to do so, but in the case of workmen—often higher paid than clerks and other employees—the legislature is encouraging the idea that, unless they can obtain work on unvarying conditions with trade union rates of pay, they are justified in remaining idle and in accepting benefits provided, in part at least, by the State.

Unless some simpler principle can be devised for unemployment insurance, and one less likely to hinder employment, it is clear that this portion of the Insurance Bill can never be extended to other trades than those at present selected for experiment. Meanwhile, the selected trades are being placed under severe disabilities.

At the conclusion of the Committee stage, some alterations were made in the sixth schedule of the Bill which especially affect the building trade.

In the sixth schedule originally "building" was defined as follows:—"That is to say, the construction, alteration, repair, decoration, or demolition of any building or any part thereof," a definition which in the main very much followed the terms of the Factory Act. There was some discussion on this definition, and finally the clause was amended by omitting the words "any building or any part thereof," and inserting the words "buildings including the manufacture of any fittings of wood of a kind usually made in a builder's workshop or yard."

Under sub-section (i.) it is not clear how long the qualifying period of work—twenty-six weeks—is to continue as a qualification, whilst sub-sections (ii.) and (iii.) in a way place the workman on the horns of a dilemma; he has to prove that he has been continuously unemployed since his application and that he is unable to obtain work; therefore, once having put in his application which may entitle him to 7s. a week, in the interval he is hardly likely to be willing to take any small casual employment that may be offered. The proviso to the above clauses is, however, that which will involve the most difficulty in practice. This proviso, as amended in Committee, now reads:—"Provided that a workman shall not be deemed to have failed to fulfil the statutory conditions by reason only that he has declined (i.) an offer of employment in a situation vacant in consequence of a stoppage of work due to a trade dispute; (ii.) an offer of employment in the district where he was last ordinarily employed at a rate of wages lower, or on conditions less favourable, than those he habitually obtained in his usual employment in that district, or would have obtained had he continued to be employed; or (iii.) an offer of employment in any other district at a rate of wages lower, or on con-

UNEMPLOYMENT INSURANCE.

THE extreme difficulty of devising a practical scheme for insuring unemployed persons became apparent when Clauses 62 and 63 of the Insurance Bill came to be considered by the Grand Committee. Under the provisions of the Bill, for a workman to qualify for unemployment benefit, he has to prove:—

(i.) That he has, since the commencement of the Act, been employed in an insured trade during each of not less than twenty-six separate calendar weeks.

(ii.) That he has made application for unemployment benefit, and has been continuously unemployed since the application.

(iii.) That he is capable of work, but unable to obtain employment.

(iv.) That he has not exhausted his right to unemployment benefit.

Under sub-section (i.) it is not clear how long the qualifying period of work—twenty-six weeks—is to continue as a qualification, whilst sub-sections (ii.) and (iii.) in a way place the workman on the horns of a dilemma; he has to prove that he has been continuously unemployed since his application and that he is unable to obtain work; therefore, once having put in his application which may entitle him to 7s. a week, in the interval he is hardly likely to be willing to take any small casual employment that may be offered. The proviso to the above clauses is, however, that which will involve the most difficulty in practice. This proviso, as amended in Committee, now reads:—"Provided that a workman shall not be deemed to have failed to fulfil the statutory conditions by reason only that he has declined (i.) an offer of employment in a situation vacant in consequence of a stoppage of work due to a trade dispute; (ii.) an offer of employment in the district where he was last ordinarily employed at a rate of wages lower, or on conditions less favourable, than those he habitually obtained in his usual employment in that district, or would have obtained had he continued to be employed; or (iii.) an offer of employment in any other district at a rate of wages lower, or on con-

The Chairman,

in putting the vote of thanks to the meeting, said that Mr. Bolton had put before them a picture of that interesting development of English architecture when it was emerging from the Gothic medieval period into one concerning which we had fuller details. It would be most enlightening if we could have a list of architects, as Mr. Ambler had suggested, and perhaps Mr. Bolton could tell them if such a list existed. It would be interesting to the student to have such a list when travelling about the country and puzzled by the mixture of fine work sometimes found in one building. For instance, at Burleigh there was the staircase—a fine architectural feature and a most remarkable piece of design, reminding one of the period of Henry III. and Henry IV. of France. In the same way, close by in the Manor House—a house with a most interesting plan—the windows almost throughout had pediments of pure François Premier character. He did not think there were any other windows like them in England, and he certainly had never seen drawings or photographs of English work which resembled them.

The vote of thanks having been heartily agreed to,

Mr. Bolton,

in reply, said that at the present time the proposed list of architects was practically hopeless.

JOHN SMITHSON - MARR.

Three children
died in
infancy.

They had a good many names, but, beyond a certain point, you could get no further. One found that Simon Basil, for instance, on such and such a day had an order to go to Hatfield; but where he was born, whether married, and so on, could only be dug out by chance. It was only by chance that the valuable reference to John Thorpe which he had given had been found. The late Professor Aitchison had an extraordinary knowledge of this kind, gained by reading all sorts of out-of-the-way books, but it was never systematised. Mr. Harry Sirr had worked out valuable facts about the Thorpes and Smithsons. The Civil War caused an enormous gap, and but for the war we should know a great deal more about Inigo Jones than we do, and some of the best facts about him were the ill-recorded memories of those who outlived the war. As to accounts, all those about Hatfield were known, and those of Wadham were given by Mr. Jackson in his book, and in other cases the college accounts were full as a matter of L.S.D. As to Jacobean decoration, he had shown on the screen the gilt chamber at Holland House and also the staircase at Knole. He did not see how architecture could be studied properly without some reference to political and historical questions. For instance, you could not understand how designs for Whitehall came to be prepared, and then were not carried out unless one looked to some extent to history and the social and political aspect of the time. There might be some who wished to teach architecture as a matter of construction without any reference to history and politics, but it would not suffice throughout the Renaissance period, at all events. As to Du Cerceau, if they started discussing him they would not get away that night. As to Smithson, he belonged to the Elizabethan rather than to the Jacobean period. It did not follow that Robert Smithson was the architect of Wollaton House; there was reason to think that the designs were made by John Thorpe, and that Smithson carried them out. The epitaph seemed to mean that he was an agent for the family—House being used in that sense. He did not think he had said it was easy to distinguish between Elizabethan and Jacobean. It was possible to distinguish between the

work of Thorpe and Inigo Jones. In different localities the work varied. Looked at however broadly there was a distinct difference, and of this he had tried to render some account.

We have received the following communication from Mr. Louis Ambler, who took part in the discussion on Mr. Bolton's paper:—

"THE THREE GENERATIONS OF SMITHSONS, ARCHITECTS IN THE REIGNS OF ELIZABETH, JAMES I., AND CHARLES I.

My authorities for the particulars of the above are the following:—

1. The inscription on Robert Smythson's tombstone in Wollaton Church, Notts, viz.:—

"Here lyeth y^e body of Mr. Robert Smythson, gent., Architect and Surveyor unto the most worthy House of Wollaton with diverse others of great account, he lived in y^e fayth of Christ 79 years and then departed this life y^e XVth of October A^{no} D^{omi} 1614."

(In those days "i" and "y" were used almost indiscriminately, and the same person's name was sometimes spelt with an "i" and again with a "y.")

The pedigree of the Smithson family (of Bolsover, within 20 miles of Wollaton) in the Harleian Society's publications, Vols. 39 and 40, "Familie minorum gentium":—

3. Horace Walpole's "Anecdotes of Painters in England," third edition, 1797: "John Smithson was an architect in the service of the Earls of Newcastle. He built part of Welbeck in 1664, the riding school there in 1623" (a footnote says, "as appears by his name over the gate"), "and the stables in 1625; and when William Cavendish, Earl and afterwards Duke of Newcastle, proposed to repair and make great additions to Bolsover Castle, Smithson, it is said, was sent to Italy to collect designs."

4. The collection of Smithson's drawings belonging to Colonel Coke, of Brookhill Hall, including some plans of Bolsover, Welbeck, Worksop Manor, Clifton, Wollaton, and other houses in Notts, many of them signed or initialed "Jo. S." (John Smithson).

5. The inscription on Huntingdon Smithson's tombstone in Bolsover Church, viz.:—"Reader, beneath this plain stone buried (lie) Smithson's remainder of mortality. Whose skill in architecture did deserve A fairer tombe his memory to preserve; But since his nobler gifts of piety To God, to men justice and charity, Are gone to Heaven a building to prepare Not made with hands, his friends contented are."

He here shall rest in hope till th' world shall burn, And intermingled ashes with his urn.

Huntingdon Smithson,

Gent.

Obit. *ix*bris. 27, 1648."

(November).

6. Walpole confuses John and Huntingdon Smithson, father and son, to some extent, saying that the former "died in 1648, and his son, a man of some skill in architecture, was buried in the same grave," where John Smithson was buried in 1644. Samuel Pegge, the antiquary, in his letter to the Duke of Portland, September 25, 1785, describing Bolsover Castle, says that Huntingdon Smithson, who was living at Bolsover in 1601, was its architect.

Most probably he was associated with his father in the work begun by Elizabeth, Countess of Shrewsbury (Bea of Hardwick?), shortly before her death in 1607, and continued by her second son, Sir Charles Cavendish and completed by him in 1616. This was the rebuilding of the main structure on the old foundations and the external pavilions. Sir Charles died in 1617, and his son William (afterwards Earl Marquis, and Duke of Newcastle) built the detached pile, now in ruins. On a stone in the building is engraved "H. S. 1629," no doubt referring to Huntingdon Smithson, the architect.

The above paragraphs 2, 3, and 6 are from notes by Mr. Walter L. Spiers in Vol. XVI., third series, *R.I.B.A. Journal*, and 4 is from a volume by Mr. J. Alfred Golch in the same

SCHOOL BUILDINGS.

THE annual report of the London County Council, just issued, states that, while of secondary importance compared with the teaching staff, the question of the condition and sufficiency of the school buildings must always be one which calls for the continuous action on the part of the Council authority. With the changes in educational ideals and the movements of population which are ever taking place school buildings rapidly become out of date, or, in some cases, even unnecessary, and therefore the local authority in a town of the size of London must always have before it difficult and costly building problems. The point has often been raised as to whether it is advisable to build any school which will last for more than, say, twenty years, since in two decades opinions change so rapidly in regard to structural ideals that a school building of this age is, as a rule, looked upon with disfavour. Thus, twenty years ago, schools were built in such a way that as few classrooms as possible had a southern aspect, presumably because it was thought that in summer in such rooms the heat would be oppressive, whereas if rooms faced east and north they could always be kept warm by artificial means. Public opinion has now changed completely on this matter, and the extreme importance of securing as much sunlight as possible for the children is generally recognised. Consequently, it is now the custom to plan the schools in such a way that a maximum amount of direct sunshine is brought into the teaching rooms. Similarly, during the time which has elapsed since the School Board began to plan school buildings forty years ago ideals in regard to sanitation, lighting, ventilation, heating, cloakrooms, size of rooms, provision of halls, teachers' rooms, etc., have completely changed, and at no time during the history of education have opinions been changing so rapidly as at the present. It is obvious, therefore, that the Council is faced with a very serious problem in dealing with old buildings which it inherited from the School Board. There are in the county a number of schools which were erected before 1880, and, while many of these have been improved from time to time, there are still over 100 which for one reason or another must be regarded as unsatisfactory. The policy recently adopted by the Board of Education of restricting the number of pupils on the register of any one teacher to sixty has resulted in the loss of some 13,000 effective school places. This, coupled with the desire to render the old schools brighter, healthier, safer, and more comfortable for teachers and pupils, has created great activity in connexion with school buildings. In the new schools completed during the year the outstanding feature is the size of the classrooms, which are planned to accommodate not more than forty pupils in the case of senior departments, and not more than forty-eight in the infants' departments.

When the plans of new schools are under consideration the question of the necessity for erecting a domestic economy centre, or handicraft centre, on the same site is carefully inquired into, and if there is found to be need for such accommodation the erection of the necessary buildings is included in the contract for the main school. Where it is likely that a school will require to be enlarged in the near future it is the practice to build the walls of the requisite size for the number to be accommodated in the completed school. In such cases cloakrooms, teachers' rooms, lavatories, etc., are also built complete, and this provision for future requirements, while it adds to the initial cost, is really a considerable saving to the Council, as when the additional classrooms are erected the further cost is only about 7/10s. per place.

Thus, by the action of the authorities, the present ideal of school planning has been evolved. The large schoolroom, previously encumbered with desks, and occupied probably by two, three, or four classes, has given place to the hall; sufficient classrooms are provided so that each class in the school shall have its separate classrooms, the amount of floor space provided for each child has been raised from 8 sq. ft. to 10 sq. ft. for seniors, and 9 sq. ft. for infants, and the amount of cubic space from 80 ft. to 100 ft.; and adjuncts have been provided in the way of art and science rooms.

Ill-Regulated Ornamentation.

It is certainly true that the study of Elizabethan and Jacobean architecture has been judged by the excessive attention given to its often ill-regulated ornamentation; as, for instance, in Mr. C. T. Richardson's book. There is nothing in the repeated and monotonous patterns, the majority of which are remarkable more for their complexity than for their interest or their refinement. The same work in many cases that verges on the lower forms of Oriental and savage art.

It is impossible to dwell in or near this cheerful house without the life becoming dead, and even diverted from its course, by its imperious influence. The cold and serious power of the classic architecture added to the rich libertine fancy of the Elizabethan, treading unrestrained and unveiled the maze of nature and of phantasy, leaving the classic purity of outline with exquisite tracery of fairy life.

Every door and window and pilaster is encased and clinging the arabesque carvings of scrolls and fruit, of graceful figures in fantastic forms and positions, all of infinite variety, all full of originality, of life, of power, and of character, all of exquisite workmanship.

The effect of the whole is lightness and brightness while the eye is charmed and the sense lulled with a luxurious satisfaction at the ending wealth of beauty and lavish ornamentation. But, together with this delight to the eye and sense, there is present to the mind something not altogether painless, of oppression, of the mating of incongruous elements, arousing, as it were, an uneasy consciousness, and affecting the soul somewhat as the overpowering perfume of tropical vegetation affects the senses.

It is how the author of "John Ruskin" expresses the effect of work such as that in the great gallery of Knole, and the Jacobean houses, which, as you may see, supplied the basis of his description of the ideal Renaissance Palace.

The author does not fail, however, to lay the key in answer to the abuse of the style.

"I speak too harshly of these things," he writes. "I see nothing in them but the highest of humanity, differing in its outward aspect in different ages, but alike in meaning and audible voice. This house is itself a representation of the world of the past, and reality combined, of the material and the spiritual, of the animal mingled with those half-faint and fitful glimpses of the unknown life, the verge of which we stand."

Naturally, if we adopt only a standard of decorative design, such as we see in, say, the College Chapel, screen at Cambridge, the level of the original examples, such as we may see at Perugia and Verona, is debased, then the great body of Jacobean work must strike us as coarse and debased.

General Considerations of Jacobean Work.

Jacobean work varies enormously, fluctuating between the fretted, bossy, intricate, and over-decorated types that prevailed in Elizabethan times, and better models inspired by the strong tendency towards ideals of classic

at Aston Hall, 1618-35, the gallery ceiling rises far apart from the remainder of the room, and even from the frieze immediately below it.

The same is true of the panelling and woodwork of these great houses, which at times, with multitudes of arched panels, now again seems an anticipation of the simple and clear work that would later on supersede it.

In the complete picture of the Jacobean house we used to reassemble the furniture, the tapestries, pictures, and dress of the period. The Burleigh portrait of Elizabeth I. gave us a clue to the all-round decorative aspect of the age. We are now brought to surroundings of a patterned carpet, reflecting in a northern clime the sun of the springtime of the Renaissance.

Naturally, we may well be careful in ascribing ignorance to some of these Jacobean architects as the motive of their handling of classical detail. There will be found in the rest of it a wit and humour of treat-

ment which implies knowledge, observation, and thought, and is as legitimate as any other form of fancy or burlesque.

It stands to reason that it can only be attempted with success by those who are masters of their subject-matter. The actual degree of refinement is in the discretion of the artist, and it will be a reflection of the taste of the age. It has ever been the special prerogative of genius to clothe truth in the garments of motley.

The great mantelpieces, the friezes set out with symbolic figures, the great wall and altar tombs with their strangely-involved eulogistic inscriptions are all expressions of the mood of the moment, outlets for the pedantry and bombast of the age. There are, however, instances where these brave shows touch high levels and awake deep feelings, as though they were already tinged by the scaffolds of the Civil War.

We do an injustice to this half-century if we are alive only to its materialistic pomp. The age itself awoke with a start at the sudden drama of the fall and execution of Strafford, to the fact that no temporising policy could now avert the dire calamity of civil war. Up to this point leaders had changed sides with amazing levity, and under strong suspicion of personal gain. Sir Dudley Digges and Lord Strafford were instances, but now the trumpet had sounded, the lists were closed, and the fanatics on both sides forced on the fatal issue. The Jacobean age closes with the violent deaths of Buckingham, Strafford, Laud, and Charles, with a Court in exile, a ruined nobility and gentry, and a broken and scattered school of artists.

The misery and bloodshed of the Civil War affects us like the closing scene of a great fire, when the stately building falls with a crash, and the whole sky is reddened with the reflected glare.

The conclusion of the whole matter is that we inherit from this half-century some unique and lovely English homes, and derive therefrom a pleasure that is certainly no mere outcome of sentimental associations. Places like Fountains Hall, Abbot's Hospital, Kirby Quadrangle, St. John's, Warwick, Moyn's Park, and the garden front of St. John's, Oxford, to enumerate those most likely to be known to you all, produce an impression that no prejudgment can efface.

The forces behind nationality are exceedingly strong, because they are anchored in a past which we cannot absolutely lay bare and can only dimly appreciate. In a true sense the dead speak and live with us, and our work must be conditioned by what they have done. If, in the end, it is to fall into its place as links in the long chain, neither of whose ends are visible."

Mr. Laurence Weaver, F.S.A.,

in proposing a vote of thanks to Mr. Bolton, said he had been very much impressed by the evidence in reference to Inigo Jones—not that it was new—working in the vernacular manner such a long time after his full Palladian outbreak at Whitehall. It was perhaps rather a shock to some of them to realise so effectively that Inigo Jones was doing the traditional work, and doing it in such an efficient way, long after his Palladian work put everything else in the background. He appreciated what Mr. Bolton had said as to the interaction of architecture and history. If we thought of buildings from the point of view of people who lived in them we should have a fresher interest in the buildings themselves.

Mr. W. Curtis Green,

in seconding the vote of thanks, said that Mr. Bolton appeared to him as the ideal student, for he did not think too much about the superficial aspect of a thing, but tried to or did get behind it to what lay beyond. Mr. Bolton had what, for want of a better word, might be called a sense of architectonics, and he had told them that he tried to minimise the importance which ornament so often took in our view of what was good or right in architecture, and remarked that ornament often concealed architecture, and that we needed to clear our minds of Gothic and Classic arch and lintel, round and pointed, and get to the building itself, to the idea of architecture, and that we could only do by studying fine architecture. Mr. Bolton mentioned Du Cerceau's book and writings, and he (the speaker) was rather surprised that the lecturer did not go further into the comparison between

Jacobean and François Premier work, and draw some analogies between the two; and in this connexion he would suggest that our English work of some part of the Jacobean period was comparable with the François Premier work. Professor Blomfield said in his recent book that in considering this Jacobean work a cool and critical study of these buildings showed that they were not the last word of consummate art, but the half-articulate work of beginners trying to express themselves in unfamiliar language.

The object of such an interesting and delightful paper as Mr. Bolton's was to show how to study old work—to show the necessity of soaking ourselves in old work, and, as far as possible, that soaking should be in one period, one building, or one group of buildings, so that we may, however many months we might have of it, thoroughly master one great period of design, and then we should be in a position to appreciate and to understand any period. We should begin then to understand where the source of inspiration came from in the men who did the work, and we should begin to get the source of inspiration for our own work in our own time within ourselves, and within the people for whom we have to work and with whom we work.

Mr. Yates

asked if Mr. Bolton had come across any painted decorations in addition to the case he mentioned at Knole. We knew that about 100 years before the Jacobean period there was a lot of painted decoration, brought to a fine state of perfection, in the screens of Norfolk and Suffolk, but the art seemed to have disappeared in England, and he could give no reason for it.

Mr. Laurence Weaver

said there was a coloured ceiling at Pinkie House, Musselburgh—a house built in 1613 by the Lord Chancellor of Scotland. It was said that this ceiling of the long gallery was the result of English influence.

Mr. G. S. Mileham

said the period under discussion was of the greatest importance, because it was the first time that architecture had become really a part of the life of the village as well as the life of the monastery.

Mr. Andrew Oliver asked if Mr. Bolton had come across any of the old building accounts of these great buildings.

Mr. Bolton: There are the volumes of the Hatfield accounts, the State papers.

Mr. Louis Ambler,

in supporting the vote of thanks for the admirable and scholarly paper, said could Mr. Bolton give them the date of Moyns Park? The whole of the design appeared to be Tudor, not Jacobean, although there might be Jacobean additions and alterations. Taking the whole subject of Elizabethan and Jacobean, he understood Mr. Bolton to say that we could certainly distinguish between them. Personally, he was not able to do that, for he found that in different parts of the country that what we might take at first glance to be Elizabethan appeared on further examination to be Jacobean and vice versa. He thought it was largely a matter of locality: in the North the Elizabethan style, as we know it, was not so much developed at the same early period as it was in the southern counties. Take, for instance, Fountains Hall, which was built in 1611. What was to differentiate it absolutely from the Elizabethan buildings of, say, 1580 or 1590 in southern counties? Take Hardwick Hall, which was built about 1590 to 1597, as Mr. Bolton truly said, it was extremely like Hatfield, except it had not the wings; the centre was very similar to Hatfield, which was built twenty years later. The Inigo Jones influence did not appear to have made itself felt in the northern counties until after 1680. He had rather hoped that Mr. Bolton would have mentioned the names of more architects who had been connected with certain buildings. Mr. Bolton had given some information on the point, but he did not mention the Smithsons, who were well known in the Midlands, being three generations of architects—Robert Smithson, born in 1535 and died in 1614, who on his monument was described as architect and surveyor to the House of Wolston; John Smithson, who was the architect of Bolsover Castle and portions of Welbeck; and his son, Huntington Smithson, who continued the work, the former being buried in 1634 and the latter in 1648, both in Bolsover Church.

It seems obvious that some questions may arise in connexion with this definition. The Solicitor-General expressed the opinion that drainage work would come within the term "building," and also the fitting of a corrugated-iron roof; the masons employed on the mouldings would be included, but not brick-makers. The men engaged in the manufacture of the iron roof would be included under paragraph 4, "Mechanical Engineering."

"Saw milling, including machine wood-work," was brought within the category of insured trades, and the definition of "mechanical engineering" was amended so as to read, "mechanical engineering, including the manufacture of ordnance and firearms, iron founding, whether included under the foregoing heading or not."

It seems to have been admitted that the drafting of these definitions would require further consideration, and it is to be hoped that it may receive it, as it would be regrettable were this part of the Bill to occasion litigation of the character that has arisen, both under the Factory Acts and the Workmen's Compensation Act of 1897 in connexion with similar definitions. The rates of benefit have been equalised in all insured trades, and raised to 7s., with some special provisions in the case of workmen under eighteen years of age.

FORCED BUILDING LABOUR IN THE MIDDLE AGES.

THE impressment of men for the purpose of serving in warfare is well known, but it is probable that few builders are aware of the fact that the impressment of carpenters, bricklayers, masons, and other builders' workmen was more or less common in England in the Middle Ages.

The following three mediæval documents show very clearly that the greater number, if not all, of the builders' craftsmen in the Middle Ages were liable to be pressed involuntarily into service.

Our first document is of the time of Richard III., and of the year 1483. This is to be found on page 116 of the British Museum manuscript Harl. 433, and is a copy of a warrant from the King. It is addressed to mayors, sheriffs, and others demanding assistance for Thomas Nevill to "take" bricklayers and labourers to serve the bricklayers:—

"Richard &c. To all Mairs, Sherifes, bailieffes, constables and all other our officers true liegemen & subgettes, greeting. Forsomuche as we have commaunded & appointed our well beloued seruaut, Thomas Neuyll, to doe make for vs certayne brickwerke at our towne of Cardinale & other places. We desiring the best performing of the same have yeven unto our said seruaut power, licence & auctorite by these our lettres, to take as many artificers expert in breke leyne and labourers to serve them for our vases as vnto hym shal be thought necessarie & expedient for the speedy avancement of our said vases. We therefore wolle & desire you and also charge you that vnto our said seruaut in due execution of the said auctorite ye will be helping favouring & assisting in all that ye gladly may. And if any persone, or persones, wolle of wilfulnesse withstande or disleue the same, that than ye wolle committe them to our wards, to go to remedy vnto the tyme they be conformable to do vs service. And in yevening your assistance to him ye shall mynystre vnto vs full good pleasure. Yeven &c. the XXth day of Septembre, anno primo."

Our next document is from a Record Office MS. [Eucher, Acc. 477-12]. The date of this authority to "arrest and take up" workmen is 1538. The holder of the commission was a carpenter (as we know from the mention in the same volume of his employment as such). His authority to take workmen was probably understood, though not expressly stated as being such, to be limited to the taking of carpenters alone:—

"Also to John Maphorne for his costes & expensis ryding to Eton Bridge, Lyngheld, Blechyngton, Dorkyng, Rygate and Hovey, with the Kinges commission to rest [arrest] and take up workmen by the space of XIII daies, at vid. the day our beside his daies wages for hymself & his horse. . . . Vis. Vid."

Our third and last proof of the fact of the more or less common custom of impressing men for building labour is taken from the last-mentioned MS. In this case it will be seen that the holder of the commission to arrest and take men was a mason. We may reasonably

suppose that in this case the authority was restricted to the taking of masons only:—

"Also to Thomas Forard, freman, for his costes & expensis ryding with the Kinges commission in Glostershire, Wilsbere, Herefordshire & Wossershire to rest & take up workmen by the space of XXX daies, at VIIIId. the day for hymself & his horse ouer & byside his daies wages. . . . XXs."

CEMENT IN EGYPT.

THE consumption of cement in Egypt is covered partly by domestic production partly by importation. The latter, as with other building materials, has greatly increased since the beginning of 1911. Business in Egypt has improved most happily; and with this improvement comes an increased activity in private building. In addition, however, there is in course of erection a large number of public buildings of importance. The length of time required for their construction will determine the supplies required.

The following table gives an idea of the cement imported from about a dozen different sources. The tons are probably metric, of 2,204 lb. average each. The present Egyptian pound of 100 piasters is worth a little more than 11. sterling:—

Source.	1908.		1909.		1910.	
	Tons.	£s.	Tons.	£s.	Tons.	£s.
Great Britain.....	28,650	50,523	12,822	24,919	35,924	64,417
Germany.....	135	253	636	1,151	5,192	10,324
Austria Hungary.....	545	788	203	444	2,545	4,867
Belgium.....	29,960	45,468	29,383	45,338	33,266	44,886
Spain.....	—	—	10	21	—	—
Denmark.....	—	—	—	—	9	18
France (mainland).....	20,595	30,754	9,194	15,287	8,694	12,318
France (Mediterranean).....	178	294	125	241	—	—
Holland.....	—	—	—	—	134	202
Greece.....	183	309	—	—	—	—
Italy.....	389	571	151	278	343	597
Roumania.....	450	878	—	—	—	—

Total.....	84,691	136,253	58,745	98,866	87,503	137,383

According to the above, the importations from Great Britain, France, and Germany have undergone considerable "adjustment"; the Belgian having remained at nearly the same level.

The total importations rose from 58,745 tons in 1909 to 87,503 tons in 1910; the value, from 98,866 £. to 137,383 £. The first half of 1911 shows steady progress.

The increase of the English and German figures is partly on account of the fact that these two countries were promised rather too hastily the orders for 4,500 tons of cement for the Egyptian railways.

England delivers principally artificial Portland cement in sacks and barrels that, as a rule, including packing, figure up to 135 piasters, delivered in Alexandria. Germany sends also artificial cement in sacks, and can deliver just about as well as other countries, and on very favourable conditions. For instance, the municipality of Alexandria has bought this year 200 tons of German cement at 160 piasters.

Belgium delivers both artificial Portland and natural cements; the former is much liked in Egypt, and is a sharp rival of the English material. The price runs from 170 to 190 piasters per ton, delivered at warehouse. These materials (about half the Belgian cement importation into Egypt) have pushed into the backgrounds the cheaper, natural cement from Belgium.

The French importation sank from about 20,000 tons in 1908 to 8,134 in 1910; principally because the rivals delivered on more favourable conditions, while the French exporters often sell free Marseilles port or f.o.b. steamer Marseilles. The freight from Marseilles to Alexandria is higher than that from Antwerp to the same port; and the prices average 25 piasters higher than for other cement of equal quality.

Of the other countries delivering cement only Austria-Hungary is worth mentioning; very good material is sent from Spalato.

For the Government buildings only artificial Portland cement is used, and it must conform to the "British Standard Specifications." The tests are made by the State Laboratory at Cairo.

As regards the domestic manufacture—the first company to name is the Société Anonyme des Ciments d'Egypte," turning out in Massarah about 10,000 tons a year. This cement, which is also used by the Egyptian Government, is principally consumed in Cairo and the vicinity. In Alexandria it has not been able to oust foreign competition. The company has been recently reorganised and its capacity increased. The raw material comes from the Mokattam stone quarries. A new Portland cement factory, that of A. Fusignani & Co., is in process of formation in Alexandria. It is intended, with a capital of 20,000 £, to produce about 15,000 tons a year. The raw materials will be drawn from Austria.

GENERAL BUILDING NEWS.

NEW COUNCIL SCHOOL, BEDLING.

The designs for this school were prepared by Mr. D. Pugh-Jones, F.S.I., county architect, and the estimated cost of the work 7,180 £. The new buildings provide accommodation for 382 scholars, and the contract was carried out by Messrs. Hamilton & Millard.

Caerphilly. Mr. D. Pugh-Jones has been responsible for over thirty new elementary schools, besides other various school works.

GENERAL POST OFFICE, GLASGOW.

Large extension works are to be carried out at this office, and the estimated cost of the work is 80,000 £. The architect is Mr. W. Oldrieve, F.R.I.B.A., of H.M. Office of Works, Edinburgh, and the contractors are Messrs. George Newton & Son.

TRADE NEWS.

The Foxton Council School, Cambridge, recently been fitted with two of D. O. Boyle's hygienic ventilating school grates, supplied Messrs. O'Brien, Thomas, & Co., Upper Thames-street, London, and Excelsior Works, South Bedfordsey.

Under the direction of Mr. S. Segar, architect, Newton Abbot, the "Boyle" system ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets has been applied to the additional ward Newton Abbot Workhouse.

Addington Schools, Surrey, are being supplied with Shorland's warm-air ventilating patent Manchester grates by Messrs. E. Shorland & Brother, Ltd., of Fallowfield, Manchester.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London Council, the following applications under London Building Acts were dealt with, names of the applicants being given in parentheses:—

Lines of Frontage and Projections.
City of London.—Erection of wooden cases at No. 35, Queen Victoria-street, C. (Messrs. Oppenheimer, Blandford, & Co., Consent).

Clapham.—A projecting wooden window at No. 246, Cavendish-road, Balham (Mr. Potterton).—Consent.

Holborn.—Projecting illuminated sign front of No. 16, New Oxford-street, Holborn (Messrs. F. Sage & Co., Ltd.).—Consent.

Paddington, South.—One-story shop basement at No. 33, Queen's-road, Bayswater

srs. Veale & Gibbs for Dr. J. Harley).—sent.

Paddington, South. Vaults in front of No. 2, Queen's-road, Paddington (Messrs. Veale & Gibbs).—Consent.

Grand.—Projecting illuminating sign in front of the Boulogne Restaurant, No. 27, Ward-street, Strand (Mr. G. K. Bird).—sent.

Wandsworth.—Projecting sign in front of No. 135, Putney Bridge-road, Wandsworth srs. Nevill & Co.).—Consent.

Woolwich.—Balconies in front of six houses on the southern side of Glenshiel-road, Eltham (T. H. Hutchings).—Consent.

Width of Way.

Finsbury, East.—Erection of a building on northern side of Banner-street, Finsbury srs. M. King & Sons).—Consent.

Greenwich.—Erection of two-story buildings in the forecourt fence on the northern-eastern side of Hoskins-street, Greenwich (Mr. A. Griffin).—Consent.

Greenwich.—Erection of buildings and a court fence in front thereof on the northern side of Hoskins-street, Greenwich, on site of Nos. 1 to 4, Webbs-cottages (Mr. Griffin).—Consent.

Waltham.—Alteration in the position of the way leading from Great Queen-street to the yard, Holborn (Messrs. Gordon & Ton).—Consent.

Waltham, West.—Erection of a warehouse along the site of Nos. 3, 4, 5, 6, 7, and 8, Bennett-street, and Nos. 10, 12, and 14, Bedford-street, Blackfriars (Mr. A. Sykes for J. Sainsbury).—Consent.

Width of Way and Lines of Frontage.

Hackney, North.—One-story addition to a building on the western side of Brunswick-road, Hackney (Messrs. J. D. Mathews & Son and Messrs. H. J. Davenport, Ltd.).—Consent.

Peckham.—Erection of a chapel building on the site of Nos. 37, 39, 41, and 43, Peckham-rd., Peckham, and Nos. 4 and 6, Philip-street (Mr. A. E. Mullins for Mr. J. Buckland).—sent.

Lines of Frontage and Deviations from Certified Plan.

Waltham.—Covered way at the premises of London General Omnibus Company, Ltd., to Micklethwait-road, Fulham (Mr. J. E. J. for the London General Omnibus Company, Ltd.).—Refused.

Lines of Frontage and Construction.

Greenwich.—Addition at the rear of No. 36, New-road, Greenwich, abutting upon Newing-road (Mr. F. C. Soar).—Consent.

Hackney, North.—Retention of a wood and shed adjoining No. 19, Northwood-road, Hackney (Mr. A. H. Ellis).—Refused.

Grand.—Wood and glass showcases at No. 1, Oxford-street, Westminster (Mr. F. T. for Messrs. Louise & Co., Ltd.).—sent.

Width of Way, Lines of Frontage, and Construction.

Paddington, South.—Temporary wood and iron building at the rear of Nos. 511 and 513, Liverpool-road, Islington, to abut upon Paradise-avenue (Mr. H. Goodchild).—Consent.

Formation of Streets.

Wandsworth.—Formation or laying out of a street for carriage traffic to lead from Ham road to Clarendon-road, Putney (Mr. Pain-Clark for Mr. C. Pettitward).—sent.

Deviation from Certified Plans.

Waltham, West.—Re-erection of Nos. 32 and 33, Devonshire-mews, East, St. Marylebone (Mr. A. F. Faulkner for Mr. W. Willett).—sent.

Width of Way, Construction, and Alteration of Buildings.

Paddington, South.—Iron and glass verandah with a flat roof at the rear of the "Golden Hotel," Notting-hill-gate, to abut upon northern side of Uxbridge-street (Mr. J. J. for Mr. W. Magee).—Consent.

Use at Rear and Alteration of Buildings.

Waltham, West.—Additional story at No. 3, Brunswick-mews, Great Cumberland-place, Waltham (Mr. J. Hudson).—Consent.

Waltham.—Staircase between the ground and first floors of Nos. 187 to 193, Knightsbridge (Mr. A. Burr for Mr. J. C. Humphreys).—sent.

Buildings for the Supply of Electricity.

Hammersmith.—Addition to the boiler-house at the Hammersmith Metropolitan Borough Council's electricity generating-station, Fulham Palace-road, Hammersmith (Mr. H.

Mair for the Hammersmith Metropolitan Borough Council).—Consent.

The recommendation marked † is contrary to the views of the Metropolitan Borough Council concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ALDERSHOT.—Church, Queen's-road; Rev. F. O'Farrell, Aldershot.

Aston (Birmingham).—Factory; Messrs. Harrison & Cox, architects, 109, Comore-road, Birmingham; Mr. W. H. Gibbs, builder, King's Heath, Birmingham.

Baghill.—Extensions to isolation hospital (2,670l.), Pontefract Joint Hospital Board.

Barnham Heath.—Addition to County Asylum (4,800l.); Mr. F. W. Ruck, County Surveyor, Week-street, Maidstone.

Birmingham.—Picture palace, Coventry-road; Messrs. Bridgewater & Porter, architects, Temple-row West, Birmingham. Stables, etc., Lodge-row; Mr. Victor Peel, architect, 13, Temple-street, Birmingham. Additions to works of Messrs. Pontifex, Ltd.; Messrs. E. Harpox & Brother, architects, Corporation, Birmingham; Mr. F. J. Briley, builder, Hay Mills, Birmingham.

Blackhall Mill (Durham).—Twenty-five houses; Mr. George Symon, Surveyor, Blaydon Urban District Council.

Cambridge.—Church (5,000l.); Primitive Methodist Trustees, Cambridge.

Cardiff.—Fire-station, Westgate-street; Mr. W. Harpur, Surveyor, Cardiff Town Council. Chendle. Extensions to works, Bird Hall-lane, for the Oil Engineering Company.

Clacton.—Church buildings; Vicar, St. James, Clacton.

Coventry.—Adaptation of premises, Hill-street, for children's home; Mr. J. Arch, Clerk, Coventry Board of Guardians.

Crossness.—Engine house at pumping-station (63,600l.); Messrs. Dick, Kerr, & Co., Ltd., builders, Cannon-street, E.C.

Croydon.—School, Stamford-road (12,100l.); Mr. E. J. Saunders, builder, Wellesley-road, Croydon.

Cwmnantgwyn.—School; Western Valley School Managers.

Darley Dale.—Church; Mr. D. Wildgoose, architect, Matlock.

Dover.—Mission hall; Vicar, St. Mary's Church, Dover.

Dowlais.—Electric theatre, corner of High and George streets, for the Victoria Cinematograph Company, Ltd.

Dundee.—Additions to warehouse, Cowan-street, for the Dundee Canister Company, Ltd. Durham.—Parish hall, Crossgate; Vicar, St. Margaret's Church, Durham.

Edinburgh.—Additions to works, Warriston-road, for Messrs. MacLagan & Cumming.

Fareham.—Extensions to Holy Trinity Church; architects, care of the Trustees.

Farnborough.—Additions to cinematograph theatre, Lynchford-road, for the Farnborough Electric Theatre Company.

Fazeley.—School; Mr. J. Hutchings, architect, County Offices, Stafford.

Felixstowe.—School (3,650l.); Mr. W. E. Watkins, Secretary, Education Committee, East Suffolk County Council, Ipswich.

Felling.—Drill hall; Commandant, Felling Detachment, 9th Battalion Durham Light Infantry (Territorials).

Forde.—Adaptation of workhouse into asylum (66,000l.); Mr. G. A. Hutchins, Surveyor, Montgomeryshire County Council, Welshpool.

Gloucester.—School, Inglesstone Common; Mr. R. S. Phillips, architect, The Cross, Gloucester.

Great Yarmouth and Gorleston.—Pumping-station; Mr. John W. Cockrill, Architect, Yarmouth Town Council.

Hanley.—Factory; Mr. C. G. Cowlishaw, architect, 22, Stafford-street, Hanley; Mr. T. Godwin, builder, Raymond-street, Hanley.

Heckmondwike.—Extensions to schools; Vicar, St. Saviour's Church, Heckmondwike.

Johnstone.—Masonic temple, Collier-street; Messrs. William Jeffrey & Sons, builders, Johnstone.

Lancaster.—Additions to workhouse; Mr. S. E. Berry, architect, Lancaster.

Largs, N.B.—Block of houses; Mr. Kay, architect, Hamilton, N.B.

Launceston.—School; Mr. R. Jacob, builder, Bugle.

Lincoln.—Carnegie library, Free School-lane; Professor R. Blomfield, architect, New Court, E.C.

* See also our list of Competitions, Contracts, etc., on another page.

Mansfield and Rainworth.—Schools; Mr. T. Collinge, Town Hall, Mansfield.

Mansfield Woodhouse.—Eight houses, Old Mill-lane, for the Mansfield Woodhouse Small Holdings Society.

Newton Abbott.—Nurses' home (460l.); Mr. F. Zealley, builder, Newton Abbott.

Nuneaton.—Two hundred houses; Manager, Arley Colliery, Cookery centre; Mr. H. Ash, architect, Market-place, Nuneaton.

Oystermouth (Swansea).—Hospital, Fairwood Common; Mr. H. A. Ellis, architect, Fishers-street, Swansea.

Pontmorlais.—Electric theatre for the Merthyr Palace Company.

Radford.—United Methodist Church, Independent-street; Mr. W. A. Higginbottom, architect, Friars-yard, Nottingham; Mr. John Lewin, builder, Netherfield.

Richmond.—Proposed enlargement of Darell-road School (about 2,500l.); architect, care of the Managers.

Rochdale.—Proposed church; Vicar, St. Ann's, Rochdale.

Shoreham.—Alterations and additions to Grammar School (1,960l.); Mr. E. H. Cud, builder, Shoreham.

Southborough.—Isolation hospital; Surveyor, Southborough Urban District Council.

Staines.—Chapel; Messrs. Smee & Houchin, architects, 82, Fleet-street, E.C.

Takeley.—School; Mr. F. Whitmore, architect, 73, Duke street, Chelmsford.

Tickhill.—Shops, Castlegate, for the Doncaster Co-operative Society, Ltd.

Trebanoc.—Church (1,000l.); Messrs. Arnold Brothers, builders, Clydach.

Troedyrhyn.—Electric theatre for the Troedyrhyn Cinema Company.

Twickenham.—A plan has been passed for four houses, Richmond-road, for Mr. F. J. Fraser.

Walsall.—Co-operative stores; Mr. H. Elton, builder, Bloxwich, Walsall.

Warkworth.—Alterations to Burn's House, Castle-hill; Mr. L. A. Loades, architect, Morpeth.

Whitefield.—Housing scheme; Mr. C. H. Wright, Borough Surveyor, Whitefield Urban District Council.

Whitehaven.—Improvements to workhouse (2,310l.); Messrs. Beswick & Davies, architects, care of Mr. W. H. Atkinson, Clerk, Board of Guardians, Whitehaven.

Wolverhampton.—Schools; Messrs. Fleming & Sons, architects, Bank-chambers, Wolverhampton; Messrs. H. Gough & Sons, builders, Dudley-road, Wolverhampton.

Yarmouth.—Proposed extensions to workhouse (9,000l.); Mr. F. Burton, Clerk, Board of Guardians, Yarmouth.

Ynysmeudw.—St. Mary's Church (2,000l.); Mr. Cook Rees, architect, Neath; Messrs. Price Brothers, builders, Cardiff.

OBITUARY.

Herr von Tschudi.

The death on November 24, at Cannstatt, is announced of Dr. Hugo von Tschudi, Director of the Bavarian National Galleries, Munich. Herr von Tschudi was Director of the National Gallery, Berlin, in 1896-1909, and author of "Donatello and Modern Criticism," and of books upon Manet and Menzel, specimens of whose works, together with examples of the modern French schools, he acquired for the Berlin Gallery.

Mr. Salmon.

The late Mr. William Forrest Salmon, of No. 53, Bothwell-street, Glasgow, a Fellow and Past-President of the Glasgow Institute of Architects, was elected a Fellow of the Royal Institute of British Architects in 1876, and served as member of the Council. The firm of Messrs. James Salmon & Son, latterly Salmon, Son, & Gillespie, F.R.I.B.A., won in January 1903, the first premium in Municipal Buildings; they were the architects of the Hamilton Municipal Buildings, 1903; Scottish Temperance League Building, Glasgow (illustrated in No. XVI. of our Series—"The Architecture of Our Large Provincial Towns," July 9, 1909); Marine Hotel, Troon, Ayr, 1897, with enlargement and the tower, 1901, at a total cost of 27,000l. (Builder, October 11, 1902); Glasgow Savings Bank, Anderson Cross Branch, with shops and saloon, and, on the upper floors, nine dwelling-houses, at a cost of about 12,000l. (Builder, March 21, 1903); new wing for fifty beds, West of Scotland Convalescent Homes, Dunoon, 1907; Carsburn Public School, Greenock, with twenty classrooms, workshops, etc., for 1,020 scholars, 1907-8; and an extension of Woodilee Asylum, Lenzie, for the Glasgow Lunacy District Board, 1903.

LAW REPORT.

Case under the London Building Acts.

A MATTER of great importance to the London building trade was discussed in the King's Bench Divisional Court on Friday, November 24, when Mr. Justice Hamilton and Mr. Justice Bankes considered a special case stated by the Tribunal of Appeal, under the London Building Acts (Amendment) Act, 1905, sect. 7, sub-sections 2 and 22, in the case of *Clark v. The London County Council*. The matter came before their Lordships in the form of an appeal by the London County Council from the decision of the Tribunal in the appeal of Mrs. Clark, owner of the Berners Hotel, against the refusal by the London County Council to issue a certificate pursuant to sect. 7 of the Act of 1905.

Counsel for the appellants: Mr. W. O. Danckwerts, K.C., and Mr. Cecil Walsh (instructed by Mr. Edward Tanner); for the respondent: Mr. C. A. Russell, K.C., and Mr. Bodkin (instructed by Messrs. Bennett & Ferris).

Introducing the appeal, Mr. Danckwerts said the matter came before their Lordships in the form of a special case stated by what was called the Tribunal of Appeal under the London Building Act, and he thought he could put the Court shortly in possession of the point which it would have to deal with. Under the Building (Amendment) Act of 1905—an Act dealing principally with precautions in regard to fire in cases of high buildings (*i.e.*, buildings having an upper story the floor of which was more than 50 ft. above the ground)—a person proposing to erect such a building had to deposit, with the notice which had to be given under the London Building Act, plans showing the precautions he proposed to take for the purpose of providing against fire. These plans had to be approved by the London County Council either *simpliciter* or on conditions. If the building owner did not concur in the London County Council's approval or disapproval, he could appeal to the Tribunal of Appeal within two months. He then had to erect the building in accordance with the plan approved by the County Council or with the modifications introduced by the Tribunal. When the building was finished he had to obtain a certificate from the Superintending Architect—before the upper part could be inhabited—to the effect that the building had been erected according to the plans and conditions (if any). If he did not do that, he was subject to certain penal consequences. If the certificate was refused, the building owner could appeal to the Tribunal within two months. Thus the first step was: The plans to be approved, either *simpliciter* or subject to conditions; secondly, the building had to be erected in accordance with the plans; and thirdly, a certificate must be obtained that the building was in accordance with the plans. The building owner could appeal against the refusal of a certificate, or he could enter an initial appeal against the action of the County Council. The point here was that Mrs. Clark deposited plans, obtained a conditional approval from the London County Council, did not appeal against that to the Tribunal of Appeal, and erected her building.

Mr. Justice Bankes: "What is meant by 'conditional approval'?"

Mr. Danckwerts: Approval subject to compliance with certain conditions. Mrs. Clark (he proceeded) erected her building, admittedly not in accordance with at least one of the conditions imposed by the London County Council. She then applied for the Superintending Architect's certificate. The Superintending Architect refused to grant a certificate, saying he could not give one, as the building was not in accordance with the conditions imposed. Mrs. Clark then appealed against the refusal of the certificate, and this was the only appeal she lodged. Upon that appeal being heard, those who represented Mrs. Clark claimed that the Tribunal of Appeal could at that hearing modify the conditions and plans which had been approved by the London County Council, and which had not been appealed against, and that if they approved of plans lodged then, for the first time, in accordance with the building as actually erected, they could give a certificate as required by the Act. He contended that this the Tribunal of Appeal could not do.

Mr. Danckwerts then read the case stated by the members of the Tribunal of Appeal. It included these passages:

Paragraph 2: "The following facts were proved or admitted before us on the hearing of the appeal in question:—On July 26, 1906, Mr. John Slater, the architect acting for Mrs. Clark in the designing and construction of the Berners Hotel, under sect. 7 of the London

Building Acts (Amendment) Act, 1905, of the intention to erect the said hotel, and duly deposited with the London County Council copies of the plans prepared for such new building, showing the means of escape provided from in case of fire proposed to be provided in connexion with such building. The said plans were conditionally approved on July 30, 1906, notice of which conditional approval was given on August 1, 1906, by the Superintending Architect on behalf of the London County Council to Mr. Slater. The second condition contained in such conditional approval was the same as that date as the second condition referred to in paragraph 3 of this case. Mr. Slater did give notice of appeal to the Tribunal of Appeal against this conditional grant on August 22, 1906, but he subsequently withdrew it."

Mr. Danckwerts interposed a statement in regard to the above paragraph. It came to nothing, he said, the London County Council giving conditional approval, and the appeal notified was abandoned. But a fresh start was made, as indicated in

Paragraph 3: "For reasons which are not material to the questions raised in this case, Mr. Slater entirely changed the plans of the proposed building in the year 1907 so as to necessitate, in the case of the western block, a fresh application in the year 1908. On April 17, 1907, he deposited with the London County Council plans showing the new or modified plan of the eastern block of the hotel. Notice of the London County Council's approval of the means of escape shown on these plans, and of their approval of the means of escape shown on the original plans of the western block, subject to certain conditions, was given to Mr. Slater on May 16, 1907, by the Superintending Architect on behalf of the Council. There were thirty-six conditions, the material one at the hearing of the appeal being the second, which was the same as that already referred to in paragraph 2, and which was in these terms:—

"That the staircases be separated from the rooms and corridors on all floors by fire-resisting partitions or walls, and all openings in such separations to be hung with self-closing, fire-resisting doors or windows glazed with fire-resisting glazing."

Paragraph 4: "On October 29, 1908, Mr. Slater deposited with the London County Council fresh plans of the western block of the hotel. Notice of the London County Council's approval of the means of escape, shown on these plans, subject to certain conditions, was given to Mr. Slater on November 19, 1908, by the Superintending Architect on behalf of the Council. There were five conditions, the material one at the hearing of the appeal being the first, which raised substantially the same practical question as the condition set out in the foregoing paragraph."

Paragraph 5: "On November 24, 1909, Mr. Slater wrote to the Superintending Architect informing him of his intention to appeal against this condition, to which he had already objected in the course of correspondence relating to the eastern block."

Paragraph 6: "In fact no appeal was brought against the conditional approvals above mentioned in respect of either the eastern or the western block of the hotel until after the refusal of the certificate mentioned below. The building of the hotel was proceeded with, and ultimately completed, without either the condition mentioned in paragraph 3 of this case relating to the eastern and western blocks, or the condition mentioned in paragraph 4 of this case, relating to the western block, being complied with. The other conditions were either at once accepted and carried out, modified by the London County Council during the progress of the work, and carried out in their modified form or dispensed with by the consent and approval of the Council. On January 20, 1910, Mr. Slater wrote a letter to the Superintending Architect of the London County Council. After the completion of the building, Mr. Slater applied to the London County Council for a certificate under sect. 7 (2) of the London Building Acts (Amendment) Act, 1905. The certificate was refused by the Superintending Architect by letter dated February 3, 1910, and on March 3, 1910, a further letter was written to Mr. Slater stating that the London County Council declined to waive the condition which Mr. Slater objected to, and setting forth the outstanding requirements which were insisted upon. At the hearing it was agreed that, with the exception of the provision of fire-resisting doors separating the staircases from the rooms and corridors on the upper floors in accordance with the condition already mentioned, all other requirements had either been carried out or Mr. Slater had undertaken that they should be, and on the date of our judgment in the appeal (June 23, 1910), it was agreed that all such other requirements had been, in fact,

carried out to the satisfaction of the London County Council."

Paragraph 7: "On March 31, Mr. Slater, on behalf of Mrs. Clark, gave formal notice of appeal. On April 29, 1910, he sent to the Tribunal of Appeal a short statement of facts together with two copies of plans, showing a plan of one of the upper floors as being typical of the remainder, and also showing the positions of the screens and doors as required by the condition insisted upon by the London County Council, and complained of by Mrs. Clark."

Paragraph 8: "The appeal came on for hearing on May 31, 1910. Before any evidence was taken, Counsel who appeared on behalf of the London County Council took the preliminary objection that, inasmuch as no appeal had been brought by Mrs. Clark against either of the conditional approvals by the London County Council within two months thereof, the time for appealing against any conditional approval had passed, and that, if an appeal being against the refusal of the London County Council to grant a certificate, the Tribunal of Appeal were confined to consider whether the building had been provided with means of escape in accordance with the plan approved by the Council, and whether the conditions, subject to which such plans were approved, had been complied with, and that the Tribunal of Appeal had no jurisdiction to hear any appeal against or evidence against the reasonableness of the conditions or conditional approvals, or to approve any plans."

Paragraph 9: "We held that, in the circumstances, on the hearing of the appeal against the refusal of the Council to grant a certificate, our jurisdiction under the London Building Acts (Amendment) Act, 1905, sects. 7 and 22, was not limited in the manner contended for by Counsel for the London County Council, but that we were entitled and bound to inquire and consider any evidence tending to show that the building had, in fact, been provided with all such means of escape therefrom in case of fire as could be reasonably required in the circumstances of the case in accordance with plans approved by us. We accordingly dismissed the evidence, but, at the request of Counsel for the London County Council, agreed to state a case for the decision of the Divisional Court."

Paragraph 10: "We heard evidence and arguments of Counsel on May 31 and June 1, 1910, and, at the close of the evidence, after hearing Counsel for the appellant respondents, we came to the conclusion that, if fire-resisting doors required by the condition could not be required in the circumstances of the case, but asked Counsel for the appellant who was the respondent, to ask that he should be allowed to appeal under sect. 7 of the Act of 1905."

Paragraph 11: "Up to that time the plans which had been before us were the copies of plans lodged with the Tribunal of Appeal referred to in paragraph 7 of this case. The plans originally deposited with the London County Council in 1906, and referred to in paragraph 2; the plans deposited with the London County Council in 1907, and referred to in paragraph 3; and the plans deposited with the London County Council in 1908, and referred to in paragraph 4."

Paragraph 12: "Although such plans were sufficient for the purpose of explaining to and enabling us to follow the evidence given in regard to the building, which we had personally viewed before the trial, they did not show the whole of the building as it had, in fact, been erected."

Paragraph 13: "Accordingly Counsel for the appellant applied to us for an adjournment in order to enable them to produce a fresh set of plans which would show the building as actually erected; that is to say, embodying the modifications in the building made by agreement with the London County Council since the deposit of the plans with the London County Council in order that we might approve such fresh plans."

Paragraph 14: "Counsel for the respondent objected to the adjournment, but we decided to grant it."

Paragraph 15: "At the adjourned hearing on June 23, 1910, Mr. Slater was recalled, and produced certain plans prepared since the adjourned hearing, which showed the building as it had actually been erected. It was proved and we find as a fact, that such plans differed from the plans deposited with the London County Council referred to in paragraphs 3 and 4 in so far as they incorporated modifications in the building which had been agreed to by the London County Council at the deposit of the said plans."

Paragraph 16: "Counsel for respondents objected to the fresh plans being put in evidence and to our approving the same, on the ground (1) that the evidence was closed; (2) that the plans had never been deposited with the London County Council; (3) that the plans had not been lodged with the Tribunal

in accordance with Regulation 3 of the regulations of the Tribunal, and that the Council had no jurisdiction to dispense with compliance with such Regulation. The County Council in so far as they indicated modifications subsequently made in building in agreement with the London County Council. We held that Regulation 3, relating to the building, is only directory or the convenience of the Tribunal, and even if that Regulation had not been complied with, the Tribunal has power to waive compliance with such Regulation, and accordingly overruled the object, but, at the request of the London County Council, I directed that a case for the decision of the County Council on the further questions raised in the case be referred to the County Council.

Paragraph 18: "We approved the plans which had been put in as mentioned in paragraph 13, showing the building as it then stood, and determined that the building had been erected in accordance with the plans in case of fire as could be reasonably required in the circumstances of the case in accordance with the plans approved by us, and made no order as to costs."

The questions for the determination of the County Council are as follows:

(a) Whether, in the circumstances aforesaid, the Tribunal, on the hearing of the appeal, only had jurisdiction to hear and determine and admit evidence upon the question whether the building had, in fact, been erected in accordance with the plans approved by the London County Council, as referred to in paragraphs 3 and 4, subject to such conditions as aforesaid, and whether the conditions had been complied with, whether the Tribunal had jurisdiction to hear and determine and admit evidence upon the question whether the building had, in fact, been provided in accordance with plans approved by the Tribunal of Appeal, with all such means of escape therefrom in case of fire as could be reasonably required in the circumstances of the case.

(b) Whether, in the circumstances aforesaid, the Tribunal had jurisdiction to admit evidence and approve the said plans. Danckwerts, continuing his argument, said that the point of substance which was in the case was, whether or not upon appeal against the refusal of the certificate open to the Tribunal of Appeal to treat in appeal against the original disapproval of the plans or imposition of conditions. If the Tribunal of Appeal were right, a man could, in the case of a building which the County Council had refused to approve, then, and he could then build, and, having completed his building, go to the County Council for a certificate that the building was completed in accordance with the plans and conditions. This could be done on the ground that the building had been appealed against or complied with, upon which he could appeal against the refusal of the certificate. The refusal would be right if it was in accordance with the truth of the conditions had not been complied with, but he man could then go to the Tribunal of Appeal for them to rehear the case as though it were before them as an appeal against the disapproval of the plans or the imposition of conditions. Unless that was so, surely this was a case in which the Tribunal of Appeal ought to be dismissed. He (Danckwerts) submitted that the County Council never intended that the County Council should disapprove plans or approve them conditionally, and then have a man snap his fingers at them, go on building, and then finally say, "I give you your certificate," and, if the County Council refused, appeal to the Tribunal of Appeal against such refusal, and get the Tribunal to reopen the whole question. He (Danckwerts) submitted Mr. Danckwerts, on behalf of the County Council, said that the question turned upon the question to be placed on facts, 7 and 22 of the case. The substance of sect. 7, he said, was that provision it was intended to secure the risks of fire with "such means of escape as could be reasonably required in the circumstances of the case." This was what he referred to as the operative part of the Regulation of the Tribunal of Appeal was that the Tribunal approved the plans submitted and that the building had been provided with "such means of escape in case of fire as could be reasonably required in the circumstances of the case," in accordance with plans approved by the Tribunal. He submitted that the same result was arrived at

by taking the matter under sub-sect. 2, which was the particular sub-section dealing with the circumstances in which a building of the kind in question could be lawfully occupied. The Tribunal of Appeal, he said, had no jurisdiction to grant a certificate. What they had determined, he suggested, was that, where a building had been provided with "all such means of escape therefrom in case of fire as could be reasonably required in the circumstances of the case," and where those provisions were in accordance with plans which either the Council or the Tribunal of Appeal had approved, the requirements of the Act had been satisfied.

Mr. Russell argued that sect. 22 of the Act meant that the building owner was to have two opportunities of bringing the matter before the Tribunal of Appeal, one of those opportunities arising if the London County Council either disapproved or conditionally approved the plans deposited with them, and the other if the building owner failed to obtain from the Council the certificate mentioned in sect. 7, sub-sect. 2. Upon either of those events, or within a limited time of either of those events, the building owner might bring the matter before the Tribunal of Appeal for the purpose of obtaining the Tribunal's decision as to whether the building "as going to be erected," or "as erected," would be or was provided with such means of escape in case of fire as could be reasonably required in the circumstances of the case. He submitted it was only reasonable, when one looked at the matter as illustrated by this case, that that should be so. It appeared, in this case, that the conditions, subject to which the plans were approved, were very numerous indeed in the first instance, some twenty or thirty being annexed. What happened? Of course, if the building owner had at once gone to the Tribunal of Appeal, those twenty or thirty conditions would have had to be discussed, and the question gone into as to whether it was reasonable or unreasonable to impose them. Instead of that, the building owner took the practical course of going on with the work, and, as questions arose, of dealing in the concrete with each point, with the result that all the conditions with one exception disappeared.

Ultimately, continued Mr. Russell, they came to the one and only real point of difference between the parties, viz. the condition as to the screens at the head of the staircases. Of course, it was obvious that the time that would be required to allow that process of weeding-out and getting rid of the conditions, which at one time would be considered material, but as the building went on would obviously become not so material, would not be merely two months after the imposition of the conditions. He submitted there was nothing whatever in the Act of Parliament to prevent the building owner, when the ultimate difference between himself and the County Council arose, bringing the matter then before the Tribunal of Appeal and asking the Tribunal to determine between him and the London County Council whether a particular condition was one compliance with which was essential or proper in order that the building might be provided with "all such means of escape therefrom in case of fire as could be reasonably required in the circumstances of the case." He suggested that, if the contention of the London County Council were correct, instead of the Tribunal of Appeal having a question of substance to deal with, whenever the matter was brought before them in a case where the appeal took place, only when the question of certificate had arisen, they could never have anything before them that was not merely a matter of form. One could hardly imagine, he thought, that they would have the machinery of a Tribunal of Appeal of this kind for determining "aye" or "no" whether a building was erected in accordance with the plans, and really it was almost clearer when one considered the case of whether a certain condition had or had not been complied with, for this, surely, could very seldom be a matter of any doubt at all.

On the question of jurisdiction, Mr. Russell contended that the matter before the Tribunal of Appeal was whether the building had been provided with means of escape in accordance with plans approved by the County Council or by the Tribunal.

Mr. Danckwerts having replied, their Lordships delivered

JUDGMENT.

Mr. Justice Hamilton, having reviewed in detail the circumstances of the case, referred to the condition imposed in regard to the screens protecting the staircases. It was plain, he said, that in that connexion there might be legitimate difference of opinion, if of a purely technical kind, as to whether a particular material was so applied that it was different from the condition imposed or whether a particular partition could be

described as fire-resisting, or whether a particular opening was closed by mechanism which could be called self-closing. If, then, although, in the circumstances, the building owner said he might appeal if the London County Council insisted upon all the conditions imposed, he did not, in fact, at that time or within two months of the notification of the County Council's conditional approval take any appeal to the Tribunal of Appeal at all, and the work proceeded and the time arrived at which, as a preliminary to the place being occupied, it was necessary, under sub-sect. 2 of sect. 7, to apply to the County Council for a certificate, and that certificate was refused, the building owner could then appeal, and appeal only from the refusal of the certificate. In this case, when the appeal came before the Tribunal of Appeal liberty was sought to call fresh evidence, and the Tribunal came to the conclusion that the building had been provided "with all such means of escape therefrom in case of fire as could be reasonably required in the circumstances of the case." It was quite immaterial to consider the rights or wrongs of that decision, the question being whether it was competent for the Tribunal to do what they did in the matter. In his (Mr. Justice Hamilton's) opinion, the answer to both the questions stated in the case was in favour of the London County Council; that the Tribunal of Appeal only had jurisdiction upon the question whether the building had been, in fact, erected in accordance with the plans approved by the London County Council, and whether the conditions imposed had been complied with. The Tribunal had not jurisdiction to approve the plans in question, which were prepared *ex post facto*. There could be no doubt that the scheme of the Act, which had been read with the previous Act of 1894, was that the Executive Authority was to be the London County Council. He accordingly thought that the answer of the Court should be "Yes" to the first part of Question "A"; "No" to the second part of that question; and "No" to Question "B."

Mr. Justice Banks agreed, and the appeal of the London County Council was accordingly allowed.

Mr. Cecil Walsh (for the London County Council): Your Lordships order a declaration in the terms of the answers to the questions, and that the case be remitted to the Tribunal of Appeal with a direction that the original appeal should have been dismissed, and that they have to deal with the question of costs. Mr. Russell (interposing): The matter has to go back to the Tribunal of Appeal to make an order and deal with the costs. I agree with my friend that the declaration will follow on the lines of the answers to the questions stated.

Mr. Justice Hamilton: We remit the appeal to the Tribunal of Appeal, with a direction that it should have been dismissed.

Mr. Russell: My clients desire to consider their position in this matter. I think we need leave to appeal in this case, and I would ask for that leave.

Mr. Justice Hamilton: Certainly.

LONDON COUNCILS.

Barking.—The Surveyor has been instructed to prepare plans and estimates for the erection of a convenience adjoining the Public Baths in the Town Yard. The Surveyor has been further instructed to proceed with the work of erecting a convenience adjacent to Loxford Bridge. The following plans have been passed:—Mr. J. Ranson five shops, Longbridge-road; The Vulcan Globe Match Company, additions to factory, Abbey-road; Mr. A. Burch, four houses, Park avenue.

Chesham.—At the last meeting of the Urban District Council the Surveyor was instructed to invite tenders for the construction of open-air baths on the Moor. The estimated cost is put at £298.

East Ham.—Sanction has been received from the Local Government Board to the borrowing of £391, for culverting the watercourse on the Greatfield Estate, and the Engineer has been instructed to proceed with the work. Plans and estimates are to be submitted by the Engineer for the erection of a fire-station to complete the present block of buildings on the Town Hall site. The following tenders have been accepted:—Messrs. Engert & Rolfe, £44, asphalted pond of swimming-bath, 4s. 3d. and 6d. per super. yard, 14d. per foot run for fillets, and 6d. per foot run for skirting, etc.; Messrs. Gibb & Canning, surface water channels and spitoons for swimming-bath, channel and catch pits, 17s. 6s., white glazed tiles, 18s. 10s.; Messrs. Oates & Green, four-stalled urinal, 16s., and white glazed sinks, 1s. 9s. each; Messrs. H. Wilmer & Sons, two water-closet suites, 1s. 17s. each; The Patent Victoria Stone Company, patent stone curb

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, —; Auction Sales, xxiv. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

** It must be understood that the following paragraphs are printed as news, and not as advertisement; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

DECEMBER 4.—**Bristol**.—Pavilion on recreation-grounds. Cost not to exceed 3,000l. Particulars from Messrs. Packer & Co., Greenbank, Bristol.

DECEMBER 15.—**Sofia**.—NEW MUNICIPAL BUILDING.—See Competition News, page 508, November 3.

DECEMBER 29.—**Glasgow**.—DESIGN FOR A BRIDGE.—Designs are invited (Alexander Thomson Travelling Studentship) for a bridge. Premiums of 60l. and 30l. are offered. See advertisement in issue of December 24, 1910, for further particulars.

DECEMBER 30.—**Armadale**.—Public hall and offices, to cost 2,500l. Premiums of 15l. and 10l. Offer only to architects who were represented on the site on October 12.

DECEMBER 30.—**Welsh Eisteddfod, 1912**.—DESIGNS FOR WORKMEN'S DWELLINGS.—Prize, 50l. Particulars from Welsh Housing Association, 9, Temple-chambers, E.C.

JANUARY 1, 1912.—**Rochdale Infirmary**.—EXTENSIONS.—Limited to Rochdale architects. Assessor, Mr. Alex. Gram, F.R.I.B.A.

JANUARY 6, 1912.—**Bolton**.—MINORS' FEDERATION Hall and Offices. Limited to architects within twenty-five miles of Bolton. Premiums, 50l. and 25l. Assessor, Mr. Jonathan Simpson, F.R.I.B.A. Particulars from Messrs. Fielding & Fernhough, 7, Fold-street, Bolton.

JANUARY 6, 1912.—**Stafford**.—PUBLIC LIBRARY.—The Stafford Corporation invite designs for a public library. Mr. Henry T. Hare, F.R.I.B.A., assessor. Second and third premiums of twenty and forty guineas. Deposit, 1l. Particulars from Mr. W. Plant, A.M.Inst.C.E.

JANUARY 9, 1912.—**Spennymoor**.—PUBLIC HALL, ETC.—The Spennymoor U.D.C. invite competitive plans and designs for a public hall, market, and offices, etc. Three premiums are offered. See advertisement in this issue for further particulars.

JANUARY 29, 1912.—**Montevideo**.—Government palace (premiums, 2,125l. and 850l.) and town improvement scheme (premiums, 1,060l., 640l., and 425l.). Conditions may be seen at the Board of Trade, 73, Bevington-street, E.C.

JANUARY 31, 1912.—**Australia**.—DESIGNS FOR FEDERAL CAPITAL CITY.—The Government of the Commonwealth of Australia invite competitive designs for the laying out of this Federal capital city. See advertisement in issue of September 1 for further particulars. See also page 508, November 3.

FEBRUARY 3, 1912.—**Bolton**.—NURSES' HOME at THE INFIRMARY.—Premiums of 30l., 20l. and 10l. Assessor, Mr. John B. Cass, F.R.I.B.A.

FEBRUARY 17, 1912.—**London, E.C.**—NEW OFFICES.—The Port of London Authority invite preliminary sketch designs for new head office in Trinity-square, and for laying out remainder of land as a building site. See advertisement in issue of November 24 for further particulars.

JULY 1, 1912.—**Dusseldorf**.—A plan for the extension of the City of Dusseldorf. Premiums of 1,000l. to 875l. Conditions on application to the Chief Burgomaster, Dusseldorf. A translation appeared on page 365, September 29.

NO DATE.—**Jordanhill, Glasgow**.—PROPOSED TRAINING COLLEGE.—See Competition News, page 508, November 3.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

DECEMBER 2.—**Truro**.—ROOFING, ETC.—Erection of glass roofing and steel framework at rear of 22, King-street. Plans and specifications from Mr. A. A. Cornelius, M.S.A., architect, Truro.

DECEMBER 4.—**Nottingham**.—REPAIRS.—For repairs to various properties. Forms of tender, conditions, etc., from Mr. W. Smith, Estates Surveyor, Guildhall, on deposit of 1l.

DECEMBER 4.—**Stakesby**.—EXTENSIONS.—For extensions to the steam laundry. Drawings and specifications from Mr. A. E. Young, architect and surveyor, 77, Baxtergate, Whitby.

DECEMBER 4.—**Swansea**.—PREMISES.—Erection of premises, Castle-street. Plans and specifications seen, and quantities from Mr. Sidney Williams, Lic.R.I.B.A., Wharton-street, Cardiff.

DECEMBER 4.—**Tynemouth**.—WAREHOUSE.—Construction of a timber wharf about 200 ft. by 40 ft., and a river wall. Drawings seen and quantities on deposit of 2l. 2s. from Mr. John F. Smilie, Borough Surveyor, Tynemouth.

DECEMBER 5.—**Bradford**.—EXTENSION.—For erection of extension to photo works, Idle-road. Plans, etc., seen, and quantities from Mr. H. E. Priestley, M.S.A., architect and surveyor, 4, Bedford-road, Manningham, Bradford.

DECEMBER 6.—**Auchindoir**.—ADDITIONS.—For additions to Glenbogie House. Plans and specifications at Glenbogie, and with Mr. W. L. Duncan, architect, Turfhill.

DECEMBER 6.—**Barnsley**.—INSTITUTE.—Erection of a new Mechanics' Institute, Hanson-street. Messrs. Crawshaw & Wilkinson, M.M.S.A., architects, 13, Regent-street, Barnsley.

DECEMBER 7.—**Caneewon**.—SCHOOL.—For alterations to Caneewon Endowed School and provision and fixing of heating apparatus. Plans and specifications from Mr. J. F. Wood, Clerk, Clarence-street, Southend-on-Sea.

DECEMBER 7.—**Dalton**.—HOUSES, ETC.—Erection of ten dwelling-houses and shop in Long-lane. Plans seen, and quantities from Mr. J. Berry, architect and surveyor, 3, Market-place, Huddersfield.

DECEMBER 7.—**Quarry Hill**.—HOUSE, ETC.—The erection of filter house and manager's house. Plans and specifications with Mr. Joseph Graham, civil engineer, Castle-street, Carlisle. Deposit of 1l. 1s.

DECEMBER 8.—**Glynneath**.—HOUSES.—Erection of two pairs of semi-detached houses. Drawings and specification with Mr. J. Llewellyn Smith, M.S.A., Aberdare, Glam.

DECEMBER 8.—**London**.—POST-OFFICE.—For demolition of old premises and erection of new branch post-office and sorting office at East Ham. Drawings, specification, and form of contract with Mr. Rutherford, 22, Carlisle-place, London, S.W. Quantities and forms of tender at H.M. Office of Works, etc., Storey's-gate, S.W. Deposit of 1l. 1s.

DECEMBER 8.—**Skipton**.—WAREHOUSE, ETC.—Erection of new warehouse and mechanics' shops, etc., at Belle Vue Mills, for the English Sewing Cotton Company, Ltd. Plans seen, and quantities from Mr. James Hartley, architect, Skipton.

DECEMBER 8.—**Tinahely**.—REPAIRS, ETC. For repairs and painting, etc., at the dispensary residence. Specification with Mr. J. Hopkins, Clerk, Board-room, Shillelagh, Ireland.

DECEMBER 11.—**Blackthorn**.—HOUSE.—Erection of a detached house. Plans seen, and quantities from Messrs. Settle & Brundrit, A.R.I.B.A., architects, Division.

DECEMBER 11.—**Springhead**.—HALL.—For new drill hall, Ashes lane. Plans and quantities from Mr. W. Cooper, F.R.I.B.A., architect, 4, Kirkcaldy-buildings, Huddersfield.

DECEMBER 12.—**Croydon**.—STATION, ETC.—Erection of a disinfecting station and cottage in Victoria. Plans and specifications seen, and quantities and form of contract from the Borough Engineer, Town Hall, Croydon. Deposit of 1l. 1s.

DECEMBER 12.—**Durham**.—SCHOOLS, ETC. Erection of new Council schools at Fence Houses and Newbottle; alterations and additions at Sacriston Council school; erection of dwelling-houses at Eldon and Chopwell. Plans, specifications, and general conditions of contract seen, and quantities from Mr. W. Rushworth, Shire Hall, Durham.

DECEMBER 12.—**Hendon**.—SCHOOL.—The Hendon Education Committee invite tenders for public elementary school. See advertisement in this issue for further particulars.

DECEMBER 12.—**Roxby-cum-Risby**.—WATERWORKS.—For the construction of works of water supply. Plans seen, and specifications from Mr. Alexander M. Cobban, Engineer, Souththorpe Lines, on deposit of 3l. 3s.

DECEMBER 12.—**Stourbridge**.—ADDITIONS.—For alterations and additions to the roads offices at Stourbridge Town Station for the G.W.R. Plans and specification seen, and forms of tender and quantities at the office of the Engineer at Wolverhampton Station.

DECEMBER 13.—**Bury**.—SHED.—Erection of a cotton shed at Knollys-green, Goods Yard, for the Lancashire and Yorkshire Railway Company. Plans seen, and quantities and specification from the Engineer, Hunt's Bank, Manchester.

DECEMBER 14.—**Barking**.—NEW POST-OFFICE.—The Commissioners of H.M. Works and Public Buildings invite tenders for erection of new post-office. See advertisement in this issue for further particulars.

DECEMBER 14.—**Teignmouth**.—POST-OFFICE.—The Commissioners of H.M. Works and Public Buildings invite tenders for extension of post-office. See advertisement in this issue for further particulars.

DECEMBER 14.—**Waltham Cross**.—SCHOOL.—The Bedfordshire County Council invite tenders for new school. See advertisement in this issue for further particulars.

DECEMBER 15.—**London**.—ADDITIONS.—For alterations and alterations to the administrative buildings at the isolation hospital, Gap-road, Wimbles. Plans and specifications seen, and quantities from the Borough Engineer and Surveyor, 10, Hall, Wimbles.

* DECEMBER 15.—**Sheerness**.—SOLDIER QUARTERS.—The Secretary of State for War invites tenders for erection of ten B. and soldiers' quarters, Sheerness Garrison, at barracks in the Eastern Command. See advertisement in this issue for further particulars.

DECEMBER 15.—**Washington (Durham)**.—HOUSES.—For erection of forty-two dwellings. Deposit of 5l. to Mr. J. H. Mole, surveyor, Chamber-street, Durham.

DECEMBER 15.—**Wigan**.—ALTERATIONS, ETC.—alterations to St. Catherine's Church. Mr. A. Yate, 12, Colindale, Wigan.

* DECEMBER 15.—**Wimbledon**.—ADDITION.—The Wimbledon Corporation invite tenders proposed additions and internal structural alterations to the Wimbledon Hospital, Gap-road, advertisement in this issue for further particulars.

DECEMBER 19.—**Southend-on-Sea**.—ESPANOLA TENSION.—For construction of the Western Espandola tension. Plans seen, specification and quantities from Mr. E. J. Elford, M.Inst.M.E., Borough Engineer, Municipal Buildings, Southend-on-Sea, on deposit of 5l. 5s.

DECEMBER 21.—**Neath**.—HOUSES.—Erection of two houses at Seven Sisters, near Neath for the Bryndulais Building Club. Plans, specification from Mr. J. Cook Rees, M.S. Parade-chambers, Neath.

DECEMBER 22.—**Kendal**.—INSTITUTE.—For erection of Allen Technical Institute and Museum. Plans and specifications seen, and quantities from Mr. S. Shaw, F.R.I.B.A., architect, Kendal.

DECEMBER 23.—**Ballyvaughan**.—RECTOR.—Erection of a rectory. Plans specification, and conditions of contract from Mr. William Fennell, F.R.I.B.A., architect, 2, Wellington-place, Belfast.

* DECEMBER 23.—**Hounslow**.—NEW HOSPITAL.—The Committee of the Hounslow Hospital invite tenders for new hospital, etc. See advertisement in this issue for further particulars.

NO DATE.—**Beaver**.—ADDITIONS, ETC.—addition and alteration to farm building and specification and quantities from the County Land Agent, 28, Castle street, Carlisle.

ENGINEERING, IRON, AND STEEL.

DECEMBER 2.—**Downton**.—WALLS.—For building and repairing sea walls between M. field and Bankmore, Portaferry. Specifications from Mr. J. Heron, County Surveyor, Downpatrick.

DECEMBER 4.—**Newport (Mon.)**.—PONTON.—For construction and delivery at the Commissioners' landing stage, Newport, of an iron pontoon. Mr. A. J. Phillips, Clerk Harb. and Pilotage Offices, Dock-street, Newport.

DECEMBER 4.—**Edinburgh**.—HEATING.—For heating of Holy Cross Academy higher-grade school and junior centre, Ferry road. J. T. R. Wilson, Convener of the Works Committee, 138, Constitution-street, Leith.

* DECEMBER 11.—**Lancaster**.—NEW BRIDGE.—The Lancaster B.C. invite tenders for girders, sinking caissons, etc., and also excavation, masons' and carpenters' work in abutments, in connection with new bridge over River Lune. See advertisement in this issue for further particulars.

DECEMBER 13.—**Braintree**.—PUMPS.—For No. 2 of three-throw pumps to raise 14,000 gallons an hour. Plans seen and specification from Messrs. Sands & Walker, Mill-chambers, Nottingham.

DECEMBER 13.—**Redcar**.—BRIDGES.—The North Eastern Railway invite tenders for the construction of two bridges over the railway, and approach roads, in lieu of the existing level crossings known as Warrenby-road crossing, and Redcar lane crossing, near Redcar. Plans seen, and specification, quantities, and form of tender from Mr. C. F. Bengough, the Company Engineer at York.

DECEMBER 14.—**Antrim**.—WELL, ETC.—For sinking a well and erection of a pump at Oldstar. Specification from Mr. J. L. Clark, Clerk, Union Board, Antrim.

DECEMBER 14.—**Northampton**.—BRIDGE.—For widening Oundle North Bridge. Plans, specification, and quantities from Mr. C. S. Moriarty, County Surveyor, County Hall, Northampton. Deposit of 2l. 2s.

DECEMBER 21.—**Earls Colne**.—BOILERHOUSE.—For sinking a borehole for water in the Borehole and schedule from the engineers, Messrs Sands & Walker, Milton-chambers, Nottingham.

NATURE, PAINTING, MATERIALS, etc.

The date given at the commencement of each paragraph is the latest date when the tender, or plan of those liable to submit tenders, may be in.

DECEMBER 3. **Portsmouth.** PAINTING, etc.—For painting and painting interior of portions of the new "Best" buildings. Specifications by Mr. A. Williams, Secretary.

DECEMBER 4. **South Hutton.** STORES.—For supply of iron, castings, wire rope, and other iron stores. Forms of tender and specifications from Mr. J. H. Lambert, South Hutton, Sunderland.

DECEMBER 4. **Tipton.** DOORS.—For altering outer doors of Dudley Port, Burnt Tree, on Green, Bloomfield, Great Bridge, and at Hill Council schools. Mr. E. Richards, Secretary, Owen-street, Tipton.

DECEMBER 5. **London.** SLEEPER POTS, etc.—Supply of cast-iron sleeper pots, with legs, for the Madras and Southern Mahratta Water Company, Ltd. Specification with the Secretary of the Company, 61, York-street, West. S.W. deposit of 11 is.

DECEMBER 7. **Eton.** PAINTING.—For painters' work at the Resident Engineer's House, Tangier. Specification seen, and form of tender from Mr. J. H. Lambert, South Hutton, Sunderland.

DECEMBER 8. **Pantperthog.** PAINTING.—For painting, painting, varnishing, and colouring of Chapel. Plans and specifications at the Chapel House. The Secretary, C.M. Chapel, Pantperthog, R.S.O., Merionethshire.

DECEMBER 9. **London.** S.E. SUPPLIES.—The S.E. Committee of Guy's Hospital invite tenders for bricks, lime, cement, sand, ballast, and high cracker, sheet lead, pipes, etc., painters' work, and glass. See advertisement in this issue for further particulars.

DECEMBER 9. **Swinton.** PALISADING.—For laying and fixing wrought-iron palisading at the Swinton Works. Specifications and form of tender to Mr. T. J. Bushell, architect, 26, John-street, Manchester.

DECEMBER 11. **Barnet.** PAINTING.—For painting of all woodwork of the hospital buildings, also entrance gates, and repairs to new school. Specification from Mr. W. H. Trevellick, 4, Church-passages, Barnet.

DECEMBER 11. **Broadstairs.** PIPES.—For supply and delivery of cast-iron socket and pipe. Specifications and form of tender from Mr. H. E. Burt, C.E., Council offices, Broadstairs.

DECEMBER 12. **Macclesfield.** PIPES, etc.—For supply of drain pipes, castings, cement, bricks, and form of tender from Mr. C. W. Stubbs, Macclesfield, Cheshire.

DECEMBER 2. **Chatterton.** DRAINAGE.—For drainage works at the Union Workhouse. Plans and specifications seen, and a form of tender from the Master of the Workhouse.

DECEMBER 2. **Hornchurch.** SEWER.—For the construction of stoneware pipe sewer in Ardleigh Green-road. Plans and particulars from the Surveyor to the Council, Victoria-chambers, Romford.

DECEMBER 4. **Buckenham.** ROAD.—For the making-up of Balgovan-road and Belmont-road. Plans seen and quantities, specifications, and forms of tender from Mr. John A. Angell, Surveyor, Guildhall, Cambridge.

DECEMBER 4. **Cambridge.** STONE.—For the supply of broken granite, syenite, basalt. Specification and forms of tender from the Borough Surveyor, Guildhall, Cambridge.

DECEMBER 5. **Bapchild.** MAINS.—For laying cast-iron water mains, fittings, and other works. Plans and specifications seen and quantities from Mr. E. C. Peasey, Surveyor, 45, High-street, Sittingbourne.

DECEMBER 5. **Chatham.** ROADS.—For making-up roads at the cottage homes. Mr. G. E. Bond, architect, Rochester.

DECEMBER 7. **Nottingham.** MATERIALS.—For the supply of stores and materials. Forms of tender from Mr. Arthur Brown, M.Inst.C.E., City Engineer, Guildhall, Nottingham, on deposit of 5s.

DECEMBER 8. **Bexhill.** CULVERT.—For the reconstruction of about 855 ft. of storm-water culvert, 3 ft. diameter, in Park-avenue. Plans seen, specifications, quantities, and forms of tender from Mr. George Ball, M.Inst.C.E., Borough Surveyor, Town Hall. Deposit of 21.

DECEMBER 8. **Grimsby.** DRAIN.—Construction of stoneware pipe drain in front of the Corporation Electric Works. Quantities and plan from Mr. H. G. Whyatt, A.M.Inst.C.E., Borough Engineer and Surveyor, 170, Victoria-street, Grimsby, on deposit of 11 is.

DECEMBER 8. **Mardy.** SEWER.—For laying stoneware surface-water drain and stoneware pipe sewer. Plans and specification seen, and forms of tender, on a deposit of 11 is, from Mr. V. J. Jones, Engineer and Surveyor, Council Offices, Pentre.

LONDON COUNCILS.—Continued from page 655.

pond of swimming-bath, 241, 10s. 6d.; Messrs. W. H. Heywood & Co., patent glazing swimming-bath, 74d. per foot run; Messrs. George Jennings, Ltd., shower-baths for swimming-bath, 34, 12s. 6d.; Mr. C. Warner, tile slab for shower-bath, 12, 5s. 6d. Plans have been passed for Messrs. Mark, Liell, & Co. for alterations at "Fern Lodge," Highgate, North; also for Mr. R. L. Curtis, for school in Brampton-road.

Loxley.—Sanction has been received from the Local Government Board to the borrowing of £650 for additional slab making machinery in buildings at the sanitary depot. The tender of Messrs. Frith, Blakeley, Sons, & Co., Ltd., has been accepted at 6361, 10s. for the erection of cork bunkers at the Electricity Works. The following plans have been passed: Mr. E. H. Slatford, Stormont-road, Highgate, motor garage, Stormont-road; Estate, and Houses, Ltd., Weston Park, Stroud Green, four warehouses, etc., off Walthamstow, North Harringway.

Walthamstow.—The 12-in. pipe sewer in Wootton-street, is to be relaid for a length of 265 ft. at an estimated cost of 1751, which sum includes half the cost of paving the roadway with asphalt on completing the sewer work.

Walthamstow.—A plan has been passed for Messrs.

A. Roberts & Co., Ltd., for the erection of premises at Glengall Wharf, West Ferry-road, St. Pancras.

The Council have decided to offer no objection to the proposal of the Metropolitan Railway Company to construct a new entrance to the company's subway between the Great Northern Railway Station and the Metropolitan Railway Station, King's-cross, the entrance to be formed on the pavement at the extreme east end of Euston-road, and near the Tube Station of the Great Northern, Piccadilly, and Brompton Railway, subject to protective conditions, and to the Company agreeing to the abolition of the valve of their tunnel at Euston-road, opposite the Midland-road, in order that the work of the reconstruction and repaving of Euston-road at this part may be completed. Electricity mains are to be extended in two roads at a cost of 761.

Stepney.—Electricity mains are to be extended in York-road, Limehouse, and Ratcliffe, and Ball Lane, West Spitalfields. No objection is to be given to the proposal of Messrs. Meredith & Drew to erect a factory in High-street, Shadwell.

Tring.—At the last meeting of the Urban District Council plans were passed for Lord Rothschild for twenty-four houses in Brook-street.

Walthamstow.—The Engineer has been in-

structed to prepare a plan and estimate of the cost of doubling the tramway track at the "Bell" Corner double junction. Plans, etc., have been approved for levelling, paving, sewerage, etc., Aveling Park-road, and notices are to be served upon the owners of the premises fronting thereon to execute such works. Plans submitted by Mr. E. Cornish for an electric theatre in Marlowe-road, Wood-street, have been passed, as have also plans submitted by Mr. C. J. Dawson for a school in Church-hill. A plan has been lodged by Mr. F. H. Heath for an electric theatre in Wood-street.

Wandsworth.—Tenders are to be invited for paving Steep-hill, Streatham, and part of North-place, Southfield, as new streets. The tender of Messrs. E. & E. Iles has been accepted for paving part of Valley road, Streatham. The footpaths are to be done with Victoria indurated paving. The tender of Messrs. G. Wimpey & Co. has also been accepted for paving part of Cote-ford-street, Tooting. Croft adamant paving is to be used for the footpaths. The following plans have been passed:—Mr. W. Kerr, additions to Photo-Printing Works, 332, Balham High-road; Messrs. A. Charnock & Co., Ltd., warehouse, Riverbank, Point Pleasant, Southfield; Messrs. H. F. Buchan & Co., three houses, Voltaire-street, Clapham North.

The Cappuccini, Amalfi.

AMALFI.

AMONG the many beautiful cities of the South which have been overwhelmed by earthquake or flood, devastated by war, few have retained with all their misfortunes so many of the past with so charming and rescue an aspect as has Amalfi; although almost a millennium has passed since it lost its proud independence its name will ever rank high in the history of the early Middle Ages in Italy. Unaware of the important part it once played on the world's stage, reaching it for the first time either by land or water, and seeing it hemmed between its mighty cliffs and the turbulent sea, would imagine that it had never been other than a beautiful

sequestered village; and, even to those who may have had some recollection of its stirring history, the same idea may have occurred which evidently struck Hallam after he had seen it in 1848, and induced him to append that note to his chapter on "Mediterranean Commerce," in which he expressed his opinion that the stories about its opulence and commerce had been exaggerated, and that the descriptions given of it by William of Apulia are to be taken as a poet's panegyric.

A slight sketch of the history of Amalfi and an account of its many misfortunes are necessary as an introduction to any description of its architecture; and from these we shall see that Hallam did

not make a sufficient allowance for the geological changes which have affected its character, and which had made the statements of the mediæval historian to appear so extremely poetic. The connected history of the place does not commence before the VIth century, for the numerous remains of Classic art to be found in the various buildings did not belong to the site, but were brought, according to popular belief, from the neighbouring city of Paestum, but more probably from Capri or Naples. At the opening of the VIIIth century it already had its bishop, and in 987, after its prosperous era had commenced, Leo, of the family of Orsocomiti, became its first archbishop. Although for a long period it claimed a

connexion with the Eastern Empire, it was in reality an independent mercantile Republic, under the control only of its own elected doge; and it took the head of the first league mentioned in the history of the Middle Ages, when its fleet, allied to those of Gaeta and Naples, in 849, defended Rome from the Saracens and defeated them in the famous battle off Ostia. For their assistance Pope Leo IV. conferred on the Republic the title of Defender of the Faith; and centuries afterwards the event was pictured by Raphael on the walls of the Stanza dell' Incendio in the Vatican. A few years later, however, Amalfi, with Naples, Salerno, and other Lombard States, did not scruple to ally themselves with the Saracens, who, after the death of Lewis II., had gained a powerful hold on Southern Italy. Although Pope John VIII. sought by a bribe of 10,000 silver mancusi to detach Amalfi from the league, the wily merchants pocketed the cash, and, in spite of their sacred title and of the innumerable excommunications thundered against them by the Pope, refused to desert their infidel allies.

This intimate association of the people of Amalfi with the Saracens during the IXth and Xth centuries, which continued after the Norman conquest of Southern Italy, is quite sufficient to account for the manner in which the Siculo-Saracenic style of architecture prevailed in the buildings of the city, and no doubt did much to further the success of their merchants in the countries which had fallen under Mohammedan control. The

factories of Amalfi were to be found in all the principal cities of the East and Sicily; and at Jerusalem, after the destruction of the church of the Holy Sepulchre by the mad Kalif El Hakem, they built the church of Sta. Maria Latina, and the firman granted for its endowment by Melek Muzzafer in 1023 is still preserved in the Franciscan convent of that city.

Amalfi's gradual loss of importance and independence, though not quite at the same time of all its prosperity, coincided with the progress of the Normans in Italy, and reached its climax when, in 1137, its inhabitants were compelled to surrender the city, which had already suffered from previous raids, to a hostile Pisan fleet. But other causes were at work which soon after completed its undoing and for ever destroyed its commercial importance. There seems to be but little doubt that when the city was first built there must have been a considerable undercliff formed by the *débris* fallen from the limestone mountains at the back of it, and on this the greater part of the place had been erected, and between its projections had been formed the spacious harbours which sheltered its fleets. But with all limestone formations abutting on the sea the rocks become undermined and formed into caverns by the fretting waves till the land slips or gradually subsides beneath the waters; and this process appears to have been going on at Amalfi during the whole of the XIIIth century, until in 1343, during some storm of exceptional violence, the whole of the foreshore, with quays,

arsenals, and walls, slid into the Mediterranean. Such slips, though not extensive, seem to have taken place at intervals all through the later centuries, in one of which the cathedral was reduced to its present size; and only two or three years ago a most extensive fall of the cliff took place and caused the partial destruction of the celebrated Cappuccini convent. The cause of this was the prolongation of the coast road past the headland at which the convent stands, to be seen in our view (p. 661), already weakened by the great pilgrimage grotto; and the work, still further reducing the strength of the natural abutment, caused a large part of the Cappuccini, together with a hotel and other buildings beyond the headland, to slide into the sea.

The cathedral church was fortunately built well within the ravine which now contains all that is left of Amalfi, and was thus saved from the catastrophe which overwhelmed most of the other buildings. It is raised high upon a lofty basement, which contains the crypt, and is intersected by one of the numerous low-lying streets which wander among the dark underground parts of the cliff. It is reached by a broad staircase of fifty-seven steps, at the head of which is a large narthex of two aisles extending across the whole width of the church. The internal columns, as well as others which once stood along the front before the recent restoration, are mainly ancient, some spirally fluted, with ancient bases and capitals of different designs. The front of the narthex has been much altered in the restoration, and, although there is ample authority for the characteristic tracery of the windows which show to the north and south, there is none for the raised arch of the central entrance; and the original condition is preserved in an engraving by Schulz in his *Mittelalters in Unteritalien*. The upper part of the façade is entirely modern architect's fancy, the original work having been destroyed in the XVIIIth century, when the church was Italianised throughout.

The great campanile, built not quite square to the main structure, standing to the north of the narthex was erected at an inscription on the east face of which testifies, in 1276; but it has suffered much from the plaster decorations added at a later date. The upper story, however, consisting of a central circular tower, with smaller ones at the angles, still retains its original appearance, and is perhaps one of the most perfect examples of the Siculo-Saracenic treatment of towers, and may be favourably compared with similar ones at Gaeta and Caserta-Vecchia. The green and yellow stone of the intersecting arches, the blackness of the unglazed openings, and the iridescent lustre of the tiles have altogether a most brilliant effect against the sombre background of the surrounding cliffs.

The central portal, within the narthex has its marble jambs richly carved with scroll-work containing mythological subjects, such as centaurs, griffons, and dragons, similar to the work at Monreale and Benevento, and the lintel is partly made up with fragments of ancient cornices. These enclose one of the most remarkable of the bronze doors produced

Duomo, Amalfi.

[Photo, by Sommer.

Constantinople by the founder, Aurachios, and was one of several added during the latter half of the XIth century for members of the noble Amalfian family of Pantaleone which they presented to various places in southern Italy. It is formed in twenty-four panels, divided between two valves, and four of the panels arranged across the centre are decorated with figures of Christ, the Blessed Virgin, and SS. Peter and Andrew, placed beneath round-arched niches. All these are formed by lines incised in the bronze, and filled in with coloured mastics, generally green and red, while the faces are filled in with silver, having the features outlined with finer black niello. The remaining twenty panels have raised crosses of a peculiar shape, only to be found on the bronze doors of Greek origin, such as those at Venice, S. Paolo f.m. Rome, Monte Cassino, and elsewhere in South Italy, each cross being secured to the panels by four bold rivets. The doors bear two inscriptions formed by incised letters filled in with green mastic, which give the name of the donor as "Pantaleon filius Mauri de Pantaleone de Mauro de Maurone mite."

An addition was made to these doors subsequent to their erection by a row of lions' heads riveted on to the second rail from the bottom, each head holding a ring in the mouth. These are not closing rings, nor can they be regarded as ornaments, and like the row of eight across the central doors of S. Mark's, Venice, have been clearly added for some purpose not at the present time quite evident. There is a similar row of heads and rings across the Greek doors of the pilgrimage church of Monte Sant' Angelo, and Hamilton Jackson says of them that they are constantly rattling when the pilgrims are entering the church, for they touch them one after another and kiss their hands afterwards. The discovery in the XIVth century of the curative qualities of an exudation from the body of S. Andrew, known as the Manna of Andrew, made this an important pilgrimage church, and the association of such rings with the idea of sanctuary doubt suggested their addition at that date.

The interior of the church is hopelessly disappointing, for the whole of it has been modernised and decorated in stucco at the beginning of the XVIIIth century by Archbishop Michele Bologna. The eighteen great columns of African papyrus and red Oriental granite, which divided the aisles from the nave, were embedded in brickwork, a pair to each pier like those in S. John Lateran, and cemented over; the frescoes of the walls and the great painting in the apse, showing a gigantic figure of Christ in the act of benediction with the tutelary saints of the city below, were covered up; the great ciborium, encrusted with marbles and supported on pillars of porphyry and verd' antico, was torn down; the ambones were modernised, and all the beautiful furniture and mosaic enrichments of the early church destroyed past remedy; and now we can only say with Bürger's heroine—

"O Mutter, Mutter! Hin ist hin!
Verloren ist verloren!"

Some brilliant fragments of mosaic, equal to the best of those remaining at Ravello or Salerno, have been saved and embedded in the plastering of the walls; and many of these may be found transcribed in Morant Lockyer's valuable and unpublished volume of drawings of mosaic work in the Institute Library.

In the great crypt beneath the east end of the church is the shrine of S. Andrew the Apostle, whose body was brought from Constantinople by Cardinal Capuano at the beginning of the XIIIth century. The crypt was very richly decorated with marbles and carving when the altar was erected by Domenico Fontana, and the striking bronze statue of the Apostle by Michelangelo Naccarino was placed on the shrine as an offering from Philip III. of Spain early in the XVIIth century. To the north of the church is an extensive cloister, known as the Paradise, where many of the principal citizens of Amalfi are buried, but which of late years has been occupied to a considerable extent as the Archbishop's stables. It is in all respects like that of the Cappuccini, which we have now to describe.

The same Cardinal Capuano founded in 1212, high up on the mountain side of the west of the city, a convent for the Cistercian order, and placed it under the charge of the Abbots of Fossanova; and in 1223, presumably on its completion, its first Abbot was appointed. It was dedicated to S. Peter of Tocco, a saint unknown to the calendar, but an early Abbot of the Benedictine order; and it was taken under the patronage of the Emperor Frederick II., who raised its church to the position of a capella palatina. Its position, confined to a mere ledge of rock, made any approximation to the usual plan of a Cistercian house utterly impossible; but it is very probable that, with the exception of the cloister and perhaps the chapel, if that was not originally the chapter-house, no portion of the first building remains. The arrangements, until the recent landslide destroyed a portion of the buildings, consisted of a large cloister lying immediately under the overhanging cliff, and opening out of the centre of its east walk

a large church of a single aisle roughly vaulted, and to the south of these and facing the sea a long range of buildings three, and in places four, stories in height, two only of which were above the cloister level, divided up into vaulted rooms about 10 ft. by 7 ft., arranged on two sides of a corridor, which are assumed to have been the cells of the Capuchins who succeeded the Cistercians in the occupation of the house, and who have given place in these days to the guests of the Albergo Cappuccini.

The cloister as it appears from the entrance to the church and the great pilgrimage grotto, now no more, are shown in our view on this page. There were only three walks after the southern range of buildings had been erected, and only the northern one of sixteen bays was perfect. The arcading is formed of three interlacing arches, the tracery being unpierced, which stand on coupled columns of white marble with cushion capitals, the angle piers being formed of four columns with capitals carved with leaves and volutes. The arcading has been covered with rough-cast, so that the material of which it is built does not appear; and these, together with the cloisters of the cathedral already mentioned, and of another convent still remaining in the city, all show the same treatment and seem to be of the same date.

Of the fortifications with which from the earliest times the place had to be protected, the most important towards the sea were engulfed in the great landslide of the XIVth century; but on the spur of the mountain, known as the Monte Aureo, which divides Amalfi from Atrani, and shows above the cathedral in our view, is a round tower and some other crumbling remains of the once strong Castello Pontone. Along the Costa d'Amalfi, however, some seven or eight of the promontories are still crowned with massive and heavily machicolated towers, which tradition says were erected by the Saracens as friends or foes of the city; and they still remain in their ruin as useless, but much more picturesque than the martello towers of our own south coast.

Cloisters of the Cappuccini.

NOTES.

King Edward Memorial.

WE notice that, in answer to a question in the House of Commons, Mr. Dudley Ward, representing the First Commissioner of Works, stated that the Government had not yet given its consent to the selection of the site at the end of the Broad Walk in the Green Park for the proposed memorial to King Edward VII. He understood that before anything was finally settled the designs should be exhibited and the House of Commons be given the opportunity not only to discuss, but to give a verdict on the question. We have already expressed our adverse opinion on this site and a preference for that at Hyde Park-corner, and we hope that the House of Commons will express the same opinion. There is little doubt that the artists selected will produce a competent design for this site, but they could produce a better one if they had the Hyde Park-corner site to deal with. We trust that when the matter comes before Parliament this point of view will not be lost sight of, and that the discussion will turn on the comparative suitability of the two sites and not on the merits or demerits of the particular designs submitted except in so far as this may tend to emphasise or prove the inherent limitations and drawbacks of the site.

The King Edward Memorial, Liverpool.

ONCE more the Liverpool Finance Committee has been pronouncing on the King Edward Memorial proposal for St. George's Hall, and has unanimously approved the revised scheme already discussed, which places the monument at one corner of the south podium and leaves the other corner "to let" for some future celebrity. The absurdity of such a course is obvious, and only indicates how hopelessly incapable is this Committee in the task of dealing with the aesthetic or philosophic aspect of the question. The *Liverpool Daily Post* points out the superior claims of the central position on the east side of the hall, advocated by Professor Adshead. The fact that this position is already occupied by a statue of the late Earl Beaconsfield seems to have imported a certain amount of political bias into the discussion, but as this statue is manifestly inadequate in scale and mass it would clearly be advantageous to find a place for it elsewhere. The whole conflict is but another example of our haphazard procedure in leaving matters of this kind in the hands of those least qualified to deal with them.

The Mansion House.

WE make a reference elsewhere (p. 682) to the present condition of the Mansion House and the apparent need for drastic renovations. The immense value of the site has aroused the feeling among the City magnates that it would be good business to remove the Lord Mayor's residence to a less valuable site. That of the Old General Post Office has been suggested, but, of course, if any change is to be made, the logical position is one in intimate relationship to the Guildhall. We should, however, strongly

deprecate any change at all if it were made with a view to the demolition of Dance's building, which, with all its faults, harmonises with the Bank and the Royal Exchange, and could not be adequately replaced by a block of commercial offices. To retain the building and divert it to some other civic purpose would be the most reasonable solution of the problem, as it is in many respects ill suited to its present use; but rather than lose such a familiar and dignified feature of the City's central group we should prefer to maintain the present arrangement, subject to all possible amelioration in the way of approaches and internal planning.

Southwark Bridge.

IT was stated at the Court of Common Council's meeting last week that the reconstruction of Southwark Bridge will be at once proceeded with. The bridge was built in 1815-1819, at a total cost of some 800,000*l.*; the ironwork, weighing 5,780 tons, was supplied by Messrs. Walker, of Rotherham, Messrs. Jolliffe & Banks were contractors for the masonry. John Rennie's designs were for a bridge having three cast-iron arches, whereof the middle arch has a span of 240 ft., and the two others a span of 210 ft., with a headway of about 30 ft. above the highest spring tides, and a width of 42½ ft. The masonry is tied throughout with vertical and horizontal bond stones; the iron ribs form a series, then newly adopted, of hollow masses, or voussoirs, as of stone, all the segmental pieces and braces being secured with long wedges and dovetailed sockets; bolts were used only during the construction. The spandrels are similarly connected; the roadway is of solid cast-iron plates joined together by means of iron cement. Joseph Gwilt made the approaches, north and south; the gradient rates are steep, being 1 in 20 (Queen-street) and 1 in 23 (Bridge-road), and have militated against the use of the bridge for horse-drawn traffic. The Corporation bought the bridge in 1868 for 200,000*l.*

London Institution, Finsbury-circus.

OUR readers will recollect that four or five years ago proposals were made for an amalgamation of the London Institution with the Royal Society of Arts. The Oriental Studies Committee of the India Office have just issued an interim report, to which are annexed Professor F. M. Simpson's plans for adapting, at a cost of about 25,000*l.*, for purposes of a School of Oriental Languages, the existing premises of the London Institution, of which the site is tentatively valued at not less than 100,000*l.* The Committee are unanimously of opinion that it would be difficult to find a site with greater advantages than that contemplated by their report. The London Institution, established in 1805-6 by a proprietary body for "the advancement of literature and the diffusion of useful knowledge," had its first home in what had been Sir Robert Clayton's house, *temp.* Charles II., at No. 8, Old Jewry, where Porson lived as librarian. In 1812 the library and offices were transferred to King's Arms-yard, Coleman-street. Seven years afterwards the Institution migrated

to the present buildings which Cubitt had erected in the then Amphitheatre, Moorfields, at a cost of 31,124*l.*, after designs and plans by William Brooks, who adapted the Corinthian portico from the Temple of Vesta at Tivoli. Of the laboratory, designed by W. H. Pepys F.R.S., there is a view in Parke's "Chemical Catechism," 1826. The library, 97 ft. by 42 ft. and 28 ft. high, on the first floor, is one of the finest rooms after its kind in London; in the rear is the theatre or lecture-room, having a capacity for 700 persons. William Upcott, who succeeded Porson in 1808, collected the valuable series of topographical works; another librarian was Richard Thomson, author of "The Chronicles of London Bridge," 1827.

The New Examiner of Plays, and After.

THE recent appointment by the Lord Chamberlain of Mr. Charles Brookfield as a joint Examiner of Plays is not without direct interest to architects, in view of the growing feeling in favour of the appointment of a Minister of Fine Arts. For the first time in its history since the end of the XVIIIth century the theatre during the last twenty years or so has opened its doors to a type of work which has commanded the respect and interest of people who wish to find in their amusements all once an intellectual and artistic recreation. Matthew Arnold's almost despairing appeal for the theatre to reorganise out of its inconsequence and inanities a better state of things was uttered at a period which Mr. Brookfield would probably distinguish as the golden age of the later British drama. A better state of things in more recent times has come to pass; and then we have at the height of a progressive movement this reactionary appointment. We do not doubt that Mr. Brookfield will be an impartial judge according to his lights. But that is not the point. The point is that it will be necessary for Mr. Masfield, Mr. Galsworthy, Mr. Bernard Shaw, Mr. Granville Barker, and other dramatists of the thoughtful kind, who are gradually forming a school of drama unique in its way, to submit their work before production to a type of intelligence with which they are wholly out of sympathy. And this brings us to the Minister of Fine Arts. The unreserved condemnation by so eminent a politician as Sir William Harcourt of Mr. Norman Shaw's New Scotland-yard, which will be within the recollection of many of our readers, suggests the danger. If we are to have a Minister of Fine Arts we must have the right man. A merely bureaucratic appointment, or an appointment of merely social influence, is calculated to do more harm than good. In France, where the bureaucratic element so largely counts in system, it scarcely operates at all in the choice of its controlling Ministers; and one of the bright spots in the history of the French administration is that it has on more than one occasion given commissions to sculptors and painters who were antagonistic to the dominating Academic influences of their day, but who are now included among the most distinguished of their countrymen. In the case of the drama the

right in this way, which explains, if it does
excuse, so regrettable a tendency. But
not this sort of thing tend to discredit
petitions in the eyes of thoughtful
ple, to give the enemy occasion to
pheme, and to refer contemptuously
the "Renaissance box of bricks"? May
not tend to deter the more genuine and
ere artists from taking any part in what
t appear to them too much like a vulgar
mble in which real artistic merit is apt
be overlooked unless it happens to be the
of the poster?

our preceding article we expressed our
satisfaction that the assessor had made up his
d as to the right treatment of the scheme.
had awarded the premiums to designs
ch were all variants of the same general
e. When, however, we come to those
ch he has commended, we find he has
started from this principle, and it is not
clear on what grounds he has com-
mended them.

We can only presume that, having awarded
prize and three premiums to the best
ked-out examples of the right idea, he
sidered that some recognition was due to
best worked-out examples of various
ing ideas. It is a question whether this
necessary or even advisable, although
aps there is no particular harm in it,
vided the position is distinctly under-
d. In this case, however, as he has not
mended several competent and well-
ked-out examples of what he himself
siders to be the right idea, this procedure
ears to do them some injustice. It
ht be fairer not to commend any on the
ng lines unless all the commendable
s on the right lines are mentioned first.

he design by Mr. F. G. Troup is one
mple out of several. The main idea of the
and the general treatment and scale of
levation are both on the approved
s. The plan is at least as architectural
he three premiated ones, while its minor
ects are no greater. If the elevation is
so attractive at first glance, it is more
ressive, while the detail shows it to be a
et and refined study of the Doric which
y people might think more characteristic
the nature of the building, and more in
mony with the general character of its
ironment.

Mr. Robert Atkinson's design is another
instance. Here a straightforward plan,
which, no doubt, has its weak points, is
expressed in a straightforward manner with-
out any striving after false or fanciful effect.
It might possibly be thought that both this
design and that by Mr. F. G. Troup, as well
as Mr. Gascoyne's, amongst others, show
a more delicate feeling for architecture
than any of the premiated ones, and are
as worthy of recognition as any of those
commended.

Another way of treating the scheme which
commended itself to several of the com-
petitors was to place the Council Chamber
in the centre of the building. In the
circumstances we do not think it the right
treatment; but, at any rate, it has the
advantage of placing the principal room
in the central position, so permitting a
pyramidal treatment leading up to a central
feature naturally obtained without undue
effort or cost. A commendation goes to

By Messrs. Lanchester & Rickards: Ground Floor.

tural qualities of a sketch design without the aid of details, then, of course, we must put up with them till the conditions improve. But even as things are, surely it would be possible either to have double competitions in every case, or else to so arrange that the assessor would have power to call for details of half a dozen or so if he found it difficult to come to a right decision without them.

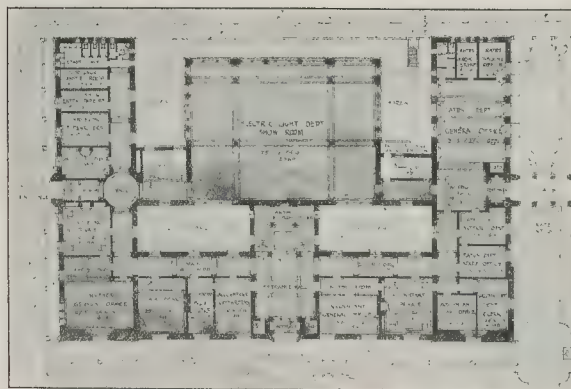

One evil result of the present system is very apparent in this competition. With very few exceptions, every one of the competitors has been spending time on his detail which would have been more profitably employed in perfecting his scheme as a whole. The result is that the scheme suffers. We have no hesitation in saying that if no details had been asked for the general level of the designs would have been appreciably raised. As it is, we find the most chaotic plans, and others in which it is evident that the complete development of the idea has had to be abandoned in order to spend time on a detail which, in the circumstances,

By Mr. W. Curtis Green, F.R.I.B.A.: First Floor.

Elevation to Marylebone-road.

By Mr. J. Reginald Truelove, A.R.I.B.A.: Ground Floor.

can express little that is relative to the matter in hand. How many of these schemes have been carried far enough to call naturally for a detail? How many are still in that unfinished state in which the mere idea of a detail is absurd? It is a little difficult to sympathise with the attitude of mind which takes a pleasure in elaborating details where the natural instinct would be to go on recasting and remodelling the scheme until every unit had fallen into its proper place and some general coherence and structural unity of conception had been obtained. Yet, if we may judge from the unnecessary size and elaboration of many of the detail drawings, considerable pleasure has been taken in them, and more importance has been attached to the presentation of a striking detail than of a striking plan.

Indeed, when we notice also how many inadequate incoherent plans have been forced into some appearance of outward

symmetry for the sake of the elevation, and how often arbitrary elevations are just planted on without any relation to the plans they are supposed to express, we cannot but feel that the chief interest of many of the designers lies in the elaboration of features and details. They seem quite unconscious that the art of designing begins with the plan, and that there is as much art and as much pleasure in so arranging and grouping the units that their truthful and unforced expressions on the elevations shall naturally produce a characteristic and satisfactory effect, as in elaborating this effect with columns and sculpture. It is the first process which is the essential one in a competition, while it is just the one that nine competitors out of ten seem to ignore or to take no pleasure in whatever, but prefer to adopt a method of procedure that reduces architecture to the level of scene painting or at any rate to that of an applied art.

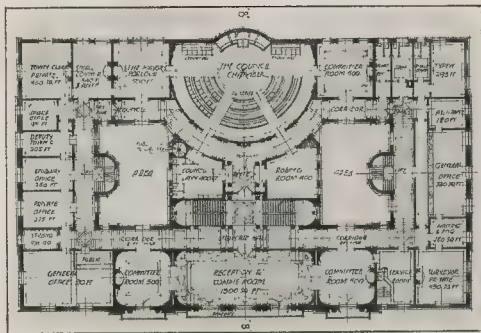

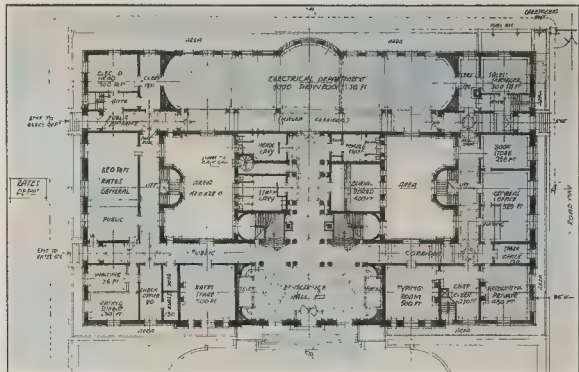

There is no doubt that, speaking generally, many of these designs show an advance towards a simpler and broader treatment and a more competent handling of the forms of classic architecture.

This is so much to the good; but the manner in which these pleasing forms and features are so often applied, or misapplied, leaves us with an unpleasant feeling of doubt as to the sincerity of the designers. We cannot help asking ourselves whether all these colossal columns, towers, domes, groups of sculpture, and other imposing features are really felt by their authors to be the only natural and inevitable expression of the necessities of the case and of the nature and purpose of the building, or whether some of them may not owe their existence rather to a desire to find some novel or imposing feature which will catch the eye of the assessor.

We are bound to admit that in the past the eye of the assessor has frequently been

Minister of Plays is not a Minister, but the expert who advises the Minister. The Minister of Fine Arts would have larger more direct powers of assistance control, of veto and supervision even a Lord Chamberlain, however sed, with regard to an art, so far as architecture is concerned, which makes it all the more necessary therefore that a Government establishes the office that it should choose not only a man likely to be impartial, but also a man without preconceived notions in the direction of a type of art that as an intellectual force is read as Queen Anne.

The two Honorary Associates who were added to the roll of the Royal Institute of British Architects on Monday last will be welcomed by all members of the profession. Mr. Herbert Crane and Mr. J. Hubert Marshall represent two artistic interests far enough apart, but coming undoubtedly within the prescribed zone. Of Mr. Crane, William Richmond said truly a few years ago that he had brought more hours into many homes than any other of the century. But we must not forget, and the recent election at the Institute will help us to remember, that he has achieved distinction in other ways, having given, for example, to the art of interior decoration a refined character which was not surpassed in the Victorian era. It will also be recalled that Mr. Crane was one of those who successfully claimed that the west of Lincoln's Inn-fields should not be allowed to suffer in the Holborn improvement scheme. Of Mr. Marshall we have heard recently in connection with his work as Director-General of Archaeology in India, and need do no more than express our satisfaction that probably through the intervention of Lord Curzon the intention of the Government to abolish the office was frustrated. That Mr. Marshall may carry on his excellent work many years is the hope of all those interested in the future of archaeology in India.

By Mr. Robert Atkinson, A.R.I.B.A. : Elevation and Plans.

MARYLEBONE MUNICIPAL BUILDINGS COMPETITION. [SECOND ARTICLE.]

ON looking at these 180 detail drawings, and trying to realise the amount of work involved and the nature of that work, we cannot help wondering if they are really all necessary to enable the assessor to form a right judgment. To maintain that they are necessary is a doubtful compliment to either assessor or competitors. In this case they seem of little value in assisting to a right selection, for in the great majority of cases they tell us little of importance that could not have been gathered from the elevation.

We imagine that Mr. Cooper must have won on his general solution of the problem, even if his claim had not been backed up by so arresting a detail.

We certainly do not want to see designs selected simply as practical solutions of a problem, with no regard whatever to their aesthetic qualities.

If the present conditions are such that the competitors are unable to show, or the assessor is unable to discover, the architect-

Q

By Messrs. Tait & Whitelaw : Ground Floor Plan.

an able design by Messrs. Clyde Young & East, which, however, does not take full advantage of the opportunity afforded by a central Council Chamber. If any design on these lines was to be commended, it might perhaps have been more reasonable to commend one such as that by Mr. Haywood, which shows more recognition of the possibilities of this treatment, and carries out the ruling idea to its logical conclusions in a way that shows some feeling for monumental design.

Mr. Curtis Green's design may not be so complete a solution of the problem as some, but it displays qualities which interest us more.

The various units of the front block are rightly placed and well expressed on the elevation in a way that is agreeably reminiscent of the manner of François Mansart and of the Carnavalet Museum. The method usually adopted with so much success by Mansart, of drawing out the expression of the arrangements by emphasising the different units or groups of units by separate roofs, is effectively and legitimately employed to emphasise the grouping of the front elevation. It is difficult, however, to admit that this method is rightly applied to the back elevation, where the treatment of the attic seems to call for more justification. The difficulty seems to arise from the position of the principal units on this front, the Electrical Showroom and the Council Chamber, which do not occupy positions in accordance with their importance, and have no organic relation to one another, or to the scheme as a whole. As their emphasis on the elevation would destroy the balance of the composition, they are masked behind a flat wall, and the elevation

loses in interest to that extent. Had they been placed on the central axis they could have been expressed, in which case an attic and separate roof over the Council

By Messrs. Tait & Whitelaw : First Floor.

Chamber alone would naturally express its position and size.

The general treatment of this scheme in elevation and detail shows a reticent and sensitive feeling for design which rarely

appears in a competition, and more rarely still obtains the recognition it deserves.

Messrs. Cooke & Twist's E-shaped design solves the problem of light to the Electrical Showroom, and dispenses with small central areas; but it involves dark corridors and defects in convenience. The elevations and detail are expressive, right in scale, and pleasing in quality. A good design in itself, but on lines which are not easily adapted to this class of building.

Mr. Reginald Truelove has a well-constructed scheme, truthfully expressed by competent elevations, which is a slight variant on the accepted idea. The three reception-rooms, however, are not in suite as one unit, and it is doubtful if the large committee-room is properly placed, or if it is advisable to occupy space on the principal floor with housekeeper's apartments for the sake of convenience of service.

Messrs. Lanchester & Rickards obtain internal effect with a direct rising approach and vista to the Council Chamber, placed where its full value in the scheme can be realised. The elevations are true in scale with the internal structure, and adequately express the character of the building.

Messrs. Tait & Whitelaw's plan is spoiled by the rooms looking out into the small central areas. Surely in so small a building as this, possessing four frontages with good light, there is no excuse for placing offices in the internal area. This is the place for the lavatories, which are placed on the principal elevation. This elevation is a most competent design in itself, but it must be admitted that it is not very characteristic of this class of building, nor exactly expressive

By Messrs. Tait & Whitelaw : Elevation to Marylebone-road.

of the internal arrangements. It is a pity that so imposing an entrance is bottled up by the porter's box and telephone.

Messrs. Jemmett & McCombie's design is well laid out and well constructed, and this is adequately expressed in the elevations, in which the various units of the plan are emphasised in accordance with their relative importance.

Mr. William Flockhart has adopted the approved idea on plan, and his elevations and details are extremely pleasing, but they do not express with any exactitude the position of the internal units.

Messrs. Geoffrey Lucas and T. A. Lodge, with C. A. Farey, submit an interesting design. The elevations which we illustrate are broad in treatment and good in scale.

Messrs. Charles Nicholas & J. Dixon Spain have a well-worked-out plan, which is the same variant of the approved idea as that adopted by Mr. Truelove.

Messrs. Leeming & Leeming's plan is

Marylebone Municipal Buildings: Design by Messrs. Jemmett & McCombie. Elevations and Section. (See page 668.)

addition to the amounts included in the 11,000*l.*, 500*l.* was provided for terra-cotta and 150*l.* for treating the front concrete wall, half of which could be deducted if it was required to be cheapened.

The most interesting part of these works was the comparison of the three schemes so as to get the lowest price from open tender, and to show how each construction compares with the other. In the first case, a scheme was prepared on the steel-frame system, the whole to be cased in with concrete afterwards. A design was then prepared, making the steelwork of light sections, such as angles, tees, built up at the maker's yard ready for fixing at the site, and in this scheme full value was taken of the concrete for the compressional members. Later, it was designed in reinforced concrete, and the costs from actual tenders were:—

Reinforced concrete building	... £11,991
Light steel frame	... 13,210
Steel frame cased in concrete	... 14,200

This clearly shows the saving in a reinforced concrete building where the building is of average size and the sheeting can be turned over. Another interesting example was a floor built over wire ovens and prepared for taking five stories. The load was 2½ cwt. per square foot, and including foundations, superstructure, 4 in. reinforced concrete walls cement finished, and all steel casements and fittings; the cost was 25*s.* per super. yard of floor covered, two floors only being erected.

Another work recently executed was a floor with a cantilever 10 ft. 6 in. long, built over ovens again, but in an existing building. The area covered was 800 yds., and the price when carried out for foundations 3 ft. below the ground was 19*s.* 6d. per super. yard.

For foundation work Mr. Burke gave a very interesting example which he was called in to act upon in Liverpool some eighteen months ago. A site had been chosen for a public building, and after the contractors commenced excavating they found that half the building would come upon a quarry partly worked, the other half on that which had been worked and had been filled up to 90 ft. The design eventually carried out was the sinking of two concrete piers 90 ft. to solid earth, and from these reinforced concrete beams, 7 ft. 6 in. deep by 24 in. wide, were carried and cantilevered so as to take the new building. The cost was about 1,000*l.*

Another interesting example some time ago was a scheme of precipitation and sludge tanks for treating 1,000,000 gallons daily of sewage. Space was very limited. A scheme of tanks,

ft. by 12 ft. wide, with cast-iron plates for sides and bottom, was prepared. The cost of this worked out to nearly 7,000*l*. A scheme of brickwork in cement was then arranged. In the capacity could not be obtained without using more land. Apart from the land, the work worked out to just over 6,000*l*. It was decided to use reinforced concrete, having external walls without ties 9 in. thick at the bottom, 6 in. thick at the top, 8 ft. high, and was just over 4,500*l*. The work, when it is being constructed, was shown on the pen, and the author said he believed it was the first set of tanks to be constructed to give a capacity in this country in reinforced concrete.

A very interesting example of pile and roadway work was given. This was designed by the English Velvet and Cord Dyers' Association. They wished to enlarge their works, but they were handicapped through having the river on one side, the govt (for supplying the works with water) on the other, and beyond the footpath and canal. On the one side the river was dammed and a reinforced concrete dike made. From this ran the columns and beams for forming a new roadway over the river and at the same time carrying the buildings to be erected. On the other side 12-in. concrete piles were driven to carry the new buildings. The super-yardage of the work was 1,250 and the total cost was 2,800*l*, including paving. The roadway was designed to take a 10-ton motor wagon.

Another work designed was a new roadway 12 ft. wide to carry two traction engines and heavy passing side by side. The suspended bridge was carried by columns, beams, and slab was 12 yds., and an equal portion had retaining walls to support the made-up road. The cost of this work was 2,000*l*.

In railway bridge work one example was given for Ambergate to carry one set of rails. It has one central pier in the river the width of which is about 120 ft. There are two 60-ft. spans and the width of the bridge is 12 ft. The cost, from tenders already sent in, is 10,000*l*.

Mr. Burke then dealt with the treatment of reinforced concrete for architectural effect. He stated that this must appeal to everyone as a very interesting and worthy of consideration view of the fact that as time goes on this particular method of construction must come more and more into favour. His own experience has been in buildings of the warehouse and factory type, where the first consideration is utility, with very little scope for elaborate design on the elevation; but at the same time question had been considered and the following were his views on the subject:—Taking the ordinary works or warehouse building with the orthodox piers, plinth courses, cornices and sills, stone bands with cornices, capitals, etc., this type of building in reinforced concrete can be very ably and economically treated. The concrete columns on the outside walls would be designed as piers of the necessary proportions to suit design and the frame beams between same utilised as window-heads with continuous band. Between the framework at 4-in. reinforced concrete wall could be constructed so as to be connected with the piers and the frame beams; the window openings and sills would, of course, be framed in the sheeting, and in case of any moulding, being required the jambs would be left high and the moulded work formed at another elevation.

In the case of rustication or V being required the blocking out of the piers, this can be done by the timber being fastened on to the ceiling before same is fixed, care being taken to prepare the timber with a good wash and so that these strips are slightly bevelled as to ensure clean striking. The ballast of this class of work should be very fine and granite if possible. If the elevations are treated so as to ensure all voids being closed off the sheeting is struck, a very good job assured and the difference from stone is hardly noticeable. If a combination of brick and stone dressings is required, the framework may be elevated on exactly the same way, the 4-in. reinforced concrete wall would be substituted by a 9-in. brick one and the reduction of moulded work or terra-cotta ornaments is a simple matter. Suppose, then, the treatment of a classic building in reinforced concrete is reviewed. Consider the monolithic method. The building of the main walls would be a very simple matter, as any details of the way of cornices, blocking out, and the

like, as well as panelling, could be easily executed in the sheeting. Then turn to a shaft with a Corinthian capital. You will see instantly that to carry out the shaft alone satisfactorily would be a very difficult job, and as far as the capital is concerned would be practically impossible.

This now carries us to the method of casting independent blocks, which would be placed in position in the same way as is now adopted with terra-cotta and reinforced concrete. The question of carving then arises. Taking it for granted that such a front could not be executed in concrete alone, the introduction of stone for reasons stated becomes necessary. Considering the combination of concrete and stone blocks, the two substances would have to be matched both in texture and in colour to be at all satisfactory. This, of course, could be done with care, but, supposing that a suitable appearance of the work on completion be attained, we must not lose sight of the probable change that would take place through the exposure to weather and general atmospheric conditions. From this the architect would then have to decide whether it would be worth while taking the risk (which would certainly exist) of adopting reinforced concrete with the combination of stone to save the extra cost which an entire stone front would incur.

In conclusion, Mr. Burke illustrated by lantern slides many examples of work he had carried out.

The lecturer was accorded a hearty vote of thanks.

An interesting discussion followed. In reply to the questions, Mr. Burke stated that he always specified the best English cement to be properly aerated and slow-setting. He did not like coke breeze or slag for the aggregate. He preferred broken bricks. The concrete in the proportion of 3 : 2 : 1 should be very liquid and well rammed. Although theoretically spiral reinforcement was best, he preferred to use $\frac{3}{4}$ -in. bent angle rods to connect the vertical bars. It was not necessary to paint the steelwork previous to encasing it. He urged builders when tendering to allow for plenty of strong timber for casing—at least 33 per cent., as, although the sides could usually be struck after ten days, the bottoms supports sometimes took three or four weeks.

At the business meeting previous to the lecture two new members and one new Associate were elected.

The Leeds and Yorkshire Architectural Society.

A general meeting was held on November 30 in the Society's Room at the Leeds Institute, the President, Mr. Sydney D. Kitson, M.A., F.R.I.B.A., in the chair.

A very interesting paper was read by Mr. Alfred Mattison on "Old Leeds." He described its growth and development from a village up to the city of the XIXth century, illustrating his text with many slides of old documents and engravings, etc.

Mr. W. H. Thorp, F.R.I.B.A., in proposing a vote of thanks, deplored the loss of many of the historical fabrics so reminiscent of the early days, and remarked upon the Red Hall, Guilford-street, which is at present undergoing drastic changes in the way of renovation and alteration. The motion was supported by Mr. C. B. Howdill, A.R.I.B.A., who spoke of the lack of civic spirit shown in Leeds, especially with regard to architectural development.

GENERAL NEWS.

Professional Announcements.

Owing to the reconstruction of Catford Bridge, and the consequent rebuilding of the head offices of Messrs. Norfolk & Prior, architects and surveyors, at 4, Station-buildings, Catford Bridge, the firm have temporarily removed to No. 7, Station-buildings, where business is being carried on as usual.

Mr. W. H. Johnson, jun., civil engineer and architect, has removed his office from 20, George-street, to 33, York-place, Edinburgh, where he has taken over the old-established business of Messrs. Menzies & Cockburn, civil engineers and architects. After this date he will continue the business under the firm name of Menzies, Cockburn, & Johnson. His new telephone number is Central 2621.

Mr. George P. Allen, architect and surveyor, has removed his offices from Dacre House, Arundel-street, Strand, to No. 32, Craven-street, Charing Cross, London, W.C.

School Accommodation.

It is estimated that the capital cost of providing the additional school accommodation necessary to carry out in London the County Council's ideal of "40" and "48" classrooms would be 2,000,000*l*. Increased maintenance expenditure would be involved on the completion of the scheme to the amount of 400,000*l*. per annum, and additional debt charges of 110,000*l*. per annum.

The Dering Collection.

On December 12, 13, and 15, Messrs. Norris & Duvall, of Hertford, will sell at auction the contents of Lockleys, near Welwyn, the residence of the late Mr. G. E. Dering. The collections comprise some fine old furniture of the Adam, Sheraton, and Hepplewhite periods, with earlier specimens, marble Italian statuary, and Dresden, Sèvres, and Berlin china. The pictures by old masters will be sold by Messrs. Christie on December 16, at their rooms; it seems they have as yet been unexhibited, and they include examples of the Dutch, German, and Flemish schools, with Hoppner's portraits of his wife as "The Primrose Girl," and Thomas, second Earl of Chichester.

Rome to Ostia Railway.

A French company has laid before the Municipality of Rome, who, it is said, are in favour of the project, proposals to construct an electrical railway from Porta San Paolo to Ostia, with its line underground between the terminus in Piazza Venezia and the Palatine-hill, and with a sunk cutting to Porta San Paolo. The cutting beyond the Palatine-hill will traverse a greater portion of the Zona Monumentale, that contains many relics of ancient Rome hitherto unexplored, and representations are made by Commendatore Boni against the probable destruction of antiquities involved by the scheme as planned at present.

Overstrand Church, Norfolk.

The Society of Antiquaries have passed unanimously a resolution that any proposal to restore the ruined church of Overstrand is undesirable and would result in the disappearance of much of the evidence of antiquity which still remains, and that a preferable course would be to secure the ruins as far as possible from the ravages of ivy and weather without attempting to graft new work on to them. The original church of St. Martin, distant two miles from Cromer, was, together with much of Cromer itself, destroyed by encroachment of the sea. The present church was built temp. Richard II.; the chancel and part of the nave fell into ruin; the remaining portion of the nave was adapted for worship in 1855. A new church was built in the churchyard forty-five years ago.

Carnarvon Castle.

A Committee of the Town Council have formulated proposals for rebuilding, with the consent of the Office of Works, the banquet-hall for purposes of a National Art Gallery for Wales, with a branch of the National Library and Museum, in commemoration of the Investiture of the Prince of Wales.

Bills (London) for the Session 1912.

The Commissioners of Works will apply in the course of next session for powers to enable them to acquire properties in London for a further extension of the Patent Office on the Took's-court, and Fumival-street sites, and in respect of the Institution of Civil Engineers, Great George-street; also to take some property, forming portion of Clifford's Inn, situated between Fetter and Chancery lanes, for the Public Record Office; and to take property lying between Montagu House, Whitehall, Horse Guards-avenue, Victoria-embankment, and the Banqueting House (where are now the Board of Trade Offices). The Corporation of the City of London will introduce a Bill for the construction of subways for foot-passengers beneath, and at the junction of, Cannon, Bread, and Queen

streets, with a subway junction to Queen Victoria-street and Bow-lane, and from Bow-lane to Mansion House Railway-Station. They also propose to seek relief from obligation to maintain and carry out their London riverside fish market at Shadwell with powers to dispose of the site (being the proposed site of a King Edward VII. Memorial and Park), to obtain certain enabling powers relating to the purchase of Spitalfields Market by Stepney Borough Council, and to establish a superannuation and pension fund for the officers and servants of the Corporation. The London Electric Railway Company's Bill relates to the making of a railway from Maida-vale, Paddington, to Willesden; a stairway from Argyll-street to Oxford-street; and subways, in Southwark, at London-street and Newington-causeway, and St. George's and London roads, to communicate with their Elephant and Castle Station tunnel and the Southwark Council tunnel.

Calton Hill, Edinburgh.

A paper on "The Calton Hill: Past, Present, and Future," with special reference to the intended completion of the Scottish National Monument, was read by Mr. Henry F. Kerr, A.R.I.B.A., at a meeting held on the 1st inst. in the hall of Moubray House, High-street, Edinburgh. Mr. Kerr said that with its fine distance outline and its natural facilities for magnificent views the Calton Hill would, if situated in any wide-awake continental capital, be made a chief sight of the city. In the early XIXth century it seemed to be the intention to make the Hill an open-air Valhalla, to keep the memories of the great ever present. Having sketched recent proposals with reference to the improvement of the Hill, he showed how it could be made a favourite resort. Edinburgh had often been compared to Athens, and there were many resemblances, notably in the two hills, the Acropolis and the Calton Hill, immediately overlooking the cities. It was this resemblance, doubtless, that decided the promoters of the National Monument to make the Calton Hill the site of the reproduced Parthenon. The approach to the Calton Hill from Princes-street and almost all the buildings upon it were all of good classic design, and when on the Hill one felt in a classic atmosphere. Of the National Monument only twelve of the forty-six columns of the reproduced Parthenon had been completed, and it was now the ambition of many to see the complete building there as a memorial to the good and great of all lands. Fortunately for the exterior, we had every detail necessary for accurate reproduction, in which all the delicate refinements of the beautiful building would be included. With faithful study and the interested and skilful help of selected workmen, the great task could be brought to a successful issue, and the Calton Hill, which had overlooked the city during its centuries of progress, would at last be nobly crowned.

Lower Thames Valley District Surveyors' Association.

The ordinary monthly meeting of this body was held at Twickenham Town Hall on Saturday last, the President, Mr. Edward Willis, Assoc. M.Inst. C.E., F.S.I., Engineer and Surveyor, Chiswick, occupying the chair at a well-attended meeting. The adjourned discussion on Mr. J. A. Webb's (Surveyor to the Hendon Rural District Council) paper, entitled "Notes on Drainage and Sewage Disposal in Small Towns and Villages," was resumed, much interest being taken in the discussion, many of the members taking part therein.—Owing to the amount of business which is dealt with by the Association, it has been found necessary to pass the following resolution:—"That all members desiring information shall be entitled to ask any questions referring to municipal engineering, surveying, and administration, but a copy of such questions shall be presented to the President or Secretary not later than half an hour after the commencement of an ordinary meeting."—The discussion on notes on "The Latest Sewer and Drain Definition Approved by Parliament," by the President, was postponed until the next meeting owing to the pressure of time.

BOOKS.

Structural Engineering. By JOSEPH HUSBAND, A.M.Inst.C.E., M.Soc.C.E. (France), and WILLIAM HARRY. (London: Longmans, Green, & Co. 1911. Pp. 396, with 357 diagrams. 7s. 6d. net.)

THIS treatise fully deserves a high place among text-books dealing with the important subject denoted by its title. The authors have endeavoured to deal with the design of frequently occurring structures from the theoretical and practical points of view. Not content with a mere statement of the main outlines of the theories involved, they have extended the application of such theories to the practical design of numerous structures and structural details of everyday occurrence.

The volume appropriately opens with a short summary of the properties of structural materials and the weights of details, but it should be understood that the extended knowledge on these subjects which is necessary to the structural designer must be obtained from treatises specially devoted to materials of construction. The succeeding chapters on "Loads and Working Stresses" and "Bending Moment and Shearing Force" are good examples of lucid treatment, and the next two chapters on "Beams" and "Columns and Struts" are equally worthy of commendation. Beyond all these introductory chapters we come to the more practical part of the work, relating to the design of built-up girders, roofs, some details of buildings, and masonry structures of various kinds.

As a general rule numerical data and arithmetical methods have been adopted, in preference to analytical methods, and mathematical formulae have been avoided wherever possible. The discussion of column strength is somewhat more extended than is customary, a feature deserving notice being the incorporation of material from the exhaustive investigation by Mr. J. M. Moncrieff, M.Inst.C.E. A brief section on tall building construction will be found of particular value to architectural students.

The book is one we have great pleasure in recommending to all students of structural design, and we feel sure that it will be widely appreciated by young architects and engineers alike, although naturally somewhat more suited to the needs of the latter.

The Historical Growth of the English Parish Church. By A. H. THOMPSON. (Cambridge University Press. 1s.)

THIS book should be read in conjunction with that on the ground plan of the parish church by the same author. The illustrations are good, especially those of the Cirencester porch, of the font cover at Well, Wiltshire, of the roof-screen at Banwell, Somerset, and of the Easter sepulchre at Howton, Notts. The porch at Cirencester, Perpendicular in style, has two stories above the ground floor, and was used by the guilds.

The chapter on the furniture of a mediæval church is very interesting. It includes mural paintings, stained glass, carved and painted woodwork, etc.

The author's views, undoubtedly correct, with regard to the altar, should be carefully read. The arrangement of the English altar was very different from that now prevalent on the Continent.

The cross and flower vases now so usual among us were seldom to be seen. The cross was not necessary, since, as a rule, a crucifix formed the centre of the design behind the altar, flowers and sweet-smelling herbs were strewn in front at certain seasons, and two lighted candles were placed on the altar at mass.

During the last few years much more study has been devoted to ecclesiology, and in several churches the old system has been adopted.

We think the author should either have omitted post-Reformation work entirely, or, to it. The work of Wren or Grinling Gibbons deserves more than a passing word.

Considering how fully the ground plan was dealt with in the last volume, four more places in this seem unnecessary. The great difference between mediæval and modern work is well emphasised. The mediæval was

the work of the whole activity of the age; the modern is the result of individual thought.

The closing words on "restorations," though axioms to the profession, will be of great importance in impressing on "the man in the street" the proper value of these works of "the men of old." It is for him that this type of book is meant. In drawing attention to the fact that even the often-despised XVIIIth-century work usually has much that is beautiful good service is done.

The Bibliography at the end of the book is good, and the work throughout is sound, interesting, and useful.

BOOK RECEIVED.

SHOULD WE STOP TEACHING ART? By C. R. ASHTEE. (London: B. T. Batsford. 3s. 6d. net.)

CORRESPONDENCE.

An Apology.

SIR,—I am instructed by the Board of Directors of Bell's United Asbestos Company, Ltd., to express to you their regret that a circular containing the text of a letter addressed to your paper by the Chairman of the company on June 5 last, with reference to the article on the subject of "Asbestos Cement Building Materials," which appeared in your issue of May 26, 1911, together with a copy of the article in question, should have been issued with a reproduction of the heading of your paper without your assent having been first obtained thereto.

The company have destroyed the block of the title and design of the *Builder*, and also all copies of the circular in hand, and undertake that no further issue of the circular shall take place. I may add that I was absent in America when the circular was issued, and consequently it was not brought to my notice, as otherwise would have been the case.

It only remains for me again to express my company's regret that the circular was issued in a form to which you have felt it necessary to take exception.

C. S. BELL,
Joint Managing Director of Bell's United Asbestos Company, Ltd.

Licentiate R.I.B.A.

SIR,—Would it not appear that the time is now ripe for the Associate members of the R.I.B.A. unanimously to protest against the continual neglect of their interests by the Council of that body? Few members of that Institute object to the creation of Licentiates as the only means to obtain Registration; but there would certainly appear to be no reason why members of that class, having been elected, should be able to proceed to the Fellowship without having to pass the same tests as those Associates have undergone.

By the new examination, which will shortly be in vogue, Licentiates will be able to secure this advantage without any of the expense and study which practically all Associates have undergone.

The President, it will be remembered, in his opening address regretted that more Associates did not "advance" to the Fellowship. They would surely be well advised to do nothing of the sort.

The formation of a Guild of Associates to ensure fair play, which they cannot obtain at present by their inadequate representation on the Council, would seem to be highly desirable.

ASSOCIATE R.I.B.A.

SIR,—"Enquirer" and "Second Enquirer" are quite correct in their assumption that the necessary age qualification will appeal very strongly to a considerable number of the younger architects, who have in every other respect all the necessary qualifications.

This is particularly hard in the case of the managing assistant of, say, twenty-six years of age (who, by the way, is perhaps responsible for the bulk of the work turned out by his office), and who might reasonably expect to commence practice on his own account within the next year or two.

Naturally, the examination question immediately presents itself. The answer is this: As it is the practice nowadays (I speak from

practical experience), owing to the fluctuation of work, to understaff rather than overstaffing the drawing office, the slightest rush of work, or, say, a competition, is immediately met by this assistant, who, I suppose, quite reasonably, is expected to devote a considerable portion of his own time to the interests of this office. In fact, some principals make a condition of engagement. I know of cases where assistants give up something like 75 per cent. of their own time to office work.

Now, then, sir, could such an assistant reasonably find the time to prepare for the titute exams? I am told that it has been done by such men and found impossible.

And yet an assistant so placed cannot enter the Licentiate class. Will he be registered on the event of the Bill being passed?

Will he take the liberty of suggesting to his employers that he "that, instead of an age qualification, there should be an experience qualification, with ten years as the minimum?"

THIRD ENQUIRER.

Architectural Assistants at the Office of Works.

SIR.—The sympathetic reply given by Mr. Alley Ward to Mr. Philip Snowden, and printed in your last issue, is very encouraging to those who have been waiting many years for some improvement in position. But the First Commissioner had not been correctly informed when he replied that he was "not at all sure there was any general desire on the part of those gentlemen who might be considered eligible to be placed on the established list with the consequent sacrifice of income which would be demanded by the regulation." As to the desire for establishment, a memorial was presented fifteen years back! The Principal Architect then recommended all managing men should be established. His recommendation had been adopted, and it is certainly the best judge of men's wishes, those men would now be receiving at double their present salaries. But nothing was done. Many applications and recommendations have been made since, but were merely merit was concerned it was "nothing done."

As to the suggested sacrifice of income, there are middle-aged men, doing good work, who have been over twenty years in the office, receiving some 200*l.* a year. This is the meagre salary of a "permanent" man, who may be only twenty-three years of age. They rise so rapidly that many who have been only a few years in the service are living 350*l.*, and some who have only been years 500*l.* a year. There is no question of ability, simply they are "permanent." Consistency and justice would therefore ask a considerable advance, not a reduction, in salary. If the matter had been taken in when first recommended by the Principal Architect, there might have been some on then for reducing salaries.

EFFICIENCY.

SIR.—Your correspondent "X." in last week's issue, is somewhat behind the times in he is wondering whether the First Commissioner of Works is aware of the conditions under which the "Architectural Assistants" are working. On the 24th ult. he gave the reply to Mr. Philip Snowden in the House of Commons that he not only knew of the unsatisfactory condition and want of status of the professional men, but that "he would consider their claims to be put on the established list."

The First Commissioner, of course, is not to blame, for he relies upon the representation of his subordinates, that are made to him by those in authority under him, and his inactivity to do justice in the part of "X." in speaking of ten years' service, overlooks the fact that the class of "Architectural Assistants" (formerly "draughtsmen") have only been in existence since February, 1907, when they started under a new title and rule that the age limit for the Civil Service Examination, then twenty-five, be altered back to thirty, and that only those were to be retained of the class of thirty and over whose services were regarded as being deserving of a Technical Certificate of Efficiency to be signed by their immediate chief.

Now at this time there were some twenty-two thus certified and retained, out of which

number some ten were aged from thirty to thirty-five, who, but for the setting back of the age limit, hoped to sit for the Examination, and thus they were deprived of a privilege they previously enjoyed, and the prospects of all the above were over.

But the danger of preferential treatment again "looms large" by the reply of the First Commissioner above referred to, who spoke of "those gentlemen who might be considered eligible," and this must be opposed "tooth and nail," if only on account of the friction bound to ensue between those similarly certified and placed on, or not placed on, the establishment. Now, if it be impossible to deal similarly with the entire class, which includes those who have since attained the age of thirty, and are certified, at the very least it must be all the above-mentioned portion of the class—or none. FAIR PLAY.

Microscopical Examination of Building Material.

SIR.—Your correspondent Mr. F. J. Barnes has evidently been unfortunate in his laboratory experimental work, which is now generally admitted as being a most valuable aid to the practical man acquainted with all the facts of the case. When theory apparently does not "square with practice" it is usually due to incomplete knowledge of facts, or to the ignoring or suppressing of some of them. It is needless to contradict his statement that Portland stone has been found to withstand the atmosphere of Glasgow better than other building material, as it is generally known that Portland stone was used for the first time in Glasgow on an important scale only two years ago, and, although it was fluted, it is already showing signs of decay. Then his idea of "seasoning" stone seems to correspond rather to the use of the term as applied to wood, an operation totally different from the seasoning of stone, which is generally taken to be what he calls "case-hardening." The classical example of the seasoning of the stone of St. Paul's for three years after dressing need hardly be quoted, and the operation of dressing after seasoning should rather be called "unseasoning," since it removes the surface skin constituting the main asset of the Portland stone when seasoned. The somewhat ambiguous case quoted as being somewhat anomalous would doubtless have been readily explained by an examination of the two types of Portland stone microscopically, which has evidently not been done. Like most other things, there are several varieties of Portland stone, and there are perhaps even greater varieties in the hygroscopic conditions of the atmosphere, as well as in the weather experienced at the three places named.

Without examining specimens of the two stones, both normal and after exposure to the action of the atmosphere in the different towns, it is rather difficult to say exactly why the difference occurs. However, it is quite credible that the hard, dense variety of roche stone, which is least affected by acid, may quite well be attacked severely by the large amount of acid in the air, favoured by the atmospheric conditions of Birmingham; whereas, such a stone would resist the sooty atmosphere of London to a greater extent, and be almost immune from the physical erosion of the wind and rain at Portsmouth. On the other hand, the soft, open-grained and therefore porous variety now commonly worked would be readily broken down by the salt-laden breezes of Portsmouth without being chemically acted upon to a disastrous degree. This same material could conceivably get such a coating of soot in London as to protect it, at least partially, against the only moderately acid atmosphere of the metropolis; and the greater quantity of acid got from the Birmingham air might be more largely removed from the open pores by moisture before serious damage was effected. However, this last condition is highly problematical, and decay would certainly supervene after a time. As a rule, anyone now concurring in the "hang theory" idea condemns himself, and confesses to partial ignorance. J. S. GLEN-PRIMROSE.

Port of London Offices Competition.

SIR.—Adverting to the letter you were kind enough to publish last week, may I also, with your permission, ask all competitors to join in a request that the perspective view

be postponed to the final competition, and that the three elevations and two sections be reduced to one each?

This should be done by or before the 16th inst. L.

A Correction.

SIR.—As has been said, "We live to learn," but the letter of one of your correspondents tells us, I think for the first time, that the statue of Achilles is a memorial of the Crimean War. I fancy some of us recollect it standing where it is some years before that event. E. SWINER HARRIS, F.R.I.B.A.

The Inventor of Portland Cement.

SIR, I see in the newspapers that Mr. I. C. Johnson, the manufacturer of Portland cement, is dead. He is spoken of in more than one paper as the inventor.

I have always understood that Joseph Aspdin, a brickmaker, of Leeds, was the first to manufacture Portland cement. This was, I believe, in 1815. C. F. M.

[*] It certainly is not established that the late Mr. I. C. Johnson was the inventor of Portland cement.—Ed.]

Cost of Joinery.

SIR, I am surprised that "F. M.'s" complaint ever found its way into your columns, and I am still more astonished that J. F. Parker should show such infantile innocence as to the anonymous letters received daily by employers of labour on kindred subjects to "F. M.'s."

I have been a foreman or manager for fifteen years of a cabinet joinery works, employing 300 to 400 men, and have my first tip yet to get. Under modern conditions, a foreman who conducted his establishment as "F. M." says would not last over the first quarter. I should like to ask "F. M." how he got to know that the foreman faked the time-sheets, as in a modern establishment the time is taken each night and written up by clerks, not under the foreman's supervision. I have had to get rid many times of the "expert and experienced" men that "F. M." speaks of—men whose experience unfits them for modern conditions of work. In a word, a foreman must surround himself with the men who are most ductile and who will follow his lead. LIVERPOOL.

SIR.—I should think the experience of "F. M." has been very exceptional. Very few foremen out of the large number of that body composite are corrupt; there is, of course, the exception. It has occurred to me, however, more than once that the autocratic powers invested in foremen, by which they are allowed to take on or discharge men, might be curtailed with advantage. A foreman is but human; he has his failings—quite perceptible ones sometimes. He might think to himself, of any particular man, "I don't like that man; I'll sack him," and do so, and the man could not appeal against his treatment, there being no one to appeal to. Or again, when one of his acquaintances apply for a job he might think, "This man belongs to my branch; I must give him a job." In either case where does the employer's interest come in? W. I.

INTERCOMMUNICATION COLUMN.

Hot Water and Galvanised-Iron Cisterns.

SIR.—The experience of your correspondent, "J. A. C.," is interesting in more ways than one. Presumably it is a closed cylinder which he refers to, not a cistern, as he states. There should be no hot water in the cistern. One would like to know the metal used for the circulating pipes. As your correspondent does not refer to any difficulties with them, they must be something different from galvanised iron. There are apparently two forms by which he can permanently cure the complaint—either by replacing the galvanised-iron cylinder by a copper one, or by obtaining a plant which will automatically either eliminate or neutralise the destroying influence in the water. S. WHITMORE ROBINSON.

EDITORIAL SUMMARY.

The leading article this week is devoted to an illustrated account of the town of Amalfi.

In "Notes" (p. 664) will be found some observations on: "Southwark Bridge"; "London Institution, Finsbury-circus"; "The New Examiner of Plays, and After"; "An Artist and an Architect"; "The Mansion House"; "The King Edward Memorial, Liverpool"; "The King Edward Memorial."

To the Marylebone Municipal Buildings Competition we devote another article, accompanied by some additional plans and details (p. 665). All the illustration plates this week are given up to the designs.

Short notices of meetings of the following architectural societies will be found on p. 669: "Leeds and Yorkshire Architectural Society"; "Nottingham Architectural Society"; "Royal Institute of the Architects of Ireland."

Book Reviews (p. 672) include: "Structural Engineering"; and "The Historical Growth of the English Parish Church."

In Correspondence Column (p. 672) will be found letters on: "An Apology"; "Microscopical Examination of Building Material"; "Port of London Offices Competition"; "A Correction"; "The Inventor of Portland Cement"; "Cost of Joinery"; "Licentiate R.I.B.A."; "Architectural Assistants at the Office of Works."

Our Monthly Illustrated Review of Construction (p. 675) contains: "The Regent-street Polytechnic"; "The Design of Tall Chimneys"; "Colouring of Paper."

The Building Trade Section (p. 680) includes: "Continuity of Employment in the Building Trade"; "Cement"; "Prime-Cost Contracts"; "Projected New Buildings in the Provinces"; "Applications under the Building Acts, 1894-1909," etc.

A report on the condition of the Mansion House appears on p. 682.

Legal Column (p. 684) includes comments on: "Repairing Covenants in Leases"; "Fire Precautions: Appeals to Tribunal of Appeal"; "Laying Out a New Street."

In Law Reports (p. 684) will be found the following: "Westminster Nuisance Case"; "Action against Builders and Contractors"; "The Validity of an Architect's Certificate."

MEETINGS.

FRIDAY, DECEMBER 8.

Aberdeen Architectural Association (in the Northern Arts Club).—Mr. G. M. Fraser on "A Historical Tour in Aberdeen." Illustrated by lantern slides. 7.30 p.m.

Glasgow Technical College Architectural Craftsmen's Society.—Mr. John Crawford on "The Duties of a Foreman Mason."

Northampton Polytechnic Institute, E.C.—Annual prize distribution. 6.30 p.m.

SATURDAY, DECEMBER 9.

Incorporated British Institute of Certified Carpenters (Carpenters' Hall, London-wall, E.C.).—Annual general meeting. 5.30 p.m.

MONDAY, DECEMBER 11.

The Architectural Association (combined meeting with Camera, Sketch, and Debate Club).—Mr. Alan E. Muehl, M.A., on "Is the Texture of Materials a Fetish?" 7.30 p.m.

University of London (Victoria and Albert Museum).—Mr. Banister Fletcher on "The Louvre and the Tuileries, Paris." 5 p.m.

The Incorporated Clerks of Works' Association (Carpenters' Hall, London-wall).—Paper by Mr. F. G. Dowson (Messrs. Roberts, Adlard, & Co.) on "Roofing, Slates, Tiles, etc. Origin, Quarrying, Productions, and Practical Uses." 8 p.m.

Royal Society of Arts (Cantor Lectures).—Professor Vivian B. Lewes on "The Carbonisation of Coal"—III. 8 p.m.

Surveyors' Institution.—Mr. W. A. Haviland on "The Burden of Upkeep on Rural Estates and its Relief under Section 89 of the Finance Act, 1910." 5 p.m.

TUESDAY, DECEMBER 12.

The Institution of Civil Engineers (Ordinary Meeting).—Paper by Mr. T. Ernest Stanton, D.Sc., M.Inst.C.E., and Mr. J. Robert Pannell.

University of London (British Museum).—Mr. Banister Fletcher on "Origin and Evolution of the Corinthian Order." Lantern illustrations. 4.30 p.m.

Nottingham Architectural Society.—Mr. W. H. Taylor, F.S.I., Lic.E.L.B.A., Barrister-at-Law, on "The Law Relating to Building Schemes." 8 p.m.

WEDNESDAY, DECEMBER 13.

Junior Institution of Engineers (at the Institution of Electrical Engineers, Victoria-bankment).—Lecture on "Steel Specifications considered Commercially." by Major H. B. Strange, R.A., ret., of Sheffield. 8 p.m.

Northern Architectural Association.—Paper by Mr. J. Hall. 7.30 p.m.

THURSDAY, DECEMBER 14.

Society of Architects.—Mr. C. A. T. Middleton on "Alexandria: Its Place in Architectural History." 8 p.m.

Concrete Institute.—Mr. G. C. Workman on "Some Recent Works in Reinforced Concrete." 8 p.m.

Sikhia Society of Architects and Surveyors.—Mr. Cass. Fawson on "Manufacture of Paper, and Methods of Printing."

Institution of Electrical Engineers.—Mr. A. E. Seabrook on "Residence Tariffs." 8 p.m.

COMPETITION NEWS.

Manchester Art Gallery.

We understand that Messrs. Crouch, Butler, & Savage, of Birmingham, have been awarded the first place in this competition. It will be remembered that ten competitors in the first competition were invited to complete their designs. We hope to illustrate the various designs fully in our next issue.

Cottages at Middlesbrough.

In the competition for six cottages for the staff of the Cleveland Asylum Mr. T. Edwin Cooper, F.R.I.B.A., the assessor, has made the following award:—

First and third, Mr. James Forbes. of Middlesbrough.
Second, Messrs. J. M. Bottomley & G. T. Wellburn, Middlesbrough.
Twenty-three sets of plans were submitted.

Society of Architects.

The Travelling Studentship of the Society of Architects, open to students under twenty-eight years of age, on the Register of the Society, will be awarded in 1912 to the author of the best design for a town hall, to cost, exclusive of furniture and fittings, not more than 30,000l. Conditions appear in the December issue of the *Journal*, in which are reproduced some of the drawings made by the Travelling Student for this year, Mr. J. R. Leathart.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. E. White, Chairman, presiding.

LOANS.—The Finance Committee recommended and it was agreed that loans should be made to borough councils as follows:—Chelsea, 3,700l. for street improvement; Fulham, 9,280l. for electricity undertaking; Hackney, 817l. towards the extension of an open space, and 4,364l. for electricity undertaking; Holborn, 8,000l. for street lighting; Southwark, 3,630l. for street improvement; and Wandsworth, 4,000l. for street improvement.

ASYLUMS.—Various alterations and additions to the general storeroom at the Hanwell Asylum are to be made, and a covered way has been erected at the Manor Asylum.

SYNAGOGUE.—It is proposed to erect a new synagogue at the rear of Nos. 124 and 126, Green-lanes, Stoke Newington, N.

BOILER-HOUSE.—The erection of an addition to the boiler-house at the Neckinger electricity station, Spa-road, Bermondsey, is to be carried out.

NEW COUNTY HALL.—In answer to a question put by one of the members of the Council, it was stated that the County Hall would probably be ready for occupation in 1916.

ILLUSTRATIONS.

Marylebone Municipal Buildings.

WE illustrate this week a detail of Mr. Cooper's design, which was placed first in the competition, to which we refer at length on pp. 665-669. Our second and third plates show features of some of the other designs.

LIGHTS ON VEHICLES.

THE attention of railway companies, carriers, tradesmen, and other persons concerned is directed by the Commissioner of Police of the Metropolis to the provisions of the Lighthouses Act, 1907 (7 Edw. 7, ch. 45), which provides that:—

"Every person who shall cause or permit a vehicle to be in any street, highway, or road to which the public have access, during the period between one hour after sunset and one hour before sunrise shall provide such vehicle with a lamp or lamps in proper working order and so constructed and capable of being so attached as when lighted to display to the front a white light visible for a reasonable distance. If only one lamp is so provided it shall be placed on the off or right side of the vehicle, and, if the lamp or lamps are so constructed as to permit a light to be seen from the rear, that light shall be red."

He shall also, if the vehicle is used for the purpose of carrying timber or any load projecting more than 6 ft. to the rear, provide the same with a lamp or lamps in proper working order and so constructed and capable of being so attached as when lighted to display to the rear a red light visible for a reasonable distance."

The Act will be strictly enforced by Police, and offenders are liable on summary conviction for each and every such offence to a penalty not exceeding forty shillings, and in the case of a second or subsequent conviction to a penalty not exceeding five pounds."

FIFTY YEARS AGO.

From the *Builder* of December 7, 1861.

A Relic of Old Suburban London: An Alarm Bell.

IN the future years of the metropolis, notwithstanding the rapid changes, there will remain various matters below the ground, and some above it, which will puzzle many hereafter. Amongst the latter we may mention the circular and other shaped plates which used to be so commonly placed on the fronts of houses by the different insurance companies. On the main coach roads within the metropolitan district the roads, which in some instances are now becoming green-looking, will be turned into paved streets; and it is not improbable that some of the milestones may be allowed to remain; and, in course of time, the brief inscriptions will become indistinct by the beating of the weather, and this may lead to the battle of archaeologists.

Our object at present is, however, only to record some particulars of an object which, fifty or sixty years ago, was commonly used in the suburbs for the purpose of frightening thieves and protecting life and property. This is the "alarm bell," which was fixed in various positions on those houses which stood in pleasant gardens but in lonely situations; where, notwithstanding the protection of blunderbuses and other weapons, persons were not safe. There are indications of these having been fixed on houses which now form portions of the lines of streets; but on examining these dwellings it will be found that they have been disguised in several ways, by facing, by putting in new windows, by concealing the roof, etc., in order to make them harmonise with their neighbours. An experienced eye will, however, detect that these have been isolated buildings, which have been standing at the time when there was no residence within a considerable distance.

AUSTRALIA AND THE ALDWYCH SITE.

THE Melbourne correspondent of the *Daily Chronicle* cables to that journal that the Federal House of Representatives has adopted the Government's scheme to acquire the freehold of the entire Aldwyth site, at a cost of 364,000l., and to erect thereon a great building, seven stories high, which will include an exhibition hall and the headquarters of the High Commissioner and the six Australian States. The retreat of the London County Council from the onerous conditions which they sought to impose four years ago has been generally approved.

MONTHLY REVIEW *of* CONSTRUCTION.

The Marlborough Hall in the Polytechnic.

[Photo. by Ewart Miller.]

THE REGENT-STREET POLYTECHNIC.—II.

[Continued from page 576.]

THE back portion of the building is of the same general character as the old construction, which has been remodelled to a very considerable extent brought thoroughly up to date as far as possible. Various additions have also been made, and the roof over the chemistry laboratory is a fine example of structural work.

Fig. 9 includes a part plan, a part elevation of the saw-tooth roof and parapet, and a cross section of the parapet construction. It will be observed that the top of the Mansard roof is finished with heavy steel girders support of the roof trusses and other construction above.

Each of the three saw-tooth trusses in the five spans measures 21 ft. 9 in. from centre to centre of the girders, along the base of the triangle, the other two sets of trusses measuring 23 ft. 1½ in. and 25 ft. 2½ in. respectively. The width of the saw-tooth roof is 21 ft. 9 in. over all.

Fig. 10 gives full details of the truss construction and requires no explanation.

On the top of the Mansard roof a very panoramic view is obtained of the metropolis from the Crystal Palace on the south to Hampstead and Highgate on the north. The eastern and western is equally extensive, but not so picturesquely delimited by wooded heights. Above the main cornice projects a lofty flag mast of steel, supplied

by Messrs. John I. Thornycroft & Co., Ltd., the well-known engineers and shipbuilders.

Fig. 11 is an elevation showing one of the five important trusses supporting the roof of the chemistry laboratory. Presenting from below the appearance of a circular arch, the construction is in reality a rigid truss exerting no appreciable thrust against the construction on either side. Each truss measures 31 ft. 3 in. over all at the bottom, the semicircular intrados springs from the distance of 1 ft. 6 in. above floor level, and is struck to the radius of 14 ft. 6 in.

The foregoing examples of the steelwork in the Polytechnic building will serve to give an idea of the interesting nature of the construction, which is in every way worthy of the eminent firm by whom it was executed.

Walls, Partitions, and Ornamental Work.

For the interior partition walls the "Mack" fire and sound resisting slabs and blocks have been largely used, having been supplied to the general contractors by the patentees, Messrs. J. A. King & Co., of Queen Victoria-street, E.C.

Brick has been used chiefly in the main walls, faced with stone on the Regent-street façade. The entrance hall is panelled throughout with marble, prepared and supplied by Messrs. J. Whitehead & Sons, Ltd., of Imperial Works, Kennington.

The ornamental plaster work was executed

by Messrs. G. & A. Brown, Architectural Ornamental Works, Hammersmith, and the stained glasswork by Messrs. Campbell & Christmas, of St. Oswald's Studios, W.

Ferro-Concrete Construction.

The ferro-concrete work in the remodelled building consists of floor panels, stairways, and a retaining wall forming the Regent-street front of the basement and sub-basement stories. All this work was designed in accordance with the Hennebique system, the working drawings having been prepared for the architect by Messrs. L. G. Mouchel & Partners, of Westminster, and it was carried out by Messrs. Holloway Bros. (London), Ltd.

It is scarcely necessary to occupy space by a description of the floors, as the Hennebique type of design is familiar to most of our readers, and the dimensions of the floor panels have already been stated.

Figs. 12 and 13 give typical details of the stair construction.

Fig. 12 contains a plan and part sectional elevation of the main stairway wherein two wells are incorporated for two passenger lifts installed by Messrs. R. Waygood & Co., Ltd., of Falmouth-road, S.E. The landings, as well as the stair slopes and treads, are in ferro-concrete, structural details of which are fully shown in the drawing, as well as the

method of anchorage between steel girders and the ferro-concrete work.

Fig. 13 is reproduced from a working drawing of the stairs from the lecture theatre, an interesting feature of the construction being the cantilever landing 8 ft. wide with the overhang of 4 ft. 6 in.

Fig. 14 illustrates the retaining wall along the front of the basement and sub-basement stories. It is 26 ft. high and consists of a vertical slab, supported by a footing slab and stiffened at intervals by counterforts. The slender dimensions of the wall, as shown

Fig. 9. Saw-Tooth Roof and Parapet.

in the drawing, sufficiently indicate the great saving of space effected by walls of this type, another important consideration being the avoidance of useless dead weight, which in mass concrete retaining walls of the ordinary kind impose unnecessary and objectionable load on the soil.

Electric Lifts.

Each of the Waygood lifts mentioned above extends from the ground floor to the fifth floor, and is capable of raising eight persons at the speed of 150 ft. per minute. The passenger car has hardwood panelling, domed top, and is fitted with mirrors inside, altogether presenting a handsome appearance.

The Gymnasium in the Polytechnic.

The gearing consists of an electric motor directly connected to worm-gearing, working in an oil bath and controlling the winding drum. The latter is grooved to fit the steel wire ropes, so as to obviate undue wear, and the ropes are attached in such manner as to guard against slip.

The cage and balance weight are suspended by four ropes, each of more than sufficient tensile strength to sustain the entire load with an ample factor of safety; but in addition a safety device is fixed to the under side of the cage, the apparatus including grips which engage the vertical runners in the event of undue stretching or failure of the ropes. A commendable feature of this safety

gear is that its action is purely mechanical and does not depend upon the operation of springs.

The lift is controlled by means of a magnetic handle in the car, the handle being fitted so that unless held in the required position it will automatically revert to the central position and cause the lift to stop. Another advantage is that the handle can be detached, thereby enabling the attendant to take it away in case he should have to leave the car for any reason, and so make it impossible for unauthorised persons to start the cage. The controller is provided with up and down limit circuit breakers operated by solenoids and fitted with a magnetic cut-out to minimise

Fig. 10. Details of Saw-Tooth Roof Truss.

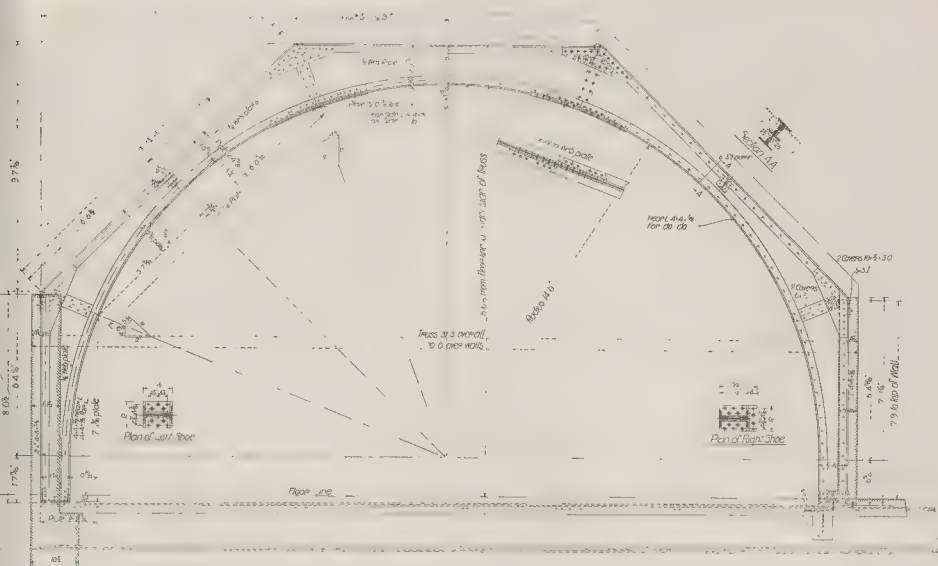

Fig. 11. Arched Truss in Roof over Chemistry Laboratory.

Operations are conducted through a car working so that it is quite automatic in cutting out resistances at a fixed point, independently of the way the handle is moved in the car. The whole apparatus is mounted on a slate panel, and arranged so that all parts are readily accessible.

The gearing and controlling devices are arranged on a bed-plate, bringing all the machinery together, and thereby obviating the necessity for trip switches in the lift shaft and simplifying the wiring.

In addition to the passenger lifts, the building is equipped with a hand-power carriage having a platform 14 ft. long by 10 in. wide, and capable of raising loads of 2 tons. The platform is strongly built, with a steel frame covered with timber. The platform guide runners are of channel fixed to the walls by wrought-iron brackets, and the lift is operated by a double-throw crab fitted with a powerful lever. This lift, providing means of communication between the ground floor, basement and sub-basement, will enable the staff to convey new machinery and testing appliances into the engineering workshops. Its ample size makes it available for the treatment of large motor-cars should one arise.

to damage it. Tall chimneys ought to be designed upon scientific principles, so that there is an absolute guarantee for their stability, and in the following paper the author desires to elucidate these principles.

Height.—In designing a tall chimney it is desirable first to know what height to make it. Forty-five feet is an ordinary height to serve two steam boilers, but in some towns, as Manchester and Leeds, 90 ft. is the minimum

THE DESIGN OF TALL CHIMNEYS.

A MEETING of the Society of Engineers (Incorporated) was held at the Institution of Mechanical Engineers, Victoria-embankment, on Monday, when Mr. Henry Adams, C.E., M.I.Mech.E., F.S.I., read a paper "The Design of Tall Chimneys." In his paper he said:

Architects in the course of their practice frequently to furnish designs for special sections, and, although they sometimes take the sensible course of calling to their aid the services of an expert, they more frequently do not what they think ought to do, and the responsibility upon the contractor. In the present condition of general knowledge the subject of stability of tall chimneys is strikingly shown in connexion with the design of the lift shaft. This was designed to withstand a wind pressure of 160 lb. per square foot. Professor Rankine calculated that it would stand only 70 lb. per square foot, while Mr. J. Hutton, a later writer, estimated wind pressure of only 32 lb. per square foot. The whole height would be sufficient

Fig. 12. Main Stairway: Plan showing Passenger Lift Wells.

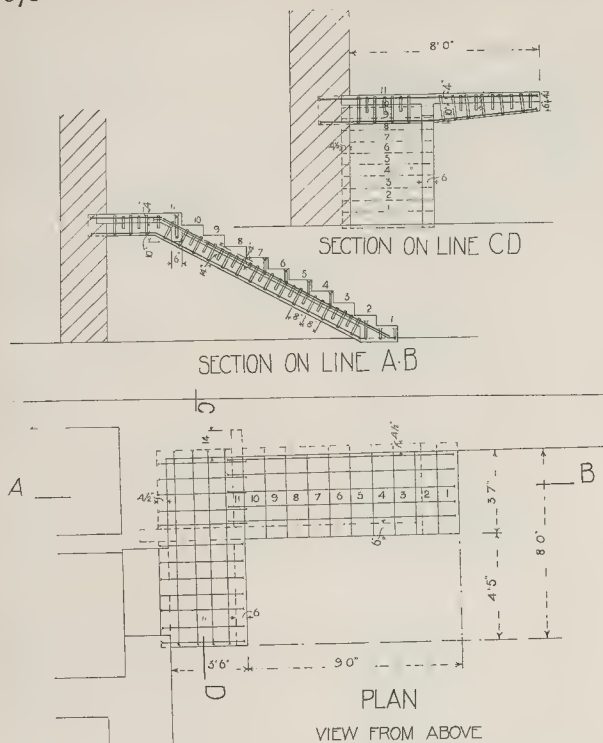

Fig. 13. Stairs from Lecture Theatre in the Polytechnic.

allowed. They are sometimes proportioned for height according to the coal burnt per week of fifty-six hours, thus:—

4 tons per week	=	75 ft. high.
13 " "	=	100 " "
25 " "	=	120 " "
50 " "	=	150 " "
100 " "	=	180 " "
150 " "	=	200 " "

Another rule is to make the height of the chimney three times length of boiler plus twice distance of furthest boiler to chimney. This allows 1 ft. of height for every foot the gases travel round the boiler and 2 ft. of height for every foot of external flue. And, again, a round chimney should not exceed twenty-five times its internal diameter in height. In many modern power-stations Babcock & Wilcox boilers and Green's economisers are used; what is saved in obstruction in the boilers is lost in the economisers, so that no material difference arises, but the chimney-shafts are, as a rule, only from 75 ft. to 100 ft. high and of very large sectional area. For chemical works, or where poisonous fumes are emitted, they should be higher than for ordinary steam boilers, in order to disperse the fumes at such a height that they may be diluted to a harmless condition by the time they reach the ground.

Shape.—The necessary sectional area being obtained, it should next be decided whether the chimney is to be round, octagonal, or square. It is generally acknowledged that circular chimneys have the best appearance, at least above the pedestal, which is usually square, and from which the circular part springs by broadened angles. Octagonal chimneys have the next best effect, some even consider that they are more sightly than round chimneys, while square chimneys always look more or less heavy and are only suitable for short stacks of large area, such as are generally used in modern central station work. The circular chimney is most efficient for its area, as it takes the least material and there are no angles in which soot may cling, but with any chimney it is desirable to add 2 in. all round to the calculated minimum area to allow for friction. Octagonal chimneys require special bricks for the angles in alternate courses, to produce the best work.

Wind Pressure. The comparative efficiency according to the shape of cross-section may also be considered from the point of view of obstruction to the wind, that which offers the greatest obstruction requiring the greatest stability or quantity of material apart from other considerations. It is not yet definitely settled what is the pressure of the wind upon a plane surface due to a given velocity, and less is known of the effect upon a surface inclined to its direction. We shall generally be quite safe, however, if we allow for ordinary purposes a pressure of 56 lb. or $\frac{1}{2}$ cwt. per square foot on a plane surface normal to the direction of the wind, and even half of this may be sufficient in many cases. When we come to fix the value of these figures against an inclined or curved surface we find much difference of opinion and no sufficient experimental evidence.

A formula agreeing closely with Hutton's experiments is:—

$$P = a p (\sin \theta)^{1.84 \cos \theta}$$

where P = total pressure in pounds,
 a = area of surface in square feet,
 p = normal pressure pounds per square foot,
 θ = angle of incidence,

and this is the basis of the majority of tables of effective pressures; but Hutton's experiments on a surface only 22 sq. in. area, which was small to be of much practical value.

Some years ago the author suggested a variable allowance according to the width, height of the structure, which would cover cases and be more in accordance with modern experiments. His empirical formula for this purpose is now:—

$$\log p = 1.125 + 0.33 \log h - 0.12 \log w$$

where p = ultimate wind pressure in pounds per sq. ft. necessary to be allowed for against a plane surface normal to the wind;
 h = height in feet of centre of gravity of surface considered, above ground level;
 w = width in feet of part to be taken as surface;

and when the surface is inclined at θ degrees to the direction of the wind, the ultimate pressure normal to the surface may be taken as $p \sin \theta$, or its effect in the same direction the wind = $p \sin^2 \theta$.

Pressure on Square Chimney.—A square chimney will give the same resistance when

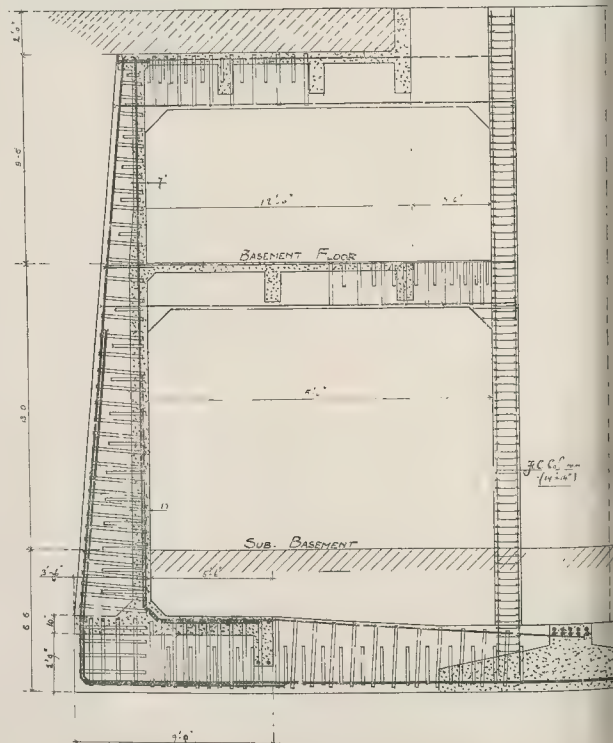

Fig. 14. Section of Retaining Wall in the Polytechnic.

the wind or standing diagonally to its ion, the greater area of the inclined e and the reduced pressure upon it making e total as the flat side under the full ure.

Pressure on Circular Chimney.—With circular eys a very serious difference of opinion as to the effective pressure of the wind, own by the following list of multipliers mended:

skine ..	.5	Professor Hutton ..	.68
Albion ..	.38	Gaudard ..	.48
Lyda ..	.57	Bressi ..	.78
B. Baker ..	.57	Adams ..	.7654

Pressure on Octagonal Chimney.—An octagonal ey has two extreme positions with regard e wind, viz., when it is acting directly t one face and when acting directly t one edge. For the former case the multiplier would be .983 and for the .082; there is not much difference, but tter coefficient gives rather the higher s as it is taken against the width over

Russian Government Rules.—In April, 1902, Russian Government issued regulations for the construction of chimney-stacks. Square e to be designed for a wind pressure of .5, per square foot, with the centre of e at the centre of gravity of diametral al plane. Octagonal stacks, 71 per cent. e above pressure, and circular stacks, 68 per cent. (*Engineering Record*).

Thickness of Brickwork.—Up to 150 ft. high, inside diameter the top length is ally one brick (9 in.) thick; above that r diameter the top length should be ick and a half thick, and the thickness e increased by a 4½-in. set-off at every below the top. The outlet at top androat or internal diameter at each set-off e of the calculated size to give the ary area plus allowance for friction. times one hears it recommended that the e chimney should be contracted, to the expulsion of the gases at a greater y and so to prevent down draught. It d also that as the gases cool in their e up the chimney they require a smaller al area to keep the velocity uniform. In d no attention is paid to either of these s and the section is kept as uniform as her requirements will permit.

er.—If the diameter of the throat is kept m and a 4½-in. set-off occurs at every e, the intermediate portions being of n thickness, a batter of 1 in 53.33 will ven, but the London County Council on a minimum batter of 1 in 48 = 2½ in. t., and besides that it will be requisite in ases to provide a firebrick lining for at the bottom 15 ft. or 20 ft., having a ess of 4½ in. and a clear space above the brickwork of 1½ in. to 2 in., necessitating greater batter.

Chimney-Cap.—The chimney-cap or cornice, London County Council rules, must not e more than the thickness of the brick- on which it rests. It may be of cast- asings bolted together and filled with rk; or of granite or other good weather- one, the separate blocks being cramped r with galvanised-iron cramps, or with a hoop sunk into the top and protected ess; or of brickwork in cement.

Chimney at Base.—There is also an important e the London County Council which says width of a shaft at the base, if square on must be at least one-tenth, and if circular n, at least one-twelfth of the total

Chimney Lining. The firebrick lining must rely self-supporting and have a clear e behind, to allow for expansion and ion independently of the main structure, ould be prevented if dirt and dust were e behind it. It is therefore necessary to the top of the space by an over-sailing e of bricks built out from the inside of ain shaft, protecting the space, but g a clearance above the lining of ½ in. y 5 ft. of its height, to permit of its ion when heated. The average height of lining is 3 height of shaft + 10 ft. A on height is 20 ft. and thickness 4½ in.; of greater height it is necessary to make ver part 9 in. thick. No air bricks e inserted in the outer wall, as is mes done with the idea of cooling the e, any such openings being very al to the draught. The only possible r air to the chimney-shaft should be

through the fire-bars or over the surface of the incandescent fuel.

The smoke inspectors of the London County Council have lately recommended openings into the chimney-shafts near the bottom to reduce the smoke nuisance. The real effect is to dilute the smoke with air before it reaches the chimney-top so that it is not so black when expelled, but it does not reduce the actual amount of carbon emitted except so far as it tends to spoil the draught and so to reduce the fuel consumption and boiler efficiency.

Stability.—Having drawn out the vertical section to suit the conditions, it will be essential to test the stability by calculation, but this is a somewhat complex matter and requires some preliminary data that will now be dealt with.

Materials and Weight.—The weight of each portion of the shaft, i.e., between each set-off, should be obtained separately so that the figures can be used singly or together. The weight will depend very much upon the material. Many chimney-shafts are built of ordinary stock bricks and ground stone-lime mortar, and may be taken at 112 lb. per cubic foot. Others are built of solid machine-pressed bricks and has lime mortar, and may be taken at 126 lb. per cubic foot. Some builders prefer perforated radial bricks and Portland cement mortar, weighing, say, about 100 lb. per cubic foot. Others consider that cement is too un-yielding and that a shaft has greater ultimate stability if it sways slightly in a gale, which they fear the use of cement mortar might prevent. The bond usually adopted is one course of headers to four courses of stretchers, but sometimes tall chimneys are built in English bond, and occasionally in all headers.

Tall Chimneys
Resistance areas of different sections

Safe Load on Material.—Assuming best workmanship and material, the maximum safe load may be taken as follows, being about 50 per cent. higher than would be allowed for live loads or inferior conditions:—

	Tons per foot super. Compression
Granite ..	25
Portland and compact limestone ..	20
Hard York stock ..	15
Blue brick in cement ..	12
Stock ..	10
" " " " " " " "	8
" " " " " " " "	6
Cement concrete 6 to 1 ..	9
Deep clay (foundations not less than 10 ft. from surface), gravel and compact earth ..	3
Made ground rammed in layers ..	1½
	Tons per foot super. Tension.
Grey lime mortar (1 to 2) ..	1.0
Lime mortar (1 to 2) ..	1.5
Portland cement mortar (1 to 3) ..	2.0

Foundation.—It is important to note that a tall chimney should stand on an independent foundation in order that the settlement, or compression of the soil, may be uniform. When a chimney is built close alongside a boiler-house, or within the four walls of a warehouse, it is sometimes placed on an extension of the other foundations and bonded in with other work, but this invariably leads to unequal settlement and subsequent cracks in the brickwork. It is evident that an ideal site would be on virgin soil of uniform character, preferably firm gravel, and not over old excavations, or a filled-in watercourse, or over old shaft workings, although all these positions have been adopted from carelessness or necessity.

Principles of Stability.—The principles of stability can best be illustrated by taking a solid square brick pier, say, 3 ft. square and 30 ft. high, weighing 1 cwt. per cubic foot. The total weight will be:—

$$3 \times 3 \times 30 \times 1 = 270 \text{ cwt.}$$

$$\text{The area of base } 3 \times 3 = 9 \text{ sq. ft.}$$

$$\frac{270}{9} = 30 \text{ cwt. per square foot.}$$

The resultant of the weight of all the parts passes vertically through the centre of gravity of the mass and cuts the centre of the base. If the wind be assumed to blow horizontally against one side the effect will be collected at the centre of the face and act with a leverage of half the height, and the resultant of the two forces P and W will gradually approach the outer edge of the base as the wind pressure increases.

Application to Chimney-Shafts.—The reason we have considered the stability of the plain brick pier is that we shall be able to deal with complex chimney-shafts the more readily. Nearly all the different forms of bed joint can be reduced to a few simple diagrams. These are collected together in Figs. 1 to 6, the shaded part being the resistance area, or measure of effective resistance, of each. Another form of section may occasionally be found, viz., square with two buttresses on each face, the resistance area of which would be found in a similar manner to the preceding, and the centre of gravity would be found experimentally by cutting out the area in drawing-paper and suspending it from two points. These shaded portions have been described as resistance areas, although they correspond exactly with the inertia areas for a neutral axis coinciding with one edge. The reason is that in calculation account is taken of the actual conditions, viz., a uniformly distributed load, and a bending moment producing compression on one side and tension on the other side of a neutral axis passing through the centre of gravity of the section.

COLOURING OF PAPER.

MR. E. HEUSER, describing recent developments in the decoration of paper, refers to great advances from an artistic standpoint, the aim being to avoid sharply-defined patterns and to effect the tasteful blending of the different colours in harmony with the structure of the paper. It is this structure which governs the diffusion of the colours, and the different varieties of fibrous materials develop different types of patterns. The effects obtained vary with the process of application of the colouring matter; sometimes this is applied in the form of clear solutions of dyestuffs, sometimes in the form of separately dyed fibres of a different nature from the body of the paper—e.g., mechanical or chemical wood pulps, sawdust, ramie, or even pieces of dyed paper stamped out, suspended in water, and allowed to flow on the surface of the wet paper on the wire of the machine. When solutions of dyestuff are used their penetration and diffusion depends on the position on the wire at which they are applied—i.e., on the amount of water present at that particular moment in the body pulp in the course of formation of the web. In the manufacture of "Phidias" or "Marmorella" papers solutions of different dyestuffs are run on the surface, diffusing to a certain extent, but retaining the form of straight stripes. These stripes are made wavy by the to-and-fro motion of strips of felt moved sideways by means of an eccentric. In the "Cirrus Relief" paper the manufacture is based on the fact that the drained surface of a free beaten pulp on the machine wire is naturally irregular, being composed of elevations and hollows. Across this uneven surface are sprayed horizontally solutions of dyestuffs, which is taken up by the sides of the elevations on the surface and misses the hollows, creating a relief effect. When the paper is smoothed out the actual relief vanishes and the paper becomes flat, but the colour relief remains. The surface of the pulp may be made irregular by drops of water, forming "craters," or regular relief patterns may be impressed by a coarse dandy roll on the surface of the paper before spraying on the colour, and when this is applied the pattern of the dandy roll remains on the finished paper in the form of a colour-relief. "Terrazzo paper" is made by first applying a uniform layer of colour by means of a felt roll to the surface of the moist web on the wire, and then spraying water on the coloured surface—the surface layer is thus disturbed and forms pale patches with dark edges. Lastly, the author mentions a method of producing patterns by allowing a differently coloured fibrous pulp to flow on the paper machine wire through a stencilled wire sieve, so that the applied pulp reproduces the patterns of the stencil before the body pulp is applied.

THE BUILDING TRADE.

PRIME-COST CONTRACTS.

A LARGE number of buildings are being erected to-day on what may be called a prime-cost basis, and as the tendency to enter into contracts on these lines appears to be on the increase, a discussion of the system may be useful. The usual agreement is one whereby the contractor accepts the actual prime cost of the building to him with a percentage addition for both establishment charges and profit, the building owner being allowed free access to his books and a clerk of the works being appointed by him to check the time, materials, etc., on the works. The advocates of the system contend that it is perfectly fair to both parties, as the building owner pays for neither more nor less than he receives, and that there is no incentive to scamping. Now it is well known that on a job where there is no lump sum contract there is always a strong tendency to slackness on the part of the workmen which the contractor finds very difficult to check. The scamping in the building trade is very much exaggerated; any respectable contractor has a reputation to keep up, and has a great deal to lose if his work is condemned. What scamping there is generally the work of an over-zealous foreman. All owners like to know, and it is essential that most should know, the cost of the building before they commence work; but under the prime-cost system this first cost is usually arrived at by a rough method of cubing or practically by guesswork, which is extremely likely to lead to disappointment on the completion of the building. The drafting of these contracts requires considerable care if they are to be made fair to both parties, and the following are a few points that may well be considered. There are two opinions as to what establishment charges are—one is that they represent, in addition to rents, etc., only the clerical work in the office, the other that they include in addition to this the time for yard supervision and yard and outside foremen.

Again, what prime cost really is raises several questions—the method of the adjusting of trade and cash discounts must be agreed upon. The question as to whether scaffolding, plant, tools, etc., should be taken by hire, by depreciation, or as an establishment charge is important, as is also the running cost of machinery at the works. Again, how are goods taken out of stock to be charged? For instance, a contractor on a lump sum contract for digging finds sand, which he carts into his yard, and again delivers to his prime-cost job: how is this to be charged? Also, if he buys for stock in bulk at a low price, anticipating a rise, which he realises, is the prime-cost charge to be made at the market value or at the price the contractor bought at? There are many other items which will occur to the reader that must be settled between the contractor and surveyor before a definite and fair prime-cost contract can be agreed upon.

CEMENT.

MR. BERTRAM BLOUNT delivered his second lecture on "Cement" at King's College on Friday, December 1, before the Institute of Chemistry, Professor Raphael Meldola, F.R.S., Vice-President, occupying the chair. Proceeding to the more practical details of his subject, Mr. Blount pointed out that owing to our limited knowledge of the chemistry of cement it is necessary to resort to tests of a physical and mechanical nature in order that the user may be able to satisfy himself that the product he employs will meet the demands laid upon it. From their very nature such tests must be arbitrary, and to ensure uniformity they must be carried out under standard conditions which will satisfy the requirements of the consumer, and not lay too heavy a burden on the producer. Mr. Blount was assisted by Mr. Gillett, who demonstrated the method of mixing the cement to be examined, on which so much of the reliability of the tests depends—a point which was illustrated by the story of a firm who undertook to subject a cement to mechanical tests and reported that a briquette had been made and had been found to contain a large

number of voids. Since cement is not deliberately used under tension it would appear at first sight to be more logical to appraise its mechanical strength by compressive rather than tensile tests; but as all the tests are merely used as a basis for comparison, and the errors inherent in compression tests largely invalidate the results, it has become customary to omit them in favour of tensile tests of either the neat cement or of mixtures of cement and sand of a given degree of fineness. Much prominence has been given to the advantages of testing mixtures of cement and sand, on the ground that such a method approximates more closely to the conditions obtaining in actual practice, whilst on the other hand it can equally be urged that the sand prescribed by any standard specification will differ widely both in size and shape from the aggregate usually employed on a commercial scale. For the user of cement the question of soundness, i.e., the property of remaining constant and unalterable in volume, must always be of paramount importance, and justifies the decision of the British Standards Committee in adhering to the simple Le Chatelier test, which has not infrequently been subjected to severe and rather adverse criticism in some countries. The methods prescribed in the standard specifications of to-day are virtually the same as those laid down some seven years ago, and the quality and uniformity of the modern product have been so well maintained that almost the only alterations have been in the direction of increased stringency, without thereby laying an unreasonable task upon the producer. The information obtained from the ordinary physical and mechanical tests is sufficient for all practical purposes, and probably will not be usefully augmented until some methods are devised for determining the proximate composition of cement and the setting time of concrete. That the former of these has not yet been realised is shown by the fact that, in spite of numerous attempts, no reliable method exists of ascertaining the content of so-called "free lime" in cement.

Turning to the economic side of the subject, it was pointed out that mainly through the introduction of the rotary kiln the cost of production of Portland cement had been so far reduced as to render possible the application of the material to uses in which lime had previously held the field, so that at the present time a limit can hardly be set to its sphere of usefulness. It was shown that whilst theoretically concrete should weigh about 162 lb. per cubic foot, the figures found in practice rarely exceeds 140 lb., or, in other words, about 14 per cent. consists of voids—a fact not to be ignored by engineers. This consideration at once suggests the possibility of increased economy in construction by using every endeavour to make concrete denser and consequently more efficient. Not only may a saving of material be effected thereby, but a further advantage is gained from the fact that the denser product will be less pervious, and better able to resist the action of water. It must be borne in mind that water continually exerts a solvent action on cement, and it is obvious that the life of the concrete depends in a large degree on its power of resisting penetration.

For structures of concrete exposed to the action of water the liberal use of cement is an obvious means of securing imperviousness; but the employment of some substance, e.g., of the pozzolanic class, which will combine with the hydrated lime set free in the process of setting of cement, is perhaps not so common. In the selection of a suitable aggregate not only must its texture be taken into consideration, but also the possibility of any chemical action that it may exert in the concrete; thus *débris* containing sulphates or easily decomposable silicates is unsuitable. So much has been said of the danger of "magnesia in cement" that the amount allowed has been reduced to quite a low figure. Undoubtedly there has been considerable confusion over this point; the presence of magnesium compounds in structures that have failed under sea-water conditions was really due not to the presence of magnesium compounds in the original cement, but to the formation of magnesium hydroxide by the

reaction of the magnesium salts in sea-water with the lime compounds of the cement.

After thus outlining a few of the intricate problems that may be presented to the technical adviser Mr. Blount sketched out a course of training for those who intended to specialise in the subject. After a broad elementary education he insisted on a sound general knowledge of chemistry supplemented, if possible, by some mechanical and engineering training, before attempting to proceed to a post-graduate training in the chemistry of cement. This should be gained in a laboratory within easy reach of some centre of the industry where access to works can be obtained, in order that the student may be able to free himself from the minute details of laboratory practice and grasp the broad principles, technological and economic, that underlie success in any chemical manufacture.

In conclusion, Mr. Blount briefly reviewed the present position of our knowledge of the chemistry of cement, and paid a high tribute to the valuable results achieved many years ago by Le Chatelier, which remain but slightly modified to-day.

In moving a vote of thanks to the lecturer and to King's College for the use of the lecture theatre, Professor Meldola expressed the opinion that the Institute had made a very good start with the new scheme of lectures, one of the principal objects of which was to bring students and young members into personal contact with acknowledged authorities on various subjects, and he mentioned that lectures would be published.

CONTINUITY OF EMPLOYMENT IN THE BUILDING TRADE.

We have received the following letter from Mr. F. J. Gayer:

"It is no longer a secret that the workmen are considering the advisability of a strike for increased wages. All 'in the know' will realise and agree that, as the trade is at its lowest ebb, a more inopportune moment could not be chosen. It is recognised that there is much to argue in favour of the operators considering the increased cost of living, and I fear a strike will not remedy the evil, but distinctly aggravate same.

Yours not being a political paper, I do not propose to advance a theory as to the cause and remedy of the bad trade, but the fact remains, in spite of the Board of Trade returns.

Fortunately, the building trade operators are gifted with more of "God's greatest gift, common sense," than most other workers, and I would suggest for the workers' consideration this theory.

Should they by force succeed in obtaining, say, 1s. per hour, the effect on the already bad state of trade will be to make same infinitely worse. Consequently, whereas now, say, ten out of twelve men are employed at 10½d. per hour, I venture to think that the will be reduced to about six at the increased rate; therefore collectively they will be worse off.

The state of trade, and keen competition also, outside of our trade has necessitated much faster pace than hitherto, and naturally the workmen resent the argument of "Hurry up, and when you have finished you get the sack."

I suggest for consideration, and for improvement, the following scheme to combat that evil:

Each firm of standing, while unable to anticipate the number of workmen to be employed, could register sufficient good, efficient men on the "staff," and when one foreman pays off they could be transferred to another foreman; any extra or casual labour could be taken on to fill up, and in course, as circumstances permit, the staff could be transferred to the regular staff.

This, in a small measure, is carried out on every job, as witness the fact that a foreman has his "followers"; but perhaps some more able builder could formulate a better scheme to remedy the evil referred

CHANGES IN THE BRISTOL BUILDING TRADE.

THE Bristol Master Builders' Association decided to increase the rate of builders' wages to 6d. per hour, to come into operation on January 1 next. This decision being arrived at on account of the small earnings of these men, due to the unusually casual nature of their employment and the loss of time through inclement weather. The arrangement does not affect workers employed in the yard and paid a flat weekly wage, or lads or old men, who are to be subject to mutual arrangement as at present. It should be pointed out that the advance is not to take effect immediately, but that such a course would constitute a heavy tax upon those builders who are engaged upon contract work, and who have to tender upon existing rates of pay. *Bristol Times.*

GENERAL BUILDING NEWS.

NEW CHURCH, LANCASTER.

A new Roman Catholic Church has been erected at a cost of about 2,000l. from the designs of the late Mr. Arthur Langdon, A. The building consists of a nave and chancel, and a small memorial chapel on the side. It resembles in many details the cathedral at Westminster.

MAINDER CHURCH EXTENSION.

The extension to St. John's Church, Maender, have been carried out at a cost of 1,000l. under the supervision of Mr. J. Coates, architect, of Cardiff. The contract was let out by Mr. W. A. Linton, builder, Newport.

NEW SCHOOL, FAIRINGHAM.

The George Memorial School has been erected at a cost of about 5,000l. by Messrs. Owen & Son, builders, of Farnborough. Edward Finn, A.R.I.B.A., was the architect, and was assisted by Mr. Robinson, the architect to the Kent Education Committee.

NEW POLICE COURT, BARROD.

The George Kenshole, of Barrood, is the architect for this building, which has been erected at a cost of 2,300l. The court-room seats 150 persons, and the contract was let out by Messrs. Williams & Sons, of Tredgar.

TRADE NEWS.

The Sanitary Hospital, Boscombe, is being built with four of D. O. Boyd's single fire stoves with ascending flues, supplied by S. O'Brien, Thomas, & Co., Upper Essex street, London, E.C.4., and Excelsior Stoves, South Bermondsey.

A new riding school is being built at the York's Headquarters, King's-road, Ealing, by Messrs. E. A. Roome & Co., of Basinghall-street, E.C.4., and Homerton, E.C.1.

Under the direction of Mr. H. R. Crabbe, Inst.C.E.R., Borough Surveyor, Pembroke, Boyle's system of ventilation (natural), being Boyle's latest patent "air-pump" motors and air inlets, has been applied to the Infirmary, Colchester.

Being supplied with Shorland's warm-air heating patent Manchester stoves with rising smoke-flues by Messrs. E. H. and Brother, Ltd., of Failsworth, Chester.

The towns of Penge and Mitcham have been fitted with Merryweather's petrol-driven fire-engine, with "Hatfield" reciprocating pump. The Penge engine will have a capacity of 350 gallons per minute.

The use of Mitcham a 500-gallon engine has been selected. It is twenty-seven years ago the Mitcham Fire Brigade obtained an existing horse-drawn steam fire-engine, of the Merryweather direct-acting type still in service.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 TO 1909.

At the meeting of the London County Council, the following applications under the Building Acts were dealt with, the names of the applicants being given in brief:

Lines of Frontage and Projections.

Kewey, Central.—Erection of a building on the site of Nos. 538 and 540, Kingsland-road, by Mr. W. Watson for Mr. M. G. and Mr. H. P. Grange.—Consent.

Hammersmith.—Erection of buildings upon the site of Nos. 18, 20, and 22, Queen-street, Hammersmith (Messrs. J. S. Quilter & Son).—Consent.

Islington, South.—Projecting one-story shop in front of No. 238, Upper-street, Islington (Messrs. Drivers, Jonas, & Co.).—Consent.

Kensington, South.—Covered way in front of No. 50, Victoria-road, South Kensington (Messrs. G. Gosdon & Sons for Mr. J. R. MacIsaac).—Refusal.

Norwood.—Porches, oriel windows, and metal sign at No. 30, Fulham-road, Kensington (Messrs. J. Offord & Sons, Ltd.).—Consent.

Lewisham.—Erection of a building on the southern side of Codrington-hill, Lewisham, with a flank next to Brockley-view (Mr. J. P. Glanville).—Consent.

Norwood.—Porches, oriel windows, and bargeboards to three houses on the southern side of Cornwall-road, Brixton (Messrs. H. Wakeford & Sons for Messrs. J. & R. Bax).—Consent.

St. George, Hanover-square.—Erection of a building upon the site of Belgrave Chapel on the north-western side of Halkin-street, Westminster (Messrs. G. Trollope & Sons and Colls & Sons, Ltd.).—Consent.

St. Pancras, East.—Erection of a building on the southern side of Clifton-road, St. Pancras, to abut upon the north-eastern side of Clifton-villas (Messrs. James Laycock & Bellamy for Messrs. Jones Brothers (Holloway), Ltd.).—Consent.

Wandsworth.—House on the southern side of Woodbourne avenue, Streatham (Messrs. Halliday & Stanger).—Consent.

Woolwich.—Eight houses on the southern side of Dunvegan-road, Eltham (Mr. J. J. Basset).—Consent.

Width of Way.

Hampstead.—Addition to No. 57, Belsize-lane, Hampstead (Mr. F. Adcock for Mr. F. Hodgson).—Consent.

Width of Way and Lines of Frontage.

Hammersmith.—Billiard-room addition at the rear of No. 117, Goldhawk-road, Hammersmith, abutting upon the eastern side of Avenue-road (Messrs. G. Elkington & Son for the Avenue Property Company, Ltd.).—Refusal.

St. Pancras, North.—Projections in advances of a proposed church on the southern side of Preston-street, Kentish Town (Mr. E. C. Shearman for the Rev. Gordon Smythe).—Refusal.

Woolwich.—Addition to a steel and iron building at the premises of the London Flambo Fuel Company, Ltd. (Mr. J. M. Kennard for the London Flambo Fuel Company).—Consent.

Woolwich.—Temporary wood and iron additions at the premises of the London Flambo Fuel Company upon a site on the western side of a footpath leading northwards from Gallions railway-station, Beckton, North Woolwich (Mr. J. M. Kennard for the London Flambo Fuel Company).—Consent.

Width of Way and Construction.

Hammersmith.—Iron shed and a wood and iron lean-to addition thereto on the southern side of Down-place, Hammersmith (Messrs. B. Bailey & Co.).—Consent.

Lines of Frontage and Construction.

Huckney, Central.—Wood and glass studio on the roof of the one-story shop at No. 269, Mare-street, Hackney (Messrs. Hodson & Whitehead for Messrs. Hodson, Rowlandson, & Hodson).—Refusal.

St. Pancras, West.—Temporary wood and iron buildings upon a site over the London and North Western Railway on the south-western side of Delancey-street, St. Pancras, and the omission of a layer of concrete over the sites of the said buildings (Messrs. Dolman & Pearce).—Consent.

Space at Rear.

Chelsea.—Building upon the space at the rear of No. 214, Pavilion-road, Chelsea (Mr. J. Hudson).—Consent.

Kensington, North.—Erection of a building upon the site of No. 13A, Pembroke-place, Kensington, with an irregular open space at the rear (Mr. J. S. Beard for Sir W. E. Cooper and others).—Consent.

St. George, Hanover-square.—Erection of buildings upon the site of Nos. 55, 56, and 57, Grosvenor-street, and No. 24, Davies-street, Westminster, so far as relates to the erection of additions to the corner building (Mr. E. Wimperis for Lieut. Col. Clifford Probyn).—Consent.

Space at Rear and Alteration of Building.

Peckham.—Retention of No. 60, Rye-lane, Peckham, without an open space at the rear exclusively belonging thereto (Mr. F. E. B. Blanc for the South-Eastern Electric Theatres, Ltd.).—Consent.

Separation and Alteration of Building.

Strand.—Alterations and additions at No. 7, Cork-street, Westminster (Mr. H. Cubitt for Mrs. Pope).—Consent.

Formation of Streets.

Clapham.—Formation or laying out of a new street for carriage traffic in continuation eastward of Rosemeath-road, Clapham Common (Messrs. E. Evans & Sons for Mr. J. Cobeldick).—Consent.

Lewisham.—Formation or laying out of a new street for carriage traffic to lead out of the northern side of St. Mildred's-road, Lee (Mr. G. A. Lansdown for the Rt. Hon. the Earl of Northbrook).—Refusal.

Alteration of Buildings.

Kensington, North.—Addition at the rear of No. 72, St. Ervan's-road, Kensington, without complying with the provisions of the First Schedule to the said Act (Mr. G. R. Holmes for Mr. A. R. Shoubridge).—Consent.

Kensington, South.—Erection of a lantern light at No. 62, Kensington High-street (Messrs. J. Barker & Co., Ltd.).—Consent.

Paddington, South.—One-story shop at No. 38, Queen's-road, Bayswater (Messrs. Veale & Gibbs).—Consent.

Strand.—Alterations at Nos. 2, 3, and 4, New Coventry-street, Westminster (Messrs. Treadwell & Martin).—Consent.

Cubical Extent.

Deptford.—Additional cubical extent in respect of proposed additions to the Key Glass Works, Coldblow-lane, New Cross (Mr. J. O. Cook for the Key Glass Works Company, Ltd.).—Refusal.

Uniting of Buildings.

Brixton.—Formation of two openings in the party wall between No. 1 Electric-avenue and No. 451, Brixton-road, Brixton, at the first-floor level (Messrs. Chappell & Co.).—Consent.

Finsbury, Central.—Uniting of Nos. 80 and 82, Clerkenwell-road, Finsbury, at the basement and fourth-floor levels (Messrs. Eilroft for Messrs. Butler & Crispe).—Consent.

*The recommendation marked * is contrary to the views of the Metropolitan Borough Council concerned.*

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERCARN.—School (5,000l.); Mr. J. Bain, architect, Shire Hall, Newport, Mon.

Blackburn.—Sanatorium for the Charity Organisation Society.

Blackley.—Proposed church (6,000l.); Vicar, St. Peter's Church, Blackley.

Blackpool.—Verandah and shelter on promenade (2,000l.); Mr. J. S. Brodie, Surveyor, Blackpool Town Council.

Bramford.—School; Mr. J. H. Hume, Secretary, Education Committee, Ipswich Town Council.

Brighouse.—Baths, Milroyd-street (6,000l.); Mr. S. S. Haywood, Surveyor, Brighouse Town Council.

Broadstairs.—School, Lloyd Estate; Mr. W. H. Robinson, Caxton House, Westminster, S.W.

Castlehill.—School (5,170l.); Mr. B. Lumb, builder, North-street, Todmorden.

Chasetown.—School; Architect, care of the Trustees, St. Joseph's Roman Catholic Church, Chasetown.

Chertsey.—School (10,135l.); Messrs. Jarvis & Richards, architects, 10, Queen Anne's-gate, S.W.

Dewsbury.—Extensions to infirmary; Mr. W. Hanstock, architect, Branch-road, Batley.

Dumbarton.—Proposed mortuary; Mr. J. Briggs, Surveyor, Dumbarton Town Council.

Dutton.—Adaptation of Durham Lodge into children's home; Mr. G. F. Ashton, Clerk, Board of Guardians, Barnsley.

Earby.—Picture palace and three lock-up shops, New-road, for the Barnoldstock Palace Company.

Eastbourne.—The following plans have been passed:—Addition, "Granville Hill," Silverdale-road, for Mr. H. G. Wilson; Mr. B. Eap, architect. Addition to Cottage Homes for the Trustees; Mr. C. Crisford, architect.

Alterations to Greystone-buildings, South-street, for Messrs. G. E. Maynard, Ltd.; Mr. A. Ford, architect. Addition to Royal Marine Hotel, Royal Parade, for Colonel Cardwell; Mr. John Trowell, builder. Plans have been lodged for an addition to the Lion Inn, Sea-side-road, for Messrs. Harvey & Son; Mr. A. Ford, architect.

Eastleigh, S.O. (Hants).—Shops, Leigh-road, for Messrs. Strong & Co., brewers, Romsey.

* See also our list of Competitions, Contracts, etc., on another page.

Eccles.—Plans have been passed for a picture theatre, Church-street and Corporation-road, for Mr. J. Knight, architect.

Egham (Surrey).—School; The Governors, St. George's Charity, Egham.

Festiniog.—Alterations and improvements at school (1,018l.); Messrs. Evans & Griffiths, builders.

Foleshill.—Seven houses and shop, Windmill-lane and Foleshill-road, for the Lockhurst-lane Co-operative Society.

Forfar.—Drill-hall; Mr. Carver Brymon, architect, Forfar.

Frodingham.—Enlargement of St. Lawrence's Church (5,000l.); Sir Charles Nicholson, Bart., architect, 2, New-square, W.C.

Glasgow.—Buildings for Messrs. Alexander Mathieson & Sons, Ltd., Saracen Tool Works, East Campbell street, Glasgow.

Grangemouth.—Buildings, East End (2,000l.); Mr. D. A. Donald, Surveyor, Grangemouth Town Council.

Great Harwood.—Reconstruction and erection of hall and read works for Messrs. T. Westby & Sons.

Greenock.—Trades' Hotel, Bogle-street (454 beds), for Mr. David John Garrett.

Greetland.—Sunday-school; Vicar, St. Thomas's Church, Greetland.

Grimsbly.—Spice factory; Mr. H. S. Caping, architect, Court-chambers, Grimsby.

Hanley.—Bottling stores; Mr. C. J. Cowlishaw, architect, Stafford-street, Hanley.

Larne.—Thirty-nine houses (120l. each); Surveyor, Larne Rural District Council.

Leith.—Ten houses, Restalrig-road, for the Edinburgh Co-operative Building Company.

Lincoln.—Parish hall, Santhorpe-street; Vicar, St. Andrew's Church, Lincoln.

Liverpool.—Headquarters (9,500l.) for the Liverpool University Settlement.

Marple.—Grocery stores for the Compstall Co-operative Society; Mr. M. Warrington, builder, Hyde.

Nantwich.—Extensions to church schools (1,600l.); the Vicar.

Northampton.—The following plans were passed:—Additions to Bottling Department, Bridge street, for Messrs. P. Phipps & Co., Ltd.; three houses, Ashburnham-road, for Mr. A. Glenn; thirteen houses, Sharman-road, and two houses, Spencer street, for Mr. G. F. Sharman; four houses, Lloyd-road, for Mr. A. Wilford; addition to laundry, Kingsley Park-terrace, for Mr. C. B. Taylor; four houses, Raymond-road, for Messrs. E. D. Sharman & Son; additions to factory, Green wood-road, for Messrs. C. & E. Lewis; sixteen houses, Spencer Bridge-road, for Mr. A. G. Godwin; thirteen houses, Birchfield-road and Abington-avenue, for Mr. A. P. Hawtin; six houses, Broadway, for Mr. W. Heap. A plan has been lodged for ten houses, Knight's-lane, for Mr. W. S. Brown.

Padiham.—Extension to premises to hold 400 extra looms for the Albion Loom and Power Company.

Petersfield.—Proposed building; Secretary, Working Men's Institute, Petersfield.

Radcliffe.—Sixty houses, North street; Mr. W. L. Rothwell, Surveyor, Radcliffe Urban District Council.

Royton.—Cotton-spinning mill for the Park and Sandy-lane Spinning Company; Mr. A. Turner, architect, Clegg-street, Oldham.

St. Anne's.—Extensions to St. Anne's School; the Managers.

Salford.—Rebuilding Lodge, Peel Park (445l.); Messrs. Fearnley & Sons, builders. Pendleton. Buildings to house slab-making machinery (4,400l.); Messrs. J. Gerard & Sons, Ltd., builders, Swinton. Alterations to workshop at Electricity Works; Messrs. C. S. Allott & Son, architects, Manchester. The following plans have been passed:—Alterations and extensions to Sandywell Brewery, Springfield-lane; the Proprietors. Alterations and extensions to mangle factory, Trafalgar-street, Broughton; the Proprietors.

Tanygrisiau.—Alterations and improvements at school (636l.); Messrs. Evan Griffith & Son, builders, Festiniog.

Tunbridge Wells.—Secondary school (8,560l.); Mr. W. T. Burrows, builder, Maidstone.

Upper Arley.—Structural alterations to the Church School; the Managers.

Walker.—Enlargement of Roman Catholic School (200 extra places); the Trustees.

Wallsend-on-Tyne.—Proposed laundry; Secretary, Co-operative Laundries, Ltd., Co-operative Hall, Wallsend-on-Tyne.

Warrington.—The following plans have been passed:—Thirteen houses, Cowdell-street, for Mr. W. Heesom; additions to chapel, Golborne-street, for the Trustees of the Golborne-street Baptist Chapel; fifteen houses, off Ashwood and Briarwood avenues, for Mr. W.

Cooper; club, St. Mary's-street, for the Trustees of the Junior Conservative Association; alterations to Nos. 77 and 79, Bridge-street, for Mr. Henry Thornton; extension to works, Factory-lane, for Messrs. J. Crossfield & Sons, Ltd.

Winchester.—Theatre; Messrs. Houston & Houston, architects, 1, Long-acre, W.C.

Wrexham.—Chapel; Messrs. Collins & Godfrey, builders, The Cross, Tewkesbury.

Ystradgynlais.—Council offices (1,500l.); Mr. T. Watkins, Surveyor, Ystradgynlais Rural District Council.

THE MANSION HOUSE.

On Thursday last week the Court of Common Council referred to Committee a proposal to deal with the Mansion House, said to be in an uninhabitable condition.

The matter was that forwarded by Mr. Carl Hentschel, who contended that the Mansion House was not in good condition, being incapable of housing a Lord Mayor in comfort and his staff in decency. Proceeding, he said:

"Economy run mad is the surest dog to find itself gasping under a cold douche of hasty and enormous expenditure.

The method is to keep down the expenditure, and each Chairman of the General Purposes Committee asks first, not what is necessary to be done, but "Can we save on our last year's bill?" It is a mistake, and the Corporation will, I am afraid, find it so. Even under our present method, however, our expenditure goes up. It is bound to, for as the Mansion House gets into a worse state the "patching" becomes more difficult and more expensive.

The fact is that really little has been done to the Mansion House beyond an annual cleansing and redecoration. I have been back for a considerable period in the accounts, and am confirmed in this view. There was a large expenditure between 1700 and 1800 (5,043l.), but that was really for roofing in the saloon, altering the interior, putting a new roof on the Egyptian Hall, and other similar work. There were repairs to the extent of 4,000l. in 1832, when Sir John Key had to vacate it for a time; and alterations in 1847, while the foundations have constantly been a source of trouble. But during the last half-century, at any rate, nothing material has been done to modernise, to improve, or to meet the altered circumstances.

The only exception I can find in this generalisation has reference to the drains, which in 1888 became so obviously in need of attention that they were thoroughly overhauled, at a cost of some 2,000l.—and not before it was required. I do not wish to frighten people, but I invite members to read the Report of the Banner Sanitation Company on untrapped drains and defective sewers, also without traps. In 1897 the drains were tested, at the cost of the then Lord Mayor, since when nothing serious has been done. To-day I say unhesitatingly that matters in the sanitary direction are bad. The lower portions of the house are disgraceful. Let your Medical Officer of Health inspect these lower regions, and I am sure he will condemn the arrangements as insufficient, inefficient, and altogether out of date.

Here are a few of the opinions I have had from past Lord Mayors and other Aldermen:—

"I think it is hardly fit for the Lord Mayors to live in, and every year it is becoming worse. I entirely agree with you that the lower floor does need absolutely to be remodelled; the kitchen and footmen's departments are not worthy of the Mansion House.

I agree with you that nothing but remodelling the lower floor of the Mansion House will suffice to bring it up to modern ideas of sanitation or even decency.

You need a first-rate architect specially skilled in the reconstruction of mansions, or large London houses, if it ought to be well done, and to do it well you require the best advice that can be obtained.

We should not like to house our private staff in the way in which the official staff of the Lord Mayor is housed.

Drastic alterations are necessary, especially in the domestic and kitchen quarters, at the Mansion House.

The Mansion House . . . is old-fashioned and out of date, and it is certainly no credit to the Corporation. . . . The sanitary arrangements are such that no modern householder, or even County Council would permit.

Paper is bleed over paper, paint over paint, and nothing is ever properly done.

The servants' departments are in a most deplorable condition, and calculated to do serious discredit to the Corporation. The general condition of the Mansion House requires the most careful and generous consideration at the hands of the Court. I think this is a

necessity, not only for the comfort and convenience of the Lord Mayor for the time being and his family, but for the credit of the City itself.

Those opinions, I venture to think, prove my case for inquiry. The works needed could be accomplished.

Now, what I ask the Court to do is to examine the whole building thoroughly. Let it be discovered whether I am, as I say I am, backed by expert opinion, and let us attempt to modernise and improve. Let us make the bedrooms adequate and hygienic, let us endeavour to make the public apartments adequate for the work they are called upon to do, and let us see that the kitchens, which play such an important part in the hospitality of the Mansion House, are worthy of the Lord Mayor's guests. When the matter has been through the mill of a thorough inquiry its expense be faced as one day it will certainly have to be faced.

To those, however, who would emphasise the difficulties of carrying out any big scheme of works on account of the Lord Mayor's presence, I would say this:—We have lately become very familiar in London with very quick construction. The method came, I think, from America, but Englishmen have adopted and improved it, and combined rapidly with solidity of workmanship. To-day the works needed at the Mansion House could be accomplished without disturbing the Lord Mayor. All could be done in six weeks in August and September. I have only to point to the rapidity of the construction of the New Opera House, the Waldorf and the Savoy Hotels, to convince my colleagues of the feasibility."

In connexion with the above we take the following from the *City Press*:—

"When Mr. Hentschel's motions were reached Mr. Leo Taylor rose to complain of the action taken by Mr. Hentschel in circulating matters in the nature of a Report before it had been before the Court. In the ordinary way Committee would have considered the matter and it would have come before the Court, and been ordered for printing. Mr. Fred L. thought that Mr. Hentschel should be thanked and not censured, for placing the whole of the matter before the Court. Mr. Hentschel, in the course of his personal explanation, said that he did not give his pamphlet to any member of the Press until that morning. Mr. Hentschel formally moved the resolution standing in his name. In seconding this, Major Humphreys said he would not waste time by making a long speech, but he certainly thought that the two questions raised deserved careful consideration in Committee. Mr. Bird complained that Mr. Hentschel had not paid attention to the value of the Mansion House site. He moved that the General Purposes Committee should be instructed to consider the question of transferring the Lord Mayor's official residence to more convenient part of the City, and sell the site of the present Mansion House.

Bird's amendment was not seconded. Deputy Wallace moved an amendment to effect that the General Purposes Committee should be asked to report forthwith as to condition of the Mansion House, with suggestions having particular regard to the cost.

Hentschel said he would gladly welcome the amendment. The Lord Mayor said he had so far had time to read Mr. Hentschel's pamphlet. Indeed, he had not had time to become Lord Mayor to go over the Mansion House. The Lady Mayoress, who had heard great deal about sanitation, and knew much about it by reason of her parish work, however, reported to him that the General Purposes Committee were recently shown at Mansion House some things that ought not to exist. She did more. She said: "If I had them to exist I should be justified in calling for the guidance of the Court. The Rev. Clement-Smith suggested that it might well to refer the question to the Sanitation Committee. On a show of hands Mr. Hentschel's first recommendation was negative, the second (Mansion House Improvements) was, by general consent, superseded by Deputy Wallace's amendment, which, to a large extent, satisfied the object that Hentschel had in view.

Mr. Carl Hentschel afterwards informed the Court that, as the matter was very urgent, he had obtained three tenders for re-roofing the Egyptian Hall, the lowest being for 192l.

He asked the Court to sanction its acceptance. The Court readily agreed."

THE SCIENCE OF VENTILATION.

At a meeting of the Royal Scottish Society of Arts, Edinburgh, held on November 27, a paper was read on the subject of ventilation by Capt. Geo. A. Chaddock, the patentee of a Chaddock mechanical window. Captain Chaddock, in prefacing his scientific explanation, said that the advocates of natural ventilation did not appear to realise the importance of even heat distribution as well as air distribution. He contended that when a person enters a room it should be regarded as rather seeking warmth, which scientific research showed it would have at any cost. Therefore, unless temperature matter in the room of artificial heat was immediately available, the cold air would gather heat by robbing the inmates, which it did to their intense discomfort. The first consideration is temperature, or even heat, as well as air distribution, conformity with nature's principles ruling over oceans of air and water.

The lecturer gave an account of the effects that had been realised in many public schools and institutions from the adoption of mechanical windows installed by the Chaddock Ventilation Company. Illustrations and diagrams relating thereto were shown, the principle of the system being to use a continuous and equal mingling of fresh air with the artificial heat supplied, eliminating draughts, and maintaining a standard of purity equal to that of the actual air, though regulated, of course, to any suitable temperature. On the question of ventilation in regard to schools, the lecturer's contention is that if air is allowed to move the line of least resistance it can only do so by passing out of a classroom into a hall or corridors, thus polluting other rooms of a building. The great bulk of the air in England, he said, thus contaminated, and for this reason the Board of Education are now prohibiting central hall systems of air moving on the line of least resistance was thus not only dangerous as a means of circulating impurities, but it tended to the maximum of discomfort, in setting up draughts and irregularities of temperature, and therefore, was a principal reason for the adoption of artificial systems. In connection to this, if the rotary air movement was used, outlets and inlets being on the same side of the classroom, the air would pass out to the side on which it entered, therefore on the line of greatest resistance, thus ensuring steady, even movement, and thereby eliminating draughts and irregularities of temperature. This procedure, he said, admits of better air treatment all the year round, and the system necessitates complete isolation of rooms, it spelled for the general health of those in the building; also excluding noise from other rooms, instruction can be carried on to advantage.

METROPOLITAN ASYLUMS BOARD.

At a usual fortnightly sitting of the Board was held on Saturday, when the following matters were disposed of:—
Cleaning and Repairs and Painting Works.—The recommendation of the Hospitals Committee, it was agreed that such cleaning and painting works and repairs as may be ordered by the Committee be carried out by infectious hospitals and wharves during either by direct labour or by contract, as may determine after consultation with the Works Committee.

19th Asylum.—For the purpose of raising the various grades and sexes of the reformed who are to be transferred to Darent Asylum it was decided to erect gates and gates at an estimated cost of £700.
19th Asylum.—Certain alterations in heating arrangements at the above Asylum authorised.

OBITUARY.

Mr. I. C. Johnson.

At his death, on November 30, at Gravesend, of Mr. Isaac C. Johnson, J.P., aged 70 years. Mr. Johnson was principal partner in the firm of Messrs. I. C. Johnson & Co., cement manufacturers. He founded works at Gatheshead-on-Tyne, where he served as Mayor, and at Cliffe and Green in Kent.

LEGAL COLUMN.

Repairing Covenants in Leases.

In our issue for March 31 last we briefly noted a decision in the Court of Appeal, *Zurcott v. Wackley*, under the title of "Landlord and Tenant." This case is now fully reported in the *Law Times*, and it raises questions of such importance to lessors and lessees that we propose examining the case and the judgments delivered at greater length. The defendants were assignees of a lease of premises in Hatton-garden, which were some 200 or 300 years old. The lease was granted in 1881 for twenty-eight years, and expired on March 25, 1909. On February 11, 1909, just before the lease expired, the London County Council under the London Building Acts gave the owner of the premises notice that the front eastern external wall to the level of the ground floor was in a dangerous condition, and requiring them to take it down and shore up the premises. The defendants disputed the necessity for this; but an arbitrator under the Building Acts determined the requirements to be necessary. The defendants continuing not to comply with the notice, an order was made by a magistrate on the owner requiring him to take down the wall. The owner, the plaintiff in this action, then pulled down the wall and rebuilt it, and claimed the costs incurred in these operations from the defendants, the assignees of the lease under the covenants to repair contained in the lease. The covenants in the lease were as follows:—That the lessees should "from time to time during the said term, at his and their own proper costs and charges, well and substantially repair . . . and keep in thorough repair and good condition all the said premises thereby demised, with all fixtures and appurtenances thereto belonging, and all buildings, improvements, and additions, . . . and yield up the said premises, buildings, etc., at the end or sooner determination of the said term 'being so repaired and kept together.'"

It is to be observed that the lease was one which placed heavy responsibility upon the lessee, "to well and substantially repair" and "to keep in thorough repair and good condition." The contention of the defendants was that, despite these very stringent covenants, he was under no liability to rebuild this wall, which had perished so much by age that it could not be restored, but must be made anew. In this connexion it is important to note that the Official Referee, to whom in the course of the proceedings the matter had been referred, had found that this wall was decayed by age and could not have been patched or repaired, it could only be rebuilt, but that the whole building did not require rebuilding. The Divisional Court held that, as only a portion of the structure was affected, the lessee could be called upon to renew this portion of the structure, as this was not an instance of a case where a new structure had to be substituted for an old structure.

The Court of Appeal affirmed the judgment of the Divisional Court, and, as they very fully considered the cases and the law relating to this subject, we may usefully refer to the judgments in some detail.

The Master of the Rolls thus stated the defendants' contention:—"The effect of time and the elements and the natural effect of old age has destroyed this wall, and it is not due to any negligence on our part. We cannot help it. We are not liable to make it good." He answered this contention by asking himself this question:—"Is what has happened of such a nature that it could be fairly said that the character of the subject-matter of the demise, or part of the demise, in question has been changed, or is it simply injury to a subsidiary portion as distinguished from the whole?"

He held it was restoration of a subsidiary portion, just as much as would have been the renewal of some rafters in a roof, or the replacing of an earthenware pipe, or the renewal of window-frames.

Lord Justice Fletcher Moulton considered the several covenants separately. "To keep in good condition" he held to impose an obligation varying with the age of the premises, but always involving a liability to maintain the house as a house, even if by replacing part after part the result was in the end to replace the whole.

"To keep in thorough repair" he interpreted in much the same sense, but as not involving a wider obligation. Whilst "to repair" he held to involve replacement so long as the house exists as a structure.

Lord Justice Buckley came to the same conclusion—"renewal as distinguished from repair is reconstruction of substantially the whole subject-matter."

These judgments contain a very helpful exposition of the law relating to such

covenants, but one word may be said upon the cases which were also carefully discussed in the two Courts.

A certain sentence occurring in the judgment of Chief Justice Tindal in an old case, *Gutteridge v. Munyard*, was much relied upon by the defendants:—"What the natural operation of time flowing on effects, and all that the elements bring about in diminishing the value, constitute a loss which, so far as it results from time and nature, falls upon the landlord."

In a well-known handbook this case is cited as an authority for the proposition:—"The tenant is not liable for dilapidations resulting from natural decay."

This case is somewhat differently reported in two reports, and the Judges in both Courts required to be laid it down that this sentence, of the Chief Justice, taken by itself, would not represent the law. It may also be observed that the covenants in that case were by no means the same as those in *Lurcott's* case, and "reasonable use and wear and tear" were also excepted.

As regards other well-known leading cases, it will be seen that the present decision is brought in line with them as follows—*Proudfoot v. Hart*. The Court approved.

The covenant there, was to keep the premises in good tenable repair, and so leave the same. Some of the floors were rotten, and the Court of Appeal held that they must be renewed. "Tenable repair" was thus defined:—"Such repair as, having regard to the age, character, and locality of the house, would make it reasonably fit for the occupation of a reasonably-minded tenant of the class who would be likely to take it."

The cases distinguished from the facts of *Lurcott's* case on the ground that the operation required to be done was more than repair and amounted to a reconstruction of the subject-matter are—*Lister v. Lane* (1893), where a house was erected upon a timber platform which had rotted away, and it was only possible either to pull it down or to underpin it to a depth of 17 ft. and build up a brick or other structure for a new foundation; *Wright v. Lawson* (1903), where a bow window could not be erected as before on cantilevers, but would have been an entirely new structure, supported by vertical supports from the ground; and *Torrens v. Walker* (1906)—noted the *Builder*, May 19, 1906—where a landlord had covenanted to repair outside walls on notice, and two of the walls were in such a state that they would have had to be pulled down from top to bottom. This house was triangular in form at the junction of two streets, and it was held that the renewal of these two walls would have practically destroyed the whole subject-matter of the covenant. In this case there was a further point, that no notice had been given of want of repair until after the premises were pronounced to be dangerous, and this alone serves to distinguish it from the present decision.

These cases show the necessity of carefully considering the nature of the covenants to repair before entering into leases, especially where the subject-matter of the demise is an old building.

Fire Precautions: Appeals to Tribunal of Appeal.

The decision given by a Divisional Court in the case of *Clarke v. London County Council*, which was reported at length in our issue of last week, decides a simple but important point under the London Building Acts (Amendment) Act, 1905. In our "Notes" (*the Builder*, June 25, 1910) we have already explained this question, but, as the report of the recent appeal is necessarily voluminous, our readers may find it useful if we again shortly summarise the point in issue in this case.

By sect. 7, sub-sect. 1, in the case of certain buildings plans have to be approved by the County Council or (in the event of an appeal) by the Tribunal of Appeal, showing the means of escape in case of fire.

By sub-sect. 2 of the same section the buildings or parts of buildings subject to this legislation shall not be occupied or let for occupation "until the Council shall have issued a certificate (or, in the event of an appeal), the Tribunal of Appeal shall have determined that such building has been provided with means of escape in accordance with plans approved as aforesaid by the Council or the Tribunal of Appeal, as the case be, and that the conditions (if any), subject to which such plans were so approved, have been complied with."

Sub-sect. 22 provides that an appeal may be taken to the Tribunal of Appeal within two months after "the refusal or conditional grant by the Council of their approval of any plans pursuant to sect. 7; or the refusal by the Council to issue a certificate pursuant to the same section."

In the case under consideration the Council had given conditional approval of the plans submitted; there were in all thirty-six conditions, all of which were complied with, except that which provided "that the staircases be separated from the rooms and corridors on all floors by fire-resisting partitions or walls, and all openings in such separations to be hung with self-closing fire-resisting doors or windows glazed with fire-resisting glazing."

This requirement was neither complied with nor appealed against; but on the building being completed a certificate under sect. 7, sub-sect. 2, was applied for, and, when refused by the County Council, appeal was made to the Tribunal of Appeal, and on the hearing of this appeal the Tribunal of Appeal decided, not that the conditions had been complied with under sub-sect. 2, but that "the building had been provided with all such means of escape freedom in case of fire as could be reasonably required in the circumstances of the case."

The Divisional Court have decided that on an appeal under sub-sect. 2, where the question to be determined is whether the building has been provided with means of escape in accordance with the plans approved or conditions imposed, the Tribunal of Appeal had no jurisdiction to reopen the whole question and to then determine whether the building was reasonably provided with means of escape. In other words, the appeal given by sect. 22 is twofold. First an appeal on the reasonableness of the means of escape provided by the plans, and second, an appeal as to whether the conditions complied with under sub-sect. 2, but the subject-matter of each appeal is separate and distinct. Had the building owner desired to test the reasonableness of the condition, he should have appealed within the time allowed and before the building was completed.

A somewhat similar requirement was contested and appealed under sect. 9, in the case of an existing building, in Berkeley Hotel Company v. London County Council (the Builder, March 12, 1910).

Laying Out a New Street.

In the recent case of Attorney-General v. Dorin, a Judge of the Chancery Division was called upon to decide whether a builder who simply builds a row of houses upon his own land by the side of a roadway is "laying out" a new street within the meaning of by-laws, which require new streets to be of a certain prescribed width at least. Between the houses and the road a strip of land was left, over which the cottages or houses were approached through gates in the hedge over circuit paths; but the leasing of this intervening strip appears to have had nothing to do with the decision. The Judge held that, although for certain purposes under the Public Health Act, 1875, the erection of this row of houses would make the road a new street, yet under the by-law the defendant had not "laid out" a new street. In holding this the Court was following a decision of the Court of Appeal in Devonport Corporation v. Tozer (1905), in which case it was held that there must be something in the nature of a physical laying out as distinguished from a metaphorical laying out.

Possibly the decision may be summarised by saying that, although the erection of a row of houses may convert a road into a new street so as to place the owner under statutory obligations to contribute to such expenses as paving, etc., it does not bring the owner within a by-law relating to streets actually newly erected.

Had the present decision been otherwise, it would appear that the owner could only build upon his land if he consented to dedicate a strip to the public as an addition to the existing roadway. The case is at present very shortly reported, and we may have to refer to it again.

LAW REPORTS.

HIGH COURT OF JUSTICE—CHANCERY DIVISION.
(Before Mr. Justice SWINFEN EADY.)

Westminster Nuisance Case: Halcyon Club, Ltd. v. The Westminster Corporation.

This case was heard on the 24th ult. upon a motion by the plaintiffs for an interim injunction to restrain the defendants until the trial or further order from committing a nuisance by erecting or maintaining against a wall of the plaintiffs' premises in Cork-street, Westminster, a public convenience, and from trespassing by erecting the same, and for a

mandatory order to compel the defendants to remove a convenience which had been temporarily erected.

The defence was that, as the sanitary authority, the defendants had the right to erect such a convenience in any suitable public place so long as they did not create a public nuisance.

Mr. F. Russell, K.C. and Mr. Latter appeared for the plaintiffs, and Mr. Morton Smith for the defendants.

Mr. Russell said that the Corporation had passed a resolution that they would do nothing further in the matter until the trial, but he did not think that was satisfactory, owing to the nuisance by smell and in other respects. The club was a ladies' club. If the plaintiffs were wrong in their action the defendants intended to take down the present erection, which was temporary, and re-erect a new one. Plaintiffs wanted an undertaking which would satisfy them until the trial.

Mr. Morton Smith said that the erection had been there since 1865, was re-erected in 1889, and was there when the negotiations took place for acquiring the plaintiffs' premises as a ladies' club. Men were employed to cart away the property of the Corporation last April. Afterwards it was found necessary to re-erect it for the Corporation, and after removal for a few hours, by mistake of the contractor, it was re-erected temporarily, and was used down to the commencement of the present action. The difficulty might not cease. It was closed to nuisance, which was not an addition to that, the freeholder was not a party to the action. He (counsel) contended that there ought to be an undertaking by the freeholder as to the rights of the Corporation.

His Lordship said there need be no undertaking of any legal rights which the Corporation possessed. The only order that he would make would be that the costs of the motion should be costs in the action.

COURT OF APPEAL.

(Before the MASTER of the ROLLS and Lords Justices FLETCHER MOULTON and FARWELL.)

Action against Builders and Contractors: Dorman, Long, & Co., Ltd. v. H. Willcock & Co.

This case was heard last week upon the appeal of the defendants from a judgment of Mr. Justice Channell in the King's Bench Division in favour of the plaintiffs.

Mr. J. R. Atkin, K.C., in support of the appeal, said that the plaintiffs brought the action against the defendants, a large firm of builders and contractors, at Wolverhampton, to recover 88l. 13s. in the following circumstances:—In September, 1907, the defendants entered into a contract for the erection of a technical college at Bristol, the contract price being about 28,000l. Under the contract the plaintiffs, who carry on business at Middlesbrough, were appointed by the architect, Mr. Cross, the sub-contractors for the supply of steelwork for the building. By the contract, before the sub-contractors and various tradesmen could get payment for work and materials supplied it was a condition that they should get the certificate of the architect, and when that certificate was given the defendants, as the contractors, had to pay the sub-contractors, etc., the sums so certified by the architect. Plaintiffs supplied steelwork for the building, and sent the invoices in the usual way to the builders, from time to time receiving payments on account upon the certificates of the architect. In July, 1909, when the work was practically finished, the plaintiffs sent in their statement of account for the final balance of the steelwork, and the architect gave his final certificate on October 22, 1909, for 2,819l. 14s. 2d., in which he included the sum due to the plaintiffs as made up from the statement of account supplied. Plaintiffs afterwards discovered that they had omitted by mistake 88l. 13s., the price of three stanchions supplied for the building. The architect declined to open up the matter, and the defendants declining to pay, the present action was brought. Defendants said that, of course, if the building owners would pay the amount they would pay it over to the plaintiffs, but otherwise they could not admit that they were liable, and their defence was that the certificate of the architect was a condition precedent to the plaintiffs' right to sue. Plaintiffs, however, contended that it was the duty of the defendants, under the contract in the circumstances of the case, to go to arbitration with the building owners on the matter, so as to get the mistake rectified, and that by their not doing so defendants had waived the point as to the architect's certificate being a condition precedent to right to sue, and Mr. Justice Channell so held. He (Counsel) contended that the learned Judge was wrong, and that he should have entered judgment for the defendants.

Mr. Sanderson, K.C., having supported the

judgment of Mr. Justice Channell on behalf of the plaintiffs.

Their Lordships allowed the appeal, holding that in the circumstances the plaintiffs had not the right upon the construction of the contract to call upon the defendants to have the certificate of the architect reviewed, and that, therefore, the defendants were not liable to the plaintiffs for the 88l. 13s.

KING'S BENCH DIVISION.

(Before Mr. Justice COLERIDGE.)

The Validity of an Architect's Certificate:

Ashwell & Nesbitt, Ltd. v. Allen & Co.

This case was heard on Monday, November 27, and the following day, and matters of considerable interest to builders and architects were discussed.

The plaintiffs, Messrs. Ashwell & Nesbitt, Ltd., of Leicester, sued Messrs. Allen & Co., of Westminster, for 377l. for work done and materials supplied to a building in Regent-street, London, under a contract of May 12, 1909. The defendants denied that the plaintiffs did the work or supplied the materials, and they further pleaded that the sum in the contract was not to be paid for until included in the architect's certificate, and that it had never been so included.

Mr. J. B. Matthews said that the action was to recover the amount claimed under the certificate of the architect for Messrs. Lewis & Allenby, who were re-erecting premises of land belonging to the Crown in Regent-street, London. The defendants were the general contractors for the work, and the plaintiffs were sub-contractors for the heating and hot water installation, to the amount of 3,320l. Various payments were made up to March 1911, falling short of the sum due by 377l., and on it being asked for the defendants denied liability. They also said the work was done under contract, and that it was a term of the contract that payment should only be made to the plaintiffs on the inclusion of the amount in the architect's certificate, and on payment of the amount. The main point in dispute was whether the defendants had received the money from the building owners. The defendants settled a claim for extras with the building owners for 5,000l., part of which was paid in cash and part in prior lien bonds issued by the building owners on the property. The plaintiffs contended that the terms of settlement were equivalent, as between themselves and the defendants, to payment to the defendants, and that the defendants were estopped from denying that they had received payment. Counsel said that his view was that the plaintiffs were clearly entitled to stand upon the certificate and be paid the amount certified.

Mr. Justice Coleridge: Can the certificate be got over on the ground of mistake? Mr. Matthews: I think it is impossible to suggest mistake. Continuing, Mr. Matthews said that because the defendants chose to enter into an arrangement with the building owners they had no right to hold over the balance of the plaintiffs' account. The formal certificate for 377l. was issued on March 1 by Mr. Verity, the architect, which the plaintiffs forwarded to the proper quarter, with request for a cheque.

In answer to the Judge, Mr. Hudson, K., who appeared for the defendants, said: Plaintiffs were, first, there must be a certificate granted for the money due to the plaintiffs; secondly, the amount of that certificate must be included in the certificate to the defendants; and thirdly, the amount must be paid to the plaintiffs.

His Lordship: There was a certificate given by the architect to the plaintiffs before the action was brought, then a certificate was given to the defendants, and a settlement of the defendants' certificate was arrived at in lieu of being paid?

Mr. Hudson: Yes.
His Lordship: It included the plaintiffs' 377l.?

Mr. Hudson: We say it does not. Disputes were going on as to the number of radiators put into the building, and we had given building owners large credits for a large difference in the numbers supplied.

His Lordship: Can you go behind the certificate on that ground?

Mr. Hudson: Yes; because the architect without any notice to my clients issued certificate for 377l.

His Lordship: He had a right to do that. Mr. Hudson: I say not, in view of the fact that he must have known that we had already given the building owner large credits in respect of the work and goods which the plaintiffs ought to have supplied and did supply.

Mr. Justice Coleridge: Do you say that certificate of an architect is bad unless he

Ford's Park, Canning Town. Messrs R. Gay & Co., warehouse, Langthorne Works, Stratford-market; Messrs. H. Tate & Sons, Ltd., additions to electric power house. The Thames Sugar Refinery, Silvertown. The following have been lodged:—Messrs. W. Bradford & Sons, additions and alterations to the "Green Gate" public-house, High-street, and Deacon-street, Stratford; Messrs. Emden, Egan, & Co., cinematograph theatre, 370, High-street, Stratford; Mr. A. Single, rebuilding workshop and warehouse, rear of 29, Hubbard-street, West Ham.

Westminster.—The tender of the Acme Flooring and Paving Company (1904), Ltd., has been accepted at 1217 16s. for paving with combined strip wood pavement the roadway of Durham House-street. The Improvements Committee have decided to alter and widen Poland-street by pulling down No. 18 and laying the site thereof into the highway. Macadam repairs are to be carried out in St. George's square at an estimated cost of 1557 6s. 8d. creosoted yellow deal paving-blocks are to be purchased from Messrs. W. W. Howard Brothers & Co., Ltd., at a cost of 412. 16s. 6d. Consent has been given to the extension to Little George-street of the sewer in the new street between the Middlesex Guildhall, Broad Sanctuary, and the Surveyors' Institution, the execution of the drainage works at the Institution, the abolition of the existing sewer running under the Institution premises, and the construction of a flushing tank, in accordance with the plan submitted by Mr. Paul Waterhouse on behalf of the Institution, subject to protective conditions and the sum of 1600, being deposited with the Council to cover the costs of works on or under the public way, which are to be executed by the Council. A proposal is on foot to continue the widening of Argyle-place to Great Marlborough-street, on the south side, between Kingly-street and Carnaby-street. Plans submitted by Messrs. Bull & Esdaile, Ltd., for additions to No. 55, Princes-gate, have been approved.

Willesden.—The tender of Rayboulds, Ltd., has been accepted for a supply of unclimbable iron fencing at Roundwood Park, at 3s. 6d. per yard, with iron gates at 35s. each. The tender of Mr. E. G. Brummell has also been accepted, at 14012, for the construction of about 1655 ft. lineal of concrete tube surface water drain at water course, rear of Denzel road. Electricity mains are to be extended at an estimated cost of 1871. Fresh plans and estimates are to be prepared by the Engineer for making-up part of Dog Lane.

Wood Green.—Plans submitted by Mr. C. H. Croxford, Borough Engineer and Surveyor, have been passed for the erection of an elementary school at Lordship-lane and Ellenborough-road, also for alterations and additions at Bounds Green-road School.

Woolwich.—Electricity mains are to be extended at an estimated cost of 651. In connexion with the making-up of a portion of Clay-lane, Plumstead, widening work is to be carried out at an estimated cost of 2402. No objection has been raised to a plan submitted by the London County Council by Mr. J. R. Vining, 89, Chancery-lane, W.C., for additions to a warehouse in Wood-street for Messrs. J. James & Co. Plans have been passed for Mr. J. J. Bassett, Easthall-road, Eltham, on behalf of Lord Rowallan, for eight houses, Dunvegan-road, Eltham, also for Messrs. Whistler & Worge, 80, High-road, Eltham, on behalf of Mr. S. R. Carr, for additions to "Mottisfont," Court-road, Eltham. Plans have been lodged by Mr. J. J. Bassett, on behalf of Lord Rowallan, for six houses, Dunvegan-gardens, Dunvegan-road, Eltham.

FOREIGN AND COLONIAL.

Australia's Demands for Artisans.

The demand for skilled labour in New South Wales is so great that the Master Builders' Association of Sydney have despatched a trade union representative to England to inform his fellow-workmen in this country of the openings that exist in New South Wales for artisans. The gentleman referred to (Mr. F. J. Murray) informed a representative of the *Morning Post* that the building trades of Sydney are seriously hampered by the lack of men, particularly bricklayers, plasterers, stone-masons, and carpenters and joiners. There are opportunities for men belonging to other trades, but Mr. Murray is only directly concerned with the needs of the Master Builders' Association. "Only recently," he said, "the State Government appointed a Royal Commission to inquire into the state of the labour market in Sydney, and the result of the inquiry was to show that there was an urgent demand for at least 3,000 artisans in the City of Sydney alone. The minimum wage (fixed

by law) for the trades with which I am more directly concerned on this mission is as follows:—Bricklayers, 12s. per day, and plasterers, carpenters, and joiners, 11s. This is for an eight-hour day, but in some of the trades—that of the masons, for instance—the hours are even less than that, being forty per week. I am not engaging men because under the laws of the Commonwealth men may not go out under contracts entered into abroad. This is a condition imposed in the interests of the workers lest they should be induced to contract on terms less favourable than those that they can command on the spot. But I can do this—I can give an intending emigrant belonging to any of the trades I have enumerated a signed card addressed to the Master Builders' Association which will ensure him an engagement on the terms I have mentioned immediately on arrival. I can also give him this assurance—that constant work awaits him at his trade for more years than he is likely to live."

An advertisement having appeared in the Press to the effect that Mr. Murray would interview bricklayers, plasterers, and joiners at the offices of Mr. John E. Ridgway, 22, Henrietta-street, Covent Garden, London, over 1,500 men and youths arrived outside the offices and clamoured to gain admission. A large number of those who put in an appearance seem to have misread the advertisement. They appear to have been under the impression that the Master Builders' Association of New South Wales were prepared to pay the passage of the applicants willing to go out there. The consequence was that there was much disorder, and a large number of police had to be requisitioned to pacify the crowd. The applicants were then formed into a queue, and they were allowed to enter the offices in batches to interview Mr. Murray. An official at the offices, in an interview, said that Mr. Murray had come over on behalf of the Master Builders' Association of New South Wales to point out the dearth of labour in these particular branches of labour. The Labour Government some time ago appointed a Royal Commission to inquire into the shortage of labour, and before this Commission the master builders gave sworn evidence of the scarcity of artisans which had been growing steadily worse for about eighteen months. The members of the Masters' Association in Sydney alone wanted 172 bricklayers, 57 masons, 135 carpenters and joiners, 19 plasterers, 31 plumbers, and a large number of painters, electricians, bricklayers, etc. Altogether Sydney alone could do with at least 3,000 artisans. The passage will only cost about 16d. There is some talk of the State Governments granting a reduction in the passage, but that has not come about yet.

Irrigation in New South Wales.

The most important irrigation scheme yet undertaken in Australia, and one of the greatest in the world, is known as the Burrenjohnk (a corruption of the aboriginal word Burrenyak) in New South Wales. It is being carried out under the auspices of the Government, and is so far advanced that the first section of 70,000 acres has been subdivided, and will be thrown open to settlers in the early part of next year, when a big immigration campaign will be inaugurated by the New South Wales Government in Europe and America. One of the contractors for this work, Mr. J. Symons, of the firm of Messrs. Lane & Peters, is now in London in connexion with this and other Australian contracts which his firm has in hand, and when seen by a *Morning Post* representative he explained that the whole scheme when fully completed will involve an expenditure of over 3,000,000l., will irrigate 1,250,000 acres, and will provide settlement areas for 40,000 persons. The irrigation works include the erection of a barrage, which, it is said, will be one of the largest in the world. It will be 232 ft. high, and will form a reservoir of 43 miles long and 200 ft. deep, with a total capacity of 32,000 million cubic ft. of water. There is a river running for 20 miles through the estate, which will be available for irrigation purposes, and this will be supplemented by 50 miles of canals, now in course of construction. The barrage is being constructed of concrete and plumbstone, the concrete being made on the spot. Nearly all the work, including excavation, concrete manufacture, and the construction of the barrage, is performed with the aid of an immense electric-power plant, and operations are carried on unceasingly day and night. A large part of the area is in mountainous country, and before the contractors could begin operations at the site of the dam they had to construct a narrow-gauge line for 28 miles through the mountains from the nearest railway line. The minimum rate of wages is 8s. 6d. per day of eight hours for common labour and 9s. 6d. per day for skilled

labour, with proportionately higher rates for professional work.

Hotel, Brazil.

H.M. Consul at São Paulo (Mr. D. O'Sullivan-Bearre) reports that a company has been formed at that place, with a capital of 5,000,000 milreis (about 553,000l.), for the purpose of erecting in the city a large hotel with all modern improvements. All material required for the construction and equipment of the hotel may be imported free of duty. The name of the company may be obtained from British manufacturers on application to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.

Improvement Works, Calcutta.

The Director-General of Commercial Intelligence of British India has forwarded a copy of the Calcutta Improvement Act, 1911, providing for the improvement and expansion of Calcutta by opening up congested areas, laying out or altering streets, providing of spaces for purposes of ventilation or recreation, and demolishing or constructing buildings, etc. The Board of Trustees is to be set up to carry out the provisions of the Act. The copy of the Act may be seen by British firms at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C.

Building in the Netherlands.

The *Staatscourant* of November 25 notes that (1) the provincial authorities of Groningen have decided to erect a hospital for mental cases at Het Bolderiep, in Groningen, at a cost of 250,000 guilder (20,833l.); (2) the municipal authorities of Utrecht have decided to erect a pharmaceutical laboratory at Catharijnesingel, at a cost of 198,000 guilder (16,500l.).

TRADE CATALOGUES.

We have received from the Carron Company a pamphlet illustrating a new series of fires which they have recently put on the market. The "Abbey," as the new series is termed, comprises eight distinct designs, with their different sizes, afford a selection of twenty-one varieties. All parts of "Abbey" fires are interchangeable, and connexion can be made either right or left hand as desired. In most cases a big burner can be fitted. The designs are a distinct advance on the wrong-headed old-fashioned iron fire, and justify the price of the firm in going to the expense of entirely new patterns.

Messrs. Young & Marton, of Calcutta Works, Stratford, London, E., send us a prospectus containing prices and illustrations of the "Hue" adaptable barless fire. Hitherto the adoption of the increased popular heart-fire has in many cases been hindered by the difficulty of adapting the form to existing grates, entailing, as the temporary removal of the chimney and the scoring of the stove. The "Hue" fire is manufactured specially to suit the area of existing grates, and all that is necessary to ensure a proper fit is to superimpose a template of the existing bottom of the grate. A specially constructed grate, closed pan beneath ensures cleanliness in use. In cases where the existing fire is shallow the firm recommend the use of special deflecting back bricks. These, if inserted in most cases by removing the backs, without the necessity of taking stove or touching the mantelpiece and surroundings. Messrs. Young & Marton manufacture complete suites, complete mantel, stove, and hearth.

Messrs. Siemens Brothers, of 33, Abchurch-lane, London, E.C., send forward us a leaflet for circulation by trade, containing the latest price list of well-known "Tantalum" lamps.

The Asbestos Manufacturers Company, of Caxton House, Westminster, send a pamphlet dealing with asbestos coverings, showing a new roofing and sheet material manufactured by the Asbestos Manufacturing Company, Ltd., of Montreal, Canada, for whom the firm act as sole distributors. It is applied in practically the manner as corrugated iron, and it is said that it is absolutely fire and weather proof, is unaffected by gas, steam, or other acids besides being superior in insulating properties to corrugated iron. Moist conditions of atmosphere, it is said, by assisting the setting of its chief component, hygroscopic, actually improves the material, being concrete in sheet form, is of an unendingly durable nature. Illustrations are from photographs of its application to houses, cold-storage plants, oil storerooms, purifier buildings, and other cases where great desideratum is the maximum of heat and immunity from fire.

PATENTS.

APPLICATIONS PUBLISHED.*

5,865 of 1910.—Walter Tietze: Door-closing vice.
7,828 of 1910.—Robert Thompson and William Affleck Thompson: Reinforcement of chimneys, ferro-concrete pillars.
10,043 of 1910.—Francis Johnson and Edgar Talles: Machine for mixing concrete, and the like.
21 of 1911.—Samuel Stelling: Chimney-pots covers for preventing down draughts and raising the up draught.
426 of 1911.—Rudolf Hermann McHardy and James McHardy: Casement stay, applicable also to analogous purposes.
611 of 1911.—James Chenhalls: Devices for venting down draught in chimney-pots, chimneys, ventilating-shafts, and the like.
145 of 1911.—John Shanks: Valve fittings for baths, lavatories, and the like.
1,044 of 1911.—Joseph Joss and Josephine: Combination rule, square, bevel, level, rammer, scratch, awl, glass-cutter and the like.
252 of 1911.—Frederick Rickards Bennett and Edward Stephen Cashen: Carriage and or sash windows.
802 of 1911.—Arthur Edwin Bishop: Dust-pan.
264 of 1911.—Henry Hope & Sons, Ltd., and John Walter Hope: Glass rods.
7,775 of 1911.—Arthur Ernest Spreadbury: Ladders, ladders, trestles, or the like.
1,336 of 1911.—Joseph Leslie Musgrave and David Gritall & Co.: Method of installation heating and cooling buildings.
1,265 of 1911.—Friedrich Schofer: Method of obviating cracking and injurious stresses in joined smoke and ventilating chimneys.
7,591 of 1911.—Eugen Frankel: Flushing apparatus.
1,104 of 1911.—Alfred Crane Russell: Connection of stair-treads and the like.
10,086 of 1911.—Adolf Donecker: Process of manufacturing weather-proof coloured gravel for garden paths and the like.

SELECTED PATENTS

7,796 of 1910.—John Ferguson: Walls.
This relates to hollow damp-proof walls which are formed with ribs *b*, projecting from inner sides and insulated by damp-proof material *c*. The ribs may be horizontal or

15,796 of 1910.

vertical, and the bricks or blocks forming them are strengthened by means of bars, clamps, *f*, interlocking keys formed on the bricks. A wall constructed of bricks on one side and on the other, and a wall having both horizontal and vertical passages are shown.

56 of 1910.—Rudolf Sedlacek Blome and Joseph Sinek: Paving.

This relates to means for grooving plastic material before it sets to represent block paving and consists in the provision of a die or adjustable in a main frame which extends across the roadway and travels on temporary rails. Rails are laid clear of the road, and thereon is mounted the main frame, which

these applications are in the stage in opposition to the grant of Patents upon can be made

consists of girders and rollers operated by hand gearing. Locking pawls at each end engage notches in the rails. Transverse tracks conforming to the curve of the road are carried on the inner faces of the girders by screws, and support an auxiliary frame. The die carrier slides in this and carries at the lower end a die frame, which is pressed downwards by springs. The frame and die are raised and lowered by racks and pinions operated by hand-wheels and controlled by a hand-brake.

16,534 of 1910.—Carlos John Brookings: Catch gear and safety retaining-mechanism for lifts.

This relates to catch-gear and safety retaining-mechanism for lifts, and consists in the provision of a pair of wedge-operated pincer grips carried by the cage, which are controlled by the vertical movement of a skeleton framework which surrounds the cage, and are adapted to engage the corrugated guide bars in the event of the hoisting-cable breaking, or by the actuation of a hand-crank in the cage. To the cage floor is rigidly attached a platform *E*, on which are pivotally mounted the gripping-jaws *G*. Wedges *I* sliding on the

16,534 of 1910.

platform *E* between the inner arms of the jaws *G* are connected by toggle links *k* to a vertical bar *J*, which forms part of a skeleton frame *L*, *M*, *N*, surrounding the cage, and supporting it by springs *O*. In the event of the hoisting-cable breaking, the springs *O*

17,084 of 1910.

depress the vertical bar *J* and thrust the wedges *I* between the inner arms of the jaws, causing their outer arms to engage the corrugated guide-bars *II*.

16,835 of 1910.—Glenn Allan: Reinforced concrete.

This relates to reinforced concrete, and consists in the provision of flat and angle bars having keyhole slots and notched tie-bars, which engage the straight sides of the slots. The floor and wall connexion is braced, and the corners of the main walls are thickened to form piers.

17,084 of 1910.—Heinrich Ditter: Floor and ceiling blocks.

This relates to interlocking blocks for floors and ceilings wherein the blocks are constructed with stepped grooves *d*, which on assembling the blocks form circular channels beneath the interlocking ribs and recesses for the reception of supporting iron rods *e*.

17,524 of 1910.—Henry Pocock: Apparatus for mixing concrete.

This relates to machines for mixing sand or gravel with concrete, and consists in providing an open-bottom divided hopper with a carriage reciprocating beneath the open bottom, the hopper having two adjustable front plates for regulating the passage of material, which is delivered from the carriage to the mixing-apparatus beneath. The main shaft *3*, mounted on the front of the machine, is driven by hand, or by a pulley fixed thereon, or through a chain-wheel *4* mounted loose thereon and connected to the shaft by a spring clutch inside an angular rim *11* connected to the wheel. The clutch is connected to a hub fixed on the shaft *3*, and has an opening at its upper end into which passes the squared end of an arm *20*, which is connected through a lever to a lever carrying a roller *24*, adapted to be engaged by a conical collar, which revolves with and reciprocates on the shaft *3*, being operated by a lever to lift the roller *24*, and turn the arm *20* to open the spring to clutch the rim *11*. The shaft *3* drives, through bevel-gearing, a shaft *8*, which carries inclined mixing-blades *9*, and a countershaft *28*, through chain gearing and a clutch, one part being loose and the other part pinned on the shaft, and the parts being engaged by a lever *33*, an arm of which has a catch to hold the clutch parts together. The ends of the shaft *28* carry cranks connected to rods *35* fixed to the back axles of the wheels of a reciprocating carriage *37* running on tracks below the mouth of the divided hopper *40*. The front openings of the hopper above the carriage are regulated by adjustable plates *44*, *46*, the plate *46* in the cement hopper being provided with a curved end *f*. In the side of the cement hopper is mounted a shaft *51* operated by connexion to the front axle of the carriage *37*, to oscillate an agitator *53*, the part *t* of which moves forward and downward with the forward movement of the carriage to force cement through the opening *43*. On the return movement of the carriage the cement falls into the mixer and the forward and downward movement of the part *t* carries cement down to fill the opening *43* for the next forward stroke.

17,524 of 1910.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, iv.; Contracts, iv. vi. vii. x.; Public Appointment, xvii.; Auction Sales, xxii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary. The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* * It must be understood that the following paragraphs are printed as news, and not as advertisement; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

DECEMBER 15.—**Sofa**.—New Municipal Building. See Competition News, page 608, November 3.
DECEMBER 21.—**R.I.B.A.** Prizes and Studentships. Work to be sent to 3, Conduit-street, before 4 p.m.
DECEMBER 22.—**Glasgow**.—Design for a Bridge.—Designs are invited (Alexander Thomson Travelling Studentship) for a bridge. Premiums of 60s. and 20s. are offered. See advertisement in issue of December 24, 1910, for further particulars.
DECEMBER 30.—**Armadale**.—Public hall and offices, to cost 2,500l. Premiums of 15s. and 10s. Open only to architects who were represented on the site on October 12.
DECEMBER 30.—**Welsh Eisteddfod, 1912**.—Designs for WORKMEN'S DWELLINGS.—Prize, 50l. Particulars from Welsh Housing Association, 3, Temple-chambers, E.C.
JANUARY 1, 1912.—**Rochdale Infirmary**.—Extensions.—Limited to Rochdale architects. Assessor, Mr. Alex. Graham, F.R.I.B.A.
JANUARY 6, 1912.—**Bolton**.—Miners' Federation Hall and Offices. Limited to architects within twenty-five miles of Bolton. Premiums, 50s. and 25s. Assessor, Mr. Jonathan Simpson, F.R.I.B.A. Particulars from Messrs. Fielding & Fernhough, 7, Fold-street, Bolton.
JANUARY 6, 1912.—**Stafford**.—Public Library.—The Stafford Corporation invite designs for a Public Library. Mr. Henry T. Hare, F.R.I.B.A., assessor. Second and third premiums of twenty and forty guineas. Deposit, 1l. Particulars from Mr. W. Plant, A.M.Inst.C.E.
* JANUARY 8.—**Banbury**.—WORKMEN'S DWELLINGS.—The Banbury T.C. invite designs for workmen's dwellings. See advertisement in this issue for further particulars.
JANUARY 9.—**Spennymoor**.—PUBLIC HALL, etc.—The Spennymoor U.D.C. invite competitive plans and designs for a public hall, market, and offices, etc. Three premiums are offered. See advertisement in issue of December 1 for further particulars.
JANUARY 29, 1912.—**Montevideo**.—Government Palace (premiums, 2,025l. and 850l.) and town improvement scheme (premiums, 1,000l., 640l., and 425l.). Conditions may be seen at the Board of Trade, 78, Broadhall-street, E.
JANUARY 31, 1912.—**Australia**.—Designs for FEDERAL CAPITAL CITY.—The Government of the Commonwealth of Australia invite competitive designs for the laying out of this Federal capital city. See advertisement in issue of September 1 for further particulars. See also page 508, November 3.
FEBRUARY 3, 1912.—**Bolton**.—NURSES' HOME at the Infirmary.—Premiums of 30l., 20l., and 10l. Assessor, Mr. John B. Gass, F.R.I.B.A.
FEBRUARY 17, 1912.—**London, E.C.**—New Offices.—The Port of London Authority invite preliminary sketch designs for new head offices in Trinity-square, and for laying out remainder of land as a building site. See advertisement in issue of November 24 for further particulars.
May 1, 1912.—**Society of Architects' Travelling Studentship**. Design for a Town Hall, 25s. and medal.
July 1, 1912.—**Dusseldorf**.—A plan for the extension of the City of Dusseldorf. Premiums of 1,000l. to 375l. Conditions on application to the Chief Burgomaster, Dusseldorf. A translation appeared on page 28, September 29.
No Date.—**Jordanhill, Glasgow**.—PROPOSED TRAINING COLLEGE.—Limited to six firms, named in Competition News, December 1, page 635.

Contracts

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

DECEMBER 8.—**Briggwater**.—ADDITIONS.—For alterations and additions to the Isolation Hospital at the docks. Borough Surveyor, Mr. F. Parr, A.M.Inst.C.E., Municipal-buildings, High-street, Briggwater.
DECEMBER 8.—**Laverockclock, etc.**—HOUSE, etc.—Erection of new farmhouse at Cotta, and new farm steading at Laverockclock. Plans and specifications with Mr. J. Witte, architect, Elgin.
DECEMBER 9.—**Elgin**.—ADDITIONS.—For additions to Elgin Academy buildings. Plans and specifications with Mr. J. Witte, architect.
DECEMBER 9.—**Great Harwood**.—COTTAGES.—Erection of twenty-seven cottages near Glad-

stone-street. Plans and specifications seen, and form of tender from Mr. A. H. Dunkin, Surveyor to the Council, Town Hall, Great Harwood.

DECEMBER 11.—**Leeds**.—CHAMBER.—Construction of an underground transformer chamber at North and South-street. Specification and drawings seen, and form of tender from Mr. H. Dickinson, Manager, 1, Whitehall-road, Leeds.

DECEMBER 11.—**Morecambe**.—RESIDENCE.—Erection of a villa residence in Bare-lane. Plans, specifications, etc., at "Ye Planry," 23, Queen-street. Mr. Albert Gorton, architect.

DECEMBER 11.—**Ossett**.—SHED.—Erection of a shed in Wakefield-road. Specification and drawings seen, and quantities and forms of tender from City Architect, Town Hall, Sheffield.

DECEMBER 11.—**Rugby**.—SHED.—Erection of a corrugated-iron shed in market. Drawings seen, and specification and quantities from Mr. D. G. Macdonald, A.M.Inst.C.E., surveyor.

DECEMBER 11.—**Sheffield**.—SCHOOLS.—For the following works:—Philadelphia Council School, alterations; Tinsley Park Council School, alterations; Carbrook Council School, new playshed, etc. Drawings seen, and quantities and forms of tender from City Architect, Town Hall, Sheffield.

DECEMBER 11.—**Southampton**.—SCHOOL.—Erection of a handcraft and cookery centre, and enlargement of Ascutup School. Plans, specification, and conditions seen, and quantities and forms of tender at the Borough Engineer's Office, Municipal Offices, Southampton. Deposit of 3l. 3s.

DECEMBER 11.—**South Norwood**.—ALTERATIONS.—For structural alterations at Branch School, Cumberlow, South Norwood. Plan at the District School at Anerley. Deposit of 1l. Mr. H. J. Chidcock, Clerk to the Managers.

DECEMBER 12.—**Abercraze**.—STORES.—Erection of stores for the Abercraze Co-operative Society. Specification, on deposit of 5s., from Manager, Co-operative Society, Abercraze.

DECEMBER 12.—**Briddington**.—SCHOOL.—Erection of new buildings in extension of the Grammar School. Drawings and specifications seen, and quantities on deposit of 1s. from the architect, Mr. John Bilson, 23, Parliament-street, Hull.

DECEMBER 12.—**Dowlais**.—INN.—Re-building of the Victoria Inn, for the Pontycyfel Brewery Company. Plans and specification seen, and quantities, on deposit of 1s. from Messrs. Johnson & Richards, architects, Merthyr Tydfil.

DECEMBER 12.—**Dowlais**.—THEATRE.—Erection of an electric theatre for the Victoria Cinema Company Ltd. Plans and specification seen, and quantities, on deposit of 1s. from Messrs. Johnson & Richards, architects, Merthyr Tydfil.

DECEMBER 12.—**Hendon**.—SCHOOL.—For erection of a public elementary school. Mr. James Anderson, Council Offices, Hendon, N.W.

DECEMBER 13.—**Bury**.—SHED.—The Lancashire and Yorkshire Railway invite tenders for the erection of a cotton-shed at Knowley-street Goods Yard. Plans seen, and quantities and specification at the Engineer's Office, Hunt's Bank, Manchester.

DECEMBER 13.—**Keighley**.—CONVENIENCES.—Erection of conveniences in West-lane. The Borough Engineer, Keighley.

DECEMBER 13.—**Salisbury**.—ALTERATIONS.—For sanitary alterations at the police-station. Mr. Albert E. Brookes, County Surveyor, Truro.

DECEMBER 14.—**Teignmouth**.—SCHOOL.—For building a screen to the boys' playshed at schools. Drawings seen, and quantities from Mr. A. J. Murgatroyd, architect, 23, Strutt-street, Manchester. Deposit of 10s. 6d.

DECEMBER 14.—**London**.—POST-OFFICE.—Erection of Barking new post-office. Drawings, specification, and form of contract at Barking Post-office. Quantities and forms of tender, on deposit of 1l. 1s., from the Secretary, H.M. Office of Works, etc., Storey's-gate, London, S.W.

METROPOLITAN WATER BOARD.

At the monthly meeting of this Board, held last Friday, the following amongst other matters were dealt with:—

Supply to Hampstead Garden Suburb, etc.—It was decided to expend £1,500 in the erection of pumping-stations at Fortis Green and Cricklewood, and in the laying of mains to improve the supply to the Kidderpore Reservoir Zone, in which are situated the Hampstead Garden suburb and the district of Hendon and Golden's Green. It was also agreed to use Diesel oil-engines in the pumping-stations.

Island Barn Reservoir.—It was reported that Messrs. R. McAlpine & Sons had completed their contract for the construction of the Island Barn reservoir. The tender was for 152,727 l. 7s. 6d.

Quantity Surveyors.—Messrs. Northcroft, Neighbour, & Nicholson were appointed to take all the quantities for the construction of the pumping-station, gas-producer house, and two cottages at the Chingford Reservoir Works.

Works.—Amongst the estimates for new works passed were the following:—3,200 l. for the laying of a main for Old Ford Pumping-station to High-street, Stratford; 1,050 l. for laying mains over Ladbroke-grove road bridge; and 671 l. for the renewal of mains in the New River district.

THE WORK OF THE R.A. STUDENTS.

THIS year is notable for the large proportion of awards in the Painting School that go to lady artists. We should be only too pleased to be able to hail the winners as having tied the claim that art knows no sex; but we honestly do so; but, to be candid, this year's work in painting is deplorably weak in the display of promise that we feel the President quite right in diplomatically passing the virtue of industry rather than indulging in prognostications as to the future career of the prize-winners.

The Gold Medal, it is true, is won "hands down" by Miss Williams, but to no other painting could it possibly have been awarded. The successful picture displays a fine sense of composition, but has few graces of technique, being wrought out with the over-insistence on forms and drawing that suggests the term "academic." The Turner and Creswick prizes have provoked the poorest result we have ever seen on the walls of Burlington House, and neither the Decoration nor the Armistage competitions are up to the

standard of past years. Surely there must be something radically wrong with a school when the output is no better than that exhibited this year.

The Sculpture School does not seem in very much better case. The work is perhaps technically more accomplished than that of the painters, but there is little displaying any sign of the imaginative faculty.

By comparison architecture stands out well; in fact, the Architectural School, though far from being what we should like to see it, is the only one that seems

at the present time to be possessed of any vitality at all. There is a good deal of dull work here, as must be inevitable, but even this frequently displays a degree of technical knowledge relatively more advanced than the principal painting competitions, while the best work certainly suggests far more promise than any shown in the other two schools.

It is, however, to the individual student that this result must be credited, it being quite obvious that no appreciable pressure is being put upon him in disciplining and training his natural abilities. No doubt the more brilliant are bringing on the less able; that is fortunately incidental to every body of workers, and it gives an occasional, but fallacious, effect of progressive method. This circumstance does not offer any guarantee against a relapse if there is a slight falling off in strength among the leading students.

The Architectural Gold Medal for "The Hall of a City Company" goes to Mr. Alan Binning, whose design is a quiet and dignified rendering of the subject. The scheme is well worked out in a good set of drawings, but we feel that the large hall, the main feature in the design, is too lofty in its proportions for the best effect, both externally and internally. The design by Mr. Bucknell offers more interesting architectural internal effects, and is most thoroughly thought out in detail, and, while it does not display quite the same breadth of effect as the winner, it is a scholarly piece of work. We fear Mr. Adrian Berrington lost his chance by approaching the problem in a spirit of light-hearted gaiety very remote from that of stolid respectability which it is customary to associate with even the recreative aspect of a City company. His design bubbles over with whimsical mirth, and, even though the "portly cit." might carry himself ever so sedately in his cups, he would feel in negotiating Mr. Berrington's curly stairs that he had been doing himself well. Another design, by Mr. J. C. Rogers, in the Byzantine manner, is worthy of note as a broad and harmonious rendering of the subject.

We find the design awarded the 20*l.* prize more interesting than the competition for the Gold Medal. This latter would generally be classed as an effort on "Beaux-Arts" lines, although we understand that the author emphatically and indignantly repudiates any such classification. The subject is a concert hall, surrounded by a cruciform group of loggie enclosing fountains and monuments. The treatment has been carefully studied from the symbolic point of view, and, although we do not feel that this has affected its architectural qualities to the extent that the interest taken in this aspect of the design seems to imply, there is a most skilful graduation from the outlying features up to the culminating point in the hall itself.

There are two subjects embodying the design for a public "place," one dealing with the southern terminal of a proposed Charing Cross Bridge, and the other with a railway-station group. These have provoked a good response from the students, and we can compliment Mr. W. H. Gammer and Mr. V. O.

Rees on their designs, which are handled with great restraint and a strong feeling for breadth of effect.

Among the other designs we noted a charming study for a winter garden by Mr. Cyril Farey, which gained him the 10*l.* prize; one for a town house by Mr. W. J. Roberts; while the work of Mr. W. L. Clark and Mr. F. B. Nightingale is characterised by scholarly and refined treatment.

We hope to publish many of these designs in early issues of the *Builder*.

THE LIVERPOOL KING EDWARD MEMORIAL.

IT is now eight months since the proposal to deface the south elevation of St. George's Hall aroused such world-wide opposition that its authors were forced to reconsider their intention, and the matter was apparently dropped.

The general impression was that this ill-advised and altogether unwarrantable project for tampering with an architectural masterpiece—a national, not a parochial inheritance—had been quashed once and for all.

The most eminent architects of Europe and America (including all the architect members of the French Academy of Fine Arts and the late Mr. Carrère), and nearly every London architect with any reputation for scholarship, the Presidents of the provincial architectural societies, leading merchants and public men of the city of Liverpool—all signed petitions and forwarded urgent protests against any meddling with the Hall.

Yet what has happened?

On Friday, December 1, the Finance Committee of the Liverpool Corporation sanctioned a brand-new scheme secretly prepared and approved by the Memorial Committee. On Wednesday, December 6, the City Council were to meet, and on that date the new proposal would be submitted to them and, if accepted, carried into effect without delay. No one outside those immediately responsible was in any way prepared for the manoeuvre. The whole affair had been engineered in camera. Only four days was left for opposition to mature, and during those four days the public were given no opportunity of viewing the model. Councillors and a few favoured individuals alone were permitted to see it; this by the express order of the authorities. Beyond the publication of photos (taken from a favourable position) and an imaginative sketch perspective in the local Press, the citizens themselves had no opportunity of forming any opinion on the real all-round appearance of the new scheme or what it actually involved. To devise effective action in the circumstances was, of course, impossible, and, though a great number of protests and appeals by the best-known Liverpool architects were published, nothing more could be done.

It may be asked, What was the explanation of this sudden *coup*? Simply this. The members of the Finance and Memorial Committees, having drawn upon their heads the universal execration of artists and connoisseurs eight months ago, bitterly resented the exposure of

their own ineptitude. The discovery that their will could be thwarted by the sheer force of public opinion, if on sufficient time were given for the opinion to be instructed, was as pleasant as it was surprising to them. This time they determined there should be no mistake. They have publicly professed to regard the opposition to the original proposal aroused as being engineered by persons too young and inexperienced to be taken seriously, whose motives were either a misguided conception of their own importance or mischievous determination to damage the reputation of the civic authorities and acquire personal advertisement. That the Committees had the support of only two well-known architects, sculptors, and a painter mattered nothing. To save their face, at any rate, the Committees decided to run no risks, and followed therefore a plan of campaign which does infinite credit to the circumspection.

As might have been anticipated, the Council debate revealed abysses of fatuity and ignorance, cheap Corporation wit abounded—puns on "odium" and "podium," etc.—and other evidence of general incapability of realising the nature of the proposal under discussion. Much of what we suppose to be "parliamentary capital" was made out of the suggestion that the memorial should be placed on the site now occupied by the Beaconsfield statue. This was denounced as a Radium dodge to insult the Conservative majority in the Council. Several admiral speeches were delivered in a last effort to save the Hall, but the majority of the Council, fearing the consequences of admitting the incompetence of the Committees, deafened their ears. A final sacrifice of Elmes's masterpiece by a sixty-seven votes being in favour of the scheme submitted and only twenty against.

Still more significant was the defeat of a subsequent proposal to delay the execution of the work for a month, in order that the architects, and through them the general public, might have some opportunity of giving their opinions on the matter.

An unfortunate circumstance assisted in the disaster was the intentional unintentional misreading of a statement coming from a quarter always associated with the strongest opposition. The statement, which was widely circulated and undoubtedly had, in its misinterpreted form, a great influence, pronounced the new scheme to be an improvement on the old, but only if accompanied by drastic alterations in the site and the provision of a great door within the Hall directly behind the outer door, making the latter a principal entrance and giving a *raison d'être* for the statue. The promoters of the new scheme had the pronouncement as if it were weakening of the opposition and admission that they were at last justified in their persistence. A vague but not the less mischievous impression was abroad that "a happy compromise" had been achieved so dear to the English temperament and always mistaken for public matters for "sound statesmanship"—had been arrived at, and subsequent efforts could wholly dispel

tion. Few members of the Council saw, wished to see, that the new scheme was an improvement on the old in so far as it was accompanied by far-reaching and costly modifications of the site and a change in the plan of the building. In our own opinion, any suggestion at that the new scheme can be made probable by altering the interior of the building is incalculably dangerous. We are convinced it is a far wiser policy to withhold from the Philistines all opportunity for further mischief, to give no vent to a greater catastrophe.

As it stands, the new scheme is as fortunate as its predecessor. In the latter it may be remembered there was, to an arrangement of dog-legged steps, cut out of the podium and in the centre an equestrian statue. Then the statue was relegated to the east end of the podium and another pedestal for a statue group placed at the west end. Now in the new scheme the whole of the middle of the podium is cut away and the introduction of a wide flight of steps parallel to those already existing is inevitable. Projections are thrown out from the remnant of the podium partially to lose the lopsided avalanche of steps, and on the projections pedestals for equestrian statues are placed, the east being embellished by the work of Sir George Gilbert Scott, the west to remain plain till some sufficiently illustrious personage has the good grace to die.

The position of affairs is almost irredeemable. To start with, the Memorial Committee decides to have an equestrian statue, the essential inappropriateness of which we need not press. Then they propose to consider the dozen or more excellent sites vacant in the city, and to receive the idea of laying hands on the site of St. George's Hall to provide a setting for their equestrian statue—albeit, having conceived the idea, the only objection seems to have been just how much mischief they could possibly do. Finally, they approve a scheme whereby the ratepayers are levied of 2,500*l.* to provide a series of steps leading nowhere and meaning nothing, and in which the actual memorial statue is made to balance an empty pedestal. It is a unique achievement in the annals of municipal futility. Before this supreme accomplishment can be reached have been many preliminary steps, it is true—the dismal Niagara steps in front of the William Brown statue, the wilderness of stone called John's Gardens, the Queen Victoria Memorial. But all these follies pale beside the new memorial scheme.

The most casual survey is sufficient to condemn it. The steps sprawl asymmetrically over the pavement and take away the impression of lofty, immutable length that was one of the glories of the south facade. They make it appear as if slipping down the hill. The jagged, cheap line of the steps where they merge one by one from the pavement emphasises the fact that the whole facade has been thrown out of balance. Resupposing the necessity of altering the south elevation of the Hall, a scheme by Mr. Horatio Farnham was published which had points of vast superiority over one adopted. In it the lower courses of the podium were retained to form a

level plateau upon which the steps descended at a regular angle.

In conclusion, let us make it quite clear that if the Liverpool Corporation thinks it can perpetuate artistic outrages of this sort with impunity, no greater mistake could be made. St. George's Hall is not the property of the gentlemen whose business it is to manage municipal finances, trams, and drains. It belongs to those persons whose minds have been fitted by education in and natural sensibility to appreciate "the most grimly intellectual of the arts." In this matter there is no question of "the agitation subsiding," "the storm blowing over."

We can safely predict that this work, if carried out, will ultimately be destroyed and the podium replaced—just as St. John's Gardens, upon which 40,000*l.* was wasted, will also be effaced and redesigned.

NOTES.

The New Capital of India.

THE reincarnation of the ancient and romantic city of Delhi as the seat of empire in India is no doubt an act of the first political importance. Few administrative measures make so striking an appeal to the imagination. Delhi has not only historical associations, but architectural ones also of no mean importance. The transfer of the headquarters of the Imperial Government from Calcutta will involve the erection of new Government buildings in proximity to the fanciful and poetic creations of the old Mogul Emperors. It is much to be desired that the Government of India will rise to the height of the occasion and realise that this is a most important event—a unique opportunity—in the architectural as well as in the political world, and will make some special effort, outside the ordinary routine of their official departments, to deal with the architectural problem in the same imaginative spirit as inspired their political action. Here, if anywhere, an artist, not just a competent and reliable official, is needed. It may be necessary to improve the sanitation of Delhi, but the one unpardonable sin would be to vulgarise it. Presumably a new Imperial quarter will arise laid out in a manner that is suitable for State ceremonies. Here the recent experience of the Durbar should be useful, involving as it did the lay-out of a temporary city for ceremonial purposes. This might possibly suggest a ruling idea for a permanent one which is now to come into existence.

The Object of the British School at Rome.

WE can heartily sympathise with Professor Reilly's anticipations, as expressed in his letter to the *Times* of the 7th inst., that the British School at Rome will have a permanently beneficial effect on our architecture. In pointing out that, compared with other countries, we sadly need the strengthening influence of classic studies Professor Reilly enforces his arguments by references to John Wood's work on Palmyra and Robert Adam's on Spalato, and by contrasting such studies with the unhealthy practice which results in a new piece of detail, or some ingenious trick of design, spreading

like an epidemic through the architecture of the day. While a great deal of modern "free classic" is "free from nothing so much as the classical spirit of refinement and restraint," we must look to the architectural students of the new school to supply the much needed corrective to such a state of affairs.

SIR EDWARD J. POYNTER Lady Students in his address to the of Art. Royal Academy students

and their friends on the evening of December 9 referred, as he did last year, to the successful work done by women students. He attributed the results mainly to the better powers of application possessed or exercised by the lady members of the schools. The President alluded particularly to the work of Miss Margaret Lindsay Williams, who, it will be remembered, secured no fewer than four prizes last year. This year this industrious painter wins the coveted Gold Medal with Travelling Studentship, also the first prize (30*l.*) with medal for her design for the decoration of a portion of a public building. A point which arises naturally in regard to this promising career, officially approved by Sir E. J. Poynter, is the future eligibility of Miss Williams for Associateship of the Royal Academy. Mary Moser and Angelica Kaufmann were original members of the Academy, and in recent times Lady Butler was only two votes behind when Sir H. von Herkomer was elected Associate. Can it be prophesied that Miss Williams, trained in the Schools and possessing the artistic qualities admired at Burlington House, will break down the barrier of sex which has existed since the foundation of the Royal Academy, and in due course, if her progress is maintained, be elected A.R.A.? There seems to be no reason why such an honour should not be conferred, if in Academic circles women continue to out-paint the men. The ranks must be filled. It may be mentioned that Miss Williams is not the first lady who has taken the "Gold" for painting; Miss Louisa Starr took it in 1867 and Miss Jessie Macgregor in 1871. Since 1879, when the Studentship and Medal were combined, one lady has won the distinction, namely, Miss Robilliard, in 1909. So far the women students have not challenged the supremacy of the men in the architectural school.

The Semi-Nude. A few weeks ago we illustrated some female statues used as lamp

standards outside the new Town Hall at South Shields. These figures have given offence to certain inhabitants who, not entirely on their own account, have protested because they fear the youth of the town will be demoralised. Sensitive maids have been seen to blush in self-consciousness, and all the usual objections are raised. We had them in London when the Venus of Velazquez found its way to the National Gallery and when Mr. Epstein's figures were placed on the British Medical building in the Strand. The supposed outrages on modesty are usually exaggerated on these occasions. The best course for the South Shields Town Council to take is to remain neutral in the controversy. The attention directed to the statues

shadow such as is cast by an arc-lamp is not wholly pleasing; its contrasts are too violent, and deprive the subject of that continuity which is essential to artistic effect. Atmosphere, by toning down the shadow effect, gives in the beautiful half-tones the soft, almost inimitable gradation of light upon a rounded surface, which forms an essential factor in repose.

Eve's golden rays
Falling on glade and stream,
Flecking the forest path with slanting beam
Made glorious by her minister the shade,
Sinking through the distant air
The purple haze

Colour.

There is still one great factor in connexion with texture upon which I have not touched, and that is colour. It would be impossible to trespass upon your patience by attempting to give any details on this subject, which has been often treated from an artistic standpoint in more scholarly effusions from this rostrum. Physically, however, colour is due to two things—the composite nature of most sources of light, which are really made up of coloured rays, and the power of most bodies upon which such rays fall of absorbing some of these colours more than others, and thus reflecting a mixture of rays dissimilar to those falling upon them. Ordinary sunlight and some artificial lights (such as acetylene) are composed of the various colours seen in the rainbow, which, mixed together, produce the sensation of white. When such light falls on a red brick, most of the blue rays are absorbed and converted into heat; the reflected light, therefore, contains such a preponderance of red rays that the object appears red. It is obvious from these considerations that the further light penetrates into a light-selecting or coloured body the deeper will be its colour, since the less will the amount of unaltered light merely reflected from its external surface. This is well illustrated by the fact that transparent coloured bodies in large pieces are deeper in tint than the same substances in the form of powder, examples of which I put before you. As it can hardly be denied that texture is affected by colour, this quality must then be influenced by the nature of the light in which the body is viewed. If proof is wanted, it is only necessary to repeat the make-believe ghost stories of our children's days and enter a darkened room with a flame tinted with sodium vapour from salt. You will readily observe the changed appearance under these conditions of the coloured powders on the table.

The wonderful play of colours which we value so much in many materials, the beautiful veins of marble giving us greens, reds, and yellows; the warm, cheering tint of Ham Hill stone; the blending of purples, browns, and reds on our sand-faced bricks, are all due to the wonderful variety of absorptive properties possessed by bodies of slightly different chemical compositions. Further, be it noted, nearly all colours in materials are due to that, at least in artistic circles, much abused metal, iron, in an oxidised form.

I have endeavoured to show that the texture of materials, the existence of which, I

think, it is not proposed to deny, depends upon various factors operating in various degrees. Some of them are certainly physical, and are thus amenable to the application of scientific investigation; others are, no doubt, temperamental, and hence are hardly reducible to distinct terms in the present state of psychological research. I take it that you have not called upon me to answer the question which forms the title of this paper. It may be that the correct attitude towards texture is that of the mechanically-trained mind, which makes symmetry of form down to the last mathematical detail a fetish, and that the worship of these irregularities which constitute texture are the outcome of a disordered brain distorted by long hair and a velveteen coat. The decision I leave to you, and at the same time give you my thanks for your patience, and my pleas for lenient dealings with my oratorical and critical shortcomings."

The lecturer showed several interesting lantern slides of the structure of building stones and timber.

Mr. A. R. Jemmett,

in proposing a vote of thanks to the lecturer, said he wished he were permitted to deal with the scientific side of the question. As it was, he would start with the question that the lecturer asked as to whether texture is a fetish; but the trouble was to know what was a fetish. The lecturer had carefully defined texture, but he had not given a lead as to "fetish," but he (the speaker) took it that it meant a sort of false god. Mr. Munby did not appear to regard texture as a fetish, or he would not have taken so much trouble in preparing such an interesting paper. No doubt there was something in texture, but the way it was used in modern work the idea of importance attached to it nowadays—was distinctly a fetish. In modern domestic work one found buildings in which more importance was attached to the material with which it was built than to the forms and proportions, and there were many architects who let their buildings "happen," as it were—their forms and shapes "happen"—and trusted to salvation to the beauty of the brickwork with which they built. A great deal of our architecture nowadays let the features and forms "occur," trusting to the bricks to pull it through; but the finer the design the less it depended on the texture of materials. If they got a little hut or barn or house with no particular interest in it of design it was saved by the materials, but if they erected a building like a Greek temple or Gothic cathedral, the texture of the material was of very little importance. All the finest effects of the buildings—the characteristic effects of the buildings—came when one was at such a distance from the building that the texture could not be seen. If one looked at St. Paul's Cathedral from Waterloo Bridge the buildings created an impression on the mind, a grand effect, which, no doubt, "texture" had something to do with; but the actual texture of the stone was a matter of little importance. In the same way the texture of the material had very little to do with the

impression created in looking at Lincoln Cathedral. Or take the west front of Notre Dame and view it from the square and then from the other side of the river—the building could tell its story, and impressed one, even if it had been built in cement. Or take the Parthenon and view it a few hundred yards away—it would look just as well if cast in cement. They could go close up to a building and, appreciating the point of view of texture of the materials, get the effect aimed at; but when they got away some quarter of a mile the texture disappeared, and any bad proportion struck one, and the building had no fine effect on one at all. In that way he thought there was a great danger in modern architecture of making a fetish of texture. Mr. Munby said that a perfectly plain surface would not interest anyone, and that the importance of texture was its variety. That was obvious in a way, as the sky at night would not interest one if there were no stars in it. We wanted to get the variety on the surface in order to get interest, so that from that point of view the production of texture was the whole art of design. They had to take perfectly plain surfaces, and proceed to ornament or mould them, and texture was got by this modelling—the giving of light and shade, and producing a texture which, seen at a distance, looked well, and from that point of view texture was not a fetish.

Mr. H. D. Searles-Wood

seconded the vote of thanks, and said that, in regard to the lantern slides they had seen, Mr. Munby had formed an album of sections of stone at the Institute, and had written an interesting introduction to them. Anyone who wanted to study the question of stone could not do better than get that book from the Institute library, for it contained a great deal of interesting information. With regard to texture, there was the question of bricks and mortar joints, and whether the work was fresh from the builder's hands or whether an interval of a few years had elapsed when the effects of the weather had told on the joints and when they were very far from satisfactory. That was the point where the picturesque ended and the painful began. It was a difficult point to determine how far good solid construction should give way to texture. As to the small bricks which were such a fetish at the present time, they made bad bonding. Small bricks did not make good brickwork unless there were small bricks throughout a wall, and that was a luxury which few of them could afford. With regard to the sections of wood, anyone could make them; it was a fascinating way of studying the wood question. Could Mr. Munby give them a reason why colour faded in materials?

Mr. J. D. Crace

said that it must not be overlooked that certain stones were adopted—Portland, for instance—not for uniformity of colour, but because they stood the climate, especially the climate of cliffs, better than other stones that were available. Stone required definite treatment in mouldings; if one took Ham Hill

Ketton Limestone.
(Magnified 20 diameters.)

Ham Hill Limestone.
(Magnified 20 diameters.)

it, it would be absurd to put in the same oil as in Portland stone. Ham Hill stone is admirably suited to buildings of a simple order, but it would be wrong to introduce ridings or carving unless on a large scale. A desirable character of stone, therefore, did depend merely on texture, and, after all, it sank into insignificance in the distance. The case of wood of even grain, a much more beautiful effect was obtained without polish, only such as would preserve it from the action of damp and weather. As to wax with solvent being a protection, the wax was rather without the solvent, as in damp weather the solvent was apt to come to the face again. As to metals, in some cases it could be polished, and the other part would show the texture, and the combination of smooth and texture was often of great advantage. He did not think that anyone would object to the natural surface of wrought-iron, which the same excuse and the same advantages could be claimed as for the natural face of wood. Atmosphere entirely modified appearance, and that was where texture led to be of consequence. As to colour, though it was quite true that colours were actually affected by how much they were taken up in the actual pigments, when they were once put on to a surface it was practically not very much affected. It was the difference between making a water-colour wing on a smooth paper or a rough one. Was there not considerable risk in trusting too much to these adventitious circumstances of building material? It seemed to him that that was a thing which every architect in practice would gradually experience. When they were considering architecture as art these variations assumed an importance, except to this extent that each material should have its own treatment, and other than that was a treatment consequent on its use or on other circumstances was a subsidiary question; but there was always the danger of laying too much stress on the adventitious conditions of surface or other things. He had noticed that whenever he had been sent on discussions on his favourite subject, the colour question, the question was at once raised: is it more successful in oil or in fresco? That was a question quite far from the question of the use of colour.

T. L. Dale
It was largely a matter of design as to whether the texture was of importance or not. It was largely a question of scale. If a building was of sufficient importance to produce an effect, texture was of slight importance, but if the building was something like some of the ideal homes, texture then a matter of importance. If they were relying on form as in a Greek temple, they could afford to disregard texture; but in ideal villa texture was sometimes the only thing which could be made at all interesting.

H. W. Britton
He always felt that the Greeks snubbed marble. In marblework they relied on fine shape and form, but form was what they got at chiefly.

Mr. A. E. Bullock having spoken,

J. B. Scott
That the materials of to-day were better than those of twenty years ago. Care ought to be given to the selection and use of material. He had remarked that if you looked at building half a mile off it did not matter what the material was, but we had to look at buildings close to us as well as at a distance.

Mr. Alec Horsnell said that every material had its texture, and an effect could be got out of it if used in a right way.

T. C. Yates
He agreed to Butterfield's work, and said that Butterfield was one of the grandest architects of his time, but he failed in texture. The College was a fine design, but the whole was overloaded with ornament; one was hindered by ornament. If Butterfield had used Mr. Munby's paper he might have lifted his external decoration, and his designs would have given even more pleasure than they do.

C. G. Boucher
The Greeks did not trouble about texture, they were going out of their way to get rid of it.

He did not agree that a flat surface gave a better notion of material, but a polished one did. If one polished granite it gained density of tone and colour. A water-colour drawing when it was glazed was far deeper in tone and colour than when unglazed.

Mr. N. Hadwen having spoken,

Mr. A. T. Bolton

said it seemed to him that one point was that colour depended upon texture. He had a particular affection for the old London chimney-pot, such as could be seen at Kew, and he had desired to put some on a house he designed, and the result was that the apparently red pot at a distance of, say, half a mile looked black. The reason for that, he believed, was that the old chimney-pot made on a potter's wheel had an open texture, but the modern ones were produced by a machine in the same way as drainpipes were, and the density of the material caused the light to affect the colour in the way described. It seemed obvious to him that colour and texture were intimately connected. The examples of ground and unground materials which Mr. Munby had shown greatly interested him (the speaker), because some years ago he gave a good deal of attention to mosaics and carefully examined some of those old ceiling mosaics at Rome and elsewhere, and he discovered that those beautiful blue vaults were produced by variations in the size of the tesserae and the size of the texture and the coarseness of the material. The importance of that was great; and spacing and jointing had a good deal to do with the result. He did not agree that the Parthenon would look the same in Portland or any other cement; the quality of the marble was intimately connected with the design. A problem was why some buildings were regarded as exceptionally beautiful? To the translucency of the marble, which modified the shadow, had been ascribed, by Mr. Chisholm, much of the beauty of the Taj Mahal; and that would apply to the Parthenon. The translucency produced by the polishing modified the shadows precisely as it did in the Taj Mahal; but with marble and a brilliant sky they had a good many of the trump cards which we did not get in this country. In Seville there were some late-period buildings, with common, washed-out, red bricks inlaid with tiles, and under the sky of Seville these lines matched the sky, the combination being very effective; he had seen from above these tiles were nothing but the commonest black tiles, and it was the sun shining on them that produced such a glorious effect. An artist saw a thing as true without necessarily knowing the true scientific reason for it; his observation might be true and his own reason for it wrong. Mr. Munby's paper showed how intimately science could help them. As to Mr. Butterfield, the answer was that the architect said his buildings would require 100 years before they could be judged, and Keble was not as old as that yet; but that would not help the inside, which was very trying in colour effect. He had always been greatly interested in the subject of old stone walling, and in order to see how it was done, had often measured lengths in various places. Wanting to get a garden wall built rather more like the old work, he bought a quantity of old stone, and, instead of employing a mason, he got a common labourer to use the material with the help of three or four other labourers. The result of their work was splendid, for it looked like a bit of some old medieval castle thrown up in a hurry with the enemy on the horizon. Though the local builders and masons did not like it at all. Later on it was necessary to make some alterations, and he let the ordinary masons do the work their way, only stipulating that there was to be no cobweb pointing, with the result that it looked like part of the ordinary seaside church—surely the lowest limit of rubble masonry. That all showed the advantage of starving old methods of walling and then setting men in a given locality to build in the way they could understand. He agreed that the size of a work was of importance in considering the question. He always thought that the very expensive bricks used in the outside of a great structure like the Westminster Cathedral were wasted, for common stocks might just as well have been used, judging by the effect of various old buildings he had seen, for the design would have looked as fine, if not finer, and the

money saved could have been spent inside, where it was needed. That was an illustration of texture being carried too far. Design and scale had a great deal to do with the question. As to wax and solvent for the treatment of woodwork, it was all right if the solvent used was spirits of wine. It was expensive, but the treatment prevented the wood taking up dirt in the objectionable way in which it had in those premises, and the solvent evaporated.

The Chairman,

in putting the vote of thanks to the meeting, said that in olden times design counted for more than texture. It certainly seemed to be the case that the old builders had not texture in mind, but they had the effect of colour; nowadays, we seemed to have lost sight of that, though some speakers had alluded to it that night. As to Mr. Grace's remark that each material should have its own particular treatment, that seemed most true, but the difficulty was to know what the treatment should be. He remembered a modern church roof made of plain deal which looked very well, and a few years afterwards he saw the church again, and he found that the roof had been varnished, and the effect was horrible—the beautiful colour of the wood had gone and the varnish had taken its place. During one's practice one found out what was the best way to treat materials.

The vote of thanks having been heartily agreed to,

Mr. Munby,

in reply, said he quite agreed with Mr. Jemmett that, if one had a big building and viewed it from a distance one was fairly independent of texture; but this involved architectural form, which was really outside the discussion. At least, that was the spirit in which he considered the proposition, i.e., that they should try and consider texture apart from architectural form altogether—as applied to a flat surface. As to the R.I.B.A. book on stones with which Mr. Searles-Wood had credited him, it had really been produced by the Science Committee. He hoped it was of some value as indicating the texture of stones and distinguishing one stone from another. In reference to the use of 2-in. bricks, 2-in. stocks could now be obtained, and there was no reason why good bonding should not be got if the work was carried right through. They were rather more costly than ordinary stocks, but not excessively so. Mr. Searles-Wood had referred to the fading of colour; a colour changed when light decomposed the material and changed it into something which had no colour or but little colour; it was the result of some actual chemical decomposition. He quite agreed with Mr. Grace that one cannot get fine finishes with Ham Hill stone; but in some districts there was a fair amount of carving carried out in the material, and it was a stone that could be recommended where one could not afford architectural detail. Touching the question of solvents, there was a difficulty in getting beeswax into the wood without the aid of a solvent. With the use of spirits of wine or turpentine, the wax could be got in easily, and then the solvent would evaporate. The final effect would depend on the amount of labour put into the work. As to Mr. Grace's remarks about metals, he (the speaker) did not mean to suggest that in a fine decorative scheme polished metals as a contrast would not be an advantage in a good many designs. Dealing with the question of treatment, the lecturer remarked that if architectural features could not be afforded, what was to be done? It was often as much as one could do to get clients to use 2-in. bricks, and many must, for small work, depend largely on texture. Something had been said about the range of use of materials. They were trying to find out at the Institute why roofing tiles failed. He was told by a manufacturer not long ago that people would have roofing tiles made in certain old tints, and in producing tiles of that tint the material was improperly prepared; that was due to the insufficiency of knowledge of what certain materials would do; it was clear, therefore, that the use of materials should be confined to certain recognised limits. A speaker had suggested that the materials of to-day were better than they

will be diverted by other interests in the locality, and the public will soon get used to the new appearance of the Municipal Buildings and their decorative features. If anyone sees moral danger in the representation of the female form it is due probably to personal idiosyncrasy, and the agitation in South Shields may be dismissed as prudish.

Overstrand Church. HAS not the Society of Antiquaries rather over-shot the mark in its protest against the reconstruction of Overstrand Church? On general principles we should be disposed to agree with the attitude taken up, but think it open to question whether they are applicable to every case. A derelict run stripped of its ivy and regarded as a sort of museum piece to be studied by the few earnest archaeologists who may find themselves in the locality does not make a strong appeal to our imagination, and, though this form of preservation may be entirely justified where there are features of unique or exceptional interest, there is also something to be said in favour of the sentiment of worshipping in a place hallowed by the tradition of centuries, even though the actual structure may be to some extent a modern one.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The third general meeting (business) of session 1911-1912 of the Royal Institute of British Architects was held on the 4th inst. at No. 9, Conduit-street, Regent-street, W., when the following gentlemen were elected:

As Fellows:

H. Barnes, West J. Swain, East Boldon.
Hartlepool, Sunderland.
H. W. Bird, Hong R. D. Wells, London.
Kongr. China, H. White, Loughton.

As Associates*:-

M. S. R. Adams, Bedford Park, Chiswick.
L. M. Angus, London.
E. E. Barks, London.
P. L. Baxter, Great P. Stannice.
H. J. Benians, Goudhurst.
W. T. Benlynn, Birmingham.
R. H. P. Bevis, Southsea.
A. G. Blackford, London.
K. S. Broad, London.
B. Brown, Bradford.
M. Brown, London.
J. E. Bullock, London.
L. H. Clarke, Harrogate.
J. C. G. Davies, Morriston, Glam.
W. F. Davies, Liverpool.
C. Davis, Putney.
C. A. Edison, Derby.
A. F. Evans, Liverpool.
L. J. Finning, Pinhoe, Exeter.
W. T. Gerbutt, Bradford.
W. S. Gorrings, Seaforth.
B. M. Godwin, London.
G. D. G. Hake, London.
C. A. Harding, Glasgow.
G. W. Home, London.
T. C. Howitt, Nottingham.
J. N. Keeseeley, London.
F. W. Knight, London.

W. Lawson, Newcastle-on-Tyne.
A. D. Leroy, London.
P. N. Logan, Bristol.
C. W. Long, London.
M. E. Martin, Brentford.
F. E. Mennie, London.
H. I. Merriman, London.
A. H. Mottram, London.
G. E. Owen, Sydney, New South Wales.
T. A. Parker, Cole, Lancashire.
J. W. Paterson, Edinburgh.
I. M. Pritchard, Chiswick.
H. L. Samson, London.
C. M. Swannell, London.
F. H. Swindells, London.
M. J. Tepper, London.
H. Thornton, Dewsbury.
A. G. W. Tickle, London.
H. West, London.
J. T. Westbye, Christania, Norway.
A. E. M. Whitehouse, Manchester.
N. Wiggell, Sunderland.
L. E. Williams, London.
A. W. Wilson, Cumbergate, Peterborough.
C. R. Winter, Bourne-mouth.
H. Wormald, Wakefield.
C. Wright, London.
A. M. C. Young, London.

As Hon. Associates:-

Walter Crane, R.W.S., Commandador Royat.
Crown of Italy, Kensington, W.
J. H. Marshall, M.A. (Cantab.), Companion of the Indian Empire; Director-General of Archaeology in India; Benmore, Simla, India, and East India U.S. Club, St. James's square.

All the applicants for Associateship passed the Qualifying Examination in June last.

Election of Licentiates.

At the Council meeting of December 4 the following candidates, having been found eligible and qualified under the Charter and by-laws, were elected Licentiates of the Institute in accordance with Bylaw 12, viz:

C. E. Ainley, Manchester.
J. Arabian.
R. J. Archibald, Middleborough.
C. W. Bell, Sunderland.
W. H. Bridges, Skegness.
B. Cooper.
A. H. Coyle, Baroda, India.
G. H. Davies, Pontypool.
W. A. Dew, Hyde, Cheshire.
A. E. Dick, Aberdeen.
C. H. Dyer, Bloemfontein.
T. Glassebrook, Stourbridge.
C. I. Greenhow, Newcastle.
C. H. Grieg, Edinburgh.
W. Hall, Oudshoorn, South Africa.
E. W. Hilton, Altrincham.
L. Holdsworth, Wakefield.
G. W. C. Lane, York.
V. A. Lawson, Stroud.

F. G. I. Legg, India.
J. M. Lewis, Madras.
J. Lowson, Aberdeen.
D. Macdonald, Dingwall.
T. Malvern, Cheltenham.
W. T. Margetts.
R. T. Miller.
B. C. Palmer, Lewes.
E. Pawley.
P. Reid, Kirkcaldy.
W. H. Scott, Cardiff.
S. Selwyn, Eastbourne.
W. G. Shipwright.
H. A. Sisley, Manchester.
C. B. Smith.
C. B. Spark, Sydney, N.S.W.
A. W. Stabler, Durham.
J. H. Stanford, Toronto.
S. Taylor, Burnley.
H. Townley, Manchester.
G. J. Viner, Morris.
J. D. White, Southampton.
A. R. Wood, Burslem, Staffs.

THE TEXTURE OF MATERIALS.

A COMBINED ordinary general and Camera, Sketch, and Debate Club meeting of the Architectural Association was held on Monday at No. 18, Tuford-street, Westminster, S.W., Mr. Gerald Horsley, President, in the chair. Mr. H. A. Hall, Hon. Secretary, made the following announcements:-

Meeting of the Camera, Sketch, and Debate Club on January 18, at 7.30 p.m. Paper by Mr. C. G. Boucher, A.R.I.B.A., entitled "Architectural Perspective."

First spring visit on January 6. Further particulars will be announced later.

The following gentlemen were elected as members, i.e. Messrs. A. Harris, Victoria street, S.W.; R. Sheppard, London; R. S. Wilshe, Finsbury Park, N.

On the motion of the President, a vote of thanks was accorded to Mr. Arthur T. Bolton for presenting diagrams of Jacobean plans to the School.

The President then nominated Mr. Theo. Frye as a member to serve on the Council to fill the present vacancy.

Mr. Alan E. Munby then read the following paper, entitled

"IS THE TEXTURE OF MATERIALS A FETTER?"

"When I mentioned the title of this paper, which your Hon. Secretary has been good enough to select for me, to an eminent official of the Institute in the hope that he would supply me with many volumes dealing with the subject, he was unable to do so, remarked, 'Well, I suppose all you can say is 'No.' My rejoinder was that, although he had gauged my literary powers with more severity than kindness, I felt a doubt as to whether so terse a paper would be exactly what was expected of me, and whether it was the best preparation for a discriminating discussion.

What is Texture?

To begin with, what is texture? One's first impulse is to appeal to Dr. Johnson and digest his definition, but the understanding of terms is not really synonymous with the defining of them, and it is the understanding with which we are now concerned. We probably all understood the feelings of the artist recently depicted in *Punch* who, on being asked in a restaurant by the amazed Phyllis whether he were really going to take brown sugar with an ice, replied: "I am, though; it gives it a texture." It is obvious that vanilla ice, with its absence of life and its unvaried surface, would be vastly improved in appearance by the addition of brown sugar, reflecting light in various directions and presenting irregularities of surface which must add interest and thus tempt investigation. It is with this question of variety that, I take it, texture is mostly concerned. Why is a tube station built of glazed faience, wholly unpleasing to the senses, when a dilapidated plaster cottage, stained and weathered with age, is able to charm our vision? Does it not depend upon the variety displayed by the latter? Select any particular feature of the plastered wall, say, a brown stain, or a sufficiently minute scale to deprive it of variety, and repeat it as the whole wall; the effect is dull and devoid of interest; the surface would lack texture owing to repetition. We are, be it observed, speaking of repetition of featureless surfaces, and repetition of architectural forms; few, indeed, would criticise the view that repeated architectural features, if these are initially good, make for repose and stateliness in buildings more than anything else.

If, then, we are to attempt a definition of texture, it should perhaps be variety on a minute scale, and we have now to inquire as to the nature of this variety. Has it a real existence as a physical entity, and, so, does it appertain to the material itself, or to the conditions of our inspection as regards light and atmosphere; or is it a thing merely of artistic cultivation or inborn feeling; or the result of mental training, whereby some and not others are affected?

Perhaps these questions are best answered by taking some individual substances and considering their physical properties and conditions of inspection.

Bricks and Tiles.

Let us take the material which forms the external surface of the vast majority of buildings in this country—brick. There are some hundreds of varieties of bricks, but we will confine ourselves to the consideration of two. If we go north of the Trent and examine some of the important brick structures we shall find that the pressed bricks of Accrington have a great virtue. They are a dull red, with a semi-vitrified face, and therefore are non-retentive of dirt and subject to surface erosion; moreover, they are large, being a full 3 in. thick, like most North-Country bricks. Very little variety is to be observed in them, and the mellowing hand of time offers to such materials in vain the insidious germs of decay. As they built up so will they remain in tone, character, and semi-sheen.

Now turn to the little hand-made, sand-faced bricks, such as those obtained from Clare, in Suffolk, rough, rich in purple patches, and bubbling with variety. What do they charm us? Is it not their irregularity? A sand ripple here, a flint there, a purple header to the right, a brown one to the left; it is surely variation which produces upon certain minds a sense of artistic satisfaction and a quiet feeling of repose and harmony. This state of mind, however, is not universal. I remember a builder who had much admired an architect's work expressing his disapproval in no measured terms at the (to him) inartistic effect of mortar joints an inch thick; and I have heard exclamations of approbation from a clerk working on a roof of hard-pressed tiles laid with a mechanical precision worthy of a dividing engine. Whether such approbation came from a well-ordered mind or from one untutored is for your decision this evening. Brick architecture is, indeed, capable of an immense variety of expressions according to the size and nature of the component bricks, quite apart from architectural treatment, and Nature lends further aids with her soft touches of vegetation.

of the most beautiful pieces of brick-I have ever seen is that composing the houses at Audley End. There is nothing striking in the design of the buildings, brick string courses, brick mullioned, arched-headed, leaded windows, very irregular, spaced, and, running out of the main of roof, gables in brick, some of them unpaved. But the rich mellowness of the building bemossed and lichened, as I lately saw it, in the full glory of a sinking left a most vivid impression on my mind. I am curious to note withal that, whether or be a fetish or not, the forces of nature seem to treat more kindly those walls which possess the charm of irregular surface, than those which attempt to elude her weathering and eroding tendencies. The hand-made tile, rough and bent, which makes a home for the seed and the moss spore, is oftentimes when found to be as hard and durable as the made yesterday instead of a century whereas the pressed tile and the terra-cotta, unless made with consummate skill, soon flake and shell, giving an appearance of dilapidation which is anything but pleasing, because it is the direct effect of mechanical disruption.

Even bricks and tiles are to some extent artificial, and what texture they possess is result of mechanical treatment. Let us turn to some materials of Nature's own making and see whether this quality of her is really a thing to be found in the natural products of the earth.

Stone.

What of stone? We must dismiss from our minds the lofty Gothic spire, with its delicate tracery laid against a blue vault of sky, or the dignity of a Renaissance façade, and the only of the flat surface of an individual of stone.

Our big cities are apt to employ stone in a too purely architectural standpoint—to utilise it for the expression of conventional features more than for what it can do for itself. Perhaps the unequal struggle between the material and the enveloping city grime is an excuse for this, but away from the town the stone may be given scope for its own beauty, unaided by form, which, on the score of it, often proves its only possible use. Indeed, that it were more often so used, and that the speculative designer stay his hand on the production of a pretentious ornament, to retain his masons' wages in exchange for the thought in the selection of his material.

At stones differ in texture is a problem which hardly requires proving, how much they differ is perhaps not fully realised. Again, we find that when relied on the material itself for effect, the sense of grain provides, at least, to the highly disordered brain of the artistic, the set sense of charm. A plain window in Ham Hill stone is delightful; the treatment in York stone is dull and banal. In London we all use Portland stone, but whether it is because we have been

brought up on the pabulum of successive repetition in the matter of specifying, or because the builder has a sacred horror of anything outside the coltite formation, has never been quite clear to me. I do not wish to degrade the theme of my discourse to a mere lecture on building stones, but, since texture is intimately connected with minute physical properties, I will venture to show you with the aid of the lantern a few specimens of enlarged photos of actual stone sections.

Now let me turn to another material of Nature's own production—timber.

Timber.

For nearly all purposes for which timber is required in situations in which its characters can be observed, it is wrought, and therefore any texture it possesses must be due to the porosity and markings of the material. No timber to my mind is more attractive than that left clean from the plane and innocent of paint or varnish. Such absence of treatment is not always possible, however, nor desirable in all situations, but where protection is required beeswax rubbed into the pores of the wood in a suitable solvent will still allow the texture of the surface to remain, and will not prevent the timber from toning. Naturally, wood which is figured and which is cut to display the figure to the best advantage presents more attraction than unmarked timber, but even a piece of yellow deal will, after a few years of exposure, assume a tone which has much individuality. That woods, even of the same class, differ considerably in structure and hence in texture will be evident in viewing the sections of a few timbers which I place before you in the lantern.

Metals.

Compare the effect of an old chair possessing the hand polish which continual use can alone afford with the same piece of furniture varnished after leaving the cabinet-maker's shop. The wood is the same, but the texture is, in the former case, brought out and the tone of the wood mellowed; whereas in the latter such variety as the wood possesses is at least partly concealed by the unbroken gloss of the varnish, which reflects much of the light falling on it direct from its outer surface. In this connexion it is of interest to note the growing public appreciation of flat as against bright surfaces. A flat surface allows the penetration of light, and hence admits of a truer appreciation of the nature of the substance, more especially when viewed obliquely. The more the light is reflected from the surface of a body without penetrating into it the less will the particular characters of the substance on which the light falls be transmitted to the observer's eye, till in an extreme case we get a mere mirror, itself a characterless thing, returning the light exactly as it receives it. We may therefore take a perfectly reflecting surface as the antithesis of texturehood, which leads us to a mental reflection on the metals which perhaps of all our materials show the least texture, and, apart from cases of imposed form, a surface of metal is not usually regarded enthusiastically for

architectural treatment. Yet metals are not quite textureless, and all have in reality a crystalline structure, which may be brought out by etching their surfaces. The slide before you shows a piece of silicon steel (much magnified) etched in this manner. Our dependence on texture is well illustrated by reflecting on the distress we should experience did a client insist on his house being faced externally with sheet-iron plates; but new methods of construction are constantly calling upon us in the matter of treatment, and, should means be found to circumvent the atmospheric oxidation of iron, such a problem might be assigned to any architect, and the economical treatment of a façade comprising only materials poor in texture might well form a subject for a prize essay. Where a metal is soft and easily oxidised it is naturally amenable to assuming a texture through irregularities of surface. Old lead, particularly if cast, even in a plain waterpipe, may be very attractive to those possessing a certain mental attitude. Yet that roughness of surface does not constitute effective texture even in a metal seems to be proved by the (at least to some of us) horrible appearance of metals applied to surfaces in the form of powder. Aluminium paint, for example. It is possible that is such cases the sense of unreality causes in honest minds a feeling of revulsion similar to that produced by 5-in. by 1-in. stained deal—"oak," half timber-work—but the psychological dissection of one's feelings and the expulsion of bias in the matter of one's attitude towards so complex a thing as texture is beyond my mental capacity.

Atmospheric Influences.

I have endeavoured to deal with some more prominent materials individually, but the conditions of their inspection must not be overlooked. The question of atmosphere in connexion with texture was raised at the beginning of this paper, and undoubtedly atmospheric influences do affect the feeling which materials display. I have never seen a Tube station nestle, even in a London fog at sunset, but undoubtedly the hardness of its lines is lessened and its enamelled surface is deadened. Distance does, indeed, often lend enchantment, because of the softness it imparts, and possibly more owing to the inventive scope it gives to the mind, which mentally fills out the picture in a manner best suited to the timbre of the observer.

Atmosphere is not, however, merely an abstract artistic expression; a definite absorption of light takes place between its reflection from the object in its passage to the eye of the observer, so that objects viewed through a vacuum space would not have quite the same appearance as those viewed through air, more especially if that air contains, as it generally does, floating solid particles.

The irregularities of a surface are interpreted to us by means of light and shade. It is the shadow cast by the projecting pebble which makes its projection apparent, and the strength and sharpness of that shadow will depend upon the nature of the light and the distance of the object. The sharp black

(Magnified 20 diameters.)

are quite large; while the development from it of the Roman form is natural and easy.

There is only one Doric capital in the Museum, and that is of exceedingly late Greek character, and carved in the local white stone, with a shallow abacus and echinus, and with annulets replaced by flat bands, like those found just below true Egyptian capitals of all known types and dates. Again, it is possible that an intermediate form is recognisable between the types of Greece and Rome, but the evidence is insufficient to base a theory on. Certainly there is another similar capital near Alexandria, lying on the beach some half-mile to the south of Nelson's Island and the Bay of Abu Kir, so like this one in size and workmanship, so far as can be judged (for it has suffered much from the action of sea-water), that it might well have been another of the same range as that in the Museum. No more than this could be said, if it were not for abundant evidence that here, upon the shore, some 15 miles from Alexandria itself, there was at one time a place of considerable size, possibly a pleasure resort (Canopus is known to have existed somewhere in this neighbourhood); for the shore-line is broken up into a series of small, well-protected and almost landlocked bays with sandy beaches separated from one another by low headlands of coral rock, forming safe and delightfully picturesque bathing-places. Overlying the coral there is a softer rock, little better than compacted sand, which forms a low cliff, nearly vertical, and against this as a backing there have been buildings in the Roman period, extending out towards and in some cases into the sea. For a length of close upon a mile there are constant evidences of this, the escarpment being in some places given a facing of Roman tiles (or bricks), sometimes plastered on the surface, and sometimes of squared masonry; while in other places cross walls of the same materials project from the cliff towards the sea; and in yet others, and much more frequently, the coral bed has been worked in the solid into the shape of rooms with intervening walls, the present level of the floors being sometimes below and sometimes above the water level—which varies little, for there is scarcely any tide.

Most of these indications of a Roman settlement are fragmentary, and need careful surveying for their elucidation, but upon one of the promontories there is something more, the remains of what was obviously once an important building. Close to it, upon its north, there lies the Doric capital already referred to, having a diameter of 20 in., and a little further north again is a broken drum of a column, the approximate diameter of which is 22 in., of a beautiful blue marble veined with white. On the other side of, and almost adjoining it to the south-east, half-submerged in water, are great masses of worked granite, having every appearance of being portions of an attached colossal statue of Ptolemaic Egyptian character. Casual inspection from the shore could determine no more than this, though one fragment looked as if it were needed; a well-equipped party might spend some time in discovering more among the surf. So, too, it is with the building, of which a few rough dimensions only could be taken by a solitary individual having only a 2-ft. rule in his pocket, and but a short hour or two at his disposal. There would even be some danger in making a close examination of the passages through the apse walls, considering how the sea pours through; but the accompanying plan of half of this extraordinary place will indicate, with the notes made upon the spot, that it is worth close investigation. It is all submerged, it must be remembered, except the "walls," and these are not built but formed of the solid coral rock, out of which the chambers and channels have been hollowed; and the chambers are cut to a greater depth seawards than towards the shore, where they eventually rise above sea level, as if they had been the ante-rooms to an enclosed sea bathing establishment.

There is a possibility, it must be admitted, that these remains (which can hardly be called ruins, being little more than rock-cut foundations) were of post-Roman origin, with the exception of the colossal statue already mentioned; for even after the fall of Rome, Alexandria retained a great amount of its importance, rivalling Constantinople for a considerable period as the centre of the Christian faith—as it still is the metropolis, if there be one, of the Coptic branch thereof. Thus the mere presence of Roman bricks regularly built up in walls, and

of Roman masonry, can be taken as definite evidence only that the work was not carried out before the advent of the Romans. On the other hand, such evidence as there is of architectural work during the period known as the Byzantine is wholly to the effect that Alexandria was then, in an architectural sense, completely dominated by the great city on the Bosphorus. This is seen in the Museum, where there are several fine Byzantine columns and isolated capitals, equal in all respects to those of Constantinople, Ravenna, and Venice, and identical in spirit with such as would be found in either of those acknowledged Byzantine centres, of any date between the Vth and Xth centuries of the Christian era. There are, for instance, Ionic columns, with Byzantine dosserets resting on their capitals, carved with the Maltese Cross; but with the carving raised above the general surface and not sunk beneath it, as is almost invariable in Byzantine work elsewhere; but in the capitals themselves the dart replaces the tongue, and the volutes are crude. Perhaps it is only a suggestion with no proof to support it—these capitals belonged to one of the earlier Christian buildings, of a date even earlier than that of the foundation of Constantinople; for it is difficult to believe that the Byzantine style sprang into existence, without evolution by gradual degrees, complete and perfect, with the building of that city and the erection of its great domed churches. And Alexandria, alone of all the great towns of the East, can reasonably be supposed to have been the place where any such gradual change took place—subject, as it was, to many influences itself.

That for which Alexandria stands alone is, in character, late Greek or early Roman as some might call it, but in greater truth Alexandrian, typified by a form of Corinthian capital practically unknown elsewhere, but common in the Egyptian port, as the numerous examples in the Museum indicate without doubt. It is, too, one of the most beautiful forms of capital known, beyond the beauty of that generally known as the Corinthian—with little evidence that it was ever used at Corinth—which it resembles in all respects except the use of leaf volutes at the angles in place of tendrils. Thus there surely is at least a doubt whether Alexandria was not the real home of the Order. If so, the name of Alexandrian should be given to it in place of Corinthian, and the Alexandrian form should be accepted as the general type. At least its recognition, and its use with such modifications as might be called for under individual circumstances, is fully justified in modern work which apes the Classic.

ROYAL ACADEMY SCHOOLS.

The following is the list of prizes and prize-winners for this year:—Historical Painting: The City of Refuge—Gold Medal and Travelling Studentship (200l.). Margaret Lindsay Williams. Landscape Painting: Storm Clearing off on the Skirts of a Wood—Turner Gold Medal and Scholarship (50l.). Gladys M. Clark Kennedy. Landscape Painting: A Look on a River or Canal—Creswick Prize (25l.) and Silver Medal, Joan Joshua. Design for the Decoration of a Portion of a Public Building: Winter—First Prize (30l.) and Silver Medal, Margaret Lindsay Williams; Second Prize (10l.) and Bronze Medal, Florence Margaret Walden. Design in Monochrome for a Figure Picture: Samson Pulling Down the Pillars in the House of Dagon (not to be treated as a single figure work). Judges, Chap. xvi.—Armitage Prizes, First (30l.) and Bronze Medal, not awarded; Armitage Prizes, Second (10l.) and Bronze Medal, Katherine Frances Clausen. Composition in Colour—Prize (10l.) and Silver Medal, James Williams. Cartoon of a Draped Figure: Agrippina Carrying the Ashes of Germanicus—Prize (25l.) and Silver Medal, Madeline Emily Green. Painting of a Figure from the Life—First Prize (10l.) and Silver Medal, Horace Edward Quick; Second Prize, Bronze Medal, Alice Adrienne Nash. Painting of a Head from the Life—First Prize (5l.) and Silver Medal, not awarded; Second Prize, Bronze Medal, Madeline Emily Green tied with Charles Vincent Holder, who, having won the prize before, was disqualified. Perspective Drawing in Outline (open to painters and sculptors only): One of the Piers near the Queen Victoria Memorial in the Mall—Prize (5l.) and Silver Medal, no competition. Set of Four Drawings of a Figure from the Life—First Prize (15l.) and Silver Medal, Frank Crown Mitchell; Second

Prize (10l.) and Bronze Medal, Horace Edward Quick, tied with Leopold Lemaige Swain, who was disqualified, having received the prize before. Set of Three Studies of Drapery—Silver Medal, Grace Mary Hawkins. Composition in Sculpture: Rescued—Gold Medal and Travelling Studentship (200l.). John Angel. Model of a Design: An Act of Mercy, to include not less than two figures—First Prize (30l.) and Silver Medal, Gilbert Ledward; Second Prize (10l.) and Bronze Medal, Newbury Abbott. Tron.* Model of a Bust from the Life—First Prize, Silver Medal, Robert Peter Baker; Second Prize, Bronze Medal, Chas. Randle Jackson. Design for a Medal: A Design for a Medal to Commemorate the Coronation, with an Enthroned Figure on one side and an Allegorical Design on the other.—Prize (5l.) and Silver Medal, Edmond T. Wyatt Ware. Set of Three Models of a Figure from the Life—First Prize (15l.) and Silver Medal, Robert Peter Baker; Second Prize (10l.) and Bronze Medal, James Booth.* Design in Architecture: The Hall of a City Company—Gold Medal and Travelling Studentship (200l.). Alan Binning. Set of Architectural Drawings—First Prize, Silver Medal, Walter Llewellyn Clark; Second Prize, Bronze Medal, Augustus Gaffett Bryett. An Architectural Design—Prize (20l.) and Silver Medal, James Mitchell Whitelaw. Set of Drawings of an Architectural Design—First Prize (15l.) and Silver Medal, Verner Owen Rees; Second Prize (10l.) and Bronze Medal, Cyril Farcy. Perspective Drawing in Outline (open to architects only): The "College" at Westminster School, containing the Dormitory, exclusive of the Sanatorium at the south end, but inclusive of the entrance and stair at the north end—Silver Medal, James Gough Cooper. Original Composition in Ornament (open to architects only): Prize (5l.) and Silver Medal, Thos. Penburth Bennett. Architectural Design with Coloured Decoration: The East End of a Memorial Chapel—Silver Medal, no competition.

Landseer Scholarships in Painting and Sculpture, of 40l. a year each, tenable for two years, have been awarded—in Painting to Archibald G. Barnes and Katherine F. Clausen, in Sculpture, to Robert P. Baker; and for one year in Sculpture to James Booth and Alfred Wilkinson.

GENERAL NEWS.

Professional Announcement.

Mr. W. L. Lucas is moving into new offices at 9, Great George-street, Westminster.

Architectural Assistants at the Office of Works.

In Friday's Parliamentary Papers Mr. Snowden asks the hon. Member for Southampton to represent the First Commissioner of Works, whether, before any steps are taken to place any of the class termed architectural assistants engaged in the Office of Works on the established list, the desires of all who are eligible will be ascertained, so that all of the class shall have an opportunity, if they so desire, of being placed upon the established list.—Mr. Dudley Ward says the answer is in the affirmative.—Mr. Snowden further asks whether the Treasury regard the technical certificate of the Board of Works Commissioners, granted to each member of the architectural assistants, as being equivalent to the certificate granted by the Civil Service Commissioners to the class engaged upon similar work and termed assistant architects; and if it was intended to carry the same privileges of establishment, equivalent pay, superannuation, and regular annual increment.—Mr. Dudley Ward replies in the negative to both questions.

The Aldwych Site.

The House of Representatives and subsequently the Senate of the Australian Commonwealth, according to a message through Reuter's Agency, have approved the decision of the Federal Government to purchase the freehold of the eastern portion of the Strand-Aldwych site for the sum of 364,000l. It is proposed to erect upon the site a building for the official headquarters of the Commonwealth, and probably also of some of the Australian States. The cost of the building is estimated at 225,000l.

* Disqualified, having received the prize before.

A notice of a motion to be put to the next meeting was read, having for its object a reduction in the number of members required to form a quorum at special meetings.

Royal Institute of the Architects of Ireland.

The annual general meeting of this Institute was held at the Rooms, No. 31, South Frederick-street, Dublin, on Thursday last week. In the absence of the President, Mr. R. Caulfield Orpen, B.A., F.R.I.A.I., Vice-President, occupied the chair. There were also present:—Messrs. J. C. Wilmot, L. McCallaghan, J. A. Geoghegan, F. Hayes, W. H. Webb, T. J. Cullen, F. G. Hicks, J. H. Mitchell, H. Alberry, A. G. C. Millar, P. J. Lynch, F. E. Sparrow, G. L. O'Connor, and C. A. Owen, Hon. Secretary.

The Hon. Secretary read the report of Council for the year 1911. A discussion ensued regarding several of the matters referred to, and the report was adopted on the motion of Mr. Wilmot, seconded by Mr. Lynch.

The Hon. Treasurer, Mr. F. Hayes, submitted his statement of accounts, showing that the Institute continues to be in a sound financial position.

The Chairman read the report of the scrutineers of the ballot for Council, and declared the following gentlemen duly elected for the year 1912:—Messrs. C. H. Ashworth, J. P. Sheridan, J. H. Webb, L. O'Callaghan, F. G. Hicks, H. Alberry, W. Kaye-Parry, A. G. C. Millar, W. A. Scott.

Liverpool Architectural Society.

At the meeting of the Liverpool Architectural Society on Monday, December 4, a paper by Mr. W. H. Ward, A.R.I.B.A., was read, entitled "Renaissance Church Architecture in France," the paper being illustrated by excellent lantern slides. The President of the Society, Mr. Arnold Thornely, F.R.I.B.A., was in the chair, and a vote of thanks to the lecturer was proposed by T. E. Eccles, F.R.I.B.A., and seconded by Mr. Gilbert Fraser, A.R.I.B.A.

Glasgow Technical College Architectural Craftsmen's Society.

At a recent meeting of the Technical College Architectural Craftsmen's Society, Glasgow, Mr. James S. Boyd in the chair. Mr. John Crawford read a paper on "The Duties of a Foreman Mason." After describing the preliminary operations, the importance of accurately setting out the main lines of the proposed buildings, and several methods of doing so were fully explained. Excavations and timbering, and the careful supervision of the bedding and bonding of foundations, walls, and columns were dealt with. Mr. Crawford emphasised the importance of good dampcourses, the ventilation of floors, also panelled and lath and plaster walls, and the building of vents to prevent down draught. The care to be exercised in erecting various kinds of walling, masonry, and circular windows, stairs, etc., was fully dealt with. The lecturer also explained the ordinary routine in building contracts, of ordering, taking delivery, and checking the various materials required.—Discussion allowed.

ENGINEERING SOCIETIES.

The Institution of Civil Engineers.

At the ordinary meeting of this Institution on Tuesday, the 5th inst., elections of new members, Associate members, and Associates, transfers of Associate members to members, and admission of students were reported. Five members were elected, i.e.:—J. Adam, D.Sc., Edgbaston, Birmingham; W. Firth, Electrical Engineer's Office, Great Eastern Railway, Liverpool-street, E.C.1; H. E. Mitton, Codnor, near Derby; L. P. D. Taylor, Moulake; H. Wadale, Gateshead-on-Tyne. One hundred and thirty-three Associate members were also elected.

BOOKS RECEIVED.

THE STORY OF FORD ARREY. By Sidney Heath. (London: Francis Griffiths. 10s. 6d. st.)
A HISTORY OF ARCHITECTURAL DEVELOPMENT. By F. M. Simpson. (Longmans, Green, & Co. 21s. net.)

THE SOCIETY OF ARCHITECTS: ALEXANDRIA, ITS PLACE IN ARCHITECTURAL HISTORY.

At a meeting of the Society of Architects on Thursday, Mr. G. A. T. Middleton, A.R.I.B.A. (Past Vice-President, Hon. Librarian), read a paper, entitled "Alexandria: Its Place in Architectural History," of which the following is an abstract:—

"On account of its geographical position and fine natural harbours, easily made more safe by artificial means, Alexandria has necessarily been the most important seaport of Egypt for many centuries, while it was for a considerable period one of the very greatest cities of the civilised world. This was during, and extended beyond, the fourth important building epoch in Egyptian history, that known as the Ptolemaic, its greatness lasting from the days of Alexander the Great—say, roughly, from 330 B.C.—to the VIlth century A.D. Near as it is to Cairo, there seems to be no evidence that it was a place of importance when the pyramids were building, 4,000 years before that time, nor even during the Protodoric or the Theban periods; but at the later date referred to, when there was a renaissance of Egyptian architecture at Edifu and Philae so closely resembling the Theban work of Karnak and Luxor as not at first acquaintance to be easily distinguished from it, Alexandria was at the height of its prosperity. It occupied a position where many influences met. It was founded and colonised almost entirely by Greeks at first, these being afterwards augmented if not supplanted by Romans; and it traded with all parts of the Eastern Mediterranean by sea, and simultaneously up the Nile with Egypt, and by caravan even with Assyria and Babylonia.

Thus it was the natural meeting-place of many influences, particularly at the time when Greek art was declining and the Roman scarce developed; yet not much is known of it, and the archaeologist and the inquirer into the evolution of architectural forms had troubled little about what its ruins might have to tell; for, not once but several times, it has been ravaged and destroyed, and the remains of its former glories are comparatively few, and the actual dates of such fragments as have been discovered can by no means be determined with precision. Even the buildings of which they formed a part can, as a rule, be only guessed at, so complete has the destruction been, and apparently so scant the care taken to record, even approximately, where the remains have been found; the site of the ancient city being now occupied by a modern town, partly Arab and partly European, or submerged beneath the waters of what is called the old harbour (now ceased by a sea-wall), while a new harbour with great wharves and quays occupies a large area to the south of it. Excavating and investigation have been unmethodical and spasmodic, and far more frequently undertaken for the purpose of utilising the masonry of former structures for the erection of new ones than for archaeological research. Even at the present time a low hill, honeycombed with catacombs, is being quarried away bodily to provide stone for a new quay in the harbour, which is to become the Mediterranean terminus of the Cape to Cairo railway.

In such circumstances it is to the Museum that a visitor naturally turns first for enlightenment; to be met, to a certain extent but not entirely, by disappointment. It contains, it is true, numerous objects, possessing both interests and beauty, arranged with considerable regard to artistic effect; but it is necessary to make one's own deductions from them. Of orderliness in the scientific sense there is little, for, though here and there an attempt has been made to collect statuettes or architectural features into groups, there has been scarcely any effort to differentiate with regard either to probable date or to locality of discovery—in most cases probably unknown. The descriptions attached to the exhibits are silent on these points, having been obviously composed by one who was more enthusiastically an art critic than as an archaeologist, and consisting for the most part of eulogies in French upon the beauty of the object, its contour, modelling and colour, wholly valueless to one in search of knowledge and capable of judging of these things for himself. It is only possible, therefore, to accept the collection as being

Alexandrian, and to apply knowledge acquired elsewhere to the double task of first producing some order out of the prevailing chaos, and then discovering in what way and to how great an extent Alexandrian architecture was influenced by what went before it, and how it afterwards influenced what was to come.

The lessons learnt, if not many, are by no means insignificant, but before those of the Museum itself can be fully understood it is necessary to pay a visit to the principal catacombs, which are under the control of the Museum authorities. The central chamber, reached by a spiral staircase from the surface, and cut in the solid rock, is said (on doubtful authority) to be the tomb of Caracalla and his wife. At any rate, its entrance is flanked by indifferent statues of a Roman Emperor and Roman lady; but these are probably of later workmanship than the chamber itself, as are also certain obviously Roman sarcophagi and Roman urns. The architecture and sculptural embellishments of the room and its immediate approach are of the most mixed character imaginable; but they agree in their indications of date, and leave little doubt about the work having been done, most of it, about 200 B.C.

Just as it is not surprising to find purely Egyptian characteristics in the ornament of the catacomb chamber, so is the presence of Greek feeling only what might be expected. Essentially, Alexandria was a Greek Colonial Settlement, if not at one time the greatest centre of Greek civilisation, and the Museum contains more architectural objects of Greek spirit, both in design and execution, than almost any other in the world—all presumably local. Thus the Greek egg and tongue is a common enrichment. It is seen, for instance, on a few Ionic capitals, enriching the echinus in the usual way, while the abacus is similarly enriched with the leaf and tongue, all sharply cut after the typical Greek manner, particularly that of a somewhat later date, such as is found at earliest in the Mausoleum at Halicarnassus (350 B.C.). The shallow character of the volute also suggests late workmanship; it recalls that of the Nereid Monument from Lycia, now in the British Museum, which is generally considered to belong to the 1st century B.C. The Alexandrian examples probably belong to a period between these dates.

So far as the multitude of examples may be taken to indicate anything, however, they give the undoubted impression that the principal Greek work at Alexandria was of the Corinthian Order. It is well known that to the west of Greece, in Sicily and Magna Græcia (Southern Italy), the Doric Order was employed exclusively, while to the east, along the Syrian coast, the Ionic was used as universally. In Greece itself, as at Athens, the greatest buildings were Doric, those of secondary size and importance were Ionic, and only the tiniest and most delicate gems were Corinthian—that is, in the days of independence. Later on, when the Romans ruled, the great Temple of Jupiter Olympius was, it must be admitted, erected in the Corinthian Order.

But the recognised examples of Greek "Corinthian" are extremely few, so few that they can be numbered on the fingers of one hand. The Choragic Monument of Lysicrates, very small, has generally been considered the most typical, till the discovery of the more beautiful capitals of the internal Order of the Tholos at Epidaurus. Both of these examples have tendrils volutes springing from acanthus leaves, and so probably has the original capital, of apparently late workmanship, which was brought from the site of the Temple of Diana, at Ephesus, and is now in the British Museum. As a rule, in the known Roman examples of Corinthian capitals the tendril is stiffened and strengthened till it has more the appearance of a voluted leaf—so much so, that the gradual evolution from it, through Romanesque work, of the French "crochet" capital has been traced, in which the leaf is that of the hart's-tongue fern when partly open.

Is it possible that Alexandria was the real home of the Corinthian Order, and that the tendril volute was a mere local variation, beautiful but not essential to it? In the numerous examples in the Alexandrian Museum the tendril volute is never found, but it is replaced by a broad voluted leaf at the corners—though tendrils are used for the caulicols. The capital in this form is exquisitely beautiful and structurally strong enough for employment on a large scale—and several of the numerous examples

were before; he did not agree with that altogether. Old tiles might be cited as often better than modern ones. Mr. Bolton had given some interesting experiences on walling. As a rule, if one left a piece of plain walling, the client, unfortunately, generally wanted to cover it up. The old walling work was done in a jolly and haphazard way by men who were only partially educated in their craft. In those days the architect was the craftsman, and he was able to supervise things at leisure. Now, the ordinary contractor was not a builder, but a business man, and the architect was harassed by technical questions which were too apt to drive out questions of feeling and the smaller details, which meant so much in their collective effect.

The President announced that the next meeting will be on January 15, when a paper will be read by Mr. E. F. Strange, entitled "Alfred Stevens."

ARCHITECTURAL SOCIETIES.

Manchester Society of Architects: Science and Proportion.

At the seasonal papers meeting of the Society on December 6 Mr. Paul Ogden, F.R.I.B.A., read a paper entitled "Science and Proportion." Mr. Ogden's paper has been awaited with much interest by those who knew how thoroughly he has investigated the subject he dealt with, and at the conclusion of the paper there was keen discussion of the points set forth.

The following quotation from the Greek teacher Epictetus, said Mr. Ogden, though not exactly a text, was of value to his present purpose as evidence of the Greek attitude of mind, and, with other quotations that would follow, shows how modern discussions of art and architecture might be regenerated.

Seeming doth not for every man answer to Being; for neither in weights nor measures doth the bare appearance content us, but for each case we have discovered some rule. And here, then, is there no rule above seeming? And how could it be that there were no evidence or discovery of things the most necessary for men? There is, then, a rule. And wherefore do we not seek it and find it, and, having found it, henceforth use it without transgression, and not so much as stretch forth a finger without it? For this it is, I think, that when it is discovered cureth of their madness those that mismeasure all things by seeming alone; so that henceforth setting out from things known and investigated, we may use an organised body of natural conceptions in all our several dealings.

Few architects there are who do not use the word proportion. Some few have given us diagrams setting out buildings on interaxial lines, but none have given reasons that the employment of such lines is the essence of the matter. Interaxial lines spaced a unit apart on plan, forming equal squares, have been used for the plan; and further than this, horizontal lines for the elevations and the spacing corresponding to the ratios of the musical scale. These will be found to give an harmonious, and therefore satisfactory result. The skeleton of interaxial lines would be something like a well-tuned musical instrument on which you may play harmonious compositions should your knowledge of consonance, which to the architect means proportion, be equal to the task. Scientists assert that the ear and the eye, which are only media to the intelligence, are both affected by the same law, i.e., by vibrations. If rhythm and proportion are common to all objects worthy of the name of excellent, and if we could infuse rhythm and proportion into such objects, we should have objects which to the Greek view would be what we term "the beautiful." An ancient Greek would not understand our use of the word "beautiful." "That which is excellent," "That which is for the chief good," are the Greek views. Greek art is based on scientific reasoning. Proof may be found in Plato's "Republic," Aristotle's "Ethics," and many other works (from which Mr. Ogden quoted passages at length).

After quoting passages from Combarieu's work "Music—Its Laws and Evolution," to establish his point that music is based on science and law, and after pointing out that the same laws of proportional numbers are at

the basis of chemistry and of the spectrum, the lecturer said that we must find one common rule applicable not only to architecture, but to music, dancing, painting, poetry, and all objects. The one rule is harmony, which springs from rhythm, which in turn springs from measurable and synchronous vibrations. Buildings raised upon a skeleton of lines of proportional spacing, subdivided in measurable proportions down to the smallest ornament, might be the solution that would bring us unity and harmony. Objectors ask, "Should all the buildings in one street be on one unit?" The reply was, "It is desirable that they should have proportional units." He had that night brought before them by means of extracts from unusual sources, theories, and principles, the result of reading outside the beaten track. Further investigation is necessary before the true principles could be gathered together.

He had not yet put up a building without using the method of interaxial lines and the work is set out by rods cut to the length of the unit. For cottages he used a unit of 3 ft. 3 in.; houses, 4 ft. to 5 ft.; schools, 5 ft. 3 in.; works, 10 ft., 15 ft., and 20 ft.; furniture and ornament, some measurable unit of the main unit.

Diagrams would not be given that night; they would be useless unless that which was adduced had been enough to justify continuing the work. We have lost the nature of Greek practice. Can we regain it? The law of numbers rules the world; the properties inherent in vibration, measurable, synchronous, harmonious, rhythmic, and in consonance, are the essence of the chief good in life.

Professor Capper, in moving a vote of thanks to Mr. Ogden, said that they were grateful for the patient research that the paper was evidence of, and admired the way the lecturer had brought his wide reading to bear upon architecture. He suggested that French Gothic partakes largely of classical unity and proportion, in contrast to the northern Gothic.

Mr. Sellars, in seconding, suggested that beauty depended on fitness as well as proportion, and the two were not always compatible. To a sailor a ship perfect in all her points was beautiful, because she was fittest for her work. In building, beauty was again fitness; when we have fitness we could reduce it to a rule, but with new habits and methods of construction growing up, what becomes of our rules? Rules may be good for the weak, but the strong will drive his coach and six through them.

Mr. Corbett thought that a general rule would be either too wide to be definite, or too narrow to be universally applicable. Greek conditions were different to modern conditions, but even their exactness was more to please their mathematicians than their artists. We must trust our trained sense.

Mr. Oldham felt that art was joy in life; but Mr. Ogden's conclusions were in contradiction to this.

Other speakers were Messrs. Hindle, Harris, Worthington, Wood, and Halliday, and after the discussion the vote of thanks was heartily accorded to Mr. Ogden.

Nottingham Architectural Society.

Through the invitation of Lieut.-Col. Brewill, F.R.I.B.A., the Nottingham Architectural Society spent an interesting hour inspecting the new Territorial Headquarters on Monday afternoon, December 4. Lieut.-Col. Brewill conducted them over the building. As the Society had paid a visit during the early stages of construction it was especially interesting to note the finishing of the work.

The building is to house the five branches of the local Territorials, and the architect (Lieut.-Col. Brewill) has very cleverly arranged separate accommodation for each branch while fitting them into one whole scheme. An electric lift is provided for carrying the heavy equipment to the upper floors, and a system of telephones will be installed whereby every room can be put into instant communication with every portion of the building. The stores will accommodate at least 1,000 rifles and 600 saddles.

Stables are provided for sixteen horses, and in the sick bay is an arrangement for slinging a sick horse if necessary. The front on Derby-road has been built in red sand-faced bricks and Hollington stone. The large drill-hall is 130 ft. long by 80 ft. wide. This large floor-space is entirely free from columns and is covered with a light steel roof of 80-ft. span, with a glass skylight the length of the hall.

In this the Keith gaslight has been substituted for electric light, being, in the architect's opinion, more suitable and economical. But even then it will require eight large lamps of 300 candle-power each to light it at night.

The ventilation is through louver boards the roof always open. All floors are in Hen-bique construction, and average 3 in. thick.

Some of the party afterwards visited the site of the explosion on Derby-road by invitation of Mr. Calvert, the consulting architect.

The afternoon concluded with an inspection of Mr. Mitchell's new garage in Toll-street. In the absence of the architects (Messrs. Booker & Shepherd) Mr. Shelton pointed out the interesting features, which are, briefly, solid steel columns in the garage on the ground floor, a reinforced concrete first floor and a very interesting arrangement of the steel roof trusses due to the peculiar formation of the site, and a suspended lift for motor-cars. In this form of lift there are no guides to obstruct the floor space.

The second meeting of the Designing Club was held the following evening at the Society's rooms, under the chairmanship of Mr. E. R. Sutton, F.R.I.B.A., Vice-President. Four carefully-thought-out designs were submitted for an "Approach to a Public Park."

The visitor, Mr. H. G. Watkins, A.R.I.B.A., who had seen the conditions, gave an interesting criticism and placed them as follows:—

1. *Pro bono publico.*
2. Dorian.
3. Carbon.
4. Member for Sark.

The Chairman, in proposing a vote of thanks to Mr. Watkins and the students who had submitted drawings, urged the importance to the students of not only sending in designs, but also attending and criticising them.

The Architectural Association of Ireland.

The annual smoking concert in connexion with this Association was held in the Imperial Hotel, Lower Sackville-street, on the 22nd ult., the chair being occupied by Mr. Page L. Dickenson, M.R.I.A.I., President. One of the most successful reunions of the Association was brought to a close by the assembled company singing "Auld Lang Syne," the accompanists throughout being Messrs. J. Elvery and E. Maiben.

A general meeting of this society was held on Tuesday, the 5th inst., in the Lecture Hall at 15, South Frederick-lane, Dublin. The President, Mr. Page L. Dickenson, M.R.I.A.I., occupied the chair. The minutes of the last general meeting having been read and signed, the Committee's report for the last session was read, and its adoption proposed by Mr. C. H. Ashworth, F.R.I.A.I., who congratulated the Association on the favourable nature of the report and the cheerful outlook for the present session; Mr. J. Geoghegan seconded, and the report was carried unanimously.

Two new members were elected, Mr. W. A. Dixon and Mr. C. D. B. Ward. Professor Scott, M.R.I.A.I., then read an interesting paper on "Byzantine Architecture," illustrated by numerous lantern views of principal mosques and palaces in Constantinople and Ravenna. In the course of his remarks Professor Scott described many of the curious customs existing among the Mohammedans in connexion with their religion and ritual. The lecturer dwelt on the similarity existing between certain mouldings and details found in Byzantine work and those in early Irish architecture.

In proposing a vote of thanks to Professor Scott at the conclusion of the lecture Mr. P. J. Lynch, M.R.I.A.I., laid great stress on the fact that a careful study and wide knowledge of Byzantine architecture was a necessary prelude to the study of Irish architecture. Mr. Lynch deplored the fact that so little attention has been paid in the past to this subject, and exhorted the members of the Royal Institute and the Association to band themselves together to form a renaissance in Irish architecture, to carry on the work so well begun in a bygone age.

Mr. O'Brien Smith briefly seconded the vote of thanks to Professor Scott. In putting the motion, which was carried with acclamation, to the meeting, the President, on behalf of the Association, sincerely congratulated Professor Scott on his recent appointment to the chair of Architecture at the National University.

Fallio College Chapel.

It is understood that the Master and fellows of Balliol College have decided against the proposal to rebuild the College Chapel, against which Mr. Norman Shaw, R.A., Mr. Basil Champneys, and others have protested.

The International Fire Service Council.

A general meeting of the International Fire Service Council will be held on the occasion of an International Fire Service and Fire Prevention Congress at St. Petersburg and Moscow from May 25 to 30, 1912 (new era), to be organised by the Imperial Fire Brigades Association of Russia, and held under the auspices of the Council.

Building on Consecrated Ground.

In the Court of Arches on December 8 Sir Lewis T. Dibdin, D.C.L., Dean of Arches, sitting in the Church House, Westminster, delivered judgment in the appeal from a judgment of the Chancellor of the Gloucester diocese refusing a faculty for the erection of a church school upon consecrated land, not used for burials, in Holy Apostles parish, Charlton Kings, near Cheltenham. Sir Lewis (Dibdin) decided to allow the appeal—without order, as to costs—upon the grounds that, whilst land once consecrated cannot, in general, be used for secular purposes, in the particular circumstances before him the efficient ecclesiastical purpose and use of the proposed school buildings were, in his opinion, established.

London University.

The Principal of London University has received from the Chancellor, Lord Rosebery, a letter written to him by a gentleman, who wishes to remain anonymous, offering to erect a University College a building for:

- (a) The combined School of Architecture and Engineering, resulting from the amalgamation of the schools at present separately conducted at University College and King's College, together with the following—so far as a sum of 30,000£ will suffice—viz.:—
 - (b) Studios for the teaching of sculpture and the rearrangement of the School of Fine Art; and
 - (c) The Department of Applied Statistics, including the Laboratory of Eugenics.
- Mr. F. M. Simpson, professor of architecture, has been appointed architect for the new central laboratories to be erected at University College.

The Carpenters' Company.

The following list of candidates successfully passed the Company's Examination in masonry building construction held recently:—161 medal and Clerks' of Works Association (size of five guineas, Thos. J. Welsh; silver medal and certificate, L. S. R. Hart; bronze medal and certificate, L. Barnard, F. Boxall, J. M. Clarke, H. J. Hollands, A. C. Huffell, George Priestley, and G. E. Vincent; certificates, J. M. Brown, R. F. Bryer, G. E. Burr, E. E. Evans, J. E. Fell, A. E. France, W. E. Hall, J. W. Judson, and A. Mitchell. It is interesting to note that a large proportion of the candidates came from the provinces, and from the more distant ones.

Diaries for 1912.

Messrs. Hudson & Kearns, Ltd., Hatfield-Street Works, Stamford-Street, S.E., have sent specimens of their registered date indicating blotting pads for 1912. These blotting pads are admirable productions, and leave little or nothing to be desired. We may draw attention to the pads, 7 and 8a, both of which are very serviceable and sensible blotting pads and diaries combined.

The Saxton Portland Cement Company, Ltd., Cambridge, have sent us a copy of their neat little pocket diary for 1912. It includes an accident insurance coupon.

COMPETITION NEWS.**Technical Institute, Cardiff.**

The awards in this competition are as follows:—First premiated design, Messrs. Jones and Percy Thomas, of Cardiff; second premiated design, Messrs Cooper & Carter, of Blackburn; third premiated design, R. J. Myrtle Smith, of London; fourth premiated design, Messrs. Spalding & Myers, of London.

The designs are to be exhibited at the City Hall, Cardiff, from Monday, the 18th, to Friday, the 22nd inst.

Cottage Hospital, Wellington, Shropshire.

Of the competitive designs submitted for this building the assessor, Mr. W. L. Bernard, F.R.I.B.A., of Bristol, has awarded first place to those prepared by Mr. Leslie T. Moore, A.R.I.B.A., of Raymond-buildings, Gray's Inn, W.C.

Sheffield, Woodseats U.M. Church.

In the limited competition recently held for this new building Messrs. George Baines & Son, architects, 5, Clement's Inn, Strand, London, W.C., were successful.

Chelsea Town Hall Decorations.

Mr. Charles Sims, A.R.A., Mr. Frank O. Salisbury, Mrs. Sargent Florence, and Mr. George Woolway are the successful artists in the competition for designs for the decoration of the large hall in the Chelsea Town Hall. The inception of the scheme was due to Mr. Christopher Head, late Mayor of the borough. Mr. John S. Sargent, R.A., Mr. P. Wilson Steer, and Mr. E. A. Rickards, F.R.I.B.A., adjudicated. Thirty-seven painters competed, including Mr. Young Hunter, Mr. Lambert, Mr. Jamieson, Mr. Robert Fowler, Mr. Leist, and Miss Emily Ford. An article on the subject will appear subsequently. We understand that a further competition will be held for other decorations.

Marylebone Municipal Buildings Competition.

In our review of this competition we did not mention that the assessor, Mr. Hare, also noted as excellent designs, worthy of commendation, the following:—No. 76, Mr. William Whitehead; No. 99, Messrs. Edwin T. Hall & E. Stanley Hall; No. 121, Mr. Matthew J. Dawson; No. 126, Messrs. H. Townshend Morgan & Alan Bruce; No. 157, Sir A. Brumwell Thomas.

Stock Exchange, Toronto.

January 2 next is the day for receiving drawings, limited to architects in Toronto, for a Stock Exchange building. Mr. F. S. Baker, F.R.I.B.A., is the professional assessor.

LONDON COUNCILS.

Baronet.—Sanction has been received from the Local Government Board to the borrowing of £2,788£ towards the paving of the High-street. Plans have been passed for Mr. Cude alterations to premises in High-street. Messrs. Scott & Fraser have lodged plans for the erection of a conference hall at the corner of High-street and Fitzjohn-avenue for the Rev. H. Ennor.

East Ham. The following tenders have been accepted:—Messrs. J. H. Sank & Son, Bangor slates for swimming-bath, 9£ 15s. 6d. per 1,200; Mr. A. Sambridge, laying slates and fixing ridge for swimming-bath, 4s. 3d. per square and 2d. per foot run, respectively; Messrs. Doulton & Co., terra-cotta pier for swimming-bath entrance, 14£. The following plans have been passed:—Mr. P. Cornish, four houses, St. Olave's-road; Mr. H. C. Seymour, ten houses and shop, Haldane-road; Mr. F. Hamlett, buildings on site of Nos. 9 and 11, Cotswold-gardens; Mr. W. Stewart, additions to "General Gordon," Albert-road, North Woolwich, also house and shop, Mitcham-road; Mr. G. Clark, ten houses, WallSEND-road.

Friern Barnet.—The following plans have been passed:—Mr. J. J. Wilkinson, three houses, Cromwell-road; Mr. A. Collins, alterations to "Fairstead," Friern-lane; Mr. H. Johnson, alterations to Mickledore, Athenaeum-road.

Greenwich.—The tender of Mr. William Bailey, 40, Pelton-road, has been accepted, at 212£ 15s. 6d., for carrying out decorative and repair works at the late Leo Board of Works Offices, Old Charlton. The north side of Nelson-street is to be repaired with York paving at an estimated cost of 156£. A portion of Pelton-road is also to be repaired with granite at 150£. The tender of Messrs. Henry Woodham & Son, Sangley-road, Catford, S.E., has been accepted, at 357£, for forming and paving as a new street part of Bramshot-avenue. A plan has been lodged by Messrs. Gunning & Son for ten houses in Anchor and Hope-lane.

Hackney.—The sewer in Richmond-road is to be constructed for a length of about 517 ft. with 15-in. glazed stoneware pipes at an estimated cost of 250£. Electricity mains are to be extended at an estimated cost of 2,200£. The tender of Mr. G. J. Anderson, 26, Lower North-street, Poplar, has been accepted at

431£ 7s. 3d., for paving part of Moundfield-road as a new street. The edge kerbs and flat channels are to be done with Cornish granite. The tender of the Acme Flooring and Paving Company (1904), Ltd., has been accepted at 3,348£ 7s. 10d., for paving the carriageway of a portion of Southgate-road with Acme sectional jarrah wood-blocks 3 in. deep. This includes the laying of the foundation and repair and maintenance for seven years. The following plans have been passed:—Mr. J. Ellis, motor garage road of No. 130, Shackwell-lane; Mr. A. J. West, additions to factory rear of No. 38, Albert-road, Dalston; Mr. E. E. Fowler, additions to factory, Bull-alley, near Clevedon-street, Stoke Newington Common; Mr. T. Critt, alterations and additions, No. 55, Tottenham-road.

Hammersmith.—Plans have been passed for Mr. A. P. Killick, for the erection of shops on the site of Nos. 162, 164, and 166, King street; also for Mr. Thomas R. Somerford, for shops on the site of Nos. 150, 152, and 152A, King street.

Hemel Hempstead.—At a recent meeting of the Joint Hospital Board it was decided to invite Mr. Ivon G. Mead, Hemel Hempstead, to act as architect for the erection of the proposed new hospital.

Hendon (Urban).—The Surveyor has been instructed to prepare plans for the construction of surface water-drains in Sunnyfields-road and Sunny-gardens, at an estimated cost of 1,326£, and in Green-lane at 703£. Kerbing and paving works are to be carried out to the footpath on the east side of Brent-street at an estimated cost of 268£. The following plans have been passed: Mr. F. Howkins, twelve houses, Hamilton-road, Woodstock Estate; Hampstead Garden Suburb Trust, Ltd., additions to "Homesfield," off Erskine-hill; Mr. V. L. Reynolds, eight houses, Hordford-road; Mr. Edwin Evans, six houses, "The Crest," Brent-street; Mr. Edward Strathairn, twenty-two houses, Hollis-road; Mr. R. V. Hart, eight shops, Golden's Green-road; Mr. A. J. Edmondson, four houses, The Riding; Mr. J. Wright, offices, etc., Ramsey and Argyle roads. Second Hampstead Tenants, Ltd., eight flats, Addison-way; Mr. G. H. King, five houses, Alexandra-road. A plan has been lodged by Mr. S. J. Aish for fourteen houses.

Poplar.—Paving works are to be carried out by the Surveyor during 1912 at an estimated cost of 10,000£. A plan submitted by the Star Manufacturing Company for the erection of new workshops in Davis-street has been approved.

South Mims.—Tenders are to be invited by the Rural District Council for laying an 18-in. pipe in Station-road, Potters Bar, at an estimated cost of 122£.

Stepney.—A new 9-in. glazed ware pipe sewer is to be substituted for the existing sewer in a portion of Varden-street, Mile End, Old Town, at an estimated cost of 175£. No objection is to be raised to the proposal of Mr. J. G. Oatley for the erection of a building in Cotton-street.

Wimbledon.—A portion of the footpath on the southern side of Wimbledon-road, Balham, is to be paved with artificial stone, and the kerb and granite setts carriage entrances relaid, at an estimated cost of 423£. The pavement in front of No. 47, Streatham-hill is to be paved with artificial stone at an estimated cost of 70£. Tenders are to be invited for carrying out repairs to Beaumont-road, Southmead-road, and a part of Augustus-street, Southfield. The tender of Messrs. E. & E. Iles has been accepted for paving part of Lessingham-avenue, Tooting (footpaths with Aberdeen adamant paving); as has also the tender of Mr. Thomas Adams for paving part of North-place, Southfield. The footpaths in this case are to be paved with Aberdeen adamant and kerbed with Cornish granite. They have further accepted the tender of Messrs. P. Parry & Co. for paving Steep-hill, Streatham. Cornish granite is to be used for the kerbs and Victoria indurated paving for the footpaths. Plans have been passed for Mr. G. R. Fletcher for additions to St. Simon and St. Jude's Roman Catholic Church, Hill-side-road, Streatham; also for Mr. A. H. Batley for a cinematograph theatre and four shops, Mitcham-road, Tooting.

Watford (Rural).—Plans have been passed for Messrs. J. Dickinson & Co., Aldenham, for an extension to the retail stores at Holmfirth Mills, also for extensions to the book department at Apsley Mills.

Watford (Urban).—The following paving works are to be carried out at the estimated costs stated: One side of Malden road, 855£; part of Lower Paddock-road, 128£; footpath, King-street to Wigen Hall-road, 104£. Paving works are also to be carried out in fourteen other roads, and application is to be made to the Local Government Board for sanction to borrow 5,536£ to carry out the work. Tenders are to be invited for carrying out the work.

of the Balmoral-road sewerage and the Calow Land storm-water drainage. Application is also to be made to the Local Government Board to borrow 2,134l. for the erection of a public convenience in Church-street. The tender of Messrs. Froude & Dawson has been accepted at 25l. 4s. for the supply of 6,000 Hickman's Stourbridge firebricks. Plans have been passed for the Trustees of St. John's Institute for a new parish hall in Escourt-road.

West Ham.—The following plans have been passed:—Mr. J. R. Moore-Smith, alterations and additions to St. Peter's Church Hall, Neville-road, Upton Park; Mr. A. Single, rebuilding workshop and warehouse, rear of No. 29, Hubbard-street, West Ham; Mr. A. Smith, alterations and addition to Aerated Candy Company's premises, Tramways-avenue, Stratford.

Wimbledon.—Repairs are to be carried out to the carriageways of six streets, and to the footways of a portion of St. John's-road, at a total estimated cost of 664l. The tender of the Improved Wood Paving Company, Ltd., has been accepted at 85l. for paying the margins of the carriageway of a portion of Merton-road. Tenders are to be invited for the enlargement of the Administrative Block at the isolation hospital. The Borough Surveyor has been directed to prepare an estimate of the cost of making-up the back passages of each block of houses on the Ashengrove Estate with granolithic paving laid *in situ*, and with slab paving. Plans submitted by Mr. P. E. Story for additions to the Court House, Queen's-road, and by the Temperance Billiard Halls, Ltd., for a billiard hall in Merton-road, have been passed. Mr. R. J. Thompson has lodged a plan for five shops in Hartfield-road.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. E. White, Chairman, presiding.

LOANS.—The Finance Committee recommended and it was agreed that a loan of 10,000l. should be made to the Hammersmith Borough Council for electricity undertaking, and a loan of 1,236l. to the Westminster City Council for contribution towards street improvement.

NEW SCHOOL.—It is proposed to erect a new school on a site in Marylebone, to provide accommodation for 768 children.

THEATRES, ETC.—The following drawings have been approved by the Theatres and Music Halls Committee:

Camden Theatre, High-street, Camden-town—construction of a permanent cinematograph enclosure.

87, High-street, Notting Hill (Electric Palace)—provision of a rewinding-room.

London Coliseum—minor alterations to the dressing-rooms and offices.

London Palladium—adaptation of certain rooms in the basement for use as dressing-rooms.

The Playhouse—new stage entrance.

Royal Academy of Music, Marylebone-road—provision of additional lavatory accommodation.

Surrey Vaudeville Theatre, Blackfriars road—alterations and additions to stage electrical arrangements.

A new cinematograph hall is to be erected on a site in High-street, Fulham, adjoining the Territorial drill hall.

CORRESPONDENCE.

National Insurance.

SIR,—I have been hoping and expecting some Member of Parliament understanding finance and business, or some leading member of the builders' societies, or one of my own profession who is a leader in the practice of architecture as well as the art of it, would take up with vigour and ability the matter of the National Insurance Bill of the Government, showing how it would affect the great business of building in this once flourishing country of ours. But there seems no stir. All are expecting, I suppose, it will "pan out all right," as usual, without "fussing."

I write solely with a view of getting some able man amongst the whole of those engaged in the building trade, including, of course, architects who get their livelihood from it, to devote some of his ability to the great subject before it is too late.

Would not all of us agree that the last few years have been very bad ones for the generality of architects and all connected with the building trade? Is it not a fact that architects as a profession have had less work in their offices? Is it not also a fact that builders find it most difficult, in ordinary building competitive estimating, to obtain a contract giving fair and reasonable profits? Or, in other words, is it not a reality that competitive estimates are out so low as to leave no profit to contractors if the contract is needed so as to keep the shops going, waiting for better times?

The reasons for all this are probably manifold. Among the reasons are, however, two prominent ones. Firstly, the unrest in financial confidence raised by the land taxes, accompanied with threats of those being "only a beginning"; secondly, the reaction of this unrest, with silly and untruthful talk about the "idle rich," amongst the working-men who get more pay for less work than formerly.

(Let me insert here in parentheses that no one objects to workers getting the best of wages if they will only give the best of their capacity in return.)

If the above is to-day the condition of the building trade with the want of confidence in financial circles, whence must come our employment, what will be the state of things if the National Insurance Bill becomes law? Is it thought likely the working-classes will quietly have threepence or fourpence taken weekly from their wages, possibly for their own benefit, but certainly for the benefit of the unfortunate ones? There will be strikes and threats of strikes against any deductions, which, even in the very best results, must make builders' expenses greater than ever. Thus are the expenses of buildings increased, which, in plain English, means there will be fewer buildings erected, reacting to the detriment and loss of architects, builders, and workmen.

In this Insurance Bill the workpeople provide a part, the employers a part, and the State a part. "The State" is only the taxpayer, and the biggest taxpayer individually is the employer, so the employer pays two parts. It will end in the employer paying the three parts. But if he pays in the main only the two parts, the cost of building by him must necessarily be increased. Less building will ensue in any case.

Further, by the want of the old confidence in the finances of the Government undertakings the price of Consols is lower than ever. Much of the reserves of most companies—insurance companies, banks, etc.—have been invested in Consols. Consequently, if Consols, by unwise legislation, get lower and lower, the value of these reserves get lower and lower, and the balance has, in sound finance, to be provided out of the margins or profits which might, and to a great extent would, be in hand for expenditure in buildings. On this head turn, for example, to a great Government Department, the Savings Bank. There we have a deficit by the reduction in the price of Consols (on account, to a great extent, of broken confidence in Government proposals and in reduced security) of over forty millions sterling, and this would have to be found by the taxpayer if the accounts were called in. But what has the price of Consols to do with building? A great deal, for if the great lending companies are losing in the value of their reserves, reducing their spending and their lending in consequence, the building trade is one of the very first to suffer.

Now let me return to the Insurance Bill. It is to be worked greatly through the friendly societies. It costs these societies to work their present business from 25 to 45 per cent. in expenses. And this new compulsory National Insurance business will presumably cost proportionately almost the same, say, an average of 30 to 35 per cent.

It is computed that there will be 16,000,000 contributors, each one of which will need a separate ledger account. Just think of it. Who is going to pay for this work? At 30 per cent. the cost will be 5,000,000l. per annum, and this, as well as the weekly taxation per head, is to come out of the taxpayers also, which means mostly the employer. How can the building trade bear its proportion of this additional taxation and burden and have any of its old prosperity returnable to it?

Will not some energetic and able man take up the subject, or will not some enterprising building newspaper use its power to have a comprehensive, clear, definite protest made by the entire profession and trade against this extra burden being laid on business enterprise?

I appeal to you, the architectural profession and the building trade generally, to be doing something before it is too late, and to make our united voice heard. CHAS. HEATHCOTE.

False Economy.

SIR,—Your article of December 1, entitled "False Economy," may perhaps lead house owners to a few salutary conclusions:—

(1) That bricks and mortar are, of their very nature, a "wasting" security, for which prudence demands a sinking fund, so that the capital value of the building may be replaced in, say, sixty years' time. Thus, assuming a house and garden to be let for 100l. per annum, the value of the building itself being 1,200l., if the owner sets aside 7l. 7s. per annum to form a sinking fund at 3 per cent. compound interest, the capital cost of the house will be recouped in sixty years, by which time the utility of the original structure is probably exhausted. Owners have only themselves to blame if they treat rentals as permanently secured net profits and make no provision for the inevitable depreciation.

(2) That great foresight is needed in house design to avoid undue or accelerated depreciation. Freaks and crazes are to be shunned; the fashion for excessively low rooms is obviously only a passing one; tiny windows which produce charming pictures posted from the outside are not likely to remain fashionable for long, in defiance of common sense, for, after all, common sense is the tortoise that in the long run outstrips that rapid and brilliant artist the hare.

(3) That especial care and skill are needed in building a large house in poor surroundings if heavy loss is to be avoided.

I have before me a newspaper cutting describing the recent sale of a "magnificent modern house," containing twenty-five large rooms, an organ gallery, range of stabling, etc., all built at great cost in a squallid neighbourhood near the docks. It fetched at auction a sum representing about one-third of its original cost, and a better result could hardly have been expected in the circumstances.

Now, one would have thought that a mansion of this type in such a neighbourhood might well have been built with an eye to the future, so as to permit of ready subdivision when its first use was exhausted, and in many like cases architects might profitably tax their brains to design a house which, while providing roomy quarters for the first owner, should lend itself readily to conversion into smaller dwellings when the surroundings have altered.

That such a scheme presents no insuperable difficulty I could prove by quoting the case of two old country houses the effective life of which has been indefinitely prolonged by a cleverly contrived subdivision.

C. H. B., F.S.I.

The R.I.B.A. and the Associates.

SIR,—In the letter of "Associate R.I.B.A." in your last week's issue complaining of the neglect of his class by the Council of the Institute he seems to lack the courage of his opinions, for he does not make any practical suggestion for carrying out his ideas.

The whole and blunt truth of the matter is that nearly all the self-nominated members of Council take no broad interest in the general welfare of the profession; no businesslike methods are adopted for the "betterment" of the members or their status in the world, only petty domestic matters are entertained, apparently for the benefit of "Members of Council." But surely something more is expected from them than merely appointing each other as "professional assessors" (with large fees) or nominating well-known men as competitors for important works?

This state of affairs is due entirely to the want of interest shown by the general body of members in the affairs of the Institute, men who are always complaining, outside, over real or supposed evils, but who have never the courage to attempt to remedy them and show fight—fight to obtain a more representative Council, a body of active, earnest business men who would put life into the Institute affairs and who would try to raise the status of our noble profession and make it respected by public opinion; but this will never happen thoroughly until we obtain Registration.

Year after year the question of Registration (to which the Institute is pledged) is stonewalled and shelved for some reason or other—first for a new Charter, then to form at hermaphrodite class called "Licentiate," now again to obtain an amended Charter to allow members of a more pushing rival society to enter into our gates; yet nothing really useful has been done, and nearly all the old family circle are sitting snugly round the Council Board playing all the good things the architectural world can supply.

Some few years ago a revolution took place through the efforts of a "Registration Committee," formed from among the Fellows and associates—to which Committee I had the honour to belong. Thanks to that Committee, we were enabled that year of its existence to elect a good working Council; but, alas, its wholesome influence soon died out and we all got into the old milk-and-water methods that we suffer from to-day! Drift, drift—a noble ship with a sleepy crew!

As the Associates largely outnumbered the Fellows, nearly two to one, it is only reasonable now that they should be equally represented on the Council, and I intend bringing forward a resolution to this effect at the next business meeting of the Institute on January 8, 1912, and to also propose that the so-called "House List" issued by the Council, wherein they nominate each other for election or re-election, be abolished, and rely on every Associate who can to attend at meeting and support that resolution.

HORACE T. BONNER.

SIR,—It was with pleasure that I read the letter by "Associate R.I.B.A." dealing with new regulations with regard to "Lic.R.I.B.A.," which appeared in your last issue.

I fully concur with the views expressed therein. The I.R.B.A. Council seem to ignore entirely all the claims of their Associate members, and no one who has attended any of their meetings can fail to observe that it is the feeling and wish of the select few which they carry or rejects a proposal.

Needless to say, this "clique" is devoid of Associate members. Cannot the Institute, represented by the Council, be persuaded to descend occasionally from the ethereal to the practical, and in place of learned treatises on the "Influence of Egyptian Architecture on Modern House Planning," and such ultra-interesting topics, to give a little consideration to the problem of A.R.I.B.A.'s who have hard work to keep themselves in shoe-leather? After a course of more or less arduous study a candidate who satisfies the examiners of the Institute is allowed, for the sum of £2s. per annum, to consider himself an associate of that body. He is then shelved away, and only considered when his subscription is in arrears.

Surely it is not unreasonable that an associate who has become a member by way rather than by the back-door should demand on his Institute some sort of consideration. We are not all shining lights in the profession, but we are the backbone of it when it is a question of doing the work.

It is unpleasant to make the above statements, but I fear they voice the sentiments of the greater number of Associates.

Things have been taken lying down long enough, and some such Guild as your correspondent suggests might in time become strong enough to stem the tide.

ANOTHER ASSOCIATE.

SIR,—In answer to the letter of "Associate I.B.A." in your last issue, I wish to inform you that a "Committee of Associates" was formed six months ago to protect the interests of that class, and I shall be pleased to give you information in connexion therewith to members of the Royal Institute.

WILLIAM H. BURN.
Hon. Secretary, Committee of Associates,
14, Southampton-street, Strand.

Official Architecture.

SIR,—From the reply of the First Commissioner on the 7th inst. in the House of Commons, it would appear that the Commissioners of the Office of Works do not regard their own certificate of Technical Efficiency as being of equal value to the similar

certificate issued by the Commissioners of the Civil Service.

Now the former was issued to those of the "Architectural Assistant" class whom they regarded as being of such good service as "draughtsmen" as to be worthy of it after, at the least, twelve months' examination (this being the probationary term for all entrants to the department) with dismissal for inefficiency to follow during all that period, and, indeed, during all the period of their previous service. Whereas the latter certificate was obtained for six days' examination at Burlington House in matter foreign for the most part to the required duties afterwards.

The importance of the value of the certificate in question is apparent, having regard to the latter part of the First Commissioner's reply to a question in the House on the 24th ult., wherein he speaks of the "consequent sacrifice of present income which would be demanded by the regulations." The Architectural Assistants are, in addition to establishment, asking for a more adequate rate of remuneration for their professional services than the majority now obtain; and they submit that the regulation should not be enforced in this special case, seeing that it was framed previous to the formation of any such class as the one in review, i.e., a temporary one with a Technical Certificate in addition, for the latter instrument in past cases carried with it the permanent position, and in this respect the class is unique, and unique treatment should be accorded it.

But with the latter certificate (that of the Civil Service Commissioners) the "temporary draughtsman" (or employee under the age of thirty and minus the Board's Certificate), have, in most cases, actually doubled their salaries from £2l. and less, to £4l. per week at one bound. The "Architectural Assistant" class ask for a lesser bound from an average of the whole class of some £3s. to £4l. (and, in a few cases, from 50s. to this sum).

Perhaps a further question in the House will elicit the information for what purpose was the certificate created in February, 1907, unless for improved status and remuneration, seeing that every member of the newly-created class of "Architectural Assistants" (formerly draughtsmen) were duly accredited servants of the Board, having long since passed their probationary period, and being thus retained were, of course, necessarily efficient.

It is gratifying to know from the reply of the First Commissioner on the 7th inst. to a second question that preferential treatment, wisely foreshadowed by your correspondent last week, is not now contemplated by him which is in strict accord with Civil Service rule, which prescribes that the services of all of one class should be regarded as of equal value and to merit equal treatment.

JUSTICE.

[The replies referred to will be found in our General News column, p. 702.]

Cost of Joinery.

SIR,—Much may be said on this subject. There can be no doubt that where a foreman dominates and controls a business the way is open for irregularities, and his discipline of the shop may lead to the inference that he carries on an employment bureau.

It must be obvious in many cases that the foreman has interests that do not coincide with the firm's, and unless the office is alert serious loss may continue. Where a foreman takes orders and executes on his "own," the time-sheets are manipulated to suit the office bookings, and the workmen may be entirely innocent of any wrong; thus the costs of many jobs are inflated. This is patent where orders never see an order-book, and goods are delivered that do not appear in the day-book. "F.M." could not know that the foreman faked the time-sheet unless it came to him from the office afterwards, but it is a wise precaution to have ductile men where this is done.

Tips may have no existence, but there may be many drinks, etc., to explain much that is not strictly in line with modern up-to-date business methods.

Danger lies in allowing the foreman to manage any business. No firm can be successful if workmen control or interfere in the management.

SECOND LIVERPOOL.

Certified Plans of Houses Dating from Before the Year 1800.

SIR,—The historical value of plans of old buildings which have been pulled down has often been demonstrated, and it is of the utmost importance that these should be available for reference. Since, in most cases of demolition, surveys are made in the ordinary course of business, and copies of certified plans are lodged with the District Surveyor, it is evident that a large number of these records are actually in existence. May we, therefore, through your columns, ask all architects who have such drawings in their possession, or who may have occasion to make them, kindly to communicate with us, and, if possible, allow us the opportunity of having tracings made for the London collection? At the cost of a very little trouble a most important amount of information could thus be obtained.

PHILIP NORMAN, Chairman.

PERCY W. LOVELL, Secretary.

The Committee for the Survey of the Memorials of Greater London, 23, Old Queen-street, S.W.

Marylebone Municipal Buildings.

SIR,—In view of your very able criticism of the Marylebone Municipal Buildings Competition last week, and considering the importance of the utility of such buildings to the public, it would be very interesting matter to a great many readers no doubt if you could see your way to still further illustrate plans and details of those very earnest endeavours which your critic thinks, "happily and rightly," very meritorious schemes, viz., of those whose names he mentioned in the latter part of his article.

By them the solution of the problem governed by the conditions laid down seems to have been literally carried out to a remarkable extent, taking into great consideration the placing of the various public offices for convenient approach, as also for the convenience of the official staff.

With a proper adherence to the conditions some of these plans (in this particular competition) have been studied with wonderful care, with a due regard for exactitude and consistent with a simple and yet dignified building which I take the liberty of saying has been interpreted by some competitors as a *sine qua non*.

TRUTH.

We regret that the pressure on our columns prevents our publication of the meritorious plans referred to by our correspondent.—Ed.]

Manchester Architectural Competition for Library and Art Gallery.

SIR,—I learn from this morning's *Daily Dispatch* that the ten designs submitted in the "final" competition are to be publicly exhibited for a fortnight.

May I respectfully suggest to our Corporation the inclusion also in the exhibition of the ten "sketch" designs, descriptive reports, and estimates of cost, submitted by the same authors in the preliminary round, and which were the assessor's choice out of the 223 schemes sent in—and that obtained them this honourable position?

Doubtless also an exhibition of the "sketch" designs, etc., alongside the "final" ones would be of interest to the Manchester public generally.

G. H. WILLOUGHBY.

National Buildings, Manchester.

December 9.

FIFTY YEARS AGO.

From the *Builder* of December 14, 1861.

New Motive Power.

AN invention by Mr. Lenoir seems to meet with approval in scientific circles in Paris. It is simply the application of common gas, exploded in small quantities above and below the piston of what was once a steam-engine, the explosions being produced under regulation by the electric spark from a Rumkoff machine. The gas costs 500 litres per hour for each horse-power, ten hours' work costing about 1s. 3d. per horse-power. This invention is about to be applied to locomotives on land and water, and the gas required may be produced by the decomposition of water itself.

EDITORIAL SUMMARY.

The leading article this week is upon the work of the R.A. Students this year.

In a second article we deal with the new scheme proposed for the Liverpool King Edward Memorial (p. 694).

In our "Notes" Column (p. 695) will be found comments on: "Lady Students of Art"; "The Semi-Nude"; "The New Capital of India"; "The Object of the British School at Rome"; "Overstrand Church."

A business meeting of the Royal Institute of British Architects was held on the 4th inst., when candidates for membership were elected (p. 696).

At the combined meeting of the Architectural Association with the Camera, Sketch, and Debate Club on Monday a paper was read by Mr. Alan E. Munby, entitled "Is the Texture of Materials a Fetish?" A discussion followed (p. 696).

Short reports of meetings of the following architectural societies appear on p. 700: "Nottingham Architectural Society"; "Architectural Association of Ireland"; "Glasgow Technical College Architectural Craftsmen's Society"; "Manchester Society of Architects"; "The Royal Institute of the Architects of Ireland."

At a meeting of the Society of Architects on Thursday, Mr. G. A. T. Middleton read a paper on "Alexandria: Its Place in Architectural History," an abstract of which is given on p. 701.

The list of prize-winners for this year of the Royal Academy Schools is given on p. 702.

In our Correspondence columns (p. 704) will be found letters on: "False Economy"; "National Insurance"; "Certified Plans of Houses Dating from Before the Year 1800"; "Cost of Joinery"; "The R.I.B.A. and the Associates"; "Marylebone Municipal Buildings"; "Official Architecture"; and "Manchester Library and Art Gallery Competition."

A report of a meeting of the Model Abattoir Society is given on this page.

In place of the Monthly Review we give this week (p. 707) a comprehensive review, with many illustrations, of the Competition for the Proposed Library and Art Gallery Manchester.

An abstract of a lecture on "Early Christian Mosaics," by Mr. G. MacN. Rushforth, will be found on p. 715. It is followed by an abstract of Professor Elvey Smith's lecture on "The Early Roman Churches," both lectures being delivered at King's College (University of London).

In our Building Trade Section (p. 721) will be found: "Day Works"; "Combination among Builders"; "The Mediæval Sawyer"; "Projected New Buildings in the Provinces"; "Applications under the Building Acts, 1894-1909."

In Legal Column (p. 724) will be found comments on: "Baker v. Ingall" (Trade Union Law); "Gas Mains: Building" or "Tunnel"?; "Building Estate—Implied Grant of Right of Way"; "Waste Land by Highways."

Law Reports (p. 724) include: "L.C.C. v. Clark"; "Action by Contractors on District Surveyor's Certificate."

MEETINGS.

FRIDAY, DECEMBER 15.

The Institution of Mechanical Engineers. (1) Discussion upon "Double-Cutting and High-Speed Planing Machines," by Mr. J. Hartley Wicksteed. (2) Paper to be read and discussed (if time permits) "Oil-Burning Locomotives on the Tehuantepec National Railway, Mexico," by Mr. B. Godfrey Aston. 8 p.m.

MONDAY, DECEMBER 18.

The Royal Institute of British Architects. "The Newer Responsibilities of Architects," under the management of the Practice Standing Committee. Papers by Messrs. A. Shaxon Snell, W. Henry White, Wm. Woodward, and Edward Greenop. 8 p.m.

Victoria and Albert Museum.—Mr. Banister Fletcher on "The Later Renaissance Palaces and Churches of France." 5 p.m.

TUESDAY, DECEMBER 19.

The Illuminating Engineering Society (Royal Society of Arts, John-street, Adelphi, London).—Mr. Haydn T. Harrison on "Some Aspects of Railway Station and Goods Yard Illumination." 8 p.m.

University of London (British Museum).—Mr. Banister Fletcher on "Greek Theatres, Propylæa, Stadia, etc. Eastern Illustrations." 4.30 p.m.
The Institution of Civil Engineers.—Ordinary meeting. Paper on "Experiments on the Strength and Fatigue Properties of Welded Joints in Iron and Steel," by Messrs T. E. Stanton, D.Sc., M.Inst.C.E., and J. R. Fannell.

WEDNESDAY, DECEMBER 20.

The Institution of Civil Engineers.—Students' visit to the testing works and museums of Messrs. D. Kirkaldy & Son, Southwark-street, S.E.

ILLUSTRATIONS.

Manchester Library and Art Gallery.

Our illustrations this week are devoted to some of the designs sent in for the Manchester Library and Art Gallery competition, to which we refer at length on page 707 et seq.

MODEL ABATTOIR SOCIETY.

On Thursday, December 7, Sir James Crichton Browne presided at the Rooms of the Royal Society of Arts over a conference arranged by the Model Abattoir Society, and in the course of a most interesting address said the Society was established in 1886 by the late Sir Benjamin Ward Richardson with the object of enlightening a then somewhat ignorant and indifferent public as to the evils existing in private slaughter-houses. It had distributed literature and arranged conferences, and had given advice as to planning and construction when requested. They felt that the time had now come when they should enter on a more active propaganda, and that a demand should be made for the provision in all populous places of properly constructed slaughter-houses adequate to the requirements of the place, isolated outside the town, connected with a railway system by a branch line, and approached by wide roads, so that if cattle were driven through them there need be no interference with traffic, and so arranged as to facilitate strict skilled and unremitting supervision over all the animals brought for slaughter, and all the meat sent out. A properly conducted municipal slaughter-house run on business lines should prove a profitable municipal investment, and had already done so in several cases. Public slaughter-houses were of ancient date, for in 300 B.C. animals were slaughtered in the open-air in the Forum in Rome, which was the great centre of public business, and was adorned with temples, colonnades, and basilicas. Later, to meet the convenience of butchers, a house on the banks of the Tiber was given to them for the purposes of their trade—a genuine special public slaughter-house. In ancient Greece and Rome the temples were public abattoirs where the slaughter of animals was carried out under strict regulations, of religious origin, but really humane and hygienic in their nature. The slaughtering must sometimes have been on a large scale, as in State sacrifice victims were presented in great numbers, and at the Athenian festival in commemoration of the victory at Marathon, 500 goats were slain at one time. In mediæval times public slaughter-houses existed in many large towns in Germany under the name of *Kuttelhofe*, and these were mostly situated on rivers where copious supplies of water could be obtained, and where drainage was easy. It was not, however, until the middle of the last century that laws were enacted in Prussia and other German States empowering urban authorities to require that all animals killed in towns should be slaughtered in public abattoirs. In France, in the XVth and XVIth centuries, numerous towns possessed public slaughter-houses, but owing to their situation and neglect they became atrocious nuisances, and it was the Code Napoleon that caused the provision of suitable slaughter-houses in all large towns. In Norway and Sweden a law of 1892 required the provision of public slaughter-houses, but it had only been partially carried out. In Denmark there were public slaughter-houses in a few towns, and the one at Copenhagen, although not without defects, was creditable to the country. A recent visitor enlarged on the ample space provided—the broad avenues planted with trees, the absence of high buildings or inhabited dwellings close by, the amplitude of the pens allotted to big cattle, the careful sloping of the floors, the

currents of fresh water passing through the separate accommodation for cattle known to be diseased, etc. In England the power to provide public slaughter-houses was given by the Public Health Act of 1848, but the authorities had no power to control the continuance of private slaughter-houses, and therefore they had been unable to ensure that public slaughter-houses when provided would be built by butchers. The policy of their Society was to make obligatory the erection in all urban places of public slaughter-houses and the removal of all private slaughter-houses from the congested neighbourhoods in which they now existed. They wanted to ensure that the public slaughter-houses and the lairs connected with them were properly warmed, ventilated, drained, and furnished with suitable conveniences for washing and cleansing. It was undoubtedly to Germany that they must turn for the best examples of slaughter-house construction and management, but in order that immediate guidance may not be wanting in this country the Society had had prepared by Mr. Ayling a model of a slaughter-house embodying all the most modern improvements to be found in Germany and anywhere else. This model, domiciled in the Royal Sanitary Institute, was exhibited in the room that evening, and was seen to any part of the country where there was an opportunity of showing it to advantage.

Mr. H. S. Ayling said that some years ago Mr. Blashill, the then architect of the London County Council, and the Medical Officer of Health, reported strongly in favour of public abattoirs, but the opposition of the trade was too strong. Recently the matter had been pressed on Parliament, the London County Council, and the Local Government Board, but practically nothing had been done. There were 243 private slaughter-houses in London, many in densely-packed neighbourhoods, and he did not think a single one of them complied with the by-laws of the Local Government Board, which recommended that there should be no slaughter-house within a 100 ft. of a residence. With regard to the construction of slaughter-houses, there were two main types: the separate chamber and the open hall, but the former was becoming obsolete. At Chatham the Admiralty had adopted a system which had the advantages of the open hall without the disadvantages. Mr. Ayling proceeded to describe the model abattoir exhibited, and said the scheme provided for dealing with about 100,000 animals per annum. The principle aimed at was to design the building to deal with the animals on hygienic and humanitarian lines, and arrangements were also made by which the bye-products, which went to waste in small private slaughter-houses, could be profitably dealt with. It was arranged that all the animals should arrive either by railway or road and enter at the back of the abattoir, and the accommodation for the various operators to deal with them was planned in such a way that there was no retracing of steps at any stage. In addition to the lairs, stunning courts, cooling rooms, buildings for the treatment of so-called offal, etc., the scheme also provided for baths and dressing and messing rooms for the staff, a residence for the superintendent, offices, lavatories, etc. Mr. Ayling said that recent writer deprecated the erection of large public abattoirs on the ground that such places were unfit for publication, and suggested that they should be enclosed by high brick walls or hidden away underground. If that idea was adopted they might get some of the advantages which the Society were aiming at. He did not see why such buildings should not have a distinct architectural character. It was true that the passer-by would be reminded of an unpleasant fact in life, but so he was if he passed a children's hospital or a home for incurables.

Considerable discussion ensued, in which Dr. Kenwood, Mr. E. H. Rowbotham, Mr. M. Myers, Mr. Apson, Mr. A. C. Brown, and Mr. C. Cash took part. The discussion ranged almost entirely round the question of the humane slaughtering of animals, and the merits of the Jewish method of slaughtering evoked some differences of opinion.

Eventually the Chairman moved: "That in the opinion of this meeting public abattoirs should entirely supersede private slaughter-houses in urban districts, and only the most humane methods of slaughtering should be permitted."

The resolution was carried unanimously.

MANCHESTER LIBRARY AND ART GALLERY COMPETITION.

THE COMPETITION *for* LIBRARY *and* ART GALLERY, MANCHESTER.

Design by Mr. F. W. Simon (Liverpool).

the question had been put to competitors in the above competition, "What condition presents the greatest difficulty?" the reply would have been unanimous that it was the limitation of area. Apart from the question of principal finance, this limitation seemed severe and uncalled for, and, as a result, not all of the designs exhibited, and in all ability not one of those that did not reach the second stage, is as good as it might have been had a little more latitude been allowed.

And yet this handicap, important though it does not appear to us as great, from a purely architectural standpoint, as the duty of combining the buildings necessary for two distinct and practically separate institutions in one design that must, according to all recognised ideals, possess a monarchical homogeneity. It is an oft-repeated axiom that a building should express its use, and, though this axiom has been the stalking-horse for numerous difficulties, it really rests on a sound basis. Therefore, there are two buildings demanding expression of their specific characteristics in this in a single comprehensive design? It is quite obvious that one of the constituent parts will inevitably dominate, in an architectural sense, the other, and in this particular instance the dominant one has been recognised in the art galleries, except in the case of one competitor, who has, by a strong *tour de force*, been able to secure this position for the library. It is useless to dispute, because we all know that when the demands of architecture come up against the limitations of finance it is not the latter which go to the wall, and all our architects can do is to sketch their personal convictions and do what they can under conditions dictated by the higher powers. If the

problem is so set them they must try and work two buildings into one on the lines that we once heard aptly described as "budget architecture" in a criticism of the successful design in an important London competition.

From the point of view of the practical economist there was something to be said for

the conjunction, which had the advantage of enabling all the principal rooms of the library to be arranged on one floor without undue extravagance in land. We should have expected that this would have been so generally appreciated that the designs—at all events those which reached the "short list"—would all have exhibited this method, any

Principal Floor Plan: By Mr. Robert Atkinson (London).

First Floor Plan: By Mr. Robert Atkinson (London).

other involving marked practical disadvantages. In this respect it is curious to note the variety in the treatment adopted in the designs selected for the final competition, and it seems to argue a certain hesitancy and uncertainty in the assessor's mind that he should have selected what were, in his view, the best in each of a number of varied solutions of the problem rather than have determined on what was the right method and selected designs based on it. Whatever the complications and difficulties, it seems to us that when a number of schemes are analysed it will inevitably be found that one type of arrangement is definitely superior to all others, and that any design conforming to this type must take precedence of one, admittedly more brilliant, that is on the wrong tack in handling the logical necessities of the problem.

This can hardly have been Professor Reginald Blomfield's view, as, though six of the ten premiated designs adopt the ground-

Cross-Section: By Mr. Robert Atkinson (London).

Second Floor Plan: By Mr. Robert Atkinson (London).

floor library, which appeals to us as the best treatment, the four others have a large proportion of this floor occupied by the sculpture court and galleries, and these exhibit a marked variety in general conception of the exigencies of the case.

There are, of course, distinct advantages in placing the sculpture court on the entrance floor, and the main question with the adjudicator must have been, Did these advantages compensate for the less convenient library? We can understand his deciding either that they did or did not; but he seems, till the making of his final decision, to have been in doubt on this point, and to have placed an almost equal number of the two types.

In making his final award the assessor has adopted the type of design that divides the ground floor between the library and sculpture gallery, not, it would appear, because he believes in this as inherently the right system, but because the design displays a very high degree of skill in the way in which the maximum accommodation is obtained on the area available, and also, as the award makes clear, because he feels in strong sympathy with the architectural treatment. In the winning designs by Messrs. Crouch, Butler, & Savage the library is balanced by the sculpture court, each occupying nearly half the site, the space between them containing the vestibule, central hall, and lecture

theatre. From the central hall the main staircases rise to the right and left, while on each side of these are pairs of entrances to sculpture court and the reference library, the latter flanked by the magazine-room and the technical-room, over which, on a mezzanine, are the art and music libraries. Owing to the arrangement of the stack-room, which is located in the basement (see section), and extends right across the building, this design is at a great advantage in comparison with all the others (except Mr. Robert Atkinson's and Messrs. Worthington's) in regard to the area available for the ground-floor rooms. We would not suggest that this scheme is inadmissible under the conditions but it is certainly very different from the stack-room, independent of artificial light that was described. In fairness to all competitors the condition in question should have been made more clearly as a suggestion only if this form of stack-room is acceptable.

The authors of this design were probably quite aware that they were taking risks both in regard to this feature and to the lighting of the sculpture court, and made these sacrifices deliberately with a view to reducing the height of the building to the minimum possible. As a result they are easily ahead of other competitors in this respect, and the lower proportion gives an advantage in the architectural treatment.

By Messrs. Bradshaw & Gass (Bolton).

has been duly appreciated by the or. e simplicity of the general scheme is ng, and the planning of the upper points of arrangement there appear to ous defects. Apart from the fact that pairs of entrances on either side of the al hall lack the dignity their purpose ds, those to the library have the disadvantage of cutting up the staff imodation, which is not well located. entrances and staircases are also ted at the ends of the building; but with these the intercommunication in orary is not all that could be desired.

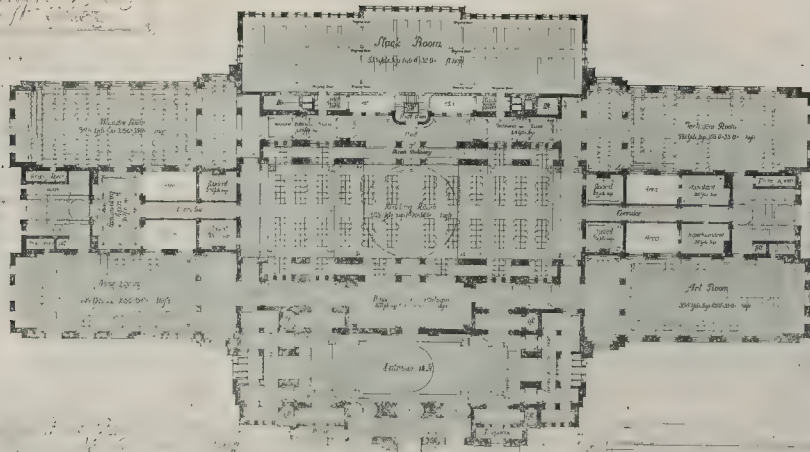

The first-floor rooms are reached by means of a gallery round the central hall, but we cannot say that the approach to them is architecturally adequate to the scale of the rooms. On the second floor the maximum possible area is obtained for the top-lighted galleries, and by this means this design is contrived with one floor less than most of the others submitted.

In regard to its architecture, the winning design received the following encomium from the assessor:—"The architectural character of the design generally is that of severe classic, such as was practised in Manchester and Liverpool in the earlier part of the last century, and is, in my opinion, eminently

suitable for the purpose. Its details have been well considered from a practical point of view, and the result is, in my opinion, a fine, straightforward architectural monument well adapted to the site and worthy of its position as a central feature of Manchester."

Passing on to the designs in which the ground floor is entirely devoted to the library—an arrangement which certainly gives superior possibilities in management and control—we find in this category the designs of Messrs. Robert Atkinson, Bradshaw & Gass, Cooper & Slater, Warwick & Hall, A. G. Henderson, and Messrs. Worthington & Son.

Mr. Robert Atkinson in his design has raised his main library floor sufficiently high

By Messrs. Bradshaw & Gass (Bolton).

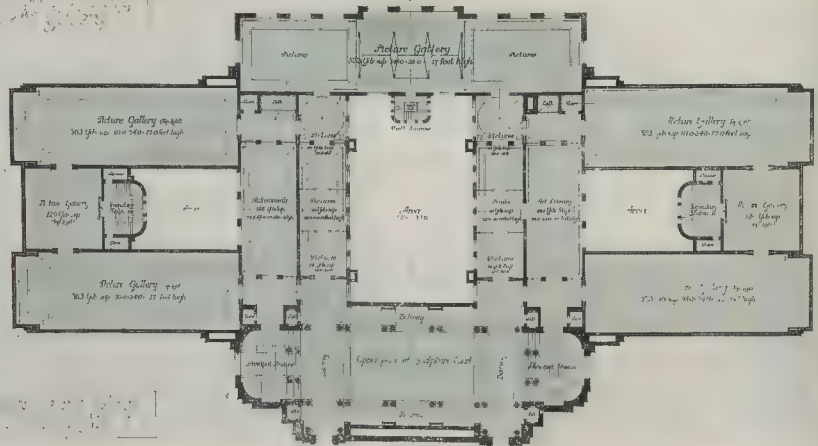

to carry his main entrance through from the front underneath it into a central hall and staircases. His reference library is placed at the back, and the other rooms run round all the frontages of the building. He thus secures good approaches to the various rooms, though, on the other hand, the staff is necessarily somewhat scattered. Above the central hall is placed the sculpture court, with access on all four sides to the museum galleries, thus giving a particularly attractive plan for these floors—the simplest, and at the same time one of the most effective, in its internal effect, of all the designs submitted. Unfortunately the means Mr. Atkinson adopts to secure the continuity of his library suite necessarily results in a mean and inadequate entrance, cramped in height and altogether unworthy of a building of this importance. The external treatment, while broad and dignified, displays defects of proportion very unusual in Mr. Atkinson's designs.

The design by Messrs. Bradshaw & Gass is an excellent example of the central reference library type, with a good entrance hall in front and stack-room at the back—the latter rather too wide, considering that it is lit from one side only. The four rooms for magazines, music, art, and technical books are well arranged in pairs, forming the front and back of the two wings, and the whole plan of this floor is well schemed from the point of view of control. It might be felt that access to the magazine-room should be more direct: but if it were brought to the front the staff would not be grouped in the compact way that forms so notable a feature in this plan. The main entrance hall, which serves both library and art gallery, is carried up through the mezzanine floor, giving it ample height for an impressive effect and materially improving the lighting. A staircase at each end leads up to the well-proportioned sculpture court on the first floor, which forms the entrance hall of the principal museum floor. A series of sculpture galleries runs all round the central area that gives light to the reading-room, and other museum departments occupy the two wings, the circulation being excellently managed throughout.

The second floor is mainly devoted to picture galleries, those in the two wings being top lit, while the centre block is carried up another story giving an additional group of top-lit galleries, which are thus conveniently grouped for allocation to loan collections. Besides the main entrance in the front, each end of the building has an entrance and staircase up to the second floor.

Detail, by Messrs. Bradshaw & Gass (Bolton).

By Messrs. Bradshaw & Gass (Bolton).

By Messrs. Bradshaw & Gass (Bolton).

design for the exterior shows a good of mass and proportion, but unfortunately seems to have been conceived without regard to that of the interior; thus the horizontal division does not mark the principal floor, but one of minor importance internally, with the result that two tiers of windows above it look rather empty, and in the section the internal treatment shows itself as absolutely falsified by the external treatment.

The design by Messrs. Cooper & Slater shows several marked similarities to that submitted by Messrs. Bradshaw & Gass. The arrangement of the library on the first floor is almost identical, except that the lecture hall is worked in between two rooms in the west wing. The arrangement through the reference library to the lecture hall at the back is not quite so well worked, but the book stack has rather better lighting. The upper floors are also similar in their general scheme, but the liberties of embodying all the complex elements in one homogeneous block of design have proved rather too much for the authors' powers of design. The central part is absolutely illusory as the expression of architectural purpose, masking, as it does, two floors and bits of two others at the end bottom, while the break in the front line, unhappy in itself, is difficult to justify, as necessitated by essentials of the

Messrs. Warwick & Hall have a compact and businesslike arrangement for their

entrance hall and staircases can hardly be regarded as architecturally impressive, but the limitation of the building area must be considered as partly responsible for this. The proportions of the various rooms are carefully studied, and advantage is taken of the extra height of the large reading-room to obtain light over the technical and magazine rooms at the ends to supplement that from the central dome. Perhaps the position of the main sculpture hall in relation to the principal staircase is hardly an ideal one, and the upper floors generally do not give any opportunity for striking architectural effects; at the same time, the rooms are all well lit and conveniently arranged for the purpose in view.

To Mr. A. G. Henderson we must offer our condolences on the loss of his partner, Mr. J. R. Hacking, in conjunction with whom he won his place in the second stage of this competition. His design also belongs to the group in which the plan is based on a central reference library, which is continued at each end as magazine and technical rooms, also top lit, while beyond these are the art and music libraries. This arrangement makes the library service particularly compact and convenient. The book stack at the back is fairly well lit, and a hall in front opens on the right and left into the staircases up to the art gallery. The main rooms of the library are too low in their proportions

By Messrs. Cooper & Slater (Blackburn).

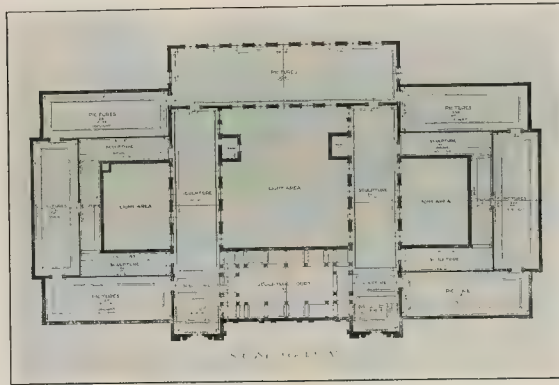

library floor, and are also able to find space at this level for the two lecture-rooms. The

and would be anything but impressive, although good in arrangement. Neither would the art galleries over be very interesting from an architectural point of view, though the central court is spacious and well placed. Externally the design well expresses the internal treatment, though it is a little unfortunate that the main cornice should come halfway up the walls of the picture galleries. The details of this design are characterised by severity and restraint. The too ingenious method of obtaining projections for the circular staircases is crudely worked out, and the worst feature of this design.

One of the ablest designs submitted is that by Messrs. Worthington & Son, which but for a weakness in the staff arrangements for the library would probably have stood a very good chance of success. The rooms are well lit and well proportioned, while a consistent architectural scheme is maintained throughout. Externally this is one of the most pleasing designs submitted, displaying the restraint and dignity that Mr. Blomfield admires in the successful one, and at the same time giving a very good suite of galleries for museum purposes. The position of the stack-room in the basement is a disadvantage shared with the winning and Mr. Atkinson's designs, but on such a limited

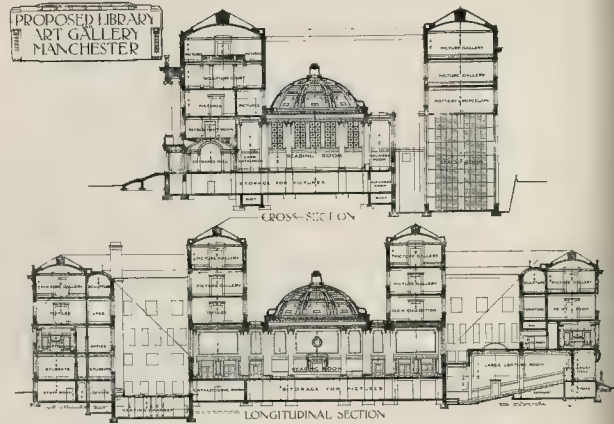

By Messrs. Cooper & Slater (Blackburn).

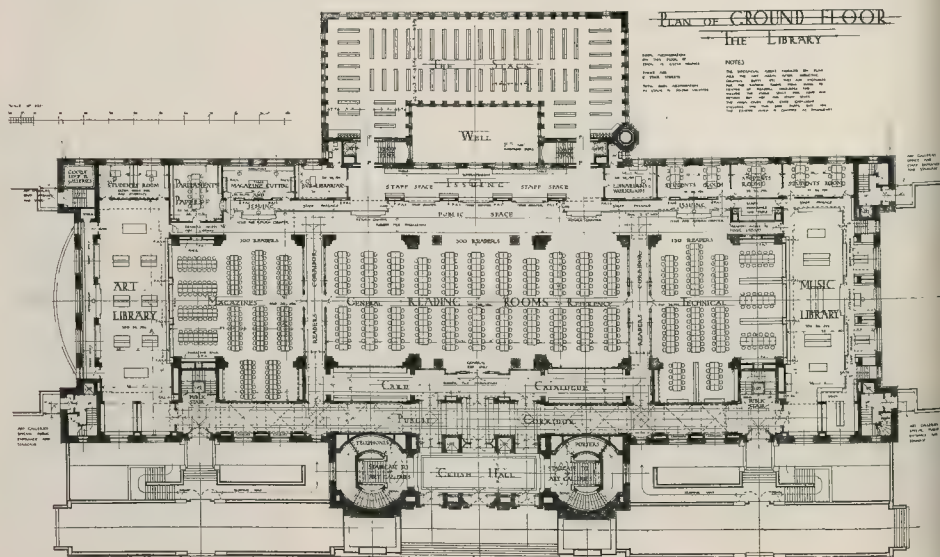

By Messrs. Cooper & Slater (Blackburn).

site it may fairly be contended that this is a lesser sacrifice than the curtailment of the ground-floor area, if that be the alternative.

It must be counted as a merit in Mr. F. W. Simon's design that it architecturally expresses the large reference library—certainly the most important room in the building—and that with this achieved the rest of the accommodation is provided in workable form. That this remainder does not suffer to some extent can hardly be contended; the three main staircases are too equal in importance to be satisfactory as a means of approaching such an important public building as an art gallery, while the value of the sculpture gallery as a central feature, so definitely felt by many of the competitors, is here lost by its virtual detachment. The library, though not impracticable in use, is certainly inferior to those where the main rooms are grouped on a single floor, and the galleries do not give the same facilities for circulation that may be found in most of the other designs. However, Mr. Simon must be congratulated on having produced a very impressive design, though some exception must be taken to the means he adopts

PROPOSED LIBRARY
ART GALLERY
MANCHESTER

By Messrs. Cooper & Slater (Blackburn).

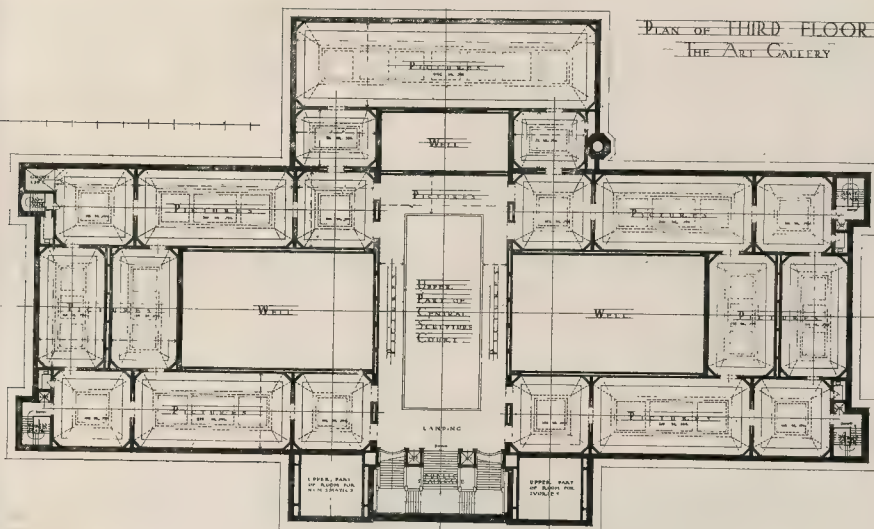

By Mr. A. G. Henderson (Glasgow).

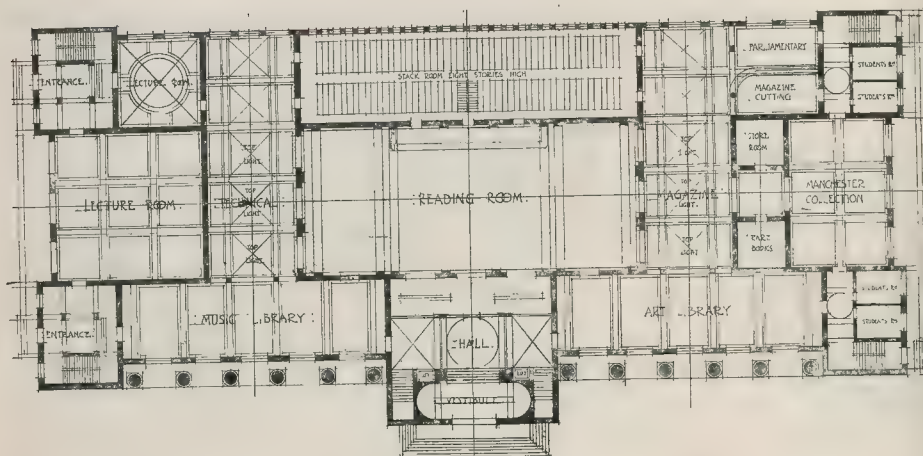

in building up his architectural masses out of a number of unimportant rooms. It is not easy to conceive why Mr. Simon, having felt so strongly the value of expressing externally the importance of the large reading-room, should have been content to have added its terminal pavilions without making them bear any definite relationship to the internal design of his building.

The design by Messrs. H. Percy Adams & Chas. Holden looks at first sight somewhat confused, but on closer study it will be found that the arrangements are practical and generally convenient, though they hardly suggest interesting effects architecturally. Roughly speaking, in this design the building is divided vertically, the front half being given to the museum galleries and the back to the library, which can be entered from the back or through the sculpture court, which forms the entrance hall of the museum.

This solution is distinct from that adopted by any other among the ten competitors. It does not appear to us the right one, and presents many difficulties, and must have entailed a vast amount of study to make it

Manchester Library, etc.: Design by Mr. A. G. Henderson (Glasgow).

Manchester Library, etc. : Design by Messrs. Warwick & Hall.

By Messrs. Warwick & Hall (London).

ieble. That Messrs. Adams & Holden succeeded in doing this is a magnificent monial to their ability and perseverance. ne same, we cannot but think that they d have done better if they had worked le lines of horizontal rather than vertical ration between the two distinct institut- t, which it was the problem of this etition to combine in a single building. . R. F. Farrar's design has a central nce library, but varies from those ously described in that one-third of the nd floor is given up to the sculpture and galleries, which form the entrance e art gallery from the east front of the ing, the main front being given up to brary entrance, or rather the entrance e reference library, the route to the ing rooms being architecturally in- ive. The minor libraries occupy two of the block corresponding to the ture court. Apparently these rooms are ed to be entered either by passing l the reference library or from an un- sive door on the west front; whichever ative is adopted the approach to the double staircase provided is quite

inadequate. In this design the library staff would be badly scattered and the library almost unworkable as planned. On the upper floors adequate lighting is provided, but that is about the only merit they can claim.

While the external treatment conveys an impression of mass and dignity, this is secured only by an entire disregard of the logical connexion between it and the building it contains. A glance at the plans show how absolutely the scale of the interior is at variance with that of the façades. It is difficult to see why this design came to deserve inclusion in the selected ten.

As the Manchester Corporation has not finally decided whether to allot the site to the library and art galleries, or whether to devote it to the provision of a new exchange, no immediate steps can be taken in starting the building. It will be regrettable if the work involved in this competition is rendered abortive by a change of public opinion in the city, as, though we cannot express the view that the successful design is entirely satisfactory, the conditions are so much to blame for its defects that no doubt it would be very

greatly improved in execution, and we could confidently look to Messrs. Crouch, Butler, & Savage to give Manchester a fine building, thoroughly well suited to its requirements.

EARLY CHRISTIAN MOSAICS.

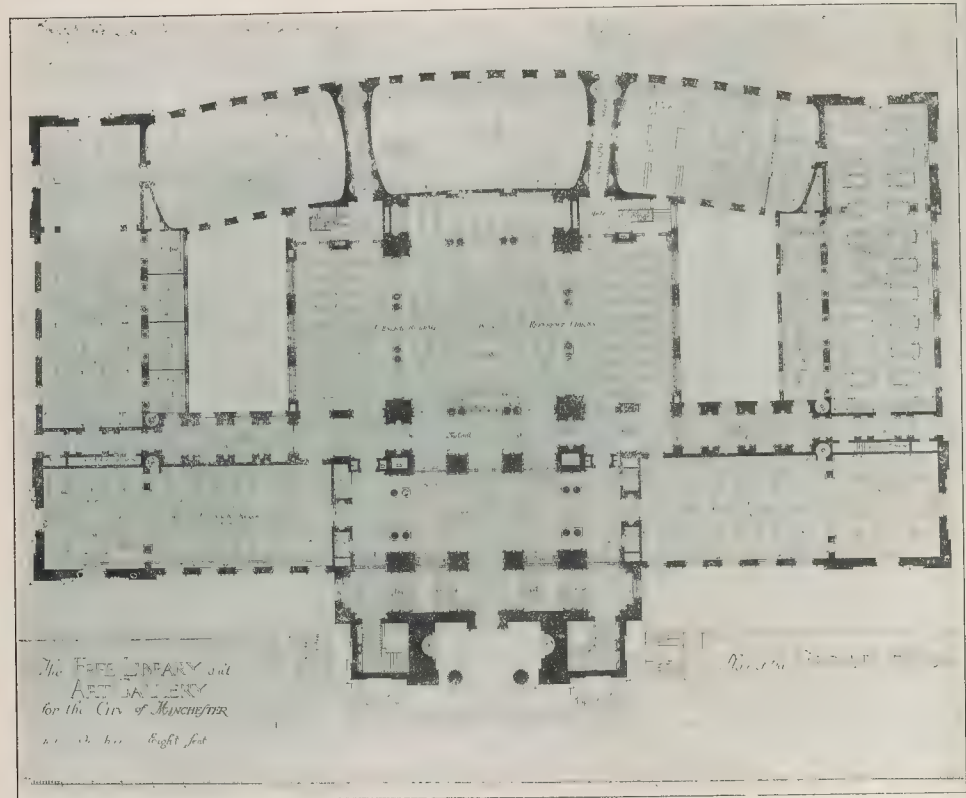

At King's College, on November 29, Mr. G. McN. Rushforth, formerly head of the British School at Rome, lectured on "Christian Mosaics," and in the course of his remarks he said:—

"The two essential features of mosaic as a decoration of walls or vaults are:—(1) Solidity, which makes it peculiarly appropriate to its setting in a monumental building; (2) texture, the network of lines formed by the tesserae being analogous, *e.g.*, to the stitches in tapestry. Any attempt to imitate a painting (as in the modern mosaic copies of the original oil paintings over the altars in St. Peter's at Rome) is an abuse of the art.

The apparently sudden efflorescence of the art of pictorial Christian mosaic in connexion with Constantine's churches must have been due to a favourable combination of conditions, such as the development which was taking place in Roman architecture in the matter of

By Messrs. Worthington & Son (Manchester).

Manchester Library, etc.: Design by Messrs. Worthington & Son, (Manchester).

Manchester Library, etc.: Design by Mr. F. W. Simon.

me and vault construction, and the coming into existence of the Christian basilica or church. Each, in spite of its prototypes, was a new form erected for a new purpose, and as such demanding a new kind of decoration. But all plastic forms have origins. Unfortunately, the case of mosaic the evidence is too fragmentary for us to trace its continuous development from its original use as a pavement to the statues on the apse or wall surfaces of a Christian church. The passage from the floor to the wall had already taken place before the end of the 1st century A.D., as was noted by Pliny*†; the Nymphaeum at Monte del Incastro, sketched out by Dr. Ashby,† with its dome, decorated with plain white mosaic, which is almost perfect," shows that by the latter half

of the next century the development had not gone far, especially as the plain white dome is contrasted with the decorative treatment of the niches in the walls of the building. No doubt as time went on regular pictures began to appear on the walls and vaults; but the secular buildings which contained them have disappeared or been stripped of their decorations. Thus the Palace of Diocletian at Spalato has traces of mosaics on its vaults, but, unfortunately, not sufficient to show their character or subjects. In default of actual examples, we may get an idea of what mosaics in palaces or other secular buildings were like from some of the early mosaics in churches in which the Christian element is very small or entirely absent. Such is the mosaic of the apse at the eastern end of the vestibule of the Lateran Baptistery (now the chapel of SS. Rufiana e Seconda), with its splendid design of acanthus

scrolls, so characteristic of Constantinian art. Another Constantinian building, the round church of S. Costanza, has on the vault of its circular aisle decorative designs in mosaic of a purely secular character, which might have appeared on the roof (or, for the matter of that, the floor) of any classical or pagan building.

S. Costanza contained other mosaics of a definitely Christian character. Those of the dome are lost, but those of the two main lateral niches survive, more or less, and are of great importance as showing that the typical design for the apse mosaic in the great Christian basilicas—the figure of Christ accompanied by the Chief Apostles, amid various symbolical adjuncts, sheep, palm-trees, etc.—belongs to the age of Constantine. The original apses of his great basilicas in Rome have all perished, but a record of the mosaic in that of St. Peter's

* Nat. Hist., xxvi., 64.
† Papers of the British School at Rome," iii. (190), 104.

Manchester Library, etc.: Design by Mr. F. W. Simon.

Manchester Library, etc.: Design by Mr. F. W. Simon.

was made before its destruction in the XVIth century,* and it shows all the essentials of the design in one of the lateral niches of S. Costanza. Another mosaic at S. Costanza (in the small dome above the altar, now destroyed) in the same way exhibited the main features of the well-known apse mosaic of S. Pudenziana at Rome, which, though it belongs to the end of the IVth century, may be classed artistically with the works of the Constantinian age. Among those features are the two female figures representing the Church of the Circumcision and the Church of the Gentiles (as in the rather later mosaic of S. Sabina). Still more interesting are the buildings forming the background to Christ and the Apostles, which are now believed to represent the churches erected by Constantine and his mother over the Holy places at Jerusalem, grouped around the hill of Calvary, with

* Ciampini. *De Sacris Aedificiis*, Tab. xlii.

its jewelled cross rising behind the enthroned Christ.

Belonging to the same age, but introducing us to a wider range of subjects, are the mosaics of the nave (Old Testament scenes) and chancel arch (The Nativity of Christ) in S. Maria Maggiore, which cannot be separated artistically, and probably belong to the middle of the IVth century. They are the best examples we have of the "classical" style, and their technique may be studied in the unequalled reproductions in Dr. Richter's book,* which is indispensable for the subject, though its particular theory as to the date cannot be sustained.

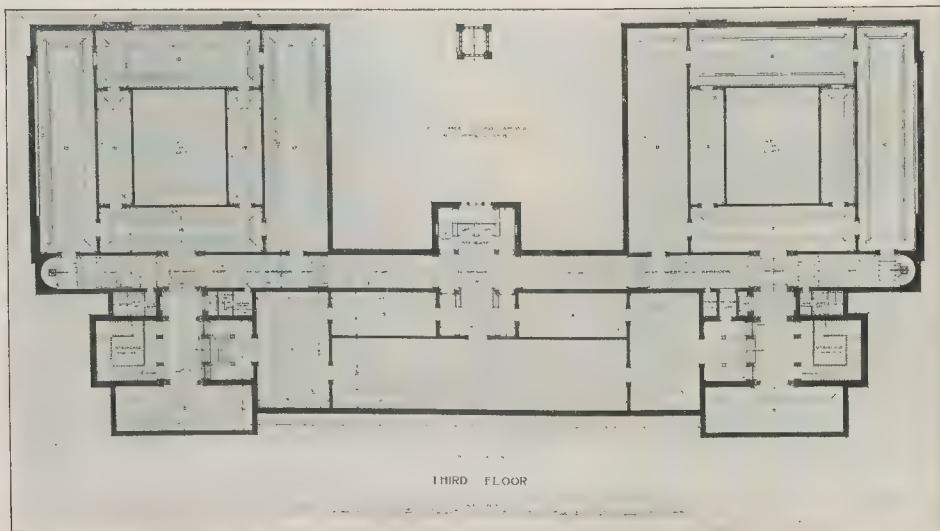

For typical mosaics of the Vth century we must turn to Ravenna, which became the Imperial residence in 402. In the mausoleum of Galla Placidia the decorative scheme is

* "The Golden Age of Classic Christian Art," By J. P. Richter and A. Cameron Taylor. Methuen, 1904.

practically intact, and the general effect is still quite classical. Its design may be compared with that of the less known but extraordinarily brilliant mosaics of the Old Baptistery attached to the Cathedral at Naples, probably belonging to the same period, but rather later. The Orthodox Baptistery at Ravenna also retains most of its original decorations, and here we get the complete treatment of a dome in mosaic. The lower zone of this, with its architectural designs of "classical" origin may be compared with the similar treatment of the dome of St. George at Salonica.†

* G. T. Rivoira. "Lombard Architecture" (Heinemann, 1910), Vol. I, p. 193, Fig. 279, shows the interior; and an article in the *Bollettino d'Arte del Ministero della Pubblica Istruzione*, iii. (1909), p. 217 gives a number of illustrations of the mosaics.

† G. T. Rivoira. "Lombard Architecture," I, p. 1, Fig. 12; O. M. Dalton. "Byzantine Art and Archaeology" (Oxford, 1911), p. 375, Fig. 221.

Manchester Library, etc.: Design by Mr. F. W. Simon.

So far the mosaics, while they are clearly an expression of the new Christian ideas, still reserve much of the form and feeling of classical Roman art. But meanwhile, and increasingly as time went on, a great revolution was taking place in the domain of art, which, when completed, meant the great contrast between the art of the ancient Græco-Roman world and that of mediæval Europe. One thing that brought about the change was the great decline in civilisation from the IIIrd century onwards. The standard of art always bears a certain relation to the standard of culture. And one result was that there were no longer artists capable of maintaining the ground won in the course of the long development of Græco-Roman art. There were moments of revival, and it was fortunate for early Christian art that one of these, the Constantinian Renaissance, was able to provide the new Christian conceptions with so much of form and method derived from ancient art, at a time when the tradition was still fresh and the impulse not quite exhausted. But in spite of such revivals, and in spite of the fact that some of the lessons of the past were never wholly forgotten, the general result was that the artist was replaced by the artisan and the individual observation of nature by a system of formal patterns. Figures are no longer naturally grouped in variety of attitude and gesture; they are rigid, isolated, conventional in gesture, always represented looking full-face out of the picture. Their surroundings, too, are conventionalised and schematic, and they no longer appear in the perspective of a realistic scene, but against a gold background.

The transition is well illustrated by the mosaics in S. Apollinare Nuovo (first quarter of the VIth century) at Ravenna. The upper scenes in the nave fairly represent the old tradition, but in the long procession of martyrs now then we seem to enter a new world. Of less striking in this respect are the well-known votive moving pictures of Justinian and Theodora in S. Vitale.

If we return to Rome we see the old designs of traditions being modified under the new influences. The apse mosaic of SS. Cosma e Damiano (525-530) recalls the design of the Constantinian mosaics, and we may say that all the majesty and grandeur of the representation derived from its prototypes of the great age. It may even look on it as the last great work

in the Constantinian tradition. Nevertheless, it is full of signs of the times. In particular there is no unity of action among the figures, who all look straight out of the picture as if they wanted to attract the attention of the spectator and thus detract from the impressiveness and significance of the scene. And this was a work carried out under the conservative régime of Theodoric. The Byzantine conquest of Italy, which really marks the end of the ancient world, introduced a period of increasing barbarism, and its results may be seen in the deterioration of the mosaics of this age in the Roman churches. Typical are those of S. Lorenzo outside the walls for the end of the VIth century, those of S. Venanzio at the Lateran for the VIIth, and those of S. Maria in Domnica and of S. Marco for the IXth. The last shows what the Roman tradition had sunk to, and with it the series of the old mosaics is brought to a close. Art almost ceased to exist till the first dawn of the Renaissance appears in the XIth century."

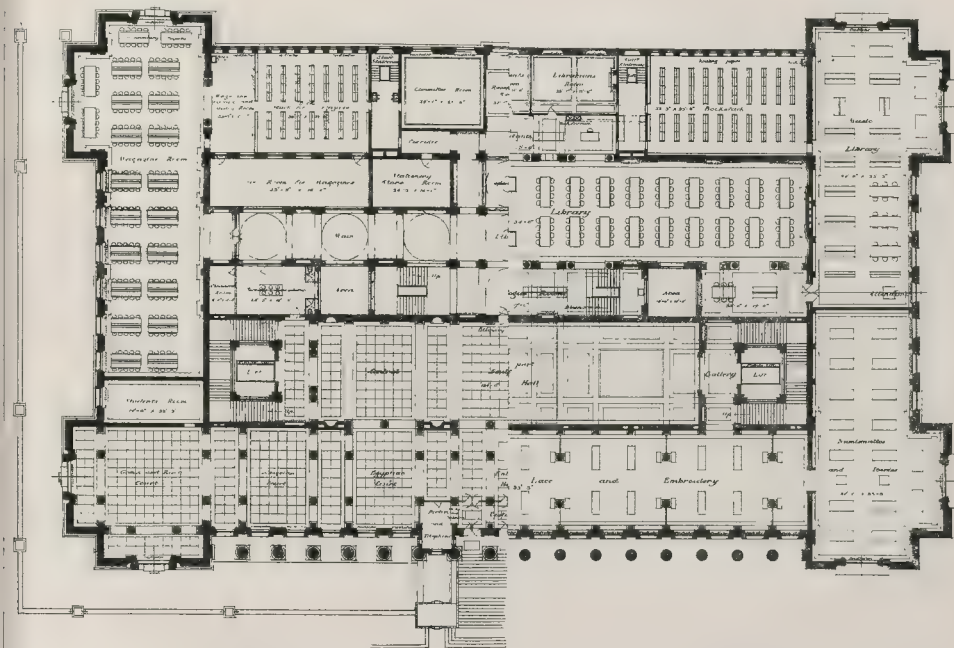

Manchester Library, etc.: Section, by Mr. F. W. Simon (Liverpool).

EARLY ROMAN CHURCHES.

PROFESSOR R. ELSEY SMITH delivered the fourth of the course of lectures on Christian Art, which are being given at King's College during the winter session, the subject being "Early Roman Churches."

He referred to the troubled history of the Christian Church in Rome during the first three centuries of our era and its culmination in the fierce persecution under Diocletian, followed early in the IVth century by the recognition of Christianity by the Emperor. He referred to the privileges granted by the Roman laws to burial clubs and the advantage taken of them by the Christian community, and to the fact that even martyrs publicly executed were not refused the privilege of burial in their own catacombs, with the result that many of these tombs became objects of veneration, and in more settled times had churches raised over them.

The influential position of some of the

Roman convents even in the days of persecution was referred to, and the fact that in less troublous times meetings were held in private houses, some of which, in the case of such convents, probably did include a private basilica.

A general description of a typical basilican church followed. The Church of S. Clemente at Rome was utilised as an illustration of the plan of such buildings. The forecourt, the triple division of the building into nave and aisles, the position of the apse, and the enclosed choir, with the arrangement of the arcade, or the alternative treatment of a colonnade, carrying an architrave supporting the arch roofs, were illustrated, while for the external treatment the Church of S. Apollinare at Ravenna was described as presenting now the least altered exterior.

The Constantinian foundations were all

referred to, and two of the great five-aisled examples—St. Peter's and St. Paul's—were described in some detail, and the special features of the planning and internal treatment of the two examples which still survive—S. Agnese and Lorenzo fuori le Mura—were fully illustrated, though it was pointed out that but little, if anything, of the actual structures could be considered with any certainty to belong to the earliest buildings.

Examples of some later foundations were illustrated, including S. Maria Maggiore and S. Prassede; so also were the floors both of early and later type, and the treatment of the screens, nimbus, ciboria, and other fittings.

The persistence of the basilican type of building, in spite of various modifications and variations in detail, was pointed out, and the important influence the establishment of this type of plan and the general treatment of the interior had on the treatment of

ecclesiastical architecture in Western Europe, not only in Romanesque, but also in late periods.

In conclusion, the lecturer referred to the circular and polygonal buildings, pointing out that the tomb of S. Costanza belonged, as regards its system of construction, to that of late Imperial Rome, rather than to that of the basilicas themselves, with which the much larger circular building of S. Stefano Rotondo, however, conformed.

The polygonal type of buildings so extensively used, not only in Rome, but throughout Italy, was described, and attention was directed to the alteration in the character and treatment that had occurred in the earliest example still remaining in Rome, that of the Lateran basilica, which had been altered from a structure of a single story with an encircling aisle to one provided also with a two-storied colonnade and an upper gallery.

THE BUILDING TRADE.

DAY WORKS.

DAY works are always more or less irritating to the surveyor, but when they are prepared in a soverely spare, day-work sheets are even more irksome to the quantity surveyors when the final accounts of a contract than well kept diaries. Yet, alas, how seldom they meet with! A foreman should find no difficulty in the preparation of his returns if he adopts a good system at the commencement of the job and keeps to it all through. The return should be made daily, up to Friday night for preference, and two copies should be made, one for the clerk of the works and the other for the surveyor; the time, etc., should be booked daily in a book kept for that purpose, and should be agreed to with the clerk of the works, so that the surveyor can have his copy without delay. The latter will find that he will avoid a great deal of trouble if he checks them at the end of the day instead of letting them accumulate until the end of the job. The returns should always be well displayed; numbering the various items will be found most useful; descriptions should be made full and lucid. How often the sheets delivered with the same item differently described week after week! A good space between each item is very useful in cases of disagreement between the clerk of works and foreman. The remarks column must not be neglected; the reason why extra has occurred, when and by whom it was ordered, and any other note that may be useful to settle any disputes at the final settlement should be inserted. There should be a remarks column for the use of the surveyor. It is very useful to note every variation upon the vouchers, whether it is to be adjusted as a day work or by measure. Work which will be concealed, such as foundations, etc., should be measured and noted, and the dimensions given upon the sheets; it is often very useful to give sketches or drawings of such work. Materials too often returned in various ways, very confusing; cement mortar is found weighed one week, being transposed the next week into bushels of sand and cement. Mortar appears in every conceivable form of measure, such as yards, hods, pails, bushels, keels, etc., all of which is very annoying to the surveyor. The charging of foreman's time frequently leads to dispute, and it seems new to be generally accepted that it is included in the rate the surveyor allows. There may, however, be cases where it can be legitimately charged; for instance, when at the end of a contract the foreman has left the job and has come back to attend to alterations, etc.

THE MEDIEVAL SAWYER.

In the Middle Ages where large building works were undertaken the sawyer was an indispensable workman. Much of the timber used in extensive building operations was cut up by the sawyers in pits dug by labourers in the woods where the trees were felled. All accounts of the engagement and payment of sawyers the engagement of a single sawyer is never mentioned. A carpenter could use the smaller saws, but the sawyer was by whom the great tree or log was sawn, and, naturally, for so large a tool two men would be needed. Such a fact explains why, for no great number of sawyers are engaged, two, a sawyer and his mate, are always employed and paid together. The building of the famous palace of Henry VIII. near Ewell hundreds of workmen were employed. It is clear that at one time the progress of this building there was no or no sawing to be done, but the entry reads the engagement of two, not one. (Rec. Off. MS. Exch. Acc. 477-12.) Any particulars of the work carried out by Henry VIII. at Sheriff Hoten Castle in are given in MS. Exch. Acc. 484-3. We find the record of the engagement of

six sawyers at "vid every man by the daye." The names of these six sawyers were: Robert Shire, John Shire, Davie Bell, Robert Hall, Hew Warter, Peter Warter. The details show us that the top and lower sawyer were paid at the same rate - 6d. a day each. Also we gather that it was, and very naturally so, a common circumstance for men of the same family to work together as sawyers; in the above-mentioned account we see that two out of the three couples were apparently brothers or relatives. In MS. 458-26 we have a record of payments to a "Robert Abbott and his sonne, sawyers." In Exch. Acc. 465-20 we see some sort of enumeration of sawyers' work. We read of the "bycking and slytting of diverse kyndes of Tymber as well into bordes as also into Joystis, Rawfters, quavters, poncions" (puncheons). In the twenty-fourth year of the reign of Henry VIII. various repairs were carried out on a property at Hatfield in Hertfordshire. Particulars of the work done and wages paid were entered in a book, which still survives, and is labelled in the Record Office as Exch. Acc. 464-23. In this book we see the not very common custom of paying the workmen partly in money and partly by payment for their board. The following entry shows us this system applied to the engagement of sawyers; it also places unusually clearly before us the fact of the engagement of sawyers in even numbers:—

"Item, to cristofer Sagher & his felow (fellows) for V dayis (days) warke, havyn XVId a day 'tis. viiid; and for theyre bord theis dais ms. iiii.

That is to say, they were paid 4d. each every day in money, 2d. each being paid for their board, making in all the usual earnings of 6d. a day.

On June 15 we meet with an entry of wages paid to "Christofer Sagher and his felow (fellow) for viii dais saghyng." The reference is of interest, for it tells us something of the derivation of surnames, and of the name Sawyer in particular. In our extract we have Christopher Sawyer for sawing, the surname being clearly derived from the man's occupation. In still earlier days, such an entry would have been Christopher, the sawyer, for sawing. The "the" disappears, and the calling becomes a surname, (Christopher Sawyer.

Of all medieval artisans the sawyer was more frequently paid by piecework than any other craftsman. He, like the rest, commonly worked by time, but the recorded instances of payments to him for piecework exceed in number all similar references to other artisans.

An example of payment by piecework to sawyers is to be found in MS. Exch. Acc. 544-12:—

"To the same two sawyers for sawyng of VO of borde at xiid the hundrith . . . vs."

Here we see that the sawyers were paid xiid. for the hundred—that is, for the hundred boards sawn. This amount, coinciding with that commonly paid to two sawyers for a day's work, shows us approximately the amount of sawing done by two sawyers in the medieval day.

An English picture of two sawyers at work is to be found on page 99b of a XIVth-century manuscript in the British Museum (MS. 10, E. iv.). The sawyers are not depicted as working in a saw-pit, but are represented as sawing a beam, which is placed against a tall four-legged rest. The saw is grasped at each end by a sawyer, the handles of the saw not being set transversely, but placed vertically at the ends of the saw. The men are dressed in the ordinary working men's garments of the Middle Ages—namely, each in hose or long stockings covering closely the whole leg, and in a close-fitting tunic-garment, which falls from the waist in slightly gathered-up folds. The sleeves, as would be expected, fit closely to allow free action of the arms. Neither man has a head covering, but we may suppose the kerchief, wrapped round the head with a hanging end, to have been very commonly the fashion.

SUNDERLAND AND DISTRICT BUILDING TRADES' ASSOCIATION.

The annual dinner of the Sunderland and District Building Trades' Association was held at the Grand Hotel, Sunderland, on the 5th inst. Mr. R. J. Hudson, the President, occupied the chair, and amongst others present were the Mayor of Sunderland (Councillor Brown), Mr. J. W. White (Sunderland), President of the National Federation; Councillor T. J. Armstrong (President of the Tyne and Blyth District Federation).

Mr. Morice Wright, in proposing "The National Federation of Building Trades' Employers," referred to the fact that Sunderland had given a good many notable men to the Federation, and this year in particular had provided a President in the person of Mr. White, who had also had the exceptional honour conferred upon him of being elected a member of the National Industrial Council as a representative of the building trades. In recognition of the distinction conferred upon Mr. White, he had pleasure in handing him, on behalf of the local association, an address of congratulation and also a silver salver and two silver vases.

Mr. White, after acknowledging the gifts, referred to recent legislation and its effect on the building trade. It was originally said that the Workmen's Compensation Act would represent something like 4s. or 5s. per cent., but now they found that it represented no less than 40s. per cent. Criticising the Insurance Bill, he said, so far as he could make out, the cost to the building trade employer would work out at about 1½ per cent. That was in relation to sickness benefit. The Bill would come into operation too early, many of them having taken contracts for some time ahead without consideration of that charge of 1½ per cent., which consequently would have to come out of the pockets of the employer.

CONTRACT OR MUNICIPAL LABOUR AT BLACKBURN?

The proposal by the Waterworks Committee of the Blackburn Corporation to let the work of the proposed new water reservoir in the Wiltshire district by contract was challenged at a meeting of the Town Council by Mr. Higham, who contended that it ought to be done by labour employed direct by the Corporation. In contract work of this character, involving a great deal of excavation of land, that might be easy or might prove to be rock, it was "heads I win, tails you lose," for the contractor, who made a great profit if the job proved easy, and, if it proved difficult and unprofitable, "broke," and left the Corporation to finish it themselves. By employing direct labour they would also avoid the possibility of scamped work.

Mr. Hammond seconded. Mr. Nuttall said that Mr. Bryan, their Consulting Engineer, strongly advised the Corporation to let the work to contractors of experience in that class of undertaking, and it was of no use calling in expert advice unless it was acted upon.

Mr. Hartley said that all work done by the Corporation was extremely expensive, and on the grounds of economy they should avail themselves of the ordinary competition by contractors.

Mr. Gregson and Mr. Slater thought there should be some understanding as to what the rates were to receive, 6d. per hour being mentioned as a minimum.

Mr. Edmondson said he was a member of the Master Builders' Association, and they had agreed to meet the men on this subject, but the men were not prepared to meet the masters without some advocate with them. That was why the labourers did not receive 6d. per hour from the Masters' Association.

The recommendation of the Committee was approved, seven voting against it.

THE LATE MR. H. BROADHURST.

Mr. Henry Broadhurst, of Trent Cottage, Cromer, formerly a journeyman stonemason, and afterwards M.P. and Under-Secretary of State, Home Office, in 1886, has left estate of the gross value of 5,962l. 6s. 2d., with net personality 5,481l. 9s. 5d.

Manchester Library, etc.: Longitudinal Section, by Mr. R. Fielding Farrar (Leeds).

Roman convents even in the days of persecution was referred to, and the fact that in less troublous times meetings were held in private houses, some of which, in the case of such convents, probably did include a private basilica.

A general description of a typical basilican church followed. The Church of S. Clemente at Rome was utilised as an illustration of the plan of such buildings. The forecourt, the triple division of the building into nave and aisles, the position of the apse, and the enclosed choir, with the arrangement of the arcade, or the alternative treatment of a colonnade, carrying an architrave supporting the arch roofs, were illustrated, while for the external treatment the Church of S. Apollinare at Ravenna was described as presenting now the least altered exterior.

The Constantinian foundations were all

referred to, and two of the great five-aisled examples—St. Peter's and St. Paul's—were described in some detail, and the special features of the planning and internal treatment of the two examples which still survive—S. Agnese and Lorenzo fuori le Mura—were fully illustrated, though it was pointed out that but little, if anything, of the actual structures could be considered with any certainty to belong to the earliest buildings.

Examples of some later foundations were illustrated, including S. Maria Maggiore and S. Prassede; so also were the floors both of early and later type, and the treatment of the screens, nimbuses, ciboria, and other fittings.

The persistence of the basilican type of building, in spite of various modifications and variations in detail, was pointed out, and the important influence the establishment of this type of plan and the general treatment of the interior had on the treatment of

ecclesiastical architecture in Western Europe, not only in Romanesque, but also in later periods.

In conclusion, the lecturer referred to the circular and polygonal buildings, pointing out that the tomb of S. Costanza belonged, as regards its system of construction, to that of late Imperial Rome, rather than to that of the basilicas themselves, with which the much larger circular building of S. Stefano Rotondo, however, conformed.

The polygonal type of buildings so extensively used, not only in Rome, but throughout Italy, was described, and attention was directed to the alteration in the character and treatment that had occurred in the earliest example still remaining in Rome, that of the Lateran basilica, which had been altered from a structure of a single story with an enclosing aisle to one provided also with a two-storied colonnade and an upper gallery.

Surveyors' Institution.—A plan was submitted by Mr. Paul Waterhouse on behalf of the Surveyors' Institution for the reconstruction of the sewage of the building, and it was

LEGAL COLUMN.

In reference to the article on "Repairing Covenants in Leases," which appeared in our last issue, page 663, the names in the case were given as *Zurcott v. Wakeley*, whereas it should have read: *Lurcott v. Wakeley*.

Trade Union Law.

The case of *Baker v. Ingall* (noted the *Builder*, March 31 last) has been carried to the Court of Appeal, and it affords one more example of the difficulties which arise in connexion with the law relating to trade unions. The defendant was a member of a friendly society, registered as a trade union, the Friendly Society of Ironfounders of England, Ireland, and Wales, and he was being sued by the plaintiff society for the sum of 100*l.*, which had been paid to him as benefit whilst suffering from an accident. One of the rules of the society was that all members receiving accident benefit must sign an agreement that in the event of their returning to the trade they will refund the amount so received. The defendant was originally a moulder earning 2*l.* a week. About four years after the accident he was able to return to work as a coremaker at 12*l.* 5*s.*, and the County Court Judge held as a fact this was a return to the trade of an ironfounder. To the claim by the union for the return of the sums given to the defendant as benefit the member raised several technical points under the Trade Union Act, contending that this was a claim over which the Courts could exercise no jurisdiction.

The first question which has to be decided in such cases is whether the society is one whose objects are illegal at common law. If the society would have been illegal at common law, because its objects would be a restraint upon trade, then it remains to be seen whether, under the special provisions of the Trade Union Acts, recourse is open to the Courts or not. We explained this fully in our article on the second Osborne case (the *Builder*, February 24 last).

In the case under consideration the County Court Judge had held this society by its rules to be an unlawful association at common law, as being in restraint of trade, and that under sect. 4 of the Trade Union Act, 1871, the agreement could not be enforced, because that section provides that "Nothing in this Act shall enable any Court to entertain any legal proceeding instituted with the object of enforcing . . . any agreement for the payment of any penalty or forfeiture, or for the application of the funds of a trade union," and he held this to be a proceeding to enforce a penalty and relating to the application of trade union funds.

The Divisional Court had not to consider whether this society was or was not an unlawful association, because it held that the Trade Union Act did not apply, since the proceedings in question were not taken to enforce a penalty, and the agreement for the repayment of this money was not an agreement for the application of the funds, but a separate and distinct agreement.

The Court of Appeal have reversed this finding. On the question of the legality of the society, the Court felt itself bound by a decision, *Russell v. Amalgamated Society of Carpenters* (see the *Builder*, January 13, 1910), to hold this society unlawful in its objects at common law, and that under the Trade Union Act this agreement was not distinct and separable, but was an agreement within sect. 4. Lord Justice Kennedy dissented from this latter finding.

It is open to the plaintiffs, the trade union, to appeal to the House of Lords on the point decided by the Court of Appeal in *Russell's* case, as to what renders a trade union illegal in its objects; but that is a question which has involved much litigation.

When the legislature legalised trade unions by the Trade Union Act, 1871, it seems to have been deemed expedient not to allow these hitherto "illegal" societies to have free access to the Courts. The reason for this limitation, if any ever existed, appears to have passed away, and expediency seems now to point entirely in the direction of throwing the Courts open to trade unions and their members. In the present case, for instance, why should the trade union be unable to enforce a reasonable agreement against one of its members? Unfortunately, far from adopting the view that the Courts should be open to all, the legislature by the Trade Disputes Act has made a further move in the opposite direction, even excluding the general public from the Courts where wrongful acts have been committed by trade unions or their members in contemplation or furtherance of trade disputes.

Gas Mains: "Building" or "Tunnel"?

In the recent case of *Schroeder v. Worthing Gas Light and Coke Company* some points of interest were decided. The plaintiff was the owner of land at both sides of a highway, and in September, 1898, he connected his property by constructing a tunnel under the roadway. This tunnel was constructed of bricks strengthened with iron girders. The roof was 18 in. below the surface of the road, and was constructed of transverse and longitudinal girders imbedded in cement 18 in. thick. The defendants were a gas company, with statutory powers contained in a private Act passed in 1897, which incorporated the Gas Works Clauses Act, 1847.

In December, 1910, the defendants laid two gas mains 10 in. below the surface of the road, and in doing so carried away part of the cement concrete and one of the mains rested on the girders. The plaintiff contended that these mains were laid in and through the roof of his tunnel, and on his land not dedicated to the public use. The defendants contended that they had acted within their statutory powers in excavating the roadway and laying the pipes. Sect. 6 of the Gas Works Clauses Act, 1847, empowers the undertakers to open and break-up the soil of streets, and "any sewers, drains, or tunnels" under such streets; but sect. 7 provides that the undertakers shall not "lay down or place any pipe . . . into, through, or against any building, or in any land not dedicated to public use, without the consent of the owners or occupiers."

The Court held, on the authority of the case, *Thompson v. Sunderland Gas Company* (1877), that this structure was a "building." The Judge considered it was not a "tunnel," but that, even if it were, the defendants had acted *ultra vires*, since by sect. 10 they were bound to reinstate it—i.e., to restore it to the condition in which it was before; and this they had neglected to do. The Court left undecided the point as to whether or not the pipes were laid in soil dedicated to the public use, on the above findings the plaintiff was entitled to a mandatory injunction.

Building Estate: Implied Grant of Right-of-Way.

A case, *Rudd v. Bowles*, is reported in the *Weekly Notes*, which is of interest to those accepting building leases.

On March 25, 1902, the defendant, Bowles, granted leases of four plots of land to one Gluck, who had erected houses upon them under a building agreement. Afterwards, by agreement, the dates of the leases were altered to some dates in July, 1894.

There was a plan on each lease which showed twelve plots with houses, but those demised to Gluck alone were coloured. The land and houses fronted on Halons-road, Eltham, at right angles to which ran Enslin-road. The plans showed a strip of land, coloured brown, 4 ft. wide, running at the back of the plots, except the last two near Enslin-road; but there were no words indicating that this was intended as a right-of-way. At the time the dates on the leases were altered the plots, with the approval of the defendant's architect, or without objection raised, had been fenced in at the back with gates or openings giving on to the brown strip. This strip had been included in the building agreement, but with the consent of Gluck excluded from the leases. It had never been fenced in on the other side, but formed part of the defendant's land.

In September, 1910, the defendant commenced building on the brown strip, and the plaintiff, a mortgagee of Gluck, in possession, applied to the Court for a declaration that he was entitled to a right-of-way over the brown strip and for an injunction.

The Court held that the alteration in the dates of the leases did not invalidate them, and that the defendant was estopped from showing that the date inserted by himself was not the date from which the demise operated, so as to prevent anyone claiming under the lease from relying on circumstances then existing; and since at either date, it was fairly obvious to anyone inspecting the houses with the plan that the back gardens were intended to open on to the 4-ft. strip, and access from the back was necessary for the reasonable enjoyment of the houses as constructed, therefore an implied right-of-way was granted by the leases, and a declaration was granted and an injunction.

Waste Land by Highways.

Very difficult questions arise from time to time in connexion with waste lands by the sides of highways. In a recent case, *Beal v. The Berkshire County Council*, the lord of the manor of Horley was suing the County Council for trespass upon a strip of land by the highway some 350 ft. long and varying in width from 32 ft. to 12 ft. In support of his claim he relied upon certain acts of ownership exercised by him. He had taken the road trimmings for his own use or had sold them,

and had been paid a nominal rent for allowing road scrapings to be deposited upon the piece of land. Some telegraph poles had been placed on the land, and the United Telephone Company and the Postmaster-General had made a small payment in respect of them. Lastly, it was alleged some cottages had been built by one Cripps facing the piece of waste, and the plaintiff had exchanged a piece of the waste land for a piece of Cripps' land in order to give them a straight frontage.

The defendant Council, however, asserted that even if the soil was vested in the plaintiff yet for forty years there had been continuous user by the public of the surface, and the Court held that the evidence of dedication had not been rebutted by the plaintiff, and the presumption was assisted by the fact that the cottages only abutted on the piece of waste land, so if it were not part of the highway, the cottages would have had no means of access to the road. Owing to the action of the defendants in making certain admissions, which the Court held had misled the plaintiff, and in refusing to produce certain minute books and other documents, or giving any reason for their non-production, the action was dismissed without costs.

A somewhat similar case, *Coats v. Herefordshire County Council*, will be found noted in the *Builder*, June 5, 1909. In that case the Court held that the land being capable of dedication, and there being persons capable of dedicating it, exercising acts of ownership over other portions of it, who had permitted the use of the portion in question by the public for over forty years, the land must be deemed to have been duly dedicated.

LAW REPORTS.

London Building Acts:

L.C.C. v. Clark.

THE appeal in the Court of Appeal, composed of Lords Justices Vaughan Williams, Buckley, and Kennedy, on Monday, December 11, mention was made of the case in the King's Bench Division (interlocutory list of appeals) of the London County Council v. Clark.

This was the appeal of the respondent Mrs. Clark—in the matter of the London Building Act, 1894, and of the London Building Acts (Amendment) Act, 1905, sects. 7 (4) and 22—as the owner of the Berners Hotel, Berners-street, London, W., from an order of the Divisional Court composed of Justices Hamilton and Bankes upon her appeal against the refusal of the London County Council to issue a certificate pursuant to sect. 7 of the Act of 1905. The matter came before the Divisional Court on a special case stated by the Tribunal of Appeal.

Mr. C. A. Russell, K.C., stated, on the Lordships taking their seats, that he was surprised to see the appeal in the list for that day, and he was afraid the parties were not ready for the hearing. It was a case which the appellant had given notice of appeal in order to protect herself, but communications were now going on between her and the London County Council which both parties thought, if time was given them, might lead to a settlement. If the Lordships would allow the appeal to stand until the next sittings he would be glad. The appeal raised important questions under the Building Act, and there were a great many details to be considered.

Counsel, on behalf of the London County Council, said the London County Council was agreeable to this course, and thereupon the Court gave consent to the application.

COURT OF APPEAL.

(Before Lords Justices VAUGHAN WILLIAMS, BUCKLEY, and KENNEDY.)

Action by Contractors on District Surveyor's Certificate:

Thomas Free & Sons, Ltd. v. Urban District Council of Sutton.

THIS case was heard on December 12, 13, and 14 upon the application of the plaintiffs for judgment or new trial in the action which was tried by Mr. Justice Lawrence and a special jury in the King's Bench Division. There was also a cross appeal by the defendants.

Mr. Ernest Pollock, K.C., and Mr. McCarthy appeared for the appellants, and Mr. Shearman, K.C., and Mr. Morton Smith for the respondents.

Mr. Pollock said that the action was brought by the plaintiffs, a firm of contractors carrying on business at Maidenhead, to recover 270*l.*, the amount of the certificate given by the Surveyor to the defendant Council for work done by the plaintiffs in making-up a

lying out a road called Grennell-road, Sutton. At the trial the learned Judge put two questions to the jury; the first was, whether the 270*l.* was due to the plaintiffs on May 18 under the contract between the plaintiffs and the defendants; and, secondly, did the plaintiffs know that the sum was not due? The jury answered both those questions in the plaintiffs' favour. The learned Judge, however, upon the construction of the contract under which the certificate was given, and the facts, entered judgment for the defendants, in spite of the verdict, and from that judgment the plaintiffs now appealed.

The amount of the contract for making-up the road in question was 967*l.*, odd, and the amount sued for was for an instalment due under the Surveyor's certificate. Several points were raised by the defendants in the defence, but, broadly speaking, the defendants made a charge which really amounted to a charge of fraud and collusion between the plaintiffs, and Mr. Charles Chambers Smith, the Surveyor, and that charge appeared in paragraph 11 and subsequent paragraphs of the statement of defence.

The learned Counsel then referred to the material paragraphs in the statement of defence, from which it appeared that the defendants alleged that the certificate given by the Surveyor was not a certificate given by him under clause 30 of the contract, and that the date of the certificate no sufficient work was done, and, further, that at the time the certificate was given the plaintiffs and the Surveyor well knew that the sum was not due from the defendants to the plaintiffs. The learned Counsel further alleged that the contour of the road was not sufficient, that the gravel was not sufficient, and so on, and therefore there was no justification for the Surveyor granting an interim certificate under the contract. All that was negatived by the verdict of the jury, who found a verdict in the plaintiffs' favour. He (Counsel) contended that the jury had, by their verdict, brushed aside the charge of collusion between the plaintiffs and the Surveyor, and therefore that the plaintiffs were entitled to judgment upon the certificate given, because the certificate was conclusive that the sum was due to the plaintiffs.

The whole question in dispute was whether, under the circumstances, the plaintiffs were entitled to the sum certified by the Surveyor. The Surveyor was entitled by the contract to enter up to 90 per cent. of the contract sum, and when he was satisfied that the work was done the Surveyor was empowered to certify up to 90 per cent., and then there was a maintenance period, during which 10 per cent. was held in hand. What the other side was was that at the time the certificate was given it was undoubtedly a certificate for 90 per cent.

Mr. Shearman: It was for 95*l.* per cent.

Mr. Pollock: No. He said that there was 90 per cent. due to the plaintiffs, and work was done sufficiently to do to justify the certificate for 90 per cent.

Lord Justice Kennedy: Was that question left to the jury?

Mr. Shearman: No.

Mr. Pollock, having read the contract, said that the whole difference between them was whether or not the Surveyor was entitled to go into account the extras which were ordered under the contract. If he could prove that the Surveyor was entitled to take into account the extras then he (Counsel) could prove that the actual sum due to the plaintiffs at the date of the certificate was 259*l.* 15*s.* 10*d.* might be that he could not for a shilling but two justify the giving of the certificate by the Surveyor. By the contract, the certificate the Surveyor was to be a condition precedent to payment by the contractors. The work was dated February 2, 1910, and the work was commenced in February and completed in the following May. The first certificate was given on March 10, which was for 7*l.* due to the plaintiffs on account. Later progress certificates were given, and the sums paid to the plaintiffs by the defendants. At the time the disputed certificate of 270*l.* was given there was due to the plaintiffs 64*l.* 15*s.* for extras, which made the contract price up to 1,032*l.* 11*s.* 5*d.*

Mr. Shearman: What about deductions?

Mr. Pollock replied that at that time there were not any deductions. There was no defence that at that time the deductions had been ascertained. After deducting the 10 per cent., 10*s.*, that left 929*l.* 11*s.* 5*d.*; of that in the defendants had paid the plaintiffs on certificates of the Surveyor a sum of 669*l.* 10*s.* 6*d.* due to the plaintiffs in respect of the contract and extras 269*l.* 11*s.* 5*d.* It was in respect of that that the 270*l.* certificate was given.

Mr. Shearman said that for this matter the Surveyor was called upon to resign, and

he resigned. At the trial he sat next to the plaintiffs, and did not go into the witness box, therefore he gave no explanation of how he arrived at his figures. His (Counsel's) contention was that the defendants were entitled to say that in the circumstances the certificate did not bind them. His case was that the certificate, upon its face, was bad because it was common ground that at the date of the certificate the work was not completed and measured up.

Mr. Pollock said that the contract did not provide that the certificate should be given in any particular form, so that fact did not militate against the plaintiffs' claim, provided they had the certificate of the Surveyor, who was the arbitrator under the contract, the getting of the certificate being a condition precedent to the plaintiffs getting payment at all. Whatever the Surveyor did did not affect the plaintiffs' rights under the contract with the defendants.

On Wednesday, Lord Justice Vaughan Williams said that since the Court rose the previous day he had read the certificates, and he thought, as then advised, that the certificate for 270*l.* was not a final certificate, and that at the time it was given the Surveyor had not approved the work as a whole. If that was so, and there was nothing more, it was plain that the judgment of Mr. Justice Lawrence was right. He did not see that the findings of the jury had anything to do with the case.

Lord Justice Buckley: You have to satisfy me, Mr. Pollock, that at the date of the certificate 90 per cent. of the contract sum was due to the plaintiffs. I think it was only 80 per cent.

Mr. Pollock then read the judgment of Mr. Justice Lawrence, from which it appeared that his Lordship held that the certificate in question was not a final certificate, the Surveyor at the time not having expressed his approval of the quantity and quality of the work. His Lordship, being of opinion that the certificate was a progress certificate, the defendants were entitled to question it, which they would not have been entitled to do under the contract if the certificate had been a final certificate. His Lordship expressed the opinion that the proceedings were entirely misconceived, and entered judgment for the defendants.

Mr. Pollock said he had evidence that the work was completed, that it was properly examined by the Surveyor, and that he properly certified that the sum in question was due to the plaintiffs.

Mr. Shearman, in supporting the judgment of Mr. Justice Lawrence, said he submitted in the Court below that there were no questions proper to be left to the jury. He also said that the defendants had not charged that the plaintiffs and the Surveyor had been guilty of fraud.

Lord Justice Vaughan Williams: I have read a good deal of the evidence, and it struck me that, from what you said and asked, you clearly did raise the question that the sum of 270*l.* was not due.

Mr. Shearman: Yes, under the contract. One of my questions was that it was not only not due, but that they had not done it.

Lord Justice Vaughan Williams: I am still of opinion that you deliberately raised the question that the sum of 270*l.* was not due, and therefore you acquiesced in the questions being put to the jury.

Mr. Shearman: I say I did not charge fraud. I say that they were colluding only in getting money which they knew was not due, but which they knew would become due eventually.

Lord Justice Vaughan Williams: That is an imputation of fraud. It would be shocking if honest men could do anything of the sort. That is fraud.

Mr. Shearman said he was sorry to hear his Lordship say so. He contended that there was no evidence to justify the findings of the jury, and that the certificate in question was not a final certificate, but only a progress certificate. He submitted there was no evidence on which the jury could find that at the time the certificate was issued the contract was completed.

Mr. Shearman, continuing his address, contended that the certificate which the Surveyor had given for 270*l.* could not, in any circumstances, having regard to the terms of the contract, be construed to be a final certificate. Before the Surveyor could issue a final certificate he must have gone and inspected the work and certified in writing that the work was completed.

Lord Justice Kennedy: Had he not done that when he says the amount of work done was so much?

Mr. Shearman: No, I submit not. You cannot arrive at the final amount of work you have measured up. I say he cannot give the

final certificate until he has arrived at and certified the reductions. I say he has got to measure up and value. I asked the plaintiff over and over again had there been any measuring up, and he said there had not, and that it had to be settled afterwards. The plaintiff said that they had arrived at the extras approximately. I say, therefore, that no event has happened on which the plaintiffs were entitled to a 90 per cent. certificate. I submit that this is a perfectly plain common form of contract. It amounted to this, that 90 per cent. could be paid to the contractors during the progress of the work when certified by the Surveyor, and that when the matter was finally settled, then maintenance period commenced when 10 per cent. was to be withheld as a security for what might happen during the period of maintenance. I contend that that period never happened under this contract, and that no 90 per cent. certificate could be given until the period of maintenance began.

[The case was proceeding as we went to press.]

OBITUARY.

Professor Legros.

We regret to announce the death, on December 8, at his residence, Melbury, Watford, of Professor Alphonse Vivant Legros, aged seventy-four years, who was Professor of Fine Arts, University College, in 1876-84. A native of Dijon, Professor Legros began life as an apprentice to a house-decorator; he then entered the *ateliers* of Cambon, the scene-painter, and Lecoq de Boisbaudry, and studied in the Ecole des Beaux-Arts. In 1855 he sent "Le Lutrin" to the Salon, and became a teacher in the South Kensington School of Art, and afterwards in University College, being appointed Slade Professor in 1876. Examples of his work are in many public and private collections—including his "Ex Voto" in Dijon Museum; "Dead Christ" and "Amende Honorable" in the Luxembourg; and "Femmes en Prière," a portrait of Mrs. John Grey, and the memorial portrait in silver-point of Alfred Stevens in the Tate Gallery, drawings and etchings in the British Museum; and his portraits of Huxley, Marshall, Cassel, Burne-Jones, and Browning at South Kensington. He executed the bronze and granite fountains at Welbeck nine years ago. Of his many other works we may mention his "Mort du Vagabond"; portraits of Carlyle, Manning, Delion, and Gambetta, and the Watts, Darwin, Tennyson, and J. S. Mill medals. In our "Note" of November 17 we adverted to his high appreciation of Alfred Stevens and to his efforts for the establishment of the Stevens Room in the Tate Gallery. Professor Legros married, in 1854, Miss F. R. Hodgson, and received letters of naturalisation in 1881. Sir Charles Holroyd, Mr. Strang, Lady Stanley, and Countess Gleichen were his pupils.

Mr. J. R. Carroll.

The late Mr. James Rawson Carroll, of Dublin, was a Fellow of the Royal Institute of the Architects of Ireland, and served during many years as member of the Council. He was elected a Fellow of the Royal Institute of British Architects in 1876. With his partner, Mr. Frederick Batchelor, F.R.I.B.A., practising at No. 133, Great Brunswick-street, Dublin, he was the architect of—in Dublin—the Richmond Surgical Hospital, in North Brunswick-street, for eighty-five beds (and provision for future considerable extension), with central and administration blocks, two wing-pavilions, home for thirty-one nurses, operation-theatre block, etc. (1901); the new buildings for out-patients and 120 in-patients, and with sanitary annexes, to combine under one roof the St. Mark's Ophthalmic Hospital, Lincoln-place; and the Provincial Banking Company's premises, Belfast (1903); Limerick Work-house; and additions, at a cost of more than 10,000*l.*, to the Great Southern Hotel, Killarney, eleven years ago.

M. Fleury.

We have also to announce the death, on December 7, in Paris, of M. Tony Robert Fleury, President d'Honneur de la Société des Artistes Français, aged seventy-three years. He was a pupil of his father, J. N. R. Fleury, and of Cogniet and Paul Delaroche. M. Fleury first exhibited in the Salon in 1850—winning "Warsaw: Massacre of April, 1861." He painted many portraits, "Le Lever de l'Ouvrière" and "Marie Antoinette, le Matin de son Exécution"; his "Le dernier jour de Corinthe," for which he gained a medal of honour, is, with several others by him, in the Luxembourg Gallery.

OBITUARY.—Continued on page 727.

BUILDING—continued.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, is to be sent in.

DECEMBER 30. — Birmingham. EXTENSION. — Erection of an extension to the station in Water-street, Aston. Quantities, on deposit of 2s., from the Quantity Surveyor, Mr. Christopher Silk, 38, Newhall-street, Birmingham. The drawings are at the offices of the architects, Messrs. Arthur Harrison & Cox, Council Chambers, 169, Colmore-row, Birmingham.

JANUARY 2, 1912. — West Hartlepool. TRAMWAY. — For the laying of about 11 miles equivalent light track of tramway. Plans and conditions in, and specification and quantities, on deposit of 11s., from Mr. Nelson F. Dennis, M.Inst.C.E., Borough Engineer, Municipal Buildings.

JANUARY 3, 1912. — Sheffield. TELEPHONE EXCHANGES. — The Commissioners of H.M. Works and Public Buildings invite tenders for erection of telephone, Sheffield, and alterations to existing exchange. See advertisement in this issue for further particulars.

JANUARY 5, 1912. — Barking. SCHOOL. — The Barking Town Education Committee invite tenders for an elementary school in Ripple-road. See advertisement in this issue for further particulars.

JANUARY 5, 1912. — Breconshire. ALTERATIONS. — For the following works, for the Breconshire Education Committee: — Crickhowell Municipal School, erection of new classrooms and alterations to existing building; Llangantenn Municipal School, addition of new classroom, new classrooms, etc. and alterations to existing building; Talgarth Council School, erection of 20 girls' cloakroom and other works. Mr. C. W. Surveyor, County Hall, Breconshire Education Building, County Hall, Brecon.

JANUARY 5, 1912. — Edenbridge. SPECIAL SUBJECTS BUILDING. — The Kent Education Committee invite tenders for special subjects building. See advertisement in this issue for further particulars.

JANUARY 5, 1912. — Portsmouth. POST-OFFICE EXTENSION. — The Commissioners of H.M. Works and Public Buildings invite tenders for demolition of old premises and extension of Head Post-office. See advertisement in this issue for further particulars.

JANUARY 5, 1912. — Welling. KENT. SCHOOL. — The Kent Education Committee invite tenders for new Council school at (Bexley) Welling. See advertisement in this issue for further particulars.

JANUARY 6, 1912. — Guildford. COTTAGES. — The Guildford B.C. invite tenders for erection of twenty cottages in Cline-road. See advertisement in this issue for further particulars.

JANUARY 6, 1912. — Manchester. SCHOOL. — The Manchester Education Committee invite tenders for a new school of domestic economy. See advertisement in this issue for further particulars.

JANUARY 6, 1912. — Pontardawe. SEWAGE WORKS. — Construction of storm-water, screening chamber, detritus tanks, siphon, circular percolating filters, humus tanks, etc. and levelling and laying out of land at the Hall, etc. Plans seen, and quantities, conditions, and form of tender from the Engineer, Mr. John Morgan, Herbert-chambers, Pontardawe, on deposit of 5s.

JANUARY 8, 1912. — Loose, Kent. SCHOOL. — The Kent Education Committee invite tenders for new Council school. See advertisement in this issue for further particulars.

JANUARY 8, 1912. — Pembroke. SCHOOL. — For the erection of a new Council school at St. Hilda's, Pembroke. Plans and specifications from the architect, Mr. D. E. Thomas, 17, Victoria-place, Haverford.

JANUARY 10, 1912. — Camberwell. EXTENSION WORKHOUSE. — The Camberwell Guardians invite tenders for erection of additional accommodation for nurses at the Workhouse in Constance-street. See advertisement in this issue for further particulars.

JANUARY 11, 1912. — East Elloe. COTTAGES. — The East Elloe R.D.C. invite tenders for the erection of cottages within certain parishes. See advertisement in this issue for further particulars.

JANUARY 11, 1912. — Fakenham. SCHOOL, ETC. — Erection of new school and erection of cloakroom and manual instruction rooms. Mr. H. J. Green, architect, Castle-meadow, Norwich. Quantities on deposit of 11s.

JANUARY 11, 1912. — London. SCHOOL. — Erection of a new County High School for Girls, at Church-hill, Walthamstow, Essex. Plans and specifications from the architect, Mr. C. J. Dawson, F.R.I.B.A., 11, Cranbrook-road, Ilford, Essex. Deposit of 5s.

JANUARY 11, 1912. — Walthamstow. SCHOOL. — The Walthamstow Higher Education Sub-Committee invite tenders for the erection of a new County High School for 300 girls. See advertisement in this issue for further particulars.

JANUARY 15, 1912. — Stratford. ADDITIONS, ETC., TO SCHOOLS. — The West Ham Education Committee invite tenders for alterations and additions to Colegrave-road and Water-lane schools. See advertisement in this issue for further particulars.

JANUARY 15, 1912. — Halifax. WORKS. — Extension of the sludge-pressing works, gauge weirs, lime-mixing plant, etc., at the Sewage Disposal Works, Copley. Plans and specifications seen, and forms of tender from Mr. James Lord, M.Inst.C.E., Borough Engineer, Town Hall, Halifax. Deposit of 5s.

NO DATE. — Addlestone. ALTERATIONS. — For alterations at Addlestone. Quantities, form of tender, etc., from Mr. Henry J. Brookes, Secretary, Princess Mary Village Homes, Addlestone.

NO DATE. — Earlsheaton. HOUSES. — Erection of four houses at Bank Top. Plans and quantities from Messrs. John Barton & Son, architects and surveyors, Halifax-road, Dewsbury.

NO DATE. — Keighley. EXTENSIONS. — For extensions to the Technical Institute. Quantities from Messrs. W. W. & A. Sugden, architects, North-street, Keighley.

NO DATE. — Laiterdyke. HOUSES. — Erection of five houses and a stable in Broad-lane, Laiterdyke. Apply Gillam, Hamerton-street, Bradford.

ENGINEERING, IRON, AND STEEL.

DECEMBER 20. — South Shields. PUMPS, ETC. — For erection of suction and delivery piping for one centrifugal pump, steam piping to turbine separator, injection to and discharge from condenser, and alterations on existing piping consequent upon the installation of the foregoing. Specification, conditions, and drawings from Mr. J. H. Cawthra, M.Inst.E.E., A.M.Inst.M.E.E., Borough Electrical Engineer, South Shields. Deposit of 10s. 6d.

DECEMBER 21. — Manchester. HEATING. — For fixing low-pressure heating apparatus at the Gibbon-street Municipal School, Beswick. Plans and quantities at the Education Offices, Deansgate, Manchester, on deposit of 11s.

DECEMBER 25. — Glasgow. BRIDGES. — For the renewal of the superstructures of five under-bridges on the Balerno and Wilsontown branches, for the Caledonian Railway Company. Drawings at the office of the Company's Engineer, Buchanan-street Station, Glasgow. Specification and schedule on deposit of 21s. 2d.

JANUARY 5, 1912. — Cardigan. BRIDGE. — Erection of a culvert bridge and wing walls at Aberporth. Plans and specifications at the Clerk's Office, Quay-street, Cardigan. Mr. David Davies, Clerk to the Council.

FURNITURE, PAINTING, MATERIALS, ETC.

DECEMBER 16. — Settle. PAINTING. — For painting six cottages, Batty Croft, Settle. Specifications at Mr. Richard Searles, architect, Settle.

DECEMBER 18. — Ashton-under-Lyne. PAINTING. — For the painting, distemper, etc., of Christ Church Central, Gatefield, and Holy Trinity Schools. Specifications at the Education Office. Mr. John Neal, Borough Comptroller, Town Hall, Ashton-under-Lyne.

DECEMBER 18. — East Ham. DEMOLITION. — The East Ham Education Committee invite tenders for the demolition of the old vicarage building, and for removal of the old material. See advertisement in this issue for further particulars.

DECEMBER 18. — Plymouth. PAINTING. — For outside painting work at the Hel's Charity Almshouses, Prince Rock. Mr. W. H. Davy, Clerk to the Managers, Greenbank-road, Plymouth.

*** DECEMBER 18. — Dartford.** IRON AND WOOD FENCING. — The Metropolitan Asylums Board invite separate tenders for supply and delivery of iron and wood fencing materials. See advertisement in this issue for further particulars.

DECEMBER 20. — Canterbury. PAINTING. — For distemping, painting, etc., of the city police station. Particulars from Mr. A. O. Turley, A.M.Inst.C.E., City Surveyor, Guildhall-street, Canterbury.

DECEMBER 20. — Harrogate. PAINTING, ETC. — For colouring, painting, whitewashing, etc., at the Royal Bath Hospital and Rawson Convalescent Home, Harrogate. Mr. B. Shaw, Secretary.

JANUARY 6, 1912. — Manchester. RED AND BUTT TERRACE. — The Manchester Education Committee invite tenders for supply of red and buff terra-cotta. See advertisement in this issue for further particulars.

ROADS, SANITARY AND WATER WORKS.

DECEMBER 16. — Chorley. MAINS. — For laying of cast-iron water-mains, with valves, hydrants, etc. Particulars, on deposit of 11s., from Mr. A. Gilly, Surveyor, 9, High-street, Chorley.

DECEMBER 16. — Hayward's Heath. MATERIAL. — For supply of broken granite and flints. Particulars and forms of tender from Mr. A. MacArthur, C.E., Surveyor, Council Offices, Hayward's Heath.

DECEMBER 16. — Totnes. FOOTPATHS, ETC. — For erecting and forming fences, forming footpaths, and other works in connection with the cemetery extension. Plans and specifications from the Borough Surveyor, Mr. W. F. Toller.

DECEMBER 18. — Blackpool. STREETS. — For sewerage and forming private streets. Plans and specification with Mr. J. S. Brodie, Borough Engineer, Town Hall, Blackpool. Quantities on deposit of 11s.

DECEMBER 18. — Blackrock. ROADWAY. — For widening roadway at Temple Hill and at Rosefield. Plans and specifications at the Town Clerk's Office, Town Hall, Blackrock. Mr. R. F. Heron, Town Clerk.

DECEMBER 18. — Glasgow. STREETS. — For paving Fisher-street and McIntosh-street with tar macadam. Specifications and forms of tender at the Office of Public Works, 64, Cochrane-street, A. W. Myles, Town Clerk.

DECEMBER 18. — Guildford. ROAD. — For the extension of Cline-road. Plans and specification seen, and form of tender from Mr. C. G. Mason, A.M.Inst.C.E., Borough Surveyor, Tinsgate.

DECEMBER 18. — Thurstonland. MAIN. — For laying cast-iron water main from Lydgate to Thurstonland. Plans seen, and quantities from Mr. J. Berry, Architect and Surveyor, 3, Market-place, Huddersfield.

DECEMBER 20. — Barlestone. SEWER. — For providing and laying earthenware socket pipe sewer. Plans and specifications from Mr. W. M. Sykes, Surveyor, Ibsack.

DECEMBER 22. — Reading. SEWER. — For laying pipe sewer in Basingstoke-road. Drawing and specification seen, and forms of tender from Mr. John Bowen, A.M.Inst.C.E., Borough Engineer and Surveyor, Town Hall, Reading.

DECEMBER 28. — Newmains. DRAINAGE. — For the construction of a sewerage system and sewage purification works. Plans seen, and specification from Mr. W. L. Douglas, M.Inst.C.E., District Engineer, District Offices, Hamilton. Deposit of 11s.

DECEMBER 30. — Derby. STONE. — Supply of broken stone. Form of tender and conditions of contract from Mr. J. W. Horton, A.M.Inst.C.E., County Surveyor, County Offices, St. Mary's-gate, Derby.

JANUARY 1, 1912. — Berkshire. MATERIALS. — Supply of broken road materials, gravel, and sand. Forms of tender from Mr. J. Fred Perkins, County Surveyor, The Forbury, Reading.

JANUARY 15, 1912. — Gloucester. STONE. — Supply of stone for use on main roads. Forms of tender from Mr. E. S. Simeon, M.Inst.C.E., County Surveyor, Shire Hall, Gloucester.

*** JANUARY 16, 1912. — Tottenham.** UNDERGROUND CONVENIENCE. — The Tottenham U.D.C. invite tenders for erection of an underground convenience in Bruce Grove. See advertisement in this issue for further particulars.

BITUARY — Continued from page 725.

M. E. Saglio.

I. Edmond Saglio, member of the Académie des Inscriptions et Belles Lettres, and, until 1903, director of the Cluny Museum, died in Paris, at eighty-three years, on December 8. With M. Dureau, he began, in about 1870, his work, the "Dictionary of Greek and Roman Antiquities." He was director of the pelius factory, and afterwards Conservator of the Department of Medieval Sculpture in Louvre.

Mr. G. Gordon Hoskins.

The *Newcastle Chronicle* records the death, at his residence, Harewood-grove, Darlington, of Mr. George Gordon Hoskins. The deceased gentleman, who had attained the age of seventy-four, retired from practice in 1907, being succeeded by his brother, Mr. Walter H. Hoskins, and later he had been in very indifferent health. Mr. Hoskins' chief work perhaps was the Middlesbrough Municipal Buildings and Town Hall, which were erected in 1883 and 1884, at a cost of

120,000l. At Darlington some of his works are the Queen Elizabeth Grammar School, the Edward Pease Public Library, the hospital and dispensary, and the fever hospital. He also designed the Harlepool Exchange at West Hartlepool. Amongst his other works are cemetery chapels and churches at Darlington and South Stockton. Mr. Hoskins was the eldest son of the late Capt. Francis Hoskins, of the 1st Royals, his mother being Julia, second daughter of Mr. William Hill, of Temple House, near Portsmouth. Educated at private schools in London and Paris,

Mr. Hoskins entered upon the profession of architect by becoming a pupil of Mr. W. D. Haskoll, of Westminster. He went, in 1864, to Darlington, where his abilities found early recognition, and his work is to be found in every part of the district. It consists of numerous mansions and villa residences, and among his other erections may be mentioned banks at Bishop Auckland, Sunderland, Middlesbrough, Barnard Castle, and Thirsk. Mr. Hoskins was appointed a Darlington Borough Magistrate in 1892, and he was elected to the County Bench in 1908. He was for some years Chairman of the Borough Licensing Committee. For a considerable period he was a member of the Darlington Town Council.

PATENTS.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premised Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

PRICES CURRENT OF MATERIALS.

* * * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices, and these which should be remembered by those who make up this information.

ROYAL ACADEMY STUDENTS' DESIGNS, 1911: "THE
HALL OF A CITY COMPANY":—
PRIZE DESIGN, BY MR. ALAN BINNING.
DESIGN BY MR. L. H. BUCKNELL.

Royal Academy Schools, 1911: "Winter," by Mr. Archibald G. Barnes.

This "Design for the Decoration of a Portion of a Public Building" was submitted in competition for the Prize (30*l.*) and Silver Medal, which was won by Miss Williams.

LET us say frankly and at once that we expected better of Chelsea. Chelsea has become a name that counts in up-to-date art matters. We have become inclined to regard the coterie of artists who congregate there as consisting of men of a talent equal to any group of the sort in, let us say, Europe. Alert, impressionable, energetic, enterprising, they have already exercised a considerable influence on English art, tending without being antagonistic to the dominating influence of the Royal Academy. They are quite a different type of man from the old Chelsea coterie, we may, for the sake of locality, comparison, and argument, speak of the artists who composed the Pre-Raphaelite coterie in that sense. The comparison need carries us farther; for it would be difficult to believe that Ford Madox Brown, Burne-Jones, Rossetti, and the others of that group would not have been more adequately to a great decorative occasion than the Chelsea men would

appear to have done on the present occasion.

For the occasion was unquestionably great. And it was one, too, which equally concerns architects, painters, and municipal authorities, and other owners of buildings, private or public, who would wish to see their large wall spaces occupied by decorative schemes which are beyond the capacity of the talented craftsman or decorative tradesman. For the benefit of the large majority of our readers we may as well briefly explain what the occasion was. Chelsea having recently erected for itself a new Town Hall, an ex-Mayor, Mr. Christopher Head, suggested that the large hall should be decorated. The suggestion was favourably received by the Council, and it was decided that the work should be started by the decoration of four panels occupying the spaces between the four side doors, Lord Cadogan, Mr. Head, and other gentlemen having offered to defray the cost. Further, the Council invited the

collaboration of the Chelsea Arts Club in the realisation of their scheme, because it was felt "that the heterogeneous results achieved in most of the decorations in London was partly due to the absence of a controlling scheme, and that the choice of the artists and subjects should not be left to individual patronage only." By a vote of the Club Mr. Sargent, Mr. Steer, and Mr. Richards were chosen as judges. So it would seem on the face of it that no scheme of the sort could possibly have started under more favourable auspices for arriving at a satisfactory result.

Many of the most prominent artists in Chelsea have taken part in the competition, and the assessors have made their awards. We shall not question the justness of the awards. The result is disappointing for other reasons. It shows that English artists are still trammelled by the merely easel aspect of painting; it shows that the production of the subject picture, whether it be of the

superficial anecdotal kind or of the eclectic type which carries greater conviction because perhaps we may trace in it something of the method of a past-master—it shows, we say, that the production of either class of picture does not assist the artist in the realisation of what the Chelsea Arts Club designate a "comprehensive decorative scheme." Under the conditions of the competition the four panels were to be devoted to Chelsea celebrities—the first to the great artists; the second to the famous writers; the third to the leaders of religion, the genius of science, and the art of music; the last to kings and queens, soldiers and statesmen. The problem, therefore, which the Chelsea artists had to solve under these conditions was a difficult one. It evokes at once a series of counterfeit presentments which would be difficult to work into the design of a mural painting of a decorative character. The majority of the competitors have adhered strictly to the conditions; the counterfeit presentments are there, but no artist at the present exhibition has in our view resolved this gathering of great spirits into a symposium that can be considered ornamental. Neither in the grouping of the famous men and women, portrayed with extreme fidelity, nor in the symbolic figures which we find here and there, is there, except perhaps in two instances, any sufficient suggestion of the imaginative quality which pictorial mural work in its higher phases demands. We believe, however, that many of the artists might be safely entrusted with the decoration of a large building were they less handicapped by preliminary restrictions; and we do not wish to infer that the final accomplishment can in every case be altogether rightly estimated from the sketches. But, judging by the sketches, there is a remarkable absence of the power of co-ordinating the actual with the symbolic which would be necessary in any pictorial solution of the problem. We have refrained from dealing with the separate works. Mr. Sargent and his brother judges cannot, we imagine, have arrived at their awards without some hesitation, for the level of merit, so far as it goes, is remarkably well sustained.

THE EAST KENT COALFIELD.

PAMPHLET just issued by the Kent Coal Concessions, Ltd., contains a serious indictment of the position taken up by the Ecclesiastical Commissioners as to the development of their properties in East Kent. One item of the indictment is based on the fact that the Commissioners have curtly rejected all offers for areas in the neighbourhood of the existing companies' borings.

While this course may be sound policy in view of a possible appreciation of values in the near future, it seems somewhat unfair to those who have borne the brunt of the cost of proving and developing that neighbouring owners who have not expended a penny should reap the full benefit of the results of these experiments. The French system quoted in this pamphlet seems much better calculated to promote development and the interests of the community as a whole.

There, where all minerals are owned by the State, private enterprise is encouraged by assuring all adventurers, as a just and equitable reward for their risk and outlay, preferential grants of leases or concessions to work all minerals discovered and proved by such outlay at a fixed royalty of 5 per cent., and it is made impossible to ignore the successful prospector by refusing his legitimate application for a grant of such proved minerals, or to utilise the results of the outlay he has risked for the purpose of enriching others who have expended nothing in exploration.

The Kent Coal Concessions feel that having proved the existence of an exceptionally rich coalfield they have a moral claim to the first offer of options or leases, especially for those areas owned by a State Department. The richness of the field has now been conclusively established, the quality of the steam coal seams being slightly superior to that in South Wales, and the seams, ninety-six in number, having an aggregate thickness of 319 ft. 11 in. The average depth, 1,000 ft., while it to some extent discounts the value, is by no means prohibitive with good organisation and suitable apparatus. The proximity of the mines to Dover ensures an excellent market for navigation steam coal.

These brief particulars indicate how important to the country is the development of our newest coalfield, and these considerations bring us to another count in the indictment of the Ecclesiastical Commissioners to the effect that while refusing to negotiate in respect of their property in the neighbourhood of Dover and Sandwich, where the Kent Coal Concessions have their collieries, they have privately leased a large estate north of Canterbury to a syndicate in which German financiers have a large if not a predominant interest. Their object is fairly obvious—while holding those estates that are bound to appreciate in value owing to the operations of the Kent Coal Concessions they are not unwilling to make a profitable deal in other places, even when the offer comes from our chief commercial competitor.

Without saying exactly what, something in the transaction seems to go against the grain. Mainly, we think, this feeling is due to the lack of correlation between the various branches of the State; each, it is presumed, conducts its affairs solely with regard to its own interests, no matter how these may clash with those of the other functions of the Government as a whole.

Anyone—asked to what department the control of our coalfields should belong—would probably reply the Board of Trade, a department much better qualified to deal with a broad question such as this; but here we have a department presumably representing a certain section of the national interests dealing with these in the same way that a private owner would deal with his property, quite regardless of how other equally important national interests may be adversely affected, and subsequently endeavouring to justify its proceedings by replies to questions in the House of Commons that are, to say the least, incomplete and evasive.

The whole question is one of the

greatest gravity in view of the influence the development of these coalfields will exercise on the building and other interests in the district, and we have felt it incumbent on us to draw the attention of our readers to a matter of such vital public importance.

NOTES.

The Institute on the responsibilities of architects, by members of the Practice

Standing Committee, raise a question which the profession will have to consider most seriously. There is no doubt that the present tendency is to overwhelm the architect with so many ever accumulating responsibilities of a more or less professional nature that it is becoming impossible for him to perform properly the essential functions of his work as a skilled designer, which, after all, is the *raison d'être* of his existence. In the past responsibilities have been too lightly assumed as tending to increase the importance of the architect as a professional man, and the Institute has not been altogether guiltless of encouraging and fostering this attitude. The result is that responsibilities once eagerly accepted have now become intolerable. Nemesis has overtaken the profession, and it is coming to be generally recognised that the present position is no longer tenable. In this matter we think that architects are worse off than other professional men, and that the public has forgotten—and perhaps the profession has encouraged them to forget—that when all is said they engage a professional man at their own risk, not his. Considering the increasing intricacy of modern life and the innumerable matters which have some bearing on the real work of the architect, it is essential to think out the whole question and to determine which of these responsibilities are really necessary and which could be more properly left to other professional men, such as surveyors or lawyers. Of the ever-increasing activities of the architect's life architecture nowadays is apt to be the least. Less time is perhaps devoted to designing a building than to the multitudinous affairs incidental to its erection and to the troubles which may arise through no fault of his own after it has been erected. The result is that both architecture and the architect suffer to the ultimate detriment of the interests of the public.

St. Paul's
Bridge and
Party Politics.

At a recent meeting of the London County Council a vote of censure was moved by the opposition setting forth that the party in power had been guilty of mismanagement of the negotiations with the City Corporation in connexion with the construction of tramways over the proposed St. Paul's Bridge. This means, we fear, that the tram route has now become a party question, and that the different parties in the London County Council will be tempted to think more of scoring off their opponents than of providing the best means of linking up the north and

about trams. We have repeatedly expressed our opinion that the St. Paul's Bridge route, as proposed, is not the best one. Holding this view we naturally consider that the negotiations in question resulted in a tentative arrangement which is not in the best interests of the public, and that these interests will be best served if the arrangement is never confirmed. It is a most important question which should be discussed in the Council entirely on its merits and with no reference to any other consideration whatever. It will be most deplorable if either side deliberately make it a party question and advocate the ratification of the proposed arrangement with the City Corporation for purely party reasons and with no reference to its intrinsic merits.

The Aldwych Site. We learn that the Australian Commonwealth has decided to make the eastern end of the Strand-Aldwych site its stronghold in London, building thereon its offices and agencies as a basis perhaps of a reflex movement of deportation, or it may be, as in the case of Canada, for a standpoint whence the Mother Country's resources may be more easily reached. The site is to be bought freehold from the London County Council at a cost of 364,000*l.*, which works out at 15*l.* per square foot, and also is more than one-third greater than the sum proposed for the actual building. The wisdom of this action depends on the purposes to which these buildings are to be put. If Australia proposes to figure as a terrific shop—and the temptation of countries to regard themselves just as more or less successful stores appears to be becoming too strong to be withstood—then, of course, it is right to set up its booth in a crowded highway and recoup by quick returns and profits as large as may be. Let it make itself known to Londoners as one great aggregation of farms if it will.

The Actuality. If, however, it would show the quality of its people and embody the aspiration of democracy, or, as it would be, flaunt its achievements, under the regis of the Southern Cross, something more is needed—something in which the soul of the shopkeeper becomes ashamed, something more like a palace, statelier and calm. But this, one must suppose, is contrary to the "exigencies of the case" and the "spirit of the age," and historical truth will be exposed to those who can read it in the infallible chronicle of bricks and stones. There is to be a hall which will "occupy nearly the whole of the ground floor" (leaving a loophole for ascent), and it "will be used for the purpose of displaying the natural products of the various Australian States"—so runs the *Times* report. A show case, observe, is to be the apparent foundation of the whole.

The Dream. After all, one may not quarrel with a thing for being what it is; one can but turn to the medium of a work which so unerringly betrays its quality—a philosopher's consolation. The architect's solace is to frame a scheme, on

paper only, perhaps, but it may be to shape imaginings, if once the spirit be roused. In a forthcoming issue of the *Builder*, which is to be published on January 5, proposals for the development of the Surrey side of the Thames will be made in which there is provision for Colonial Embassies. A great Australian Consulate rising sheer from the river, and in the borough from which so many of the original "colonists" were drawn, would be poetic justice and fine irony.

The Infirmary Site, Manchester. In our review of the Manchester Competition last week we emphasised the unsatisfactory nature

of the problem of combining two buildings in a single architectural conception. Evidently these views are not universally held, as a Manchester firm of architects, going a step further, now suggests that not only could the Library and Art Gallery be included, but also the suggested Exchange, and publishes a much becomelined design for an extensive block planned to accommodate all three. It is true that a slight extension of the site is demanded, but this is a trifle compared with the advantages of housing Commerce, Literature, and the Arts under one roof. We believe Manchester is talking of a new cathedral; why not add that to the list and finish the job?

M. Honoré Daumet. The death of M. Daumet, the Royal Gold Medallist in 1908, deprives French

architecture of one of its most cultivated and scholarly exponents. M. Daumet's *forte* lay more in the skilful restoration of old buildings than in the design of new ones, and the appointments he held under the French Government gave him full scope for the exercise of his talents in this direction; his wide range of interests and personal charm of manner attracted all with whom he came in contact, and those who met him during his visits to this country must keenly regret the loss of one possessing such exceptional gifts of sympathetic intelligence.

THE usual fortnightly meeting of the Royal Institute of British Architects was held on Monday at No. 2, Conduit-street, under the chairmanship of Mr. Leonard Stokes.

Deceased Members.

Mr. Guy Dawber, in the absence of the Hon. Secretary, said he had to announce with regret the decease of Mr. Jas. R. Carroll, of Dublin, who was elected for two years a Fellow of the Institute and resigned the Fellowship in 1908, and Mr. Geo. Gordon Hoskins, elected an Associate in 1867 and Fellow in 1870. Mr. Hoskins would always be remembered by the very fine town hall he

built at Middlelestrough. He had also to announce the death of their distinguished corresponding member, M. Honoré Daumet, at the great age of eighty-six, who was a distinguished member of the French Institute, and the doyen of French architects. He studied his art in Greece and Rome, and won the Prix de Rome in 1855. He was appointed architect of the Palais de Justice in Paris in 1879. Mr. Dawber referred to other works on which the deceased was engaged (which has already been given in the *Builder*), and added that he was President of the Committee of the International Congress of Architects, and presided over a recent meeting at Rome. In 1906 M. Daumet attended the International Congress held in London, and many of them would remember his great personal charm and the deep interest he took in the proceedings. In 1908 he was awarded the highest honour that Institute could confer upon him—the gift of the gold medal. He moved that an expression of their regret be entered on the minutes, and that a message of condolence be sent to his widow and relatives, as well as to the relatives of the other two deceased members.

The motion was carried.

THE NEWER RESPONSIBILITIES OF ARCHITECTS.

The President explained that it was originally proposed to have had four papers, but it was felt that this was rather a large number. Mr. Saxon Snell had consented to read his paper on a future occasion, and Mr. Woodward's paper would also be postponed, as these were matters dealt with in it which were going to be the subject of litigation. The two papers to be read were by Mr. W. Henry White and Mr. E. Greenop.

Mr. White, in the course of his paper, said:—

"It has been stated by a lawyer, and it may be generally held by gentlemen of the legal profession as an article of faith, that 'a lawyer's first duty is to his client,' and architects would doubtless agree with this as a general principle; but if such an attitude prevents 'equity' from obtaining, it is a hard and bitter statement, and goes far to explain why the older position of confidence in one's fellow-beings has been driven away in favour of 'contracts' drawn with much and elaborate detail in the endeavour to prevent either party getting the 'better' of the other.

The object of these notes is not to attempt to teach architects how to get the 'best' of anybody, but to draw attention to the fact that they should be so educated as to be forearmed against the difficulties which beset them in their practice, and be taught to bring logically trained minds to bear upon all their work, so that their decisions may be received with confidence by clients, builders, and others. This question of training opens up another view of the situation, namely, that there is no definite professional course on the 'business' side that young men can take up.

Another important consideration which has arisen of late years is the change in the methods of contractors in carrying on their business. There is an increasing number of contractors who sub-let their work and, instead of having a practical and useful knowledge of building work as a craft, and being able to assist the architect in carrying out difficult matters, now run their business from a counting-house.

Again, modern buildings are so much more complex in the various parts and appointments, and so much 'specialist's work' has to be accommodated and provided for, which all tends to increase the architect's work and responsibilities. Facts, however, must be faced, and architects must realise their responsibilities and train themselves to meet them in a businesslike manner.

Difficulties are caused by the client changing his mind as the work proceeds consequent upon not understanding the drawings, and such changes often result in increased cost. This should be carefully explained to the client, and, in fact, he should be informed from time to time during the progress of the works as to the approximate amount of variations. The omission of this precaution, followed by the presentation of a big bill of extras at the completion of the work, is a frequent source of trouble, and probably results in the loss of a client who, had he been treated in a businesslike manner as the work

proceeded, would have been perfectly satisfied. Changes from the drawings and specification take place in almost every contract, and herein lies the danger of the "lump sum" contract, and the advisability of making the quantities a part of the contract; indeed, it would seem to be the only fair and reasonable method, and would obviate some of the difficulties which arise under the head of variations. The average specification that is brought before the Law Courts wants much revision to bring it up to the standard of modern requirements and limitations. Could not the Royal Institute of British Architects in the interests of its members suggest clauses as to the proper specifying of timber, a standard for concrete for floors, asphalt, paint, etc. clauses which could be accepted by the profession, and which would prevent so much conflicting evidence as is now given in the average building "case"?

It does not seem to have been generally realised amongst members of the profession that the architect's position in relation to his client is a most invidious one as regards liability. The builder, after the usual twelve months' maintenance clause has expired, is freed from all further responsibility towards the client, but the architect remains liable up to the period allowed by the Statute of Limitations—i.e., six years. This is a ridiculous position! The builder receives payment for doing his work properly, and, so far as can be reasonably expected, the architect has supervised and certified it as satisfactory. But some piece of scamping develops its faults, two, three, or five years afterwards; the builder has been freed—but the architect is still liable!

No architect can "live upon his job," and it is a sheer impossibility for him to know every detail of work that has been put into a building. He is compelled to accept the lowest tender, often from builders of the client's selection, and, however conscientious and careful he may be, it is obvious he cannot, without staying upon the work during the whole time it is being carried on, be sure that every part has been done properly. With large works and competent clerks of works and good contractors he may accept his liability with equanimity, but with work carried out without a clerk of works he should have a clear and definite understanding with his client on the subject of supervision, and the builder should remain responsible for any defective work, the faults of which only develop after the ordinary period of maintenance has elapsed.

Assume the case of an unreasonable or dissatisfied client or builder, who determines to try for his "rights," as he regards them, in the Law Courts! Cases will be quoted by Mr. Greenop showing that such actions may be brought on some of the following grounds, or others which the ingenuity of the lawyer's mind can suggest, viz.:—

Variations from the contract and additions or extras ordered without the consent of the client.

The materials not of the particular kind specified.

The work upon being opened-up found to be defective.

Water-pipes furred up in an undue space of time.

The contract not completed in time.

Goods ordered under provisional sums by the architect and not paid for by the contractor, although included in a certificate met by the client, who has had to pay twice over owing to the failure of the contractor.

The client declining to pay the architect's fees and the value and interpretation of the Royal Institute of British Architects' schedule of charges.

Payment disputed for work designed and not carried out.

The client claiming the drawings from which his building was erected.

The architect's liability for "negligence" in such matters as "dry rot," insufficiency of work and materials, specifying one material and allowing another kind to be used without the client's consent.

Quantities forming part of the contract, or lump-sum contract.

The arbitration clause.

Withholding or granting certificates from the client's and the builder's points of view.

The question of sub-contractors and the employment of specialists.

The client's responsibility for injury to workmen if the contractor is unable to pay and not covered by insurance."

Mr. Edward Greenop followed, and in the course of his paper, said:—

"The reader of the paper to which you have just listened, having brought to your notice generally the position in which we now find ourselves, there has devolved upon me the task of emphasising his deductions by describing in detail the circumstances under which that position has been brought about. Even thus the ground we can cover in the time at our disposal in a subject of such importance is necessarily very limited. I trust, however, that the matter I am about to bring to your notice may justify the time I shall occupy."

Before proceeding to do this I wish to offer an advance apology for any apparent unwarranted intrusion into the domains of a learned profession other than my own.

However, I may perhaps be excused for venturing the opinion that the architect has a pardonable claim to be permitted to view his responsibilities from a different standpoint to that of the lawyer, giving a necessarily broader aspect than, if I may say so without disrespect, the training of the legal mind allows. Indeed, I will go so far as to suggest that he may fairly be credited with holding, as it were, an intermediate position between the lawyer and what is understood in the common use of the term "layman." The nature of our profession necessarily keeps us, in its ordinary practice, in close touch with that of the law, and, moreover, we stand, by reason of the complex and ever-changing detail of our vocation, in a position of extreme vulnerability to the law's assaults. The thought invites the suggestion that a good architect must be half a lawyer, and I venture to add that if lawyers could at the same time be half architects our task this evening would have been but light.

Time will not permit of reference to other than leading cases of quite recent date, and to these, therefore, I purpose confining myself, except where any special point calling for notice may be involved.

Speaking generally, allegations of negligence may be considered as the most promising card to play when it is desired, from any cause, to avoid payment of an architect's fees; in fact, they may be looked upon as approximating in value to the ace of trumps. Strictly speaking, therefore, nearly all the cases I shall offer for your consideration should come under this heading. As a matter of convenience, however, the cases have been grouped under the several heads mentioned by Mr. White."

The following are the more important among those quoted by Mr. Greenop:—

Findlay v. Roques & Carvell.

"This was an action tried in 1907 before the Lord Chief Justice and a Special Jury for the recovery of architect's fees. The amount of the account was not disputed, but the client, a lady, set up a counterclaim for damages for negligence on the ground that she was wrongly advised as to the financial possibilities and risks attending her venture. It was alleged by the client that she was advised by the architects that there was a demand in the locality for small houses; that she could build the houses for a certain sum and sell them to considerable advantage. In the result, the cost of erection considerably exceeded the alleged estimate, and the sale price was much below expectations.

The jury found in favour of the client for a considerable sum. The case points to the danger of the architect associating himself with the investment aspect in such matters, unless specially instructed to do so.

Keyser v. Trask & Sons & Webb.

This action, fought in 1907, was for negligence against both architect and builder as co-defendants, and came before Mr. Justice Darling and a Special Jury. The building was a chapel, the walls of which were decorated by a mural artist. Four and a half years after the paintings were finished the paint began to peel off owing to damp. Another architect was thereupon called in, and on examining the walls reported the interior to be in places packed with rubbish of the character which usually accumulates

during a building job. It was contended by counsel for the architect that to have prevented the isolated instances of irregularities discovered, practically continuous supervision of the architect would have been necessary, and the evidence suggests strong doubt as to whether the packing of rubbish was the real cause of the damp from which the decorations had suffered. The jury, however, found against both architect and builder.

Lenning v. Davey & Salter.

This was an action against architects for negligence, the first stage of which was before Mr. Justice Darling and a Special Jury in the King's Bench in 1906.

The client, a solicitor, after having paid upon several interim certificates issued by the architects, revoked their authority to further certify; the architects, however, continued to issue certificates. The client refused to honour them, and the builder sued upon them. The client alleged as his defence to the builder's action, that there was bad work. The builder answered that upon this point the architect's certificate was final. Upon the case coming into Court, the client's defence proved to be valueless, and he was compelled to settle the action in Court. He thereupon brought an action against the architects for the recovery of a sum of 600*l.* damages and costs. Notwithstanding a strong direction by the Judge, pointing in the architect's favour, the jury found against them to the extent of 750*l.*

The architects appealed, and the appeal was heard by the Master of the Rolls with Lords Justices Cozens Hardy and Fletcher Moulton. Mr. Justice Darling reported to the Appeal Court that in his opinion the verdict of the jury was wrong.

The Court of Appeal were strongly in favour of the architects upon the merits of the case, but did not think it could withdraw the case from a jury, and that consequently there must be a new trial. The case was thereupon retried before Mr. Justice Lawrence and a Special Jury, with the result that a verdict was given for the architects upon the question of negligence, and also upon their counterclaim for fees, a miserable 87*l.* odd.

Leicester Board of Guardians v. Trollope.

Tried before Mr. Justice Channell, January 23, 1911. An infirmity was completed in 1906, and a final certificate given by the architect. In 1908, two years after, it was discovered that the floors were affected with rot, and 2,000*l.* to 3,000*l.* had to be expended in taking them up and relaying. The contract provided for 6 in. of concrete, then 2 in. of fine concrete, and wooden joists on top. It was found that wooden pegs had been driven into the ground upon which the wooden joists were laid, the space beneath being then filled in with concrete, leaving the pegs in. These pegs, it was found, had sucked up moisture from the earth, and so caused the joists and flooring to rot. A clerk of works had been employed, but it was contended by the clients that his duties were defined, in writing, as merely those of an inspector and assistant to the architect. The architect admitted that he had not seen the floor during construction, but that he had trusted to the clerk of works.

Mr. Justice Channell gave judgment against the architect, who, he thought, was not greatly in fault, but at the same time he expressed the opinion that the laying of the floor was not a detail which could justifiably be left to the clerk of works.

It is interesting to note that the Judge expressed the opinion that the clients were in error in supposing that, as two years had elapsed since the date of the final certificate, they were debarred from proceeding against the builder.

The builder finally met the architect fairly in contributing towards the damages and costs. It is, therefore, pleasant to record that the attitude of both architect and builder in meeting the case was such as reflects credit upon them."

The important case of Robins v. Goddard was then dealt with.

Agent or Principal?—Crittall Manufacturing Company v. L.C.C.

"This was an action by a sub-contractor to recover against the clients failing payment by the builder. Iron sashes were supplied to a

school. A clause in the contract entitled the clients to retain the cost of the goods from the builder until he had paid the sub-contractor, but this right was not exercised, the amount being included in a certificate to the builder. The builder gave bills in payment to the sub-contractors, but owing to the builder's failure they were not met. The sub-contractor thereupon brought an action to recover the amount from the clients, and succeeded, Mr. Justice Channell deciding in their favour on these grounds:

- (1) The clients were the real principals, as the contract was to procure something for their benefit which
 - (2) Was to become their property, and
 - (3) As regards the terms of the contract, they were the persons interested, not the builder. The Judge expressed the opinion that when the clients' architect instructed the builders to place the order with the sub-contractors on the terms of their quotation, the quotation having been invited by the architect who was the clients' agent, the architect thereby directed the builders to make the contract for the clients.
- This decision has been received by all sub-contracting firms with natural jubilation. The responsibility it imposes upon the client through the architect is obvious. It appears imperative in future that architects should obtain a written undertaking from the sub-contractor that he will not look to the client or payment.

The Ownership of Drawings.

The law appears to be established by two cases:—*Ebby v. Gowan and Gibbon v. Pease*. The former is an old case in which the building was not carried out, the architect being paid the 2½ per cent. and claiming to retain the drawings. The Court decided against him. In the second case, *Gibbon v. Pease*, the previous case was followed, both in the Divisional Court and the Court of Appeal. The Court of Appeal supported the Judge below. It stands, the retention of the drawings by the architect by special agreement with the client seems the only resource available to us. An interesting paper on the subject was read before the last International Congress of Architects in this country by Mr. H. H. Statham.

The last subject upon which I shall speak is that of "Fees," and I will be brief upon it, dealing with two cases only, which show the view taken by the Courts.

The first case is that of *Tree v. Mitchell*, tried before Mr. Justice Walton in 1909.

The amount awarded to the architect seemed to vary with the opinions expressed by the Judge in awarding it, and I think we shall all agree with his Lordship in one observation made, namely, that it was "a very unfortunate and extremely unsatisfactory case."

The second case, and the last with which I propose troubling you, was that of *Brown v. Meckel & Co.*, tried before Mr. Muir Mackenzie in 1909, who elected to make some observations upon the Institute scale. He said that it had been repeatedly pointed out by the Judges that there was no implied obligation on a client to pay upon the Institute scale, but that an express agreement must be obtained, and that the scale, therefore, could not be considered, except so far as the fact that it was a scale, and had a certain amount of sanction attached to it by the weight of the repute of the persons who prescribed it."

Mr. A. M. Brice

said the relationship of the architect in a contract was twofold. First and foremost, he was the agent of the building owner, mainly on the exercise of ministerial acts, amongst others of which was the giving of interim certificates, and many of the difficulties alluded to by the author arose from the fact that there had been some confusion between the interim and the conclusive certificate. In giving interim certificates the architect was only exercising his ministerial office, and it was not until he gave the conclusive certificate that he acted as an arbitrator or quasi arbitrator in a judicial capacity. Directly he made the final assessment of what was due to the builder, and the final assessment as to the quality of the materials, he exercised the judicial functions which were bestowed upon him not only by the building owner, but by

the builder, who were the consenting parties to the contract. The architect, as an employee, was liable to dismissal by the building owner, and, even if wrongfully dismissed, he could not continue to act in his capacity of architect for the excellent reason that an employee, as he only rendered personal service, could not in law demand specific performance. He could not ask for an injunction against the employment of another architect, and his only claim was for damages for wrongful dismissal. But when they came to the second, and, of course, the more important position which the architect held as quasi arbitrator between the two parties, his position as an agent disappeared. His agency, which could at any moment be revoked by the employer, ceased to be revocable, because the consenting parties to the contract had, in fact, made a submission in the sense of the Arbitration Act, and that was irrevocable. The architect was appointed the arbitrator or judge between them, and neither one party or the other could revoke. Of course, both of them could, for that was the reason why *Robins v. Goddard* had not entirely been put out of court by *Roberts v. Hickman*. He agreed that lawyers might deserve some hard knocks, but would point out that the parties to the quarrel came into Court with the express object of obtaining from specially-trained minds, stored with an enormous number of precedents, what they meant when they said "So and so." He differed entirely from Mr. White in what he said about the liability of the builder ceasing after the usual period of maintenance. If there had been fraud or defective work, the Statute of Limitations did not run from the date of the original work, but from the date on which that fraud might reasonably have been discovered. If a builder, in the temporary absence of the architect, put in bad work and covered it up, that clearly was fraud, and when the defects made themselves patent, then the fraud was discovered for the first time "reasonably," and the Statute of Limitations only then began to run. As to the case of *Findlay v. Roques and Carvell*, it must be remembered that the architect was a professional man, and was always subject to the law's control in so far as he held himself out as being able and willing to carry out certain work. He ventured to submit that advice as to the probable demand in a locality for a certain class of property was not properly an architect's work, and he certainly did not think any client could recover damages against him, *qua* architect, for tendering information as to the financial possibilities of the future. In *Robins v. Goddard* the point was that the certificates given were interim certificates, whereas in the other case mentioned by Mr. Greenop the certificates were conclusive, and therefore the second case could not override *Robins v. Goddard*. As to sub-contractors, if the architect told the sub-contractor he must look to the builder for payment, it was all right, but in the case which had been quoted this was not the case. The sub-contractor simply had a general order given by the architect in his capacity as agent for the building owner, and he was quite entitled to bring an action against the building owner in consequence. At the same time, if a builder chose to carry out instructions for an architect, which he knew perfectly well were beyond the authority of the architect, then he could not bring an action against the building owner.

Mr. G. R. Blanco White said complaint had been made that a building contract was interpreted in the Courts of Justice in the same way and with the same care that other contracts were interpreted, but that complaint was not well founded, because, in addition to the architect and the builder, the building owner, who was a layman, was also concerned. In every one of the cases which had been quoted they had to bear in mind that the Court was asked to say not what the law had decided in previous cases with regard to building, but what was the intention of the parties as laid down in the particular contract which was before it. The question of whether the architect was an arbitrator or an agent must depend on the contract, and in the Institute contract in some clauses the architect was made the agent and in other clauses the arbitrator between

the parties. In Clause 30, regarding the issue of certificates, the architect had to act as an arbitrator, and was to express an opinion independently of anything said to him by the builder. In other clauses, also, the architect acted as arbitrator; as, for instance, in Clause 13, and also in Clause 32, if his name was filled in. In other clauses, however, the architect was acting clearly as the agent for the employer, as in Clause 12, which dealt with variations and extras. He agreed with Mr. Brice that the case of *Roberts v. Hickman* did not reverse *Robins v. Goddard*. The first case dealt with the question of certificates where the architect had to act impartially, and use his judgment and act as arbitrator, whereas the question in *Robins v. Goddard* was whether the intention of the contract was that the only remedy of the building owner should be under Clause 17 for any defects. That was to say whether the only liability of the builder, so far as defects were concerned, should be the putting of the building right in accordance with the maintenance clause, or whether, in addition, the builder was liable for a common law action for doing defective work. *Robins v. Goddard* settled the question that the building owner had his action for defective work in addition to the rights he had under the machinery of Clause 17. But, after all, what the Court had to decide in that case was the meaning of the particular contract, and whether the Court guessed right as to what was meant was a difficult question. What one felt was that, even if the Court guessed wrong, it was not right to put the whole blame on them, and that those members of the Institute who drew up the contract should take some blame. There was no doubt at present ambiguities in the form of contract, and in Clause 12 it was said that extras and improvements did not cover alterations. He should have thought that it was the intention that the architect should be permitted not only to add or cut a room away, but also to alter a room. There were other ambiguities in the clause which he supposed would be settled when some building owner brought an action at great expense to himself. There was no doubt that the present contract needed revision.

The President

said he thought it would be convenient to adjourn the discussion at that stage, and to resume it at the meeting when Mr. Saxon Snell's and Mr. Woodward's papers were read.

This was agreed to by the meeting.

The President announced that the next meeting, to be held in January, was a business meeting, and would be immediately followed by a special general meeting to discuss proposals of the utmost importance respecting the Society of Architects, of which full particulars were about to be sent to all members.

ARCHITECTURAL SOCIETIES.

Architectural Society of Liverpool University.

The annual dinner of the Architectural Society of Liverpool University was held in the Students' Union Club, Bedford-street, last week, when Mr. A. R. Sykes presided. Amongst others present were Sir W. H. Lever, Bart., Mr. Arnold Thornley, Mr. E. Kirkby, Professors Adshead and C. H. Reilly, and Messrs. C. W. Townsend, J. W. Mawson, and L. P. Abercrombie.

The loyal toasts having been honoured, Professor Reilly proposed "Our Guests," and remarked that it was only right at that annual dinner to have with them their benefactor, Sir William Lever. They always felt that Sir William had the qualities that a great architect ought to have—he was a practical man and he was an idealist.

Mr. Arnold Thornley, in replying, congratulated the Society upon the beautiful premises in which they were housed. He saw the School of Architecture and the School of Civic Design not only conferring upon the profession a great benefit, but serving the purpose of educating the public to appreciate architecture to a fuller extent than had hitherto been the case. He hoped that in the years to come they should not have such things occurring as they had lately seen in what he might call the desecration of St. George's Hall

There was no doubt if the public had been better informed as to the rudiments of classical architecture they would not have seen this happening. He thought it was most deplorable, and he hoped that the scheme would now be improved so as to make the best of a bad job. Talking about public improvements, one matter required urgent attention, and that had reference to the pierhead. They would have noticed that there it was proposed to erect a memorial to the late Sir Alfred Jones, and it was rather interesting to note that the design and model had been approved before they knew where they were going to put it. This must have been done thoughtlessly, as, in his opinion, it was quite impossible to successfully provide a suitable monument until they had fixed on a site. Their Society had taken the opportunity of considering the laying-out of the pierhead with a view of the proper placing of monuments, and he hoped that their efforts would result in a successful solution of the problem. What they wanted was a representative body with some knowledge of architecture and some sense of the beautiful to control these matters, and he should like to see Sir William Lever as the chairman of such an authority.

Sir William Lever gave "The School and the Society," and said he took a great interest in both the School and their Society, and he felt they would do grand work in Liverpool, where there was such a wide field for them to cover. In regard to the Sir Alfred Jones statue, and as one of the committee, he took full responsibility for anything that was done. Sites were limited. They thought it right that, having regard to the part Sir Alfred Jones played in shipping and commerce, the monument should be placed near the water's edge, and they had hit upon perhaps the only available site. The problem in Liverpool was to find suitable positions for statues. In the establishment of schools of architecture they were taking a step towards improving England. They wanted cities in which they could walk without having their sense of beauty offended, without feeling that on one side they had wretchedness and poverty, and on the other municipal buildings, banks, and insurance premises. The work lay to their hands as architects.

Messrs. C. W. Townsend and J. W. Mawson responded.

On the initiative of Mr. W. H. Thompson the toast of "The Staff" was honoured, and Professor S. D. Adshead and Mr. L. P. Abercrombie having suitably replied, the function was brought to a close.

The Leeds and Yorkshire Architectural Society: Early Roman Churches.

A general meeting of this Society was held on December 14 at the Leeds Institute, the President, Mr. Sydney D. Kitson, M.A., F.R.I.B.A., in the chair. Mr. A. E. Dixon, F.R.I.B.A., of Birmingham, read an interesting paper on the "Early Roman Churches" to a number of members and Associates. The lecture dealt with the Early Christian churches of between the IIIrd and IXth centuries, also mentioning the chapels, tombs, and catacombs. In dealing with the various features of these buildings the mosaics commanded special attention, being illustrated by a number of excellent slides showing the decorations to the apses of many churches. A remarkable feature in the subjects of these mosaics is their peaceful seriousness; humour and scenes of judgment or retribution are entirely absent. In contrast to this the lecture concluded by a few slides showing grotesque capitals from the neighbourhood of Poitiers, where in all cases grim humour was the predominating subject.

A discussion followed, and Mr. H. S. Chorley, M.A., F.R.I.B.A., proposed a hearty vote of thanks, which was seconded by Mr. A. E. L. Kirk, A.R.I.B.A., and supported by Mr. C. B. Howdill, A.R.I.B.A.

INTERNATIONAL EXHIBITION, ROME, 1911.

Mr. H. Hughes-Stanton has received the official confirmation from the Minister of Public Instruction of Italy that the Italian Government has purchased his large work, "St. Jean, Avignon (exhibited in the Royal Academy, 1909) from the British Section of the International Exhibition at Rome. It will be placed in the Royal Gallery of Modern Art, Florence. Works have been purchased from each of the foreign countries exhibiting.

THE SOCIETY OF ARCHITECTS.

THE second ordinary meeting of the Society of Architects for the session 1911-1912 was held at 28, Bedford-square, W.C., on the 14th inst., the President, Mr. Geo. E. Bond, J.P., in the chair.

The following candidates were declared to be duly elected:—

As Members—

F. W. C. Barker, London	W. H. Johnson, Wigan
W. R. Benwell, London	W. H. Jones, Swansea
A. C. Blackmore, Hull	W. L. Keay, London
A. Bromly, Croydon	H. Leece, Huntingdon
F. R. Catling, London	J. M. Lester, Harrow
E. A. Chilton, Eastbourne	K. Peters, Galway
F. G. Cooke, Eastbourne	J. B. Pickering, Canterbury
G. H. Crickmay, Leigh-on-Sea	C. J. Pictou, Chard
W. G. Davies, Birkenhead	T. Rayson, Oxford
H. O. Ellis, London	W. C. Shall, Llandaff
Annie Hall, London	J. D. Swanston, Kirkcaldy
S. C. Hanson, Southall	V. S. Whitaker, Barnley
R. E. Haymes, Shrewsbury	F. B. Whiting, London
	E. B. Williamson, Ashford

As Students—

J. Gomm, Ealing	A. C. Souby, London
E. E. Keefe, Norwich	B. H. Thomas, Llangadock
B. J. Ryan, London	

Mr. G. A. T. Middleton then read a paper on "Alexandria: Its Place in Architectural History," an abstract of which appeared in our last issue (p. 701).

In the discussion which followed,

Mr. R. G. Lovell, in proposing a vote of thanks to the lecturer, said that the lecturer's deductions with regard to the home of the Corinthian Order seemed to be exceedingly well founded. The evidence of Egyptian occupation was to be traced a good deal further up the Nile than Alexandria, as he remembered making a sketch of an Ionic capital at Luxor.

Mr. H. Freyberg, F.S.I., in seconding the vote of thanks, said he had never had the opportunity of visiting any part of Egypt, but there was one question which arose in his mind as Mr. Middleton proceeded, and that was the question as to what had become of the remainder of the buildings of which vestiges had been found, and which, if existing at the present time, would be remarkable throughout the whole world. The answer to the question, he thought, might be found in the history of places like Venice, where at the conclusion of a successful war the conquerors made their opponents throw in, in addition to the war indemnity, certain shafts of previous marbles, which were carried to the home of the victors.

Mr. H. Slicer and Mr. Robert W. Carden, having spoken,

The President,

in putting the vote of thanks to the meeting, said Mr. Middleton had made a point of the fact that Alexandria, from an architectural point of view, had been neglected, and he entirely agreed with him, but he thought the reason was that Alexandria had other claims to distinction which were overwhelmingly obvious and to a great extent overshadowed any claim it might have to be an architectural centre. Alexandria during the Ptolemaic period developed the exact sciences, and did so much for the establishment and development of what they might call modern civilisation that they were now feeling its effects and were enjoying its results.

A hearty vote of thanks was then accorded to Mr. Middleton, who replied to the discussion, and the proceedings terminated.

THE TOWN PLANNING ACT WHITE PAPER.

THE Memorandum issued by the Local Government Board, dated November 9, 1911, gives information as to the operation of the Housing and Town Planning Act since it was passed on December 3, 1909. The amendments made by Part I. of this Act to the previous Housing Acts have simplified the procedure for dealing with insanitary houses and areas. A striking increase of local activity is the result, representations with respect to 23,792 houses being made during the year 1910-11, as against 6,312 during the year 1908-9.

Information is given below as to a number of local authorities who have taken definite action with a view to the preparation of schemes under the Act, and there is reason to believe that in some cases better methods of developing estates are being adopted by landowners and others without the formalities of town-planning schemes, and that the existence of the powers of the Act has already had a very beneficial influence quite apart from the actual preparation of schemes under it.

In the following eight cases the Board have given authority for the preparation of schemes, viz. :—

Birmingham Corporation.—An area of about 2,320 acres in Quinton, Harborne, and Edgbaston in the city, and in the part of Northfield in the urban district of King's Norton and Northfield added to the city as from November 9, 1911.

Birmingham Corporation.—An area of about 1,442 acres in the Parish of Aston, in the eastern part of the city.

Ruislip-Northwood Urban District Council.—An area of about 5,906 acres in the urban district and in the parish of Rickmansworth (rural) in the rural district of Watford.

North Bromsgrove Urban District Council.—An area of about 554 acres in the urban district.

Rochdale Corporation.—A small area of about 43 acres in the borough.

Chesterfield Corporation.—A small area of about 64 acres in the borough.

Oldbury Urban District Council.—An area of about 1,763 acres in the Warley portion of the urban district.

Bournemouth Corporation.—An area of about 202 acres in the Boscombe East and Southbourne wards of the borough.

In one case, that of an application from the Corporation of Rochester relating to a very small area, the Board were unable to give the authority asked for as the land was for the most part held by the Secretary of State for War, and, being Crown lands, could not be included in a town-planning scheme.

The Board have before them at the present time two applications for authority to prepare schemes, viz. :—

Hanwell Urban District Council.—An area of about 198 acres in the urban district.

Liverpool Corporation.—An area of about 88 acres near the eastern boundary of the city.

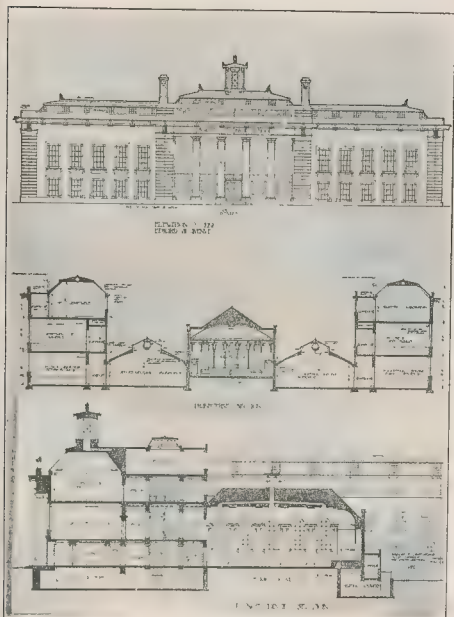

The Board have information showing that the preliminary notices have been given under the regulations by the following eleven local authorities with a view to application being made to the Board for authority to prepare or adopt schemes, viz. :—Barrow-in-Furness, Ellesmere Port and Whitby, Finchley, Huddersfield, Middleton, Nelson, Newcastle-upon-Tyne, Sheffield, Sutton Coldfield, Twickenham, and Willesden.

In twenty-two other cases the information available would seem to show that the consideration of the matter by the local authority has reached a stage practically equivalent to a decision to proceed with a scheme, viz. :—Acton, Barnes, Beckenham, Blackburn, Cleckheaton, Croydon, Greenford, Grimsby, Halifax, Hayes, Kingston-upon-Hull, Malden (The) and Coombe, Merton, Middlesbrough, Portsmouth, Sedgley, Southall-Norwood, Southampton, Stockport, Surbiton, Walthamstow, and Warrington.

In numerous other cases the Board are aware either from correspondence or interviews with their officers that the question of preparing a scheme is under consideration, and the following twenty-eight local authorities may be mentioned in this connexion:—Birkenhead, Bushey, Carshalton, Coventry, Croydon, Enfield, Epom, Esher and the Dittons, Hale, Hendon, Horne Bay, Hessele, Irlam, Leek, Little Crosby, Newport (Mon.), Northwich, Richmond (Surrey), Rotherham, Southgate, Stoke-on-Trent, Stratford, Sutton (Surrey), Tynemouth, Wakefield, Wallend, Wembley, and York.

There can be little doubt that many other authorities are contemplating town-planning schemes, but have not yet found it necessary to communicate with the Board on the subject.

We should have thought that in the case of Rochester it should not have been necessary to go as far as to complete the formal procedure necessary to make a definite application to the Board just to find out that Crown land cannot be included in a scheme. Surely this fact could have been ascertained at an earlier stage in the proceedings, and much useless trouble

Selected Design : By Messrs. Ivor Jones, A.R.I.B.A., & Percy Thomas (Cardiff).

[nd expense] been avoided. Why the notice served on the owners, presumably the War Office, or at any rate the preliminary Conference, did not disclose this fact is not evident. Possibly a simplification of the procedure might meet such cases, and also stimulate activity in the same way as it was stimulated by the simplification of the procedure of the previous housing Acts.

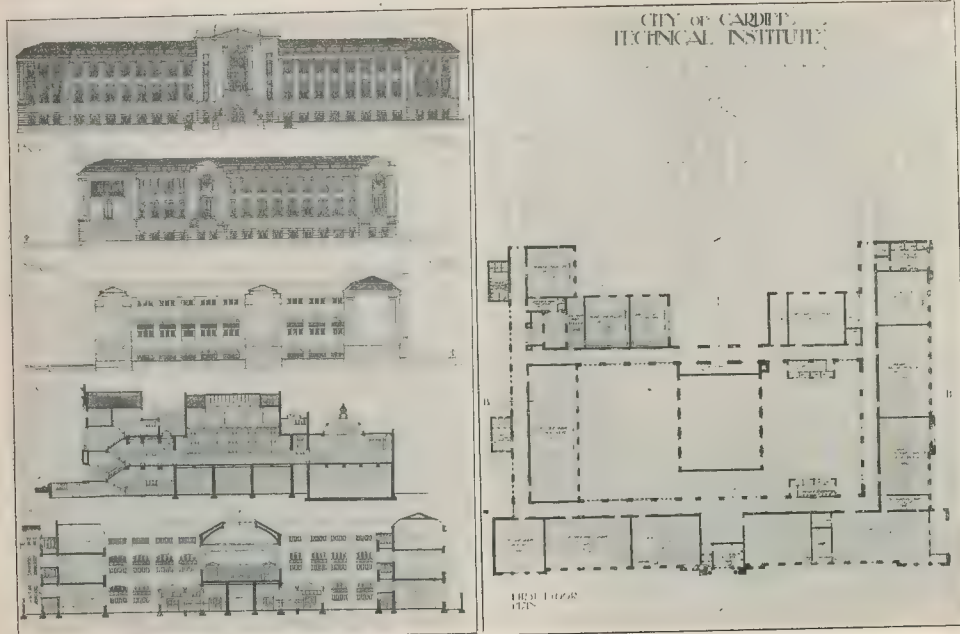

CARDIFF TECHNICAL INSTITUTE COMPETITION.

THE result of this competition was briefly announced in our issue of last week. Mr. James S. Gibson, F.R.I.B.A., was the Assessor, and awarded the first place to Messrs. Ivor Jones, A.R.I.B.A., and Percy Thomas, of Cardiff; Messrs. Cooper & Slater, of Blackburn,

Mr. J. Myrtle Smith, of Chelsea, and Messrs. Spalding & Myers (with Mr. E. G. Theakston), of London, coming second, third, and fourth respectively. It should be a source of some gratification to Cardiff architects that this competition has been secured by a local firm with a design well worthy to rank with the monumental buildings already erected on the Cathays Park. The site was an open one,

Cardiff Technical Institute Competition : Selected Design, by Messrs. Ivor Jones, A.R.I.B.A., & Percy Thomas (Cardiff).

Fourth Premiated Design : By Messrs. Spalding & Myers and Mr. E. G. Theakston (London).

below. The women's technical department is placed above the staircase hall on a second floor.

We might comment that the lavatory accommodation is quite inadequate and requires to be amplified.

The elevations generally are on simple and dignified lines, the projection on the main front formed by the large lecture-room being treated as a colonnade between heavy rusticated piers, with simply treated flanking blocks, of which the side elevations are a repetition. The Mansard roofs with glass in the lower slope and Roman tiles covering the intervening spaces, are effective, but the view of these would be

quite cut off by the bold projecting cornice, except from a considerable distance.

Messrs. Cooper & Slater's design shows an entrance vestibule at the road level, with an inner lobby and staircases up and down, somewhat dissociating the principal floors from one another. The disposal of the departments is very similar to the first premiated scheme, but by no means so carefully worked out. The lighting of the architectural and one of the engineering drawing offices is unsatisfactory, and when the future extension is added the former will be still worse off. The workshops fill the whole of the central areas on the lower floor, and necessitate the lighting of corridors

and lavatories by small clearstory windows, this scheme also rendering the central space under the examination hall useless. On the upper ground floor this hall is centrally placed, with the large lecture-room immediately behind it. The platform of the central hall seems to divide the corridor, which would otherwise complete the circulation of the whole floor in an unfortunate way.

The principal elevation to the main avenue is handled on a more elaborate scale than the first premiated design, and, whilst it has dignity, our impression is that it would be too costly. It can hardly be considered suggestive of the purpose of the building. The return elevation

Cardiff Technical Institute Competition : Fourth Premiated Design, by Messrs. Spalding & Myers and Mr. E. G. Theakston (London).

towards College-road is designed to form a symmetrical façade when the future extension is added.

The design submitted by Mr. J. Myrtle Smith, of Chelsea, receives third place. It is somewhat a matter for surprise that a design showing the workshops under the examination hall and lecture-room (which occupy the same respective positions as in the last scheme) should have received commendation, as the conditions distinctly asked for top-lighted workshops, and common sense would have suggested that the noise of mechanical engineering would hardly conduce to the proper conduct of examinations and lectures. There seems a disproportionate length of corridor. The elevations are not striking, and the treatment of the projecting features on the principal fronts does not grow out of the plan, but is obviously a case of "masking."

The fourth premiated design by Messrs. Spalding & Myers, of London, adopts a treatment somewhat in favour of several of the competitors, by placing the workshops partly under the hall and top-lighting the remainder. This economises space and gets over the difficult question of lighting any rooms or corridors under such a large area, but it is hardly successful in every way. The lecture-room in his design is semicircular, which would probably prove a convenient shape. The authors of this design have, like those of the first one, adopted the idea of putting the corridor of the south block against the outer wall, but the placing of lavatories on this side, although treated in a satisfactory manner externally, is hardly permissible, as this front would be very prominent. The principal elevation is a bold piece of work, but somewhat crowded and lacking in breadth.

Among the schemes which did not receive notice is a striking set (No. 8) which, in the unfortunate absence of names on the drawings, we attribute to the winner of the recent Marylebone Town Hall Competition, with very finely-drawn elevations, which, while ornamental in character, would certainly prove prohibitive in view of the cost limit defined. The plan is somewhat wasteful.

No. 41 has one of the best elevations sent in, attached to an impossible plan. The general standard of planning is not high, and does not show the acquaintance with the requirements of technical institute buildings that might have been looked for.

THE BRITISH MEMORIAL TO THE CENTENARY OF THE ARGENTINE.

The photograph illustrates the new memorial clock-tower presented by the British community of Argentina as their memorial to the commemoration of the Centenary of the Declaration of Independence of the Republic. The foundation-stone was laid on November 26 of last year, and the work is now practically completed. The site selected was that portion of the foreshore of the River Plate between the Paseo de Julio and the docks. In close proximity to this site the Central Argentine Railway will erect a station of fine design in place of their existing sheds. The clock-tower is 240 ft. 8 in. high to the top of the ship, which serves in lieu of a weathercock. It is thus some 20 ft. higher than the western towers of St. Paul's Cathedral, while the centre of the clock itself, whose four faces are each 18 ft. in diameter, is 157 ft. above the ground. This clock is undoubtedly the largest in South America, and is one of the great clocks of the world. Standing as it does in an isolated position, it will be visible for a considerable distance along the Paseo de Julio and over the docks. The British clock-tower is, in fact, the first object to greet the eye of the traveller approaching Buenos Aires by water and the last of the city he sees when leaving.

The style chosen for the monument is founded on the phase of Renaissance architecture existing in England about the year 1580, which is the period of the second—and permanent—foundation under Juan de Garay of the city of Santa Maria de Buenos Aires. The architect, Mr. Ambrose Poynter, F.R.S.B.A. (who won the first prize in a competition open to architects and draughtsmen of British nationality in the Argentine Republic), in selecting this style has sought in his design to refine as far as possible upon the profiles and proportions of the Orders and the detail and ornamentation of general without sacrificing the peculiarities and treatment, which give distinctiveness and

originality to the Elizabethan variety of Renaissance architecture. The materials selected are, naturally, those usually employed for buildings of that period in England—red brick and freestone. The use of real brick and real stone is a novelty in Buenos Aires, as none of the brick produced locally is sufficiently good for external use, and suitable stone is practically non-existent in the vicinity. The buildings in the town are almost without exception faced with stucco work, imitating fine stone and executed with marvellous skill, and the little brickwork to be seen generally turns out upon near examination to be a sham of coloured cement.

It was stipulated, however, by the Committee that in this case British materials should be preferably employed. The tower itself is square in form, and supports an octagonal drum and upola, the latter covered with copper and surmounted by a wrought vane carrying a gilded ship, a reproduction of a three-masted man-of-war of the year 1580. This ship has a double significance, not only as typifying Britain's sea-borne commerce, but also as forming part of the coat-of-arms of the city of Buenos Aires.

The open octagonal turret surmounting the tower is of stone with eight granite columns, and contains the hour bell—6 ft. in diameter—and the four bells for the quarters, which will strike the Westminster chimes. In the chamber below is a carillon chime, and beneath this is the clock itself, driven by electricity.

Below the clock level is the great cornice of the tower, with its wrought-iron railing, forming a gallery, which will serve as a point from which, at a height of 137 ft. above the ground, visitors may obtain a good view of the docks and town.

This gallery is reached by an electric lift starting from a waiting hall at the entrance level. This hall, forming the base of the tower, is raised above the level of the surrounding plaza, and is approached from a balustraded terrace with a flight of steps (lighted by monumental candelabra).

These are placed in the middle of each face, and there is a fountain at each corner. This ground story and the one above, to a total height of 46 ft., are faced with stone. Over this rises the brick shaft for a further 80 ft. to the underside of the main cornice. The recess facing the Paseo de Julio serves as an entrance, and has a great door of English oak, with a carved stone panel in the arch head over it,

with the inscription:—"Los Residentes Británicos al gran pueblo Argentino salud. 25 de Mayo, 1910." (The British residents to the great Argentine people, greeting, 25th of May, 1910.)

The cost of the tower is estimated at some 25,000*l.*, the larger part of which has been contributed by the banks, railway companies, and financial and business houses connected with the River Plate. The British Centenary Committee is under the Chairmanship of H.M. Minister, Mr. Walter Townley; he and the Hon. Treasurer, Mr. H. H. Long, and the Hon. Secretary, Mr. G. Lloyd Davies, are largely responsible for the success of the movement.

THE WESTMINSTER TOTHILL.

By MONTAGU SHARPE, D.L., CHAIRMAN OF MIDDLESEX QUARTER SESSIONS.

Nor long ago I was asked, "Where did the Tothill formerly stand in Westminster?" and, after much consideration, I gave the following reply, which may perhaps interest the readers of the *Builder*:

A tothill is described as "an elevation from which a look-out could be kept over the surrounding country." It is therefore evident that, in ancient times, before the land at Westminster was covered with buildings, a view could be obtained from the top of even a slight elevation raised upon the flat and marshy delta formed by the Thames and the two arms of the Tybourne, one of which flowed past the Abbey Church and the other by Vauxhall Bridge-road; also that Tothill-street, Tothill Church, and Tothill-fields, situated within this delta, must have been so named from an adjacent "tothill."

Tothill-street leads from the west door of the Abbey into Broad-street, and, after crossing it, the line of route is now continued by York-street, formerly known as Petty France. Near by stood Tothill Church, and from Norden's map dated 1596 "the way to Tothill-fields" lay to the south, down what is now called Broad-street. These fields, says Besant, "were to Westminster much as Smithfield and Moorfields were to the City of London."

Now it appears that the Westminster Tothill was an artificial mound of earth about the size of a haystack, and that it stood near the site of Caxton Hall, where the District Railway now runs. For this statement the following reasons are given:—

Here, in medieval times, was standing a mound known as St. Hermit's Hill, for, in Stowe's "Survey of London and Westminster," 1735, V. 636, it is stated that:—

"From the entry into Tothill-fields the street is called Petty France, in which, and upon St. Hermit's Hill on the south side thereof, Cornelius Van Dun (a Frabranter born, Yeoman of the Guard to King Henry VIII., Edward VI., Mary and Elizabeth) built twenty houses for poor women to dwell rent free, and near hereto was a Chapel of Mary Magdalen, now wholly ruined."

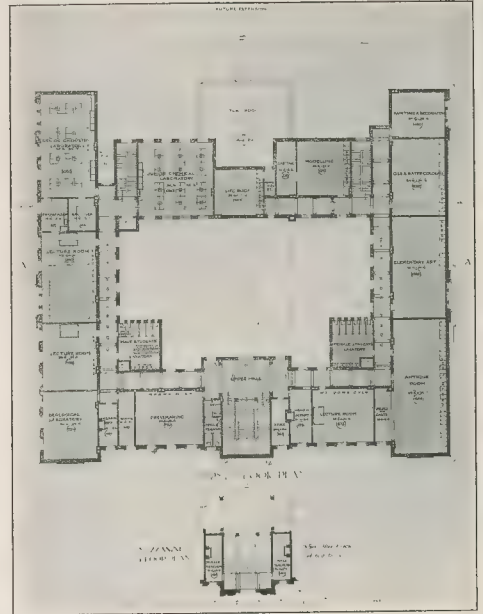

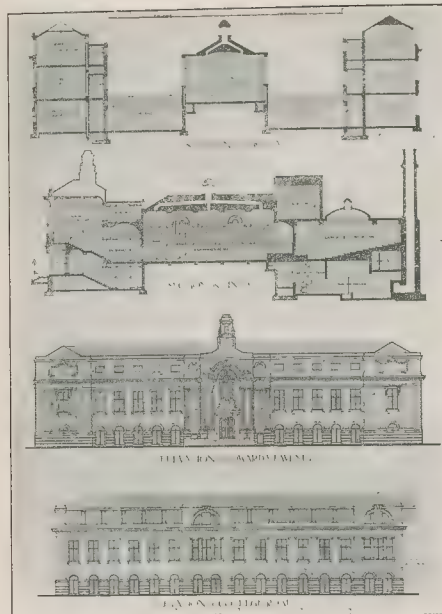

At the present time a variation from the name of this hill is to be found close by in a *cul de sac*, called St. Ermin's-hill, which leads from the western side of the Broadway to the east wall of St. Ermin's Hotel, though it formerly continued into Caxton-street.

Small artificial mounds of earth dating from ancient times and bearing curious names are to be found in many of the districts of Britain settled by the Romans, and some even remain in the ever-changing neighbourhood of London. One—erroneously called "Boadicea's Tumulus"—is standing near Hampstead Heath; another, planted with cedars, is in Syon Park, and can be seen from the Thames; and a third mound is to be found at Slough, known as "Salt Hill," and, by Eton boys, also as "Ad Montem." At Teddington in 1800 a similar mound was standing not far from the gate to the avenue of Bushey Park, marked on Ptolemy's 2-in. survey as "Barrow Hill," and described by Lysons as a tumulus of considerable size. He states that the earliest form of the name of Teddington was "Totyngton," and which doubtless originated from that tumulus or tothill.

Those readers of the *Builder* who have made a practical study of the geometrical system used in Britain by the Roman Agrimensores when surveying a district or pagus for settlement, are aware that these mounds were called "botontini," and, with stones, roads, oak posts, etc., were used respectively to mark the outer boundary line and the inner divisions of lands selected for agricultural development by rural

Clock-Tower, Buenos Aires.

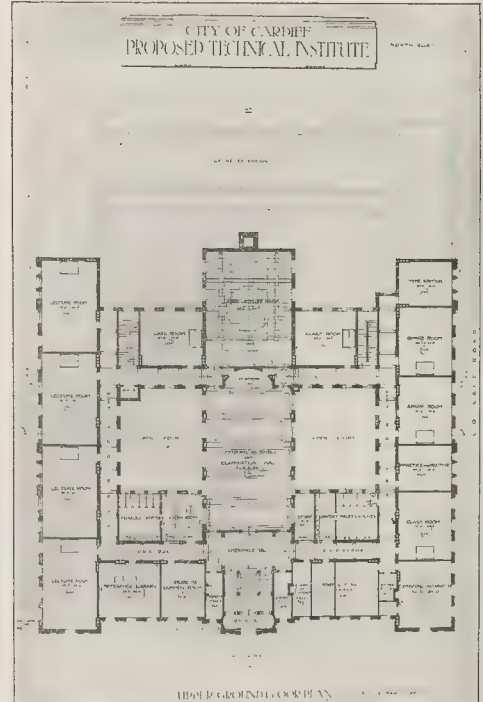

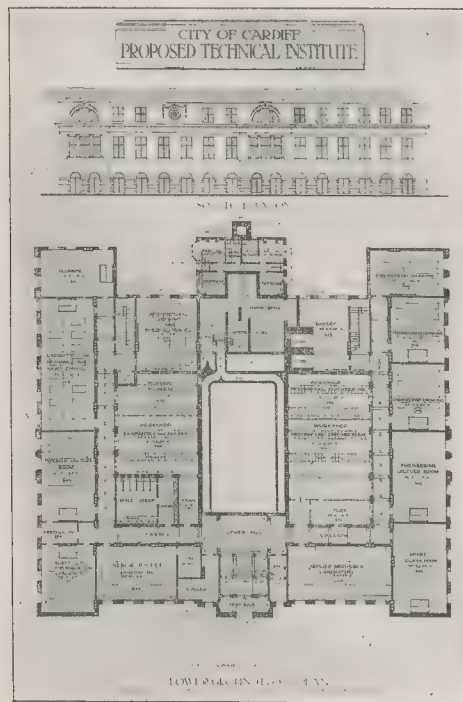

Second Premiated Design : By Messrs. Cooper & Slater (Blackburn).

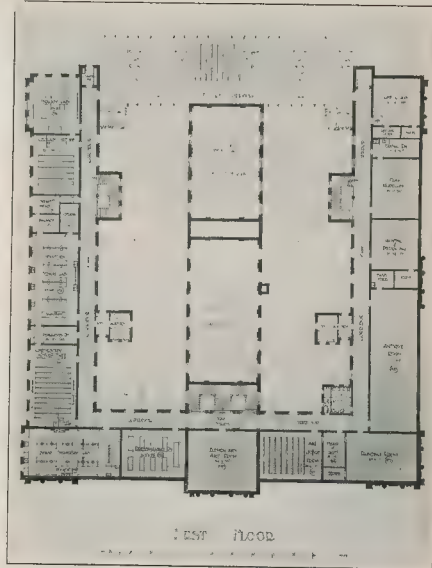

having road frontages on three sides, a proviso, however, being that future extension on the west side should be considered. The sixty-one designs have been publicly exhibited at the City Hall, Cardiff, and are on view until Friday evening, the 22nd inst.

If it be not a radical error of plan to place the examination hall and offices on a floor by themselves, thereby isolating them from the working parts of the building, there is no question that Mr. Gibson has given the first position to a scheme which can have afforded

him little trouble in selection. The drawings are admirable examples of what competition designs should be, and show clearly and concisely the details of arrangement. The keynote of Messrs. Jones & Thomas's scheme, and doubtless the point upon which it scored heavily

Cardiff Technical Institute Competition : Second Premiated Design, by Messrs. Cooper & Slater (Blackburn).

Third Premiated Design By Mr. J. Myrtle Smith (London).

over nearly all other competitors, was the placing of the entrance vestibule and the examination hall on a mezzanine floor practically at the roadway level, with internal staircases leading to the upper and lower ground floors respectively. On one side of the entrance is placed the principal's and committee room, and on the other the staff offices and porter's room. There is the objection to this general arrangement that the principal's room should be in direct communication with the main floor as stipulated, and not in such an isolated position. Also the examination hall has rather the appearance of a concert hall with retiring-rooms at the far end, and there is no secondary means of access except across the

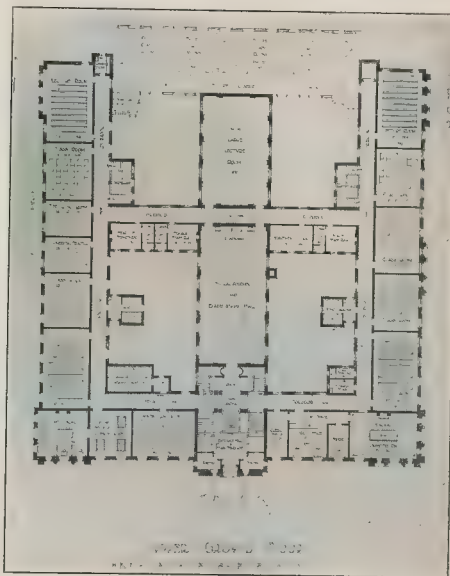

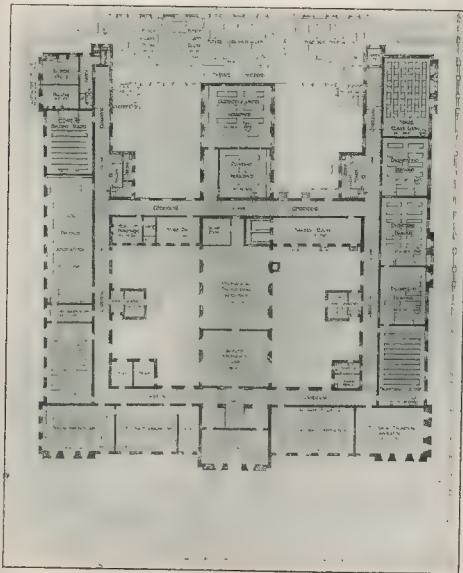

central area. These criticisms, however, by no means detract from the ingenuity shown in overcoming the difficulty of access to two floors of practically equal importance, one below and one much above the road level.

The lower floor divides into two sections, the physics department on the left and the engineering and artisans' rooms to the right. The stipulated sizes of the various rooms have been somewhat freely interpreted with the commendable object of getting the division walls of the upper floor over the lower ones. It might be mentioned that communication between the two sides of the building on this lower floor is rendered awkward by the necessity

for mounting and descending the stairs to cross the entrance hall.

On the upper ground floor a spacious landing is shown, with the large lecture hall centrally situated and forming a dominating feature both on plan and in elevation. The placing of this room is perhaps the most admirable feature of this scheme. The class and lecture rooms on this floor are well distributed, and the subsidiary staircases come happily for both present and future service.

To obviate elevational difficulties and overcome the disadvantage of having placed the art rooms on the south side of the top floor, the corridor serving the art section is put against the outer wall instead of over the corridor

Cardiff Technical Institute Competition: Third Premiated Design, by Mr. J. Myrtle Smith (London).

communities. The countryside was divided first into large square areas equal to 810 acres by parallel lines distant 9 furlongs apart, and then, in suitable places, it was parcelled out into small farms and holdings, which also enjoyed common rights in adjacent heaths and woods.

In London two of these marks remain—viz. the said bototinus near Hampstead Heath, and London Stone, by Cannon-street Station, while the positions of others are known, e.g., Stone Cross, near Somerset House, and Oswulf's Stone, by the Marble Arch, etc., though the last-named appears to have belonged to another surveyed district.

The Hampstead bototinus is thus described by Mr. C. H. Read, F.S.A., in *Middlesex, Herts, N. & Q. I. 4*. "The barrow is a circular mound of about 8 ft. in diameter and 11 ft. high. On the north and south is a level stretch for about 20 ft. on either side bounded by a ditch." Like a true bototinus it contained charcoal, for, on a trench being driven through the centre "considerable traces of charcoal were met with at all depths, and finally, about the centre a hole full of charcoal was found." It had been erected by Roman surveyors upon the border of a district to indicate its boundary line, which ran just outside the mound. "*Monticellus plantivimus de terra, quos bototinus appellavimus et intra ipsos carbonis et cinis et testa tusa cooperavimus*," *Gromatici Veteres*, 308. Again, St. Augustine, in *De Civitate*, xxi., 4, writes: "*Quid in carbonibus—at eos sustinere soleant qua limites figunt ad convincendum litigatorem*."

Now, taking this bototinus and London Stone as the apexes of opposite rectangles of a parallelogram, the two major lines will be found to be twice 9 furlongs apart, and the line from the bototinus running S.E. will, if produced to the Thames, pass to the west of Caxton Hall, crossing Victoria-street by the Army and Navy Stores. If to the east of this boundary line another parallel to it be drawn 9 furlongs distant, the southern end of this latter line will pass by Stone cross, and the third, as above stated, is identified by London Stone. The fifth parallel appears to have been indicated by a mark, of which the only name survives in "Markfield," on the south of Tottenham, while the sixth and eastern boundary line touched the bank of the River Lea by the Roman crossing at Old Ford, though the surveyors most probably placed their first line here and worked westwards.

It is not necessary to refer to the decumanal, or cross lines which completed the division of the land into square areas, but if the true positions of the following mark stones were known, viz., Hergotestane (Haggerston); Hocestone (Hoxton); and Lillstone (Lisson Grove), all of which gave names to Domesday Manors, also those of Dalston, Whittington's Stone, and the stone which stood in Goswell-road, they would show, judging by results from other districts, their connexion with the internal divisions of the old Roman pegasus surrounding the City of London.

It may be therefore said that the ancient "Tothill," or "Hermit's Hill," at Westminster, was a Roman boundary mark erected by the State Surveyors probably in the early part of the IInd century A.D., on a site close to the north-west corner of Caxton Hall, and that it remained in existence until the middle of the XVth century.

Similar and further evidence of this ancient geometrical survey is to be obtained further afield in Middlesex, as well as in other Romanised parts of Britain, where the surface of the land has undergone but little change. There the rural parish churches also afford assistance, for many stand upon the sites of former Roman Compita, or chapels, erected to the Lares Compitales near the village crossways, the routes of which followed the lines of the State survey. I have dealt with this further evidence of the survey in a paper on "Parish Churches on the Sites of Romano-British Chapels."

GENERAL NEWS.

Victoria and Albert Museum.

Important examples of old English furniture have been acquired recently by the Victoria and Albert Museum. To the collection of English Gothic woodwork has been added a portion of a rood-screen of oak, still bearing traces of its original colour. It dates from the late XIVth or early XVth century, and the western front of the screen, of which this portion formed the eastern, is still *in situ* in Tibbrook Church, Bedfordshire.

Among other objects acquired are four finely-carved bedposts of the time of Henry VIII.; a writing desk elaborately inlaid with architectural designs of the type commonly known as "Nonesuch," from their resemblance to the façade of the palace of that name built by Henry VIII.; a Cromwellian armchair; several Charles II. chairs; and a chest of drawers, with cabinet above, dated 1688.

Coronation Honours, Indian Empire.

The following appointments and promotions have been made upon the occasion of the Durbar at Delhi:—Order of the Star of India: C.S.I.—C. E. V. Goumont, Public Works Department, Chief Engineer and Secretary, Agra and Oudh, for Buildings, Roads, etc.; G. G. White, Chief Engineer and Secretary, P.W.D. Burma; F. B. Bryant, Inspector-General of Forests; Colonel T. F. B. Renny-Tailyour, R.E., Superintendent of Surveys, Southern Circle; and Major A. C. de L. J. de Lotbinière, C.I.E., R.E., P.W.D., State Engineer, Kashmir. Order of the Indian Empire: C.I.E.—H. Murray, Imperial Forest Service (retired), lately Senior Conservator of Forests, Bombay; M. Visvesvaraya, P.W.D. (retired), Chief Engineer, Mysore; and C. A. Smith, Chief Engineer and Secretary, Madras, P.W.D., M.V.O. (Fourth Class)—T. R. J. Ward, C.I.E., A.M.Inst.C.E., P.W.D., Superintending Engineer, Western Jumna Canal Circle, Punjab; Major S. D. Crookshank, R.E., P.W.D., Agra and Oudh, Superintendent of Works, Delhi Coronation Durbar; and R. B. J. Ram, C.I.E., P.W.D. Punjab (retired). Kaiser-I-Hind Medal for Public Service in India (First Class)—E. G. Barton, B.A., B.E., M.Inst.C.E., District Engineer, Darbhanga, Bengal; and J. F. Brunton, M.Inst.C.E., M.Inst.M.E., Chief Officer and Chief Engineer, Karachi Municipality.

Westminster Cathedral.

An account of the recent works carried out upon the fabric will be found in the *Catholic Directory* for 1912. The completion is announced of the marble decoration in the lower portion of the Sanctuary, together with the baldacchino and the arcades of the organ galleries, and in the Chapels of the Blessed Sacrament, Our Lady, the Holy Souls, SS. Gregory and Augustine, the Sacred Heart, and St. Thomas (Cardinal Vaughan's Chantry). The expenditure, inclusively of payments for the Hall and Cloisters, amounted, in last October, to 262,073*l.* 15*s.* 11*d.*

The Dering Sale.

At the dispersal by auction of the late Mr. G. E. Dering's effects at Lockleys, near Welwyn, on December 12, 13, and 15, Monti's marble composition, "The Sleep of Sorrow and the Dream of Joy," which was in the International Exhibition, 1862, was bought for 250 guineas, and P. Magni's "Reading Girl" for 150 guineas. The furniture included an XVIIIth-century sedan-chair, 24*l.*, and a Hepplewhite mahogany sideboard inlaid with black stringing on fluted taper legs, 27*l.*

Bessemer Memorial Laboratory.

At the annual dinner of the Institution of Mining and Metallurgy, held on December 15 under the presidency of Mr. H. Livingstone Sulman, the toast of the Institution was proposed by Sir Alfred Keogh, who announced that the Bessemer Memorial Committee had resolved to transfer to the Royal School of Mines the laboratory which they had presented to the Imperial College of Science and Technology.

Statue of Lord Minto.

The equestrian statue of the Earl of Minto to commemorate his Viceroyalty of India will be sculptured by Sir William Goscombe John, R.A.

Tyndale Memorial, Belgium.

A monument of Tyndale, executed by M. Rombaut, will be shortly set up at Vilvorde, near Brussels, where Tyndale was imprisoned and condemned to the stake.

Cranner Memorial, Cambridge.

Mr. A. Bruce-Joy has been appointed as sculptor of the Archbishop Cranner Memorial for Jesus College, Cambridge.

Pedlar's Acre, Lambeth.

Mr. Justice Neville has decided in favour of the Lambeth Borough Council their petition for the payment to them of the income of a sum of about 82,000*l.*, the purchase price of the Pedlar's Acre estate, by the London

County Council, as parcel of the site of the new County Hall on Thames-side. The Rector and Churchwardens of St. Mary, Lambeth, contended that the estate in part should be devoted to ecclesiastical purposes. We may here mention that the estate consists of 1 acre 17 poles, at "Church Hopes," in the osier beds of Narrow-wall (since Belvedere road), Lambeth Marshes, near Westminster Bridge foot. It was, as is generally believed, given to the parish in the XVth century by the chapman, "Dog Smith," who is commemorated by the stained-glass window, representing a pedlar, with his pack and dog, in the middle aisle of the parish church. The land was, it seems, not called "Pedlar's Acre" until 1690. There is record that in 1504 it yielded 2*s.* 8*d.* per annum; when the London County Council acquired the property the Borough Council derived from it 1,800*l.* yearly, which they expended upon reduction of the rates. An Act was passed in 1826 to determine conflicts of interest and opinions that had arisen as the value of the estate increased. That Statute (7 Geo. IV., c. 46) vested the charity in trustees for application in aid of the parish rates.

Messrs. Sprague's Diary.

The forty-third annual edition of the well-known diary which is issued by Messrs. Sprague & Co., Ltd., of East Harding-street, Fetter-lane, E.C., contains lists of officers and fixtures of the R.I.B.A., the Architectural Association, and other institutions connected with the profession, in addition to the information usually found in a diary, and the tables and calculations which make this publication so useful to members of the profession and others. The firm also issue a pocket-book, which, like the diary, is conveniently arranged and nicely got up.

"Whitaker's Almanack."

Whitaker's Almanack for 1912 (London: 12, Warwick-lane, Paternoster-row) is the forty-fourth issue of an indispensable work of reference, which for accuracy and usefulness is comparable with the *Post Office London Directory*. The first number of the *Almanack* was published on December 10, 1868, and contained 562 pages, with an Index of 2,000 references. The present volume contains 856 pages, with an Index of 7,000 references. The first number contained particulars of Great Britain; "with some reference to other countries," while the present issue deals with "all the nations of the world, with particular reference to the British Empire and the United States." Included in the principal new articles are the following:—Science and Invention, Labour Unrest in World, Trade Union Statistics, Public and Private Wealth, Imperial Telegraphy, etc. The miscellaneous statistics added include:—Trade Statistics, Wages and Employment, Finances of Local Authorities, etc. In fact, the *Almanack* covers enormous ground, and it deserves the position it has attained as a popular and reliable work of reference. There are two editions: Paper covered (536 pages), 1*s.*, and half-bound (856 pages), 6*s.* 6*d.*

CORRESPONDENCE.

The Policy of the R.I.B.A.

SIR,—I have read with great interest the two letters appearing in your last issue, the one dealing with "National Insurance," by Mr. Chas. Heathcote, the other re "The R.I.B.A. and Its Associates," by Mr. Horace T. Bonner. These letters, although dealing with different matters, may be regarded as synonymous, for each points out, in no uncertain manner, either the incapability or the indifference of the Council of the R.I.B.A. to attend to the national or individual welfare of its members. Within the last few years Government laws have been passed which are seriously detrimental to the profession, yet we hardly have so much as a squeak from the Royal Institute. And what is the birthright of those hopeful enthusiasts who after years of laborious study are eventually born into the family of "Associates"? They are allowed to pay two guineas a year into the funds of the Royal Institute, half-a-guinea a year to one of the allied provincial societies which may be in their district and which they are expected to join. They are bound and tied down by rules and regulations, and have to pay due regard to professional etiquette, all of which become a source of annoyance and

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. E. White, Chairman, presiding.

LOANS.—The Finance Committee recommended and it was agreed to make the following loans to various borough councils:—Islington, 2,400*l.* for electricity undertaking; Wandsworth, 4,400*l.* for street improvements; St. Pancras, 988*l.* for altering gradient of roadway; Poplar, 2,965*l.* for electricity undertaking.

NEW SCHOOLS.—It is proposed to erect a new school on a site in Hortensia-road, Chelsea, to provide accommodation for 200 girls; and also a new school on the Ocean-street site, Stepney, providing accommodation for 800 children.

HEATING WORK.—Additional heating work is to be carried out at the Hoxton House school, at a cost of about 133*l.* 13*s.* 3*d.*

THEATRES, &c.—The following drawings have been approved by the Theatres and Music Halls Committee:—Empire Theatre of Varieties, Leicester-square—alterations to property-room; 538 and 540, Kingsland-road—heating and ventilating arrangements; Shaftesbury-avenue (proposed new theatre)—heating and ventilating arrangements. Plans have also been approved for the erection of a cinematograph hall on a site in Mitcham-road, Tooting.

WHITECHAPEL FIRE-STATION.—Owing to the unsatisfactory accommodation for the men at this fire-station, considerable improvements are to be carried out at a cost of 185*l.*, including alterations to the electric light installation.

REPAIRS TO BANDSTANDS.—Concave ceiling

ings are to be provided and general repairs carried out at the bandstands in Brockwell and Clissold Parks at an estimated cost of 400*l.*

CONVENIENCES, KENNINGTON.—New public conveniences are to be constructed on the triangular detached portion of Kennington Park at the junction of Kennington Park-road with Brixton-road.

KING EDWARD VII. MEMORIAL.—In a joint report of the General Purposes, Improvements, and Parks and Open Spaces Committees, it was recommended that in the opinion of the Council the formation of a park or open space at Shadwell would afford a fitting memorial in East London to the late King, and that an amount of 14,000*l.* for the acquisition of the site for the purposes of a public park be approved; also that, subject to the King Edward VII. Memorial Committee acquiring the Shadwell Market estate and laying out the estate as a public park, the Council do undertake the maintenance of the park for the use of the public. This recommendation was agreed to without discussion.

ST. PAUL'S BRIDGE.—The joint report of the Highways Committee and Improvements Committee contained copies of the correspondence which had passed between the Council and the City Corporation with reference to this bridge and the construction of trams in connexion therewith.

COMPETITION NEWS.

Prestatyn, North Wales.

A competition has been instituted to secure a town plan of the estate of Lord Aberconway and the Trustees of the Prestatyn Estate. The premiums offered are 50*l.*, 30*l.*, and 20*l.*. Mr. H. V. Lancaster, F.R.I.B.A., is the assessor. It is desired to develop the estate as a residential seaside town, but without the usual type of sea front or parade.

Forest-fach, Parish Hall.

The design of Mr. H. A. Ellis, of Swansea, has been selected in this competition. The cost of the building will be about 1,200*l.*

Plans for School Buildings, Roumania.

The "Curier Financiar" (Bucharest) of December 3 announces a competition of plans and specifications for the construction of a training college at Buzau, the cost of which must not exceed 400,000 frs. (16,000*l.*). The following prizes will be awarded for the plans:—First prize, 5,000 frs. (200*l.*); second prize, 1,000 frs. (40*l.*); third prize, 500 frs. (20*l.*). Plans and estimates must be deposited at the "Ministère des Cultes et de l'Instruction Publique," Bucharest, on January 28.

ART EXHIBITIONS.

Mr. Cayley-Robinson's water-colours for "The Blue Bird" will be on view in the Leicester Galleries for a few weeks beyond Christmas. Early in the New Year an exhibition will be opened in the same galleries of landscapes in oil and water-colour by Sir Alfred East, A.R.A.

BOOK RECEIVED.

REFRIGERATION, COLD STORAGE, AND ICE-MAKING. By A. J. Wallis-Tyler, C.E. (London: Crosby Lockwood & Son. 10*s.* 6*d.* net.)

R.A. Schools: Design awarded the Gold Medal, by Mr. Alan Binning.

EDITORIAL SUMMARY.

"The Decoration of Chelsea Town Hall" is the title of the leading article this week.

A second article, on "The East Kent Coal-field," appears on p. 732.

In "Notes" columns (p. 732) will be found some observations on: "The Infirmary Site, Manchester"; "The Late M. Daumet"; "The Responsibilities of Architects"; "St. Paul's Bridge and Party Politics"; "The Aldwych Site."

A meeting of the Royal Institute of British Architects was held on Monday, when papers were read on: "The Newer Responsibilities of Architects," by Mr. W. Henry White and Mr. E. Greenop (p. 733).

Brief reports of the following architectural societies appear on p. 735: "The Leeds and Yorkshire Architectural Society"; "Architectural Society of Liverpool University."

A meeting of the Society of Architects was held on the 14th inst., when a paper was read by Mr. G. A. T. Middleton, an abstract of which appeared in our last issue. Some notes of the discussion which followed are given this week, on p. 736.

A short notice of the Town Planning Act White Paper issued by the Local Government Board appears on p. 736.

An article on the Carliff Technical Institute's Competition is given on p. 737. Illustrations of the premiated designs are given in connexion with it.

The British Memorial to the Centenary of the Argentine is described and illustrated on p. 741.

An article on "The Westminster Tothill," by Mr. Montagu Sharpe, D.L., Chairman of Middlesex Quarter Sessions, appears on pp. 741-742.

In our Correspondence columns (p. 742) will be found letters on: "A Correction"; "The Policy of the R.I.B.A."; "Use of the Order"; "Architectural Assistants, Office of Works."

Our Monthly Historical Review, illustrated (p. 747), includes: "Some Worcestershire Churches"; "Historical Facts and Jacobean Architecture"; and Notes.

The Building Trade Section (p. 754) includes: "The London Chamber of Commerce and Labour Unrest"; "Building Act Reform"; "Suggested Standardisation of Copper Tubes"; "Government Contracts"; "London Master Builders' Association"; "The Plumbers' Company."

In Law Reports (p. 758) are short reports of the following: "The Euston-road Building Line"; "Action by Contractors on District Surveyor's Certificate"; "Dispute over Reconstruction Work."

MEETING.

FRIDAY, DECEMBER 22.

Junior Institution of Engineers.—Visit to the factory of Messrs. Otto Monsted, Ltd., margarine manufacturers, at Southall. 3 p.m.

ILLUSTRATIONS.

Royal Academy Schools.

R. ALAN BINNING'S design for "The Hall of a City Company" was awarded the Gold Medal and Travelling Studentship (2004.), and

Mr. Bucknell's was among the most interesting of the other competitive drawings. We referred to the work of the Schools generally in our issue of last week, and in future issues we shall illustrate some of the other designs sent in for the Gold Medal and smaller prizes.

Mr. Binning is in the office of Mr. Leonard Stokes, P.R.I.B.A. It will be remembered that in 1907 he won the second prize for a set of architectural drawings, and the first prize for a set of drawings of an architectural design ("Monument in a Public Park"); and in 1908 he took the Silver Medal for an architectural design with coloured decoration ("A Domed Chapel"). Mr. Binning therefore finishes his student career with appropriate honours, and we wish him success in the future.

Mr. Bucknell is in the office of Messrs. Lanchester & Rickards. Last year he won the 25l. prize for a design in architecture.

R.A. Schools: Design awarded the Gold Medal, by Mr. Alan Binning.

form insurmountable barriers—especially to the provincial architect, who has to compete in these hard times with land agents, valuers, speculative builders, clerks, and other incompetent men who work for reduced fees and trade on the ignorant public. To have A.R.I.B.A. after your name and be a fully-qualified person does not daunt the unqualified or officious local sanitary, nuisance, or building inspector, who comes and orders you to do this, that or the other, and however ridiculous this order may be, it must be complied with, or you are threatened with a law suit. Even if you go to law and get the better of the argument, you worry your client by delaying his work and are put to infinite personal trouble and inconvenience. And where does the R.I.B.A. come in? What practical help or support do you get from this wealthy society of which you are a member? This is a question which will never be answered with credit to the R.I.B.A. until some drastic reform is introduced. The pioneers of architecture have built for themselves an Institute with a high-sounding name, but the plan is not practical and the construction is rotten. Let us have it remodelled, and let us have an Institute which will be respected by public opinion and interfering inspectors, and which will carry some weight in a court of law, and in the framing of that law, or what is the good of an Institute at all? R. E. HASTWELL, A.R.I.B.A.

SIR, I beg to inform you that I have given the Secretary of the R.I.B.A. the following notice of motion in accordance with By-law 56, viz.:

"That it be an instruction to the Council that in any future or amended Charter or by-laws under such future or amended Charter that an equal number of Fellows and Associates be elected to such Council exclusive of the President, four Vice-Presidents, and Honorary Secretary or Secretaries, and that only one list of candidates eligible for election to such Council shall be issued at one date prior to such election containing the names, residences, and qualifications of all candidates nominated for election to such Council."

This motion will come before the business meeting at the Institute on Monday, January 8, at eight o'clock p.m., when I trust the Associates will rally round to support it.

HORACE T. BONNER, A.R.I.B.A.

SIR,—It is gratifying to see from the letters in your valuable paper that the Associate members of the Institute are at last waking up, and I heartily welcome the motion which Mr. Bonner proposes to bring forward at the business meeting to be held on January 8, 1912.

With regard to the treatment of the Associates at the annual general meeting on May 1 last, and to the President's reference in his opening address on November 6 last to the further revision of the Royal Charter and By-laws, in order to carry out the Council's proposed amalgamation with the Society of Architects, I suggest that the Associates not only demand equal representation on the Council to that of the Fellows, but further, that every effort be made to obtain the right for Associate members to vote on any proposed alteration or amendment of the By-laws.

I hope that Mr. Bonner's appeal for a large attendance on the 8th proximo will be responded to by every Associate who can possibly be present. ASSOCIATE R.I.B.A.

SIR,—I read with much interest the various letters that have appeared on the subject of the treatment of the Associate class by the R.I.B.A., and the creation of what Mr. Bonner terms the "no class" Licentiate, with their Fellowship chances by the "back door."

I wrote several letters about this question some time ago, but they did not seem to touch my fellow Associates at the moment.

I proposed that we should require the Licentiates to remain outside the Fellowship class, who surely already contain enough back-door men of about 1905 date.

Some of us are too busy getting a living, or else we might join the fighting front, but surely there are plenty in easy circumstances who can do so.

Our present representatives seem a very quiet lot; in fact, several never open their mouths at meetings, and the one or two who do seem to avoid any useful topic.

Let us have a referendum of all the Associates

and the policy generally required, and get our representatives to state what they mean to do or not to do before election time (such as Town Councillors do), and, if necessary, let us eject them. Anyway, let us liven them up and see they keep awake.

A referendum of letters, etc. (not postcards), will cost money, so we must ask for subs. Will this Associates' club take it up? I should like to hear what their line of attack is and also what they want us to do. SWALLOWITE.

Architectural Assistants, Office of Works.

SIR,—Your correspondent misunderstands the intention of my letter which appeared in your issue on the 1st inst.

I pointed out that the injustice of temporary employment extends far beyond the architectural assistants, and that many others who occupy equally important positions in the Office of Works suffer from the same injustice, and I instanced the clerks of works. Now that the architectural assistants have been promised permanent appointments I venture to hope that in fairness to the others the same conditions will be offered to them. X.

SIR,—It should be understood that the above class are fighting for official status by establishment (now promised to each member by the First Commissioner in the House of Commons on the 7th inst.), as much as for adequate remuneration for their professional services, for in their present condition, without departmental work, which has been during the past few years taken from them surreptitiously and seized upon by a class junior to them, together with the need of the exercise of their abilities reduced to a minimum; and in the absence of this all interest in the architectural work is ended.

And to this must be added (whether by order of the Principal Architect, certainly with the knowledge of the heads of the branches, but it is believed without the sanction of the Board) the vexatious interference of a number of junior assistants (formerly draughtsmen), who, armed with their Civil Service Certificate, are riding "rough-shod" over the members of the "Architectural Assistant" class, the majority of whose members taught them on their entry into the Department, and who are their seniors in service, age, and, it must be conceded, by attainments, who, without having reason to be proud of their former pupils, righteously object to this treatment.

But now that our Parliamentary searchlight is being turned on the dark corners of the Office of Works Architectural Section, further ugly facts will be bound to come to light, and the Secretary of the Department would be well advised to make independent personal inquiry, and without delay, into the conditions that obtain, and not from those officers who have misrepresented facts to him in the past.

LABOUR MEMBER.

The Use of the "Order."

SIR,—It is refreshing to find an architect designing without introducing attached columns, like Mr. Curtis Green in his scheme for the Marylebone Municipal Buildings.

Certainly a most dignified appearance is generally given when an "Order" is introduced, but the effect is obtained so easily that it is open to question whether it does not tend to encourage what might perhaps be called laziness in design. But for this royal road to success architects might be more on the alert to devise other means of giving dignity to their designs. Variety would be obtained and money saved which could be expended on sculpture, thus giving more of what Fergusson called "phonetic value."

The Reform and Travellers' Clubs and Bridgewater House might be quoted as examples of Sir Charles Barry's fondness for designing without an "Order."

W. L. H. LVERTON.

A Correction.

SIR,—Will you kindly allow me space to correct an error in your report of the Conference of the Model Abattoir Society, held at the Royal Society of Arts on the 7th inst.? In it I am credited with having stated that if public abattoirs were enclosed by high brick walls, or hidden underground, we "might get some of the advantages the

Society were aiming at." This is entirely the reverse of my opinion.

Referring to my manuscript, I find the words used were, "If this were done nearly all the advantages of the public abattoir would be counteracted. Private slaughter-houses are to-day hidden from view, and it would be a retrograde movement to perpetuate this undesirable arrangement."

I am as little in sympathy with the prevalent idea in some Continental countries that the public abattoir should be a "show" building as that of the rooted idea in England that it must necessarily only be mentioned in abated breath before polite society.

Until we become a nation of vegetarians let us frankly acknowledge that buildings for the preparation of beef are as necessary, and should be as hygienic, as those for the manufacture of biscuits. R. STEPHEN AYLING.

INTERCOMMUNICATION COLUMN.

Timber Brands.

SIR,—Will you, through the medium of your paper, kindly inform me whether the brand distinctions on timber are all changed annually? A friend of mine agrees that they are. I maintain that such is not the case, but that new brands are added each year.

YOUNG JOINER.

[*] Most certainly the brands or marks on the end of timbers are not changed, but remain the same year after year. Of course, if new sawmills are opened in wood-producing countries, naturally, new brands come into operation, but our correspondent will find that all the well-known brands have continued for many years.—Ed.]

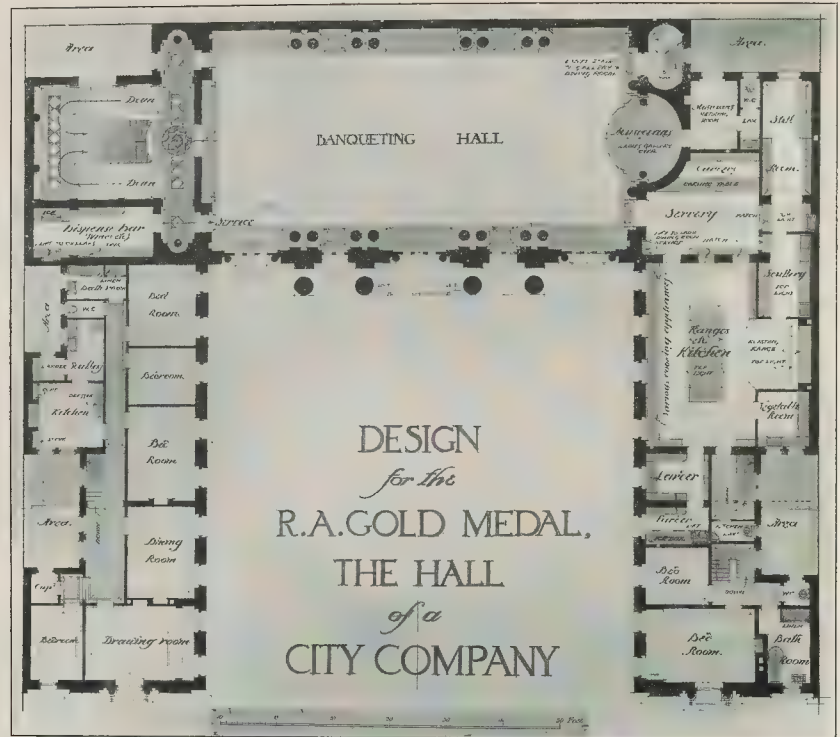

FIFTY YEARS AGO.

From the *Builder* of December 21, 1861.

A Heavy Loss.

THE death of his Royal Highness the Prince Consort has fallen on the nation with the effect of a stunning blow. Its unexpectedness; the extreme worth of the Prince—a man in the prime of power; the sorrow which all know it brings to our beloved Queen; and the gravity of the position of the country at the moment, have all tended to increase the wail of lamentation which has come up from all classes and conditions of men. Even yet the loss cannot be fully estimated; but by none will it be deemed greater than by those connected with art, science, and literature; and by none of these latter than by our own readers. The debt which the industrial arts of this country owe to the Prince is enormous. No one comparing their present state with that which prevailed within the remembrance of not old people, and recollecting the part he has played, can doubt as to the powerful influence that has been exerted for good in these matters, and which may be said to have culminated in the suggestion and perfecting of the scheme of the first great International Exhibition.

The extent of his information and his knowledge of the principles of art were remarkable. It was with him no simple "I prefer that," or "I desire this"; but "It should be in such a way because of such a thing." It happened to us to be in the tea-room of the Royal Society on the evening that the Prince paid his first visit there. The visit being unexpected, the meeting was a small one; and we can perfectly well remember the general observation when the Prince, then quite young, passed round the table on which some miscellaneous objects of curiosity had been placed and spoke with knowledge of every one of them—from a piece of amber, of which he named the original locality, to the model of a machine for cutting ship-timbers. A distinguished man, now dead, gave expression to his surprise; and the Prince replied with a smile—the words are as clear in our ears as if they had been uttered yesterday—"Such matters were a good deal looked to at Bonn."

MONTHLY HISTORICAL REVIEW.

Beckford Church.

[Photo. by Mallott.]

SOME WORCESTERSHIRE CHURCHES.—II.

[Continued from page 543.]

NOT far from Bredon, described in the previous article, and nestling like it, under Bredon Hill, whose isolated height dominates the whole of Evesham and the Severn Plain, are the little villages of Overbury and Beckford. Both possess churches of considerable interest, respectively dedicated to St. Nicholas and St. Barbara. At the former restoration has, on the whole, been lenient, though it has fallen into the common mistake of stripping the walls of their decent coat of masonry to the view; nay, even calling attention to their shame by emphasising their dom jointing. This may, however, to

some extent, be condoned in view of the light which has probably been thrown by the process on the history of the church. The Norman nave, which is now decidedly dark, must have been well lighted in its original state. A range of small, round headed clear-story windows with deep internal splays still exists, each placed over a pier of the arcade, and below them on the outer side the corbel-table carrying the original aisle roofs can still be seen. At a later period the aisles were probably doubled in width and the new roof carried up above the windows, making them useless. The round-arched arcades exhibit the rude Norman workmanship in the process of feeling its way to progress. On the

south, and doubtless earlier, side the capitals are mere thick slabs of stone, with a slight capping and fluted on the under edge; on the north they begin to affect a truer capital form by the appearance of a definitely indicated abacus and necking, and by the splaying, as well as fluting, of the lower edge.

Here, as at Bredon, the church seems to have been extended by the addition of a tower, which is battlemented with angle pinnacles somewhat recalling the fine towers of Somersetshire, on the site of an original small chancel, and of a large Early English chancel beyond it, with fine if low-pitched groined vaulting. The church contains some remains of XVth-century pews with tracery panels.

North Door.

Beckford Church.

Chancel Arch.

The very careful restoration now in progress at Beckford has revealed additional points of interest in a church already by no means lacking in them. It possesses two Norman doorways enriched with naive but uncommon sculpture. Over the north door, now built up, a curious group occupies the tympanum, surrounded by a cable mould, and with a frieze below it of conventional ornament reminiscent of classical prototypes. In the centre stands a figure impaling a monster with the pointed foot of a cross held in the right hand, while the left appears to encircle a kneeling man in a cord. What is the interpretation of the scene? Does it represent the Saviour crushing the devil and rescuing mankind in a net, or does it refer to some local legend?

The more elaborate south door (sheltered under a XVth-century porch) has several receding orders of enriched members and engaged shafts, and a still more mysterious group in its tympanum. In the centre stands a squat Latin cross with a bird on its eastern arm and a rosette over its western. On either side a strange quadruped is represented apparently in the act of adoration. The bird may possibly be an allusion to the legend of the crossbill or the robin; the rosette may

[Photo. by Harris.]

Spetchley Church.

chancel belong to the XIIIth century. The latter is lit by coupled lancet lights, but one

which still shows traces internally of the original high sill. On the north of the chancel stands a vestry or schoolhouse, built in 1687, with square-headed, mullioned windows, and a gilded squint between it and the church, the purpose of which is by no means clear.

Beckford stands near the limit of two types of domestic architecture dependent on the local building materials. West and north lies the timber district with its black and white houses; south and east we are at once in Cotswold, the region of stone-built manors and cottages, mullioned windows and stone-slatted roofs. Round Broadway, whose "fatal gift of beauty" has, alas, brought it into a popularity too great for its safety, cluster a number of less-known and relatively unspoiled villages retaining much of their ancient charm—Snowhill and Willersey, Weston-sub-Edge and Bretforton. Hard by the last-named, Church Honeybourne justifies its name by possessing a church remarkable in more ways than one. The approach from the south by a long paved churchyard path is very beautiful. The chief feature in that view is a porch which, including its roof, is constructed entirely of stone, the slabs with which it is covered being carried by stone ribs or rafters springing from corbels, and their joints covered with flat stone ridge tiles.

The tower at the west end, which is of the early XIVth century, leans to an alarming degree out of the perpendicular, and its

Inkberrow Church.

stand for the sun, the animals, which look like donkeys, with four ears apiece, may be meant for oxen. But what does the whole composition mean? Perhaps one of our readers more learned in iconography can explain it. Can it stand for a symbol of the Trinity—the sun for God the Father, the bird for the Holy Spirit, the cross to indicate the Second Person, with the oxen in allusion to the nativity?

The work of restoration has revealed the remnants of a fine Norman window with delicately-carved capitals and moulded bases to its engaged shafts in the south wall, of another in the north wall, and vestiges of a pair of Norman windows on each side of the west window, a XVth-century insertion. In the east wall of the nave a door to the rood gallery from the tower staircase with an entrance from outside, and a XVth-century squint on the north side of the Norman chancel arch, have also been uncovered.

In Georgian times a fresh coat of plaster marked out to simulate ashlar was super-added on the mediæval plaster, and where this was not done, as, for instance, behind the contemporary pulpit, traces of mediæval painting are still to be seen. The joint lines are now to be obliterated with a thin skin of new plaster. On the removal of the Georgian plaster ceiling a fine oak Perpendicular roof in almost perfect condition came to light. It is of a type common in the western counties. Each pair of rafters, with its high collar beam and curved struts, constitutes a truss. These are about 6 in. thick, and are placed unevenly, but on an average about 12 in. apart. There are four massive cambered tie beams, with curved struts springing from stone corbels, but naturally no purlins. It is impossible to tell from the present condition of the roof whether it was intended to be sealed or left open.

The tower, which occupies the site of the original Norman choir, and the present

of these on the south side was replaced in the XIVth century by a "low side window,"

Churchyard Cross, Wick, Worcestershire. (See next page.)

Restored by Mr. Cecil G. Hare.

has been necessary to support it at some period by means of an enormous western buttress. It is surmounted by a remarkable bracketed spire springing from a mere string course, and having angle pinnacles and gables in each of the eight faces. The church, which is without aisles, has some fine Decorated and Early Perpendicular windows. The original steep roof of the nave, with eaves just above their heads, was replaced in the XVth century by a flat leaded one at a considerably higher level, and the additional wall thus gained is pierced on the south side by a range of clearstory windows. The XIIIth-century chancel retains its original high-pitched roof.

Leaving Church Honeybourne by a straight stretch of Roman road several miles long we must traverse an intrusive tongue of Warwickshire before reaching Worcestershire again, and, in doing so, pass through the attractive village of Bidford, interesting not only for its fine Avon Bridge referred to in last month's article, but for some noteworthy houses, both of the stone and timber varieties. One of the former is built, in alternate courses, of two varieties of local stone differing in colour. A few miles west lies Inkberrow, proudly situated among umbrageous trees on a promontory of upland, some 50 ft. to 100 ft. high, jutting out with steep sides into the plain, a spot that must have been of strategic importance in the obscure conflicts of prehistoric or mediæval politics. The church is a good example of well-proportioned refined XIVth-century work, with a sturdy, but well-detailed western tower. Originally aisleless, it was enlarged in the XVth century by the addition of a fine north aisle, with a flat roof and pinnacled battlement, and a rather squat porch. The windows of this aisle, whose tracery is peculiar in being cusped, retain some good contemporary glass in which large use is made of yellowish grisaille. A chapel forming a sort of transept on the opposite side contains the notable tomb of John Savage, who died in 1631. His effigy rests within an arcaded shrine under a horizontal canopy. The sculpture, far ruder than at Bredon, comprises figures over the black marble angle columns of an odd Chinese appearance. The monument, which was ruinous when Nash described it in 1738 in his history of Worcestershire, bears traces of rough handling, due, doubtless, to an unskilful restoration. It is of the Renaissance type customary at the period of its erection, with the exception of the tester, which is panelled with Gothic quatrefoils. Similarly, the interesting Georgian oak pulpit shows Gothic influence—the of the Strawberry Hill type—in its panelled sides. In the vestry stands a fine XVIIIth-century oak dresser.

Of the churches passed on the return road to Worcester, after the round we have been following, the most interesting is the tiny one of Spetchley, rather gloomily perched on a northward facing bank under overwhelming trees. Actually included in Spetchley Park, it has for many generations been the burying-place of the Berkeley family, and was extended by the addition of a relatively large chapel to the south of the chancel for the accommodation of their tombs, while to the north a large window was added, apparently to throw light on them. This window is curious in a church, for it is just a Tudor, square-mullioned and transomed bay of domestic type, such as might be found at Haddon Hall or some Cotswold manor-house. The principal among several interesting monuments is that of Rowland Berkeley (d. 1614), which stands in the arch opening into the chapel in the full light of this window. Though thoroughly characteristic in its detail and ornament of the Jacobean manner, it is unconventional in its general design. The canopy over the two figures, which, like the main body of the ornament, is in alabaster and richly coloured, takes the form of a thin barrel vault without superstructure springing at head and foot from slender columns. Stout obelisks, set diagonally at the angles of the monument, give a faint suggestion of support to this somewhat crazy structure, but they do not conceal the fact that the vaulted canopy has no abutment, and is, in fact, kept in equilibrium by sturdy wrought-iron stays, honestly enough displayed, built into the arch jambs.

And so by the London Road back into Worcester.

WICK CROSS, WORCESTERSHIRE.

AN interesting restoration has been carried out recently at Wick in Worcestershire. Under the care of the Rev. C. H. B. Hudson, and with the advice of Mr. Cecil G. Hare, the old Cross in the churchyard has been repaired and a new finial erected. The sculpture was executed by Messrs. R. Bridgeman & Sons, of Lichfield, Staffordshire. A description of the work written by Mr. George Baker on parchment was placed in a bottle in a cavity under the Cross.

JACOBÆAN ARCHITECTURE AND HISTORICAL FACTS.

SUPPLEMENTING our report of Mr. Arthur T. Bolton's paper on Jacobean Architecture read before the Architectural Association on November 27 (see issue of December 1), we are now able to give lists compiled by Mr. Bolton of the chief dates when buildings were erected and of facts relating to the period. These details cannot fail to be of interest and value to students.

APPENDIX I.—ENGLAND.

List of Examples and Historical Outline First Half of the XVIIth Century.

1603. ACCESSION OF JAMES I. Reign, twenty-two years; married, 1589, Anne of Denmark. 1598-9, in the winter, Globe Theatre built. "Henry V." produced. 1601, Essex insurrection. Theatres closed by order. Shakespeare's purchase of new place Stratford-on-Avon.
1602. "Hamlet" probable production. "Lear." 1607. "Antony and Cleopatra," 1608. "Tempest," 1611.
- 1602-10. Burton Agnes, Yorkshire.
1600. (?) Sir Paul Pindar's House, Bishops-gate. Facade. Now in Victoria and Albert Museum.
1603. John Florio appointed teacher Italian Prince Henry. Translation Montaigne.
1604. Hampton Court Conference. A. V. Bible ordered. Peace with Spain. 1605, Gunpowder Plot, 1608, Customs Revenue case. 1611, baronets created. First settlement America and Ulster. First Charter of East India Company, 1600, and again 1612. Sir Dudley Digges.
1604. Return Inigo Jones from first journey, 1597-1604, to Italy, and including possibly a visit to Denmark.
- 1603-16. Audley End, Essex.
1605. Northumberland House, Charing Cross (now destroyed).
- 1603-05. Knole, Kent.
- 1605-12. Bramshill, Hampshire.
1607. Charlton House, Wiltshire.
- 1605-7. Holland House, Kensington.
- 1607-11. Hatfield House, Hertfordshire.
- 1607-12. Charlton, Kent.
1609. Chapman (1559?-1634). Translation of Homer, dedication to Prince Henry.
1609. Inigo Jones to France as King's Messenger.
- 1610-12. Inigo Jones, Surveyor to Prince Henry.
1610. Ham House, Surrey.
- 1609-10. Merton College. } Frontispieces at
- 1610-13. Wadham College. } Oxford.
- 1613-18. Bodleian Quad. }
1610. Ford Abbey, Devonshire.
1611. Fountains Hall, Yorkshire.
1612. Princess Elizabeth, only daughter James I. betrothed to Elector Palatine. Death of Prince Henry. Death of Salisbury. Robert Carr becomes chief adviser to James.
1612. Holland House, Kensington. (Additions by Thorpe before 1614. Death of Sir Walter Cope.)
1612. Campden House, Notting Hill (now destroyed).
1612. Cranbourne Manor, Dorset.
1613. Bolsover Castle, Derbyshire.
- 1613-14. Inigo Jones's second journey to Italy, Rome, Venice, Vicenza, etc.
1615. Inigo Jones appointed Surveyor-General of Works.
1614. Second Parliament met and dissolved. Villiers becomes chief favourite. Sir W. Raleigh's expedition to America. 1616. Execution, 1618. Death of Shakespeare, 1616. Born, 1564. Life in London, 1585-1609?

- 1615-21. Houghton House, Bedfordshire.
- 1615-16. Chilham Castle, Kent.
- 1617-23. Chapel, Lincoln's Inn-fields.
- 1618-35. Aston Hall, Warwickshire. (NOTE.—Crewe Hall, Staffordshire, 1615-36, burnt XIXth century, rebuilt by E. M. Barry, had similar character).
- 1619-21. Abbots Hospital, Guildford, Surrey.
1619. Banqueting House, Whitehall, by Inigo Jones.
- 1619-20. Blissing Hall, Norfolk.
- The Thirty Years' War in Germany begins and
1619. James leaves his brother-in-law, King of Bohemia, in the lurch. Starts, 1620, negotiations Spanish Marriage. 1623, Charles at Madrid. 1620, Sailing of the *Mayflower*. Third Parliament, 1621. Bacon (1561-1626) impeached. 1624, Fourth Parliament. War with Spain. Treaty of Marriage, France. Death of James I.
- 1625-49. CHARLES I. TWENTY-FOUR YEARS' REIGN. BORN, 1600; married, 1625, June, Henrietta Maria of France.
1624. Castle Ashby, Inigo Jones Gallery.
1624. Sir Henry Wotton's "Elements of Architecture" published.
1625. Death Orlando Gibbons. Born, 1583. Organist Chapel Royal. Composer.
1628. St. Catherine Cree, Leadenhall-street. Eleven years of greatest stress. No Parliaments. First Parliament, 1625. Failure expedition to Cadiz. 1626, Second Parliament. Sir Dudley Digges and Eliot attempt to impeach Buckingham. 1627, War with France and failure of Buckingham's expedition, 1628, Third Parliament. Petition of Right. Wentworth and Pym. Laud from Bath and Wells to London. Wentworth comes over to King. Buckingham assassinated. 1629, Parliament dissolved.
- 1629-30. Rubens in London. Whitehall ceiling painted.
1630. St. Catherine Cree consecrated by Laud.
- 1631-35. St. John's College, Oxford.
- 1631-33. St. John's Church, Leeds.
- 1632-8. Milton's early poems. To Italy. 1638-40.
1632. Ant. Van Dyck invited to England by Charles I. Died at Blackfriars, 1641. Born 1599, Antwerp.
1635. Burford Priory.
- 1635-41. Clare College, Cambridge, and after the war, Peace France and Spain, 1630. Death Eliot in Tower. 1632. Ship Money, 1634-5 and 7. Hampden Trial. War Scotland, 1639, over liturgy introduced 1637. Fourth Parliament, 1640, and Fifth, "The Long Parliament," began November same year.
1637. Death Ben Jonson. Born, 1573. (?) Retired Court, 1630.
1638. Death of Sir Dudley Digges.
1641. Commission to deface images. May 12, Execution St. James's. October, Irish Rebellion.
1638. Inigo Jones's Design Somerset House Palace, marked "Not taken."
- 1638-40. Kirby Hall, Northamptonshire (first built 1570-2).
1642. January 4, Charles and the Five Members. Leaves London, 10th. Battle of Edgehill, October.
1644. Scots Army crosses border. Marston Moor. 1645, Laud beheaded. New model army. June Naseby. Charles to join Scots, 1646. May. Given up, January, 1647. The Independents supplant Presbyterians. Execution of Charles, January 30, 1649.
- 1649-60. COMMONWEALTH. 1658, September 3, death Cromwell. 1660, May 29, Charles II. enters London.
1649. Sir Christopher Wren admitted Wadham College.
1652. Death of Inigo Jones. Milton's blindness.

DATES NOT ASCERTAINABLE.

- Moyns Park, Essex.
- St. John's, Warwick.
- Stanway Gate House, Gloucester.
- Dukes' House, Bradford-on-Avon.
- Brympton, Somerset.
- Dorton House, Bucks.
- Quenby Hall, Leicester.

HISTORICAL NOTES.

THE Office of Works have renovated the interior arrangements and decoration of the Privy Council Offices, Whitehall. Privy Council Offices, together with the chamber in Downing-street used for the sittings of the Judicial Committee, wherein the original coat of varnish has been removed off the handsome oak panelling and its cornice. The Privy Council Offices form the southern portion of the block erected by Soane in 1824-8 for the Privy Council, Board of Trade, and, in the rear, the Exchequer, on the sites of Nos. 1-9, Whitehall, then occupied by the India Board of Control, and the Board of Trade and Plantations—see Marquand and Leverton's plan of 1804—and of the (later) tennis-court that Robert Long, the King's marker, and Captain Cooke, master of the King's tennis-courts, built for Charles II. in 1662-3, over Lord Sandvich's garden on a parcel of land known as the Brake, and after the model of that at Hampton Court. Soane, in 1825, built the Privy Council Chamber and Boardroom—the former having a coffered ceiling divided into four compartments, with lantern lights and two Scagliola columns carrying an ornamented entablature on both sides; the latter, on the west side of the middle corridor, for the Board of Trade, he decorated after the same style, using some ornamentation from the former Boardroom on that site. In 1846-7 Sir Charles Barry stilted and raised the columns, and otherwise altered Soane's south and east façades, and pulled down the east wall, with its buttresses, of the old tennis-court, but retained its west wall, for his extension up to Dover House. The old tennis-court, which Soane left as he found it, though it is often said that he and Barry encased the buttresses, was the Tudor building whose four angle-turrets are conspicuous features in the views of the XVIIth and XVIIIth centuries. Soane's two elevations, Downing-street and Whitehall, with the old tennis-court, are illustrated in our number of January 7, 1905, after a print by Higham. His models for a much more elaborated treatment of the Privy Council section are in his Museum; his own coloured drawing of the old offices is reproduced in the *Builder* of April 29, 1905.

OUR issue of January 7, 1905, contains a reproduction with the addition on our plate of dotted lines to show the positions of modern buildings—of Fisher's plan, 1680, of Whitehall Palace as in 1670, of which Verelue made an engraving. Fisher's survey plots the site of the Great Hall of the Palace which the London Topographical Society propose to mark, as far as is now possible, in the roadway and pavement of Horse Guards-avenue. The avenue traverses the north side of 'the South Court,' the 'Court' of the map ascribed to Ralph Aggas. A reference to Fisher's plan shows that the Great Hall lay between the chapel and the wine cellar—that is to say next east, to that block of the present Board of Trade Offices in Whitehall-yard which was

formerly known as Cromwell House—see also the later plan in our number cited above. The Great Hall had been part of the York Place, which Wolsey ceded to Henry VIII. in 1529-30, and which the Black Friars sold in 1248 to Walter de Grey, Archbishop of York. Hubert de Burgh, Justiciar of England temp. Henry III., bought it for 140 silver marks of the monks of Westminster and bequeathed it to the Black Friars. The Hall was the scene of the court performance of Shakespeare's *Measure for Measure* on the evening of St. Stephen's Day, 1604. The researches of Mr. Walter L. Spiers, F.R.I.B.A., and Mr. Ernest Law show that the upper part of the Tudor-Gothic hall, 100 ft. by 45 ft., stood where is now a raised recess, reached by steps between the two ranges of buildings, east and west of the Board of Trade, and that the lower end—used for the stage—with the screens beneath the minstrels' gallery, stood in the middle of Horse Guards-avenue. In the stone-built basement of Cromwell House may yet be seen four bays, in two aisles, of the vaulted crypt of the wine cellar, whereof Sydney Smirke's description and measured drawings, January 23, 1832, are in *Archæologia*, Vol. xii. Smirke ascertained that the then floor level was 5 ft. 4 in. above the old level. One of the two shields in the spandrels of the doorway bears, *per pale*, the Cardinal's own coat-arms and those formerly borne by the See of York, as on a boss in the vaulting of Christchurch gate, Canterbury (1617).

At a recent meeting of the Society for Promoting Roman Studies Mr. R. H. Forster described the results of the year's excavations. The most important discovery is that of a stone, nearly 6 ft. long, inscribed, the first two words being defaced: "SOLI INVICTO VEXILLATIO LEG. VI. VIC. P.P.F. SVB CVRA SEX CALPVRNI AGRICOLAE LEG. AVO. PR. PR." Calpurnius Agricola, it appears, was Governor of Britain in A.D. 162-5, and led the Sixth Legion's *vexillatio*, as stationed in York, against the Brigantes. It is conjectured that the "Soli Invicto" referred to Heliogabalus

On the crest of East-hill, Wandsworth, and behind the Council Offices at the parting of the two roads to Clapham Common and Battersea Rise, is a small plot of parish burial-ground, known as "Mount Nod." Therein were buried many of the French Huguenots, who, after the revocation of the Edict of Nantes, in 1685, found refuge in the town of Wandsworth, where they successfully plied their native industries, chiefly as hat-makers (including cardinals' hats), and dyers, and calico and silk printers. They worshipped in the (old) French chapel in the High-street, opposite to the parish church, originally built in 1573 by a colony of Flemings, whom Aubrey describes as workers in brass. The chapel gave way in 1882 to the Congregationalists' Memorial Hall. A memorial inscribed with the names of forty Huguenot families has just been erected in the graveyard on East-hill, and unveiled by Mr. Reginald St. Aubyn Roumieu, A.R.I.B.A., President of the Huguenot Society of London. In the Mount Nod was buried, 1720, Peter Paggen, who built the adjacent (old) Manor House on St. John's-hill, after designs attributed to Wren. Of that house, a home for many years of the Princess, afterwards Queen, Anne, there are illustrations in the *Builder* of August 24, 1889.

DURING the course of excavations at Abusir some metal waterpipes embedded in mortar were discovered in the pyramid of King Sahura, built about 2500 B.C. Specimens of this mortar at the age of nearly 4,500 years were analysed, with the result that it was found to contain 45.54 per cent. of calcium sulphate, 41.36 per cent. of calcium carbonate, and 13.10 per cent. of insoluble matter. These proportions agree fairly well with those given by previous analyses of ancient Egyptian mortars.

THE BUILDING TRADE.

THE LONDON CHAMBER OF COMMERCE AND LABOUR UNREST.

THE London Chamber of Commerce have issued a Report of the Special Committee on Trade Disputes, from which it appears that the Committee were appointed to inquire into and report upon "the whole question of the causes and effects of the recent labour unrest and the proper remedies."

The data considered by the Committee were certain resolutions passed by the Council, the General Purposes Committee, and certain of the Trade Sections of the Chamber, and, in addition to the above, certain questions were submitted to members of the Chamber and of certain other bodies, which questions are annexed to the Report. Eight hundred and thirty-one answers were received to these questions, relating to 256,650 workpeople. Certain affiliated and other associations were also consulted.

The Report states that the causes alleged for labour unrest may be divided into four heads:—(a) Social, (b) economic, (c) legislative, and (d) administrative. On these causes we may quote the observations of the Committee:—The root causes of labour unrest appear to be mainly economic. The increased cost of living, the stress of competition at home and abroad, the increasing burden of Imperial and local taxation, and the tendency of modern legislation (intended to promote the interests of the community, but usually involving large additional expenditure) have intensified the difficulties of employers of labour, which in turn must react on wage-earners, who are now feeling the cumulative effect of these burdens. The interdependence of employer and employee, often asserted, has been abundantly demonstrated, and the labour unrest is consequently in the main the outcome of forces affecting both, and of which each must bear a proportionate burden."

From the above statement it would, however, appear that the root causes of labour unrest might more accurately be attributed to both economic and legislative causes.

As to the effects of labour unrest the Committee found the following to be hindrances to employment:—

(I.) Intimidation of employees by workmen or others unconnected with the employer's business; (II.) peaceful picketing; and (III.) absence of proper police protection.

The chief interest in the Report naturally centres in the recommendations of the Committee, after a consideration of the suggestions made to them, of the remedies to be applied.

The Committee, apart from any questions relating to the methods by which employers individually or collectively may determine to carry on their own business, consider that certain remedies may be provided by legislation, and they recommend:—

I. The repeal of sects. 2, 3, and 4 of the Trade Disputes Act.

II. The enlargement of the powers of voluntary conciliation and arbitration under the Conciliation Act, 1896, so as to provide for the enforcement of agreements and awards, and the prevention of lock-outs and strikes being instituted without due notice.

III. That effective provision be made for the maintenance of law and order with legislative action to secure the freedom of labour and commerce.

IV. The repeal of the statutory monopoly enjoyed by certain watermen and lightermen on the River Thames.

The sections of the Trade Disputes Act above referred to are those which legalise peaceful picketing, which render acts done by a person in contemplation or furtherance of a trade dispute not actionable even if they induce some other person to break a contract of employment or interfere with his trade, business, or employment, or with his right to dispose of his capital or labour as he wills, and which prohibit trade unions from being held liable in actions for tort.

The above is only a summary of some of the

main features of the Report, and the recommendations will meet with the approval of a large section of the community; but in granting trade unions a privileged position outside the law a step has been taken by the legislature which will not easily be retraced.

Non-union men are as interested as employers can be in securing freedom for labour, and in this connexion it is to be observed that the Trade Sections are practically unanimous in calling for an inquiry into the working of the Trade Disputes Act, whilst many of them call attention to the systematised efforts that are being made by the unions to compel employers to employ none but union men.

BUILDING ACT REFORM.

THE Building Acts Committee of the London County Council has again had under consideration the question as to an arrangement being agreed to between the County Council and the Borough Councils with regard to buildings and structures to be dealt with by the respective authorities under Part VII. of the London Building Act. In a letter to the Borough Councils, the London County Council's Superintending Architect intimates that experience since the subject was last discussed has confirmed that Committee in the opinion that it would be to the public advantage if an arrangement could be arrived at to define which buildings and structures should be dealt with by the London County Council and the Borough Councils, and inquiring whether the Borough Engineer would be prepared to advise this Council to agree to an arrangement under which such Council would deal, under sect. 84 of the said Act, with buildings within the undermentioned limits, leaving buildings not complying with such conditions to be dealt with by the London County Council:—

Summer houses, tool sheds, coal or wood sheds, fowl houses and runs, pigeon houses, dog kennels, perambulator sheds, cycle sheds, motor car sheds, and other similar structures—

- (a) Not exceeding in area 64 sq. ft.;
- (b) Not exceeding in height 7 ft. in any part measured from the level of the ground to the underside of the eaves or roof plate;
- (c) Distant at least 5 ft.—(i.) from any street, (ii.) from any other building or structure unless there be a non-perforated wall separating the proposed structure for the whole of its length and height from such other building or structure;
- (d) Not having therein any stove, flue, fire-place, hot-air pipe, hot-water pipe, or other apparatus for warming or ventilating the same;
- (e) Not extending in any part thereof within the prescribed distance from the centre of the roadway of any street or way; and
- (f) Not projecting in any part thereof beyond the general line of building in any street or way.

THE PLUMBERS' COMPANY: ANNUAL DINNER.

THE annual dinner of the Worshipful Company of Plumbers was held at De Keyser's Royal Hotel, Victoria-embankment, on Thursday last week, the Rt. Hon. Sir T. Vezev Strong, K.C.V.O., Master on the Company, presiding, supported by the Right Hon. the Lord Mayor, Sir Thomas B. Crosby, M.D., Sir Thomas Barlow, Bart., K.C.V.O., Sir Hugh Owen, Sir Shirley Murphy, Sir B. A. Whitelegge, Dr. A. E. Newsholme (Medical Officer, Local Government Board), Mr. Leonard Stokes (President of the Royal Institute of British Architects), Mr. E. B. Barnard (Chairman, Metropolitan Water Board), Mr. Stanley Machin (Chairman of the London Chamber of Commerce), Professor W. R. Smith (Principal, Royal Institute of Public Health), Professor Bostock Hill (President, Incorporated Society of Medical Officers of Health), Mr. H. Percy Boulnois (Chairman, Royal Sanitary Institute), Dr. F. J. Waldo, Sir Philip Magnus, Mr. C. Hudson (Renter Warden), Mr. Edmund Kirby, and Mr. W. R. E. Coles (the Clerk).

The loyal toasts having been proposed by the Chairman and honoured,

Sir Thomas Barlow, President of the Royal College of Physicians, proposed the toast of "The Lord Mayor, the Corporation, and the Sheriffs of the City of London," the Lord Mayor and Mr. Sheriff G. Briggs responding.

Mr. Leonard Stokes

then proposed the toast of "The Plumbers' Company." He said that the profession to which he belonged owed a great debt of gratitude to the Company. As an architect he had had great dread of the plumber; one was afraid that the lead he used was not of the right thickness, or the pipe not of the proper diameter. There could be no doubt that architects owed a great deal to plumbers, and particularly to the Plumbers' Company, which had done so much to raise the technical skill and knowledge of the trade. Without the work of the Company plumbers would not be half as efficient as they are.

The Master,

in reply said that, although, strictly speaking, he was not a plumber, he was one by grace, and could, from records and upon advice, speak with some authority of the matter which called them together that night. The Plumbers' Company dated back to 1365. Actuated by old traditions, it endeavoured to apply a new significance to old principles. It endeavoured humbly to work in co-operation with the great professions represented there that night. The Guild stood primarily for teaching by a modern adaptation of the old system of apprenticeship, believing, as it did, that knowledge was to a large extent accumulative. The ordinary citizen, when employing a plumber, could not distinguish between good and bad work unless a Company such as theirs came to his aid, and by issuing diplomas and certificates and by giving marks and registrations clearly afforded the means of identifying efficient work. They believed that no system had yet been invented which ought to supersede the old time-honoured system of apprenticeship. Provision was made for the technical and practical instruction of apprentices and young men entering the trade, their examination, and the registration of qualified men who were made responsible to the Company for the efficiency of their work. This system had been greatly strengthened by the marking of Registered plumbers' work. The Board of Trade, under the powers enabling the Board to allow the registration of special trade marks where the Board deem it to be to the public advantage, gave the grant to the Plumbers' Company the registration of a standardisation mark to be used in connexion with the work of Registered plumbers. To ensure the efficiency of the domestic fittings of our sanitary and water services the Board of Trade have also granted the registration of a standardisation mark for fittings of adequate quality to be used as far as possible in connexion with the work of Registered plumbers. This mark is granted to a Joint Committee of Water Authorities to be used under regulations framed by the Board of Trade. The principal trade marks to distinguish proprietary interests in various articles had long been recognised, and it had no doubt gone far to secure the fair interests of producers and consumers. But the Act of 1905 extended this principle in a most beneficial direction by enabling the Board of Trade to allow marks to distinguish articles possessing certain characteristics which any one could supply to the public so long as the article complied with the definite standard of quality indicated by the mark. They might well congratulate the Board of Trade alike on this valuable addition to their statutory powers and their early application of those powers to the protection of the public in the important matters of plumbers' work and of water services. In no case could such protection be more needed. Where considerations of health and the importance of avoiding the great waste and contamination of water are concerned efficiency must be regarded as the first consideration.

The Master also suitably proposed the toast of "Our Guests," coupled with the name of Dr. Bostock Hill, who replied, and the proceedings terminated.

GOVERNMENT CONTRACTS.

The following tenders have been accepted during the past month by the Government Departments named:—*Admiralty, Works Department*.—Works services: Alterations and additions to torpedo store, Portsmouth, and extension of gun battery, Whale Island, Portsmouth.—Mr. S. Salter, York-street, Southampton.—*War Office*.—Works services: Alterations and additions to gun-compressing house, Devonport.—Messrs. J. Lysaght, Ltd., St. Vincent's Iron-works, Bristol; improving accommodation at Woodbridge Haven Coastguard Station.—Mr. F. Bennett, New-street Works, Ipswich; penstocks for new lock and dock, Portsmouth.—Messrs. Stothert & Pitt, Ltd., Bath; steelwork for gun-mounting shop, Haulbowline.—Messrs. J. Westwood & Co., Napier-yard, Millwall, E.; steel tanks for fuel oil storage, Whessoe Foundry Company, Ltd., Darlington. *War Office*.—Works services: Additions to hospital, Hilsa.—Messrs. G. Munday & Sons, 9, Botolph-claydon, E.C.; alterations and additions to married quarters, Traloe.—Mr. P. Murphy, Tulse; annexes to married quarters, Bulford Camp. Mr. F. Burton, Durrington, near Salisbury; erection of officers' mess, etc., Maryhill Barracks, Glasgow.—Messrs. W. Finlayson & Sons, Pilrig Works, Balfour-street, Leith; erection of riding school, Duke of York's Headquarters, Chelsea.—Messrs. E. A. Roome & Co., 36, Basinghall-street, E.C.; extension of dirigible shed, etc., Army aircraft factory, South Farnborough.—Messrs. P. Morton & Co., Ltd., Hamilton Ironworks, Garston, Liverpool; foundations of barrack block, etc., new infantry barracks, Redford.—Messrs. R. C. Brebner & Co., 9, South-street, Andrews-street, Edinburgh; installation of electric light, Quebec Barracks, Bordon.—Messrs. J. B. Saunders & Co., Ltd., 91, York-street, Westminster, S.W.; periodical works services at Taunton.—Messrs. R. W. Pitcher & Son, 6, Marlborough-street, Devonport; provision of Earface Drains, Bournemouth Camp.—Mr. H. Berry, Union-road, Colchester. *Crown Agents for the Colonies*: Bridgework.—Horsley Company, Ltd., Tipton, Staffs.; cement.—Associated Portland Cement Manufacturers (1900), Ltd., 3, Lloyd's avenue, E.C.; Barron's Cement Company, Ltd., 6, Lloyd's avenue, E.C.; Messrs. B. J. Johnson & Co., 4, Eastcheap, E.C.; Messrs. Martin, Earle & Co., Ltd., 139, Queen Victoria-street, E.C.; Messrs. Peters Brothers, 72, Victoria-street, S.W. *Office of Works*: Builders' work, post-office extension, Barrow-in-Furness.—Mr. J. Neal, 170, Ainslie-street, Barrow-in-Furness; finishings (second contract), Block C, Birmingham Telegraph Stores.—Messrs. Richard Fenwick, Ltd., William Edward-street, Birmingham; extension to Glasgow Head Post-office.—Messrs. G. Lawton & Sons, Watt-street, Maryhill, Glasgow; erection of Manchester Post-office.—Mr. C. G. Percival, Newcastle-street, Manchester; reinforced concrete work at Westminster new Public Offices.—Mr. F. G. Minter, Ferry Works, Putney, S.W.; heating, Edinburgh Roseburn Post-office stores.—Messrs. C. Ritchie & Co., 1, Torphichen-street, Edinburgh; National Gallery.—The Midland Heating and Ventilating Company, Ltd., 82, Upper Trinity-street, Birmingham; Western Central District Post-office.—Messrs. Cannon & Jefford, Stanbury road, Peckham, S.E.; roads at Imperial Institute.—Messrs. J. Mowlem & Co., Ltd., Grosvenor Wharf, Westminster, S.W.; wood-block flooring, South-Eastern District Post-office and National Gallery of Scotland.—The Acme Flooring and Paving Company, (1904), Ltd., Gainsborough road, Victoria Park, E.; General Post Office: laying of pipes and sykes ducts in Hull.—Messrs. Greig & Matthews, 35, Queen Victoria-street, E.C. *Metropolitan Police*: Erection of police-court at Woolwich.—Messrs. Patman & Fotheringham, 100 and 102, Theobald's-road, W.C. *Commissioners of Public Works, Ireland*: Alterations to Belfast Central Post Office.—Messrs. T. & W. Lowry, 210, Woodstock-road, Belfast; erection of land registry offices, Dublin.—Messrs. J. & R. Thompson, Ltd., Phillipsburgh-avenue, Fairview, Dublin.

SUGGESTED STANDARDISATION OF COPPER TUBES.

A project has been set on foot in Birmingham, says the *Birmingham Daily Mail*, the adoption of which, it is claimed, will be to the general advantage. It is the standardisation of screwed copper tubes. The Birmingham and District Branch of the National Association of Master Heating and Domestic Engineers are the pioneers in the matter, and they have drawn up a scale of tables of dimensions which will be submitted for consideration at a meeting of the Joint Committee of the National Association, and of the Institution of Heating and Ventilation Engineers (No. 12, Great James-street, Bedford-row, London, W.C.). Should the suggested

tables, which are of three grades—namely, for light, medium, and heavy work—be adopted, they will be forwarded on to the National Engineering Standards Committee. Should that Committee adopt them, either in their entirety or with alterations, they will then become in general use, but in the meantime it may be mentioned that the Birmingham Branch of the National Association of Master Heating and Domestic Engineers has determined to make use of them and test their practical value, though no apprehension of their general utility is felt. They have been carefully thought out and drawn up on lines nearly as possible to the standards now applicable to iron tubing, and after consultation with engineers in London, Newcastle-on-Tyne, Manchester, Liverpool, Bristol, and Leicester, representatives from which are members of the Joint Committee. Owing to the softness of the water now supplied to many of our important cities—and Birmingham is one of them—copper tubes are being much more extensively used in the installation of hot-water supplies than formerly, for the reason that the metal is not as susceptible to the action of the water as is iron. Copper will withstand the action of the water, whereas iron, it is alleged, is subject to perforation by the soft water, though old-time iron pipes are protected by the lining of deposits made when the water supplied was hard. Were copper tubes standardised, the householder, it is stated, would be able to have his repairs promptly and speedily carried out. Besides, manufacturers would be able to keep in stock the different types of tubes all round in accordance with the standards laid down. It is impossible to set out in detail the particulars of the various standards suggested in the three tables mentioned previously, copies of which can be purchased from Mr. J. Durie Kerr, the Secretary of the Birmingham Branch of the Association, at 5, Waterloo-street, but it will suffice to say that they embrace the many and various sizes, strengths, and weights of copper tubes used for domestic and engineering purposes.

LONDON MASTER BUILDERS' ASSOCIATION.

The Council met on December 14, when the President (Mr. G. Bird Godson) occupied the chair.

After receiving and approving the Finance Committee's report the Council proceeded to consider various trade matters.—The National Insurance Bill, the Trade Disputes Act (1906), National Federation communications, and the next issue of the Association Handbook and Diary.

It was decided to hold the annual dinner on Thursday, February 22 next, and the annual general meeting of the Association on the following Thursday (February 29).

Messrs. The Patent Rapid Scaffold Tie Company, Ltd., 124, Victoria-street, Westminster, S.W., was elected an associate member, and the following were nominated as ordinary members:—

Mr. B. E. Nightingale, Albert Works, Albert-embankment, S.E.

Messrs. E. A. Roome & Co., 36, Basinghall-street, E.C.

Messrs. William F. Blay, Ltd., Dartford, Kent.

Messrs. Lole & Co., 12a, Trafalgar-square, Chelsea, S.W.

Messrs. F. & F. J. Wood, 64, Cleveland-street, Mile End, E.

GENERAL BUILDING NEWS.

NEW CHURCH AT PARKSTONE.

The "Church of the Transfiguration" was dedicated last week, and has been erected at a cost of about 800*l*. The architect for the work was Mr. H. Kendall, M.S.A., of Poole, and the seating accommodation of the church is for 240 people.

EXTENSIONS TO CONSETT TECHNICAL INSTITUTE.

The extensions to this institute have been carried out at a cost of about 9,500*l*. from the designs of Messrs. Oliver, Lemon, & Sons, of Newcastle. The new buildings include a large assembly hall and new art-room.

NEW INSTITUTE, KELVEDON.

The plans for this new institute, which was opened last week, were prepared by Mr. J. W. Start, F.S.I., of Colchester. The cost of the building is about 1,050*l*, and the contract was carried out by Messrs. Spalding & Sons, of Norwich.

PROPOSED LIBRARY, BENNEZER, NEAR CARNARVON.

Plans for proposed Carnegie Library have been prepared by Mr. Albert H. Fennell, architect, Chester-le-Street, Co. Durham. It is to

be built of stone in Renaissance style to cost about 2,000*l*.

UNION CASTLE MAIL STEAMSHIP COMPANY'S OFFICES, SOUTHAMPTON.

Extensive alterations have been recently carried out in this building, which was formerly the Southampton Custom House, the buildings having been acquired some time ago by the Union Castle Steamship Company as their Southampton office. The necessities of business demanded considerable increase of accommodation, and with this in view the alterations and additions now completed were undertaken under the direction of the company's local architect, Mr. John H. Blizard, of Messrs. Lemon & Blizard, F.F.R.I.B.A. All the inside partitions of the old building on the ground floor have been removed, and the whole of the area thrown into one large office. The frontage of the new extension was carried out from a design, and details supplied by the company's London architect, Mr. William Flockhart, F.R.I.B.A., with whom Mr. Blizard has been in consultation throughout the course of the works. The heating, ventilation, and electric lighting has been carried out by Messrs. J. Davis & Co., electricians and hot-water engineers, of Southampton—the electric lighting has been done under the direct supervision of Mr. R. A. Munn, the company's superintendent engineer, of Southampton. The heating is on the low-pressure hot-water system with expansion pipes open to the atmosphere. The boiler and radiators are of the sectional type; the temperature is based at 60 deg. Fahr. internal, with the temperature of 30 deg. Fahr. external, the air being changed four times per hour, and in order to accomplish this a 36-in. Blackman's patent exhaust fan is fitted in the roof with an upcast shaft, and is driven from the 200-volt power mains in building; there are also two electric fans provided for lavatory ventilation. The electric lighting is at a pressure of 260 volts direct current from the Corporation's mains. The whole of the wiring is enclosed in solid drawn enamelled steel conduit with screwed joints.

NEW PARISH ROOM, WICKHAM BISHOPS.

This building has been erected from plans prepared by Mr. C. W. Cockham, at an estimated cost of 440*l*. The contract was carried out by Messrs. Hutton & Son, of Birch.

ASHFORD PICTURE PALACE

This new cinematograph hall has been erected from the designs of Mr. A. E. Lacey, A.R.I.B.A., of Ashford, and the building provides accommodation for about 800 people. Besides the auditorium, which has a sloping floor, there is a spacious gallery, including a ladies' room. The contract was carried out by Mr. S. H. Howland, and the electric lighting is by Messrs. Clark & Co.

TRADE NEWS.

The British Thomson-Houston Company, Ltd., manufacturers of the Mazda lamp, are taking steps to bring about a better knowledge of the principles of correct illumination, and have established an Illuminating Engineering Department, the main purpose of which is to give expert advice and guidance on all matters relating to lighting. A striking example of interior lighting is to be seen at the company's London office. The lighting is wholly reflected, no naked lamps being visible. The light is thrown upwards from reflectors enclosed in white earthenware bowls, and reflected from the ceiling. The illumination is shadowless and exactly uniform throughout, there are no dark corners, the effect upon the eyesight is most grateful and refreshing, and there is a complete absence of any sense of eye-strain.

The great west window of the Church of St. Andrew, Boscombe, has just been filled with stained glass by Messrs. Percy Bacon & Brothers, of London, who recently erected the large east window. The window consists of six lights and tracery, and contains a single figure in each light. Reading from left to right, the figures depicted are:—Florence Nightingale, St. Luke, Sister Dora, Charles Kingsley, St. James, and the Earl of Shaftesbury, each with a suitable emblem in a panel below.—A large two-light window has just been placed in the chancel of All Saints' Church, Liverpool, representing the Nativity; the window was executed by Messrs. Percy Bacon & Brothers, of London.

Under the direction of Messrs. Craig, Barr, & Cook, architects, Paisley, the "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the Infirmary Children's School, Paisley.

The Church of England School at Broughton, Hants, has recently been fitted with three of D. O. Boyd's hygienic warm-air ventilating school grates, supplied by Messrs. O'Brien,

Thomas & Co., Upper Thames-street, London, and Excelsior Works, South Bermondsey.

The contract for the construction of a new bridge to replace the existing Pont des Anglais, over that branch of the River Nile at Cairo, known as the Bahr-el-Aama, has been secured by the Cleveland Bridge and Engineering Company, Ltd., of Darlington, at a contract price of £60,000.

The new Council schools, Macclesfield, have been supplied with Shorland's warm-air ventilating patent Manchester grates by Messrs. E. H. Shorland & Brother, Ltd., of Fulsforth, Macclesfield.

WARING-WHITE BUILDING COMPANY, LTD.

This building company, promoted by Messrs. Waring & Gillows, Ltd., and Messrs. J. G. White & Co., Ltd., was incorporated on May 21, 1904, with a nominal capital of 100,000*l.*, more particularly to acquire the benefit of two building contracts which Messrs. Waring & Gillows had entered into in respect of the Ritz Hotel and the pulling down, for recreation, of No. 4, Cockspur-street, and Nos. 18 and 19, Pall-mall East. In 1906 a new company, "Messrs. Waring & White (1906), Ltd.," now the Building Construction Company, Ltd., was registered with a nominal capital of 250,000*l.*, to take over the business. At a meeting of creditors and contributories, held under a winding-up order made against the Waring-White Building Company, Ltd., of Cockspur-street, a statement of affairs was furnished showing unsecured debts of 982*l.* and an estimated surplus in assets of 46,614*l.*

LONDON BUILDING TRADE WAGES.

The various carpenters' and joiners' societies and furnishing trade and cabinetmakers' societies in London have recently made a number of important alterations in their working rules for the London district, and notice of them has been sent to the London Master Builders' Association. The most important of the proposed new rules stipulate for an increase of 1*sd.* an hour in wages, bringing the minimum rate to 1*s.* an hour; a reduction of the working hours in summer from fifty to forty-seven each week, the winter hours to remain at forty-four each week as at present; and double payment for overtime. Six months' notice has to be given to the master builders to terminate existing rules, and it is suggested the new proposals should come into operation on June 8, 1912.

THE GRINNELL SPRINKLER AND FIRE ALARM.

An example of the efficiency and utility of the Grinnell sprinkler and fire alarm has been afforded by the fire which occurred on December 6 at Gilcomston Mills, Aberdeen. A fire originated in the exhaust house of Husk Mill. There was an installation of sprinklers throughout the mills, and ten of them were immediately put in operation by the outbreak. The alarm gong was also automatically set ringing. The protection given by the sprinkler installation was such that very trifling damage was caused by the outbreak, and the owners of the mill, Messrs. John Strachan & Sons, have written to Messrs. Mather & Platt stating that their "high opinion of the Grinnell system has been further strengthened by this practical demonstration of its reliability and efficiency."

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London County Council, the following applications under the London Building Acts were dealt with, the names of the applicants being given in parentheses:—

Lines of Frontage and Projections.

Clapham.—School building with a projecting hood at "Springfield," on the eastern side of Clarendon-road, Clapham (Mr. Leonard Stokes).—Consent.

Finsbury, Central.—Projecting one-story shop in front of No. 219, Goswell-road, Finsbury (Mr. L. G. Dyke for Mr. R. W. Coan).—Consent.

Hackney, North.—External iron staircase, next to Northfield-road, at the Worshipful Company of Skinners' Middle School for Girls, Stamford-hill, Hackney (Mr. W. Campbell Jones).—Consent.

Kensington, South.—Erection of two one-story shops between Nos. 204 and 206, Holland-road, Shepherd's Bush (Mr. A. E. Parsons for Mr. J. Allen).—Consent.

Kensington, South.—Sign at Nos. 8 and 9, Ashburn-mews, Kensington (Messrs. Rawlings Brothers, Ltd.).—Consent.

Kensington, South.—Erection of an addition at No. 53, Princes-gate, Kensington (Messrs. Bull & Esdaile, Ltd.).—Consent.

St. Pancras, North.—Addition at the "Gem Picture Palace," on the north-western side of Wellesley-place, St. Pancras (Mr. J. Codrington for Mr. A. Lett).—Refused.

Strand.—Erection of three illuminated signs at the first floor and the retention of a sign at the ground floor of No. 3, Piccadilly (Messrs. Moreton Phillips & Son for Mrs. R. Freeman).—Refused.

Wandsworth.—Erection of an addition to an existing shop at No. 40, Replingham-road, Southfields (Mr. E. S. Prior).—Consent.

Woolwich.—One-story shop in front of No. 48, Plumstead Common-road, Woolwich (Mr. N. Hoskins for Mr. A. G. Anderson).—Refused.

Width of Way.

Whitechapel.—Erection of a one-story building on the western side of Milward-street (late Cotton-street), Whitechapel, southward of No. 13, Milward-street (Mr. J. G. Oudley for the Governors of the London Hospital).—Consent.

Width of Way, Lines of Frontage, and Construction.

Limehouse.—External reinforced concrete gangways over the public way of Glamis-road, Shadwell, to connect two blocks of the premises of Messrs. Meredith & Drew, Ltd. (Mr. W. G. Drew for Messrs. Meredith & Drew, Ltd.).—Refused.

Strand.—Iron and glass shelter at the entrance to the Coventry and Gambrianus Restaurant, Nos. 13 and 15, Wardour-street, Soho (Messrs. Emden, Egan, & Co. for Mr. R. Baker).—Consent.

Space at Rear and Alteration of Buildings.

Clapham.—Erection of a bathroom addition at the rear of No. 230, Clapham-road, Clapham (Mr. A. C. Nottley for Mr. R. A. Nottley).—Consent.

Formation of Streets.

Wandsworth.—Formation or laying-out of new streets for carriage traffic out of the western side of Putney-hill and the southern side of Chartist-avenue, Putney (Mr. J. C. Radford for Lord Westbury).—Consent.

Uniting of Buildings.

City of London.—Alterations at No. 266, Bishopsgate, City (Mr. H. Knight).—Consent.

City of London.—Opening in the party wall between Nos. 71 and 81, Queen Victoria-street, City (Mr. R. E. Crossland for the Investment Company, Ltd.).—Consent.

City of London.—Uniting of Nos. 69 and 70, Wood-street, City (Messrs. Harris & Sheldon, Ltd.).—Refused.

Holborn.—Openings in the party wall between Nos. 22 and 24, Hutton-wall, Holborn, at the ground and first-floor levels (Mr. T. Coles for the Educational Supply Association, Ltd.).—Consent.

Kensington, North.—Formation of three openings in the party wall between Nos. 101-103 and No. 135, Ladbroke-grove, Notting Hill, at the ground-floor level (Prudential Assurance Company, Ltd.).—Consent.

The recommendations marked * are contrary to the views of the Metropolitan Borough Councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERYSTWYTH.—About sixty houses; Mr. Rees Jones, Surveyor, Aberystwyth.

Arbroath.—Additions and alterations to infirmary (8,000*l.*); Dr. Mackintosh, Architect, Western Infirmary, Glasgow.

Aughton (near Ormskirk).—Restoration of parish church (2,500*l.*); Vicar, Aughton.

Blackhills.—Premises for the Station Town Co-operative Society.

Blackpool.—Alterations to Indian Pavilion, North Pier; Mr. F. T. Waddington, architect, 10, Birley-street, Blackpool.

Bonington.—Restoration of flour mills for the North British Railway Company.

Bradford.—Sunday-schools (3,500*l.*); Trustees, Quay Primitive Methodist Church, Bradford.

Dewsbury.—Temporary fire-station, Railway-street (1,500*l.*); Mr. H. Dearden, Surveyor, Dewsbury Town Council.

Garndiffaith.—One hundred and fifty houses; Mr. W. R. Jones, Surveyor, Abersychan Urban District Council.

Garvock.—Laundry, Halibath-road (2,500*l.*); Mr. R. H. Motion, architect, Dunfermline.

Hamilton.—Municipal offices adjoining Carnegie Library, Cadzow-street (2,500*l.*); Mr. W. H. Purdie, Surveyor, Hamilton Town Council.

Ipswich.—Church: Rev. Tyndeman Chilvers, Bethesda Baptist Church, Ipswich.

Laisterdyke.—Enlargement of Sunday-school and erection of parochial hall; Vicar, St. Mary's Church, Laisterdyke.

* See also our list of Competitions, Contracts, etc., on another page.

Leeds.—Boot factory, Woodhouse Carr, for the Co-operative Wholesale Society, Manchester.

Little Irchester.—Alterations and additions to mill for Messrs. Whitworth Brothers.

Llanelli.—Proposed club, near post-office (3,000*l.*); Secretary, Liberal Club, Llanelli.

Lowestoft.—Plans have been passed for three houses, May-road, for Mr. A. E. Clarke; also for workshops, London-road South, for Messrs. Hailey & Sons.

Ludlow.—Drill-hall, riding school, etc., Cattle Market, for the Shropshire Territorial Force Association.

Maldon.—Police station (2,485*l.*); Messrs. W. Gibson & Co., builders, Handon-lane, Finchley, N.W.

March.—Picture palace, shops, and offices, Broad-street, for the Provincial Electric Palaces Syndicate.

Milton.—School, Wimborne-road; Messrs. J. J. Bascombe & H. E. Curtis, Joint Secretaries, Education Committee, Portsmouth Town Council.

Moston (Manchester).—Church (2,000*l.*); Rev. John Fairclough, St. George's Presbyterian Church, Moston, Manchester.

Newcastle.—School, junction of Scotswood-road and George's-road, also school, Rye-hill; Mr. A. C. Coffin, Secretary, Education Committee, Newcastle Town Council.

Nowchapel.—Completion of St. James's Church (1,000*l.*); Messrs. Watkins & Adams, architects, Burslem.

Northfleet.—Cinematograph theatre, High-street, for the Northfleet Cinema Company.

Northwich.—Baths; Mr. J. E. Franck, architect, 11, Pancras-lane, London, E.C.

Oxford.—New Ruskin College, adjoining Worcester College (9,253*l.*); Messrs. R. H. Kingler & Sons, builders, 35, Queen-street, Oxford.

Pollokshaws.—Proposed three tenements, Factory-street; Mr. D. Burns, Surveyor, Pollokshaws Town Council.

Poole.—Additions to Alderney Hospital (850*l.*); Mr. F. Smith, builder, Stratford.

Quorn (near Loughborough).—Additions to premises for Messrs. M. Wright & Sons.

Ravensthorpe (Dewsbury).—Extension to brass works, John-street, for Messrs. E. Richardson & Co.

Reddish.—Additions to Reddish Vale Print Works for the Calico Printers' Association, Ltd.

St. Neots.—Alterations to Wesleyan School (1,555*l.*); Messrs. G. Wrycroft & Sons, builders, Huntingdon-street, St. Neots.

Sheffield.—Church (5,000*l.*); Trustees, St. Catherine's Roman Catholic Church, Sheffield.

Shettleston.—Offices for the North British Bottle Manufacturing Company, Ltd.

Southampton.—The following plans have been passed:—Additions to hall, Bond-street; Messrs. Jenkins & Son.

Southampton.—Alterations and additions to the Ambrose Hotel, St. Mary's-road; Mr. E. W. Young, jun. Shop and motor garage, Portsmouth-road; Mr. W. H. Masters.

Four houses, Nile-road; Messrs. Lemon & Blizard. Four houses, Church-lane and Newton and Wellington roads; Mr. F. Lowe.

Hill-lane and Newlands-avenue, also additions to "Newlands," Lumsden-avenue; Messrs. Jurd & Sanders.

Four houses, Amphill-road; Messrs. Mackintosh Brothers. Six houses, Howard's-grove; Mr. E. Soper. Plans have been lodged as follows:—Additions to the Bellemoor Inn, Bellemoor-road; Mr. C. H. Brightbill. Five houses, Russell-place, and fifteen houses, Abbott's-way; Mr. J. Smith. Rebuilding premises, Above Bar-street; Mr. G. E. Smith.

Southborough.—Almshouses, junction of Yew Tree and London roads, for the Gallard Charities.

Southend.—Completion of All Saints' Church and erection of mission-hall and parish institute (20,000*l.*); Vicar, All Saints' Church, Southend.

Swansea.—Shop frontages, Oxford and Union streets (about 10,000*l.*); Mr. Glendinning Moxham, architect, Swansea.

Walker.—Enlargement of St. Anthony's Roman Catholic School (230 extra places); the Managers.

Warrington.—Extensions to Bolton County School (5,375*l.*); Mr. Harry Fairclough, builder, Fairclough-avenue, Howley, Warrington.

Wells (Somerset).—Alterations to Wells Blue Schools (3,475*l.*); the Governors.

Woodside (Croydon).—Alterations and additions to St. Luke's Parish Church; Rev. Francis Brown, Vicar, Woodside.

Yarmouth (Great).—Extensions to police and fire stations, etc. (3,900*l.*); Mr. J. W. Cockrill, architect, Town Hall, Great Yarmouth.

Houses, Harley-road; Mr. J. S. Read. Plans have been passed for four houses, Suffolk-road, Gorleston, for Mr. R. Wales; and for additions to premises, Southgate-road, for the Yarmouth Stores.

MAGAZINES AND REVIEWS.

The first article in the *Art Journal* of architectural interest is that describing and illustrating Amerongen, the seat of the first Earl of Athlone. Like other Dutch castles, Amerongen has its moat, and is entered through a gated archway and a dignified forecourt. The interesting double bridge is the only means of access from the forecourt to the house. The architect was Cornelius van Rietvelt, who had been assistant to Van Kampen, the builder of the Town Hall (afterwards the Palace) of Amsterdam, "which is so persistently described by admiring travellers as the eighth wonder of the world." The building has somewhat the appearance of an English manor house, and is an interesting example of domestic architecture and decoration. Reproductions are given also of the late XVth-century furniture at Drayton, Northants, and under the title of "Artists as Decorators of English Furniture" reference is made to Angelica Kauffmann, R.A., who was employed by Robert Adam. "The object of Adam from about 1770 was to bring furniture into complete harmony with his mural decoration, and his furniture, painted in light colours and decorated with painted panels, has its exact counterpart in its stucco walls and ceilings inset with compositions by Zucchi (Kauffmann) and other artists. The illustrations of staircases at Drayton, Cassiobury, and elsewhere are of considerable interest. They seem to be given as supplementary to the ones in Mr. Godfrey's book on "The English Staircase" that we reviewed recently.

The *Burlington Magazine* publishes Dr. Josef Strzygowski's lecture on "The Origin of Christian Art," from which we quote the following references to architecture:—

"I leave aside, as sterile germs of form, the Hellenistic basilicas—that is to say, the churches with columns, wooden roof, and exterior atrium—and thus omit the sole type which prevailed in Rome. I concern myself only with vaulted construction which first matured in the West into that fine flower, called by us the Romanesque and Gothic styles. By restricting my theme to this point, I intend to emphasise my conviction that the forms of Oriental art did not reach the West through the Crusades—as has been main-ained—but rather that forms were developed simultaneously both in East and West along parallel lines. Thus, so far as concerns vaulting in particular, long before the Romanesque period, not only in Mesopotamia and Asia Minor, but also in Spain and Lombardy, we can point to the existence of basilica-shaped churches with vaulting; and vaulting is an indication more to be depended on than the type of construction.

I place certain western Gothic churches of Spain beside similar churches in the region of Tur-Abdin in Mesopotamia. San Juan Bautista in Baños was built by Receswinthus in 661. This church has three barrel-vaulted, parallel aisles with the horseshoe arch throughout, and this—let me observe—already in pre-Islamic times. It is, however, their barrel-vaulting which is the essential characteristic of the western Gothic churches, especially when the church is aisleless.

The barrel-vaulting with transverse arches and the horseshoe arch of the Spanish churches are, together with purely stone-construction, the favourite motives of ecclesiastical architecture in Central Asia Minor. I point to the nave of the ruined cathedral of Binbiriklisse, with its horseshoe stone-vaulting and transverse arches. Then, in vaulting to give an idea of the immense variety of construction, I cite another example, an example of the so-called rising barrels which are to be found in the cathedral of Aix-la-Chapelle also. Once more, look at the ground plan and the elevation of one of the churches of Central Asia Minor, with its covered front and almost Romanesque piers with respond shafts, and you will realise how significant it was when Sir William Ramsay and Miss Bell's excavations confirmed my dating of these buildings as regards their types.

The great building movement of the East comes overseas to Ravenna, and onwards, by Milan and Marseilles, and overland by means of the Asiatic and Greek artists who travel westwards in the train of the Goths. Buildings such as the tomb of Theodoric, or later,

the Church of Germigny-les-Près seems to me explicable only in this way. The double-choired churches also, the choir with radiating chapels, and the cruciform basilicas in the place of the tau-shaped churches of earlier date, have their origin in the East. I am of the opinion that the West—Gaul, the Rhine, and the British Isles—shares in the great developments of Christian art in the East. The offshoots of the Eastern Monastic Orders, the Gothic migration, and commerce continue the ancient combination of Celtic and Hellenistic culture. In this way, then, I explain such phenomena as the appearance of similar motives in the East and the West, and I give as an instance of it the bird and fish initials, which occur in Merovingian and also in Armenian manuscripts; and I include the erection of stone crosses, which is common both here in the British Isles and also among the Armenians. What I am leading up to is that we ought to begin to follow up these traces systematically. Means are provided here in England by the founding of the Byzantine Research Fund. England must apply all her energy, so that, just as Dr. Stein has done in Chinese Turkestan, explorations may be made on the Indian frontiers, and especially the north-western border, which the sculptures of Gandhara prove was the centre of a great art movement."

In the *Studio* we find Herman A. Webster's Parisian etchings a little reminiscent of Méryon, but possibly this is inevitable when similar subjects are selected. The effects are broadly and vigorously rendered. Architecture is represented by an illustrated article on recent domestic work, giving examples of the designs of Messrs. Guy Dawber, Leslie Mansfield, and Burkett J. Emery. Some interesting photographs are given of modern French interiors.

The article on "Smoke Abatement," by Mr. T. B. C. Kershaw, in the *Nineteenth Century* first approaches the question from the point of view of the economist, and quotes Sir William Ramsey to the effect that at least a third of the fuel we consume for heating is wasted owing to inefficient methods of use. It then goes on to deal with the failure of the existing legal procedure to cope with this evil, with the fact that the emission of smoke indicates faulty combustion and consequent loss, with work of the voluntary agencies towards securing an improvement, and with the best line of policy towards progress in the future. In view of the marked predilection in this country for the open fire, the author looks towards the discovery of a smokeless fuel, preferably free from volatile sulphur, and necessarily at a marketable price, as the most likely solution of the domestic portion of the problem.

"A Post-Impressionist Scribbler" writes in the *National Review* on the subject of the decorations by Mr. Roger Fry and other artists which have appeared recently on the walls of the Borough Polytechnic. The gist of the article is summed up in the last sentence:—"May the Council of the South London Polytechnic see the mistake made before it is too late, and cause the removal of these diagrams, which can reflect no honour on their makers or their promoters."

The *Century Magazine* has an article on "The New Manila," which should be read by all who are interested in civic development. The preparation of the first scheme was entrusted by the U.S. Government to Mr. Daniel H. Burnham, and this scheme was subsequently carried out with some modifications, under the supervision of Mr. W. E. Parsons, who studied at the Ecole des Beaux-Arts. The article commences with a description of the old Spanish town with its forts and walls, happily retained, and gives an interesting picture of the character of the buildings. We give a few extracts from this:

"Spanish architecture in the Philippines is essentially Spanish Renaissance, modified by the tropical climate and other local conditions. Unlike the architecture of southern Italy, where thick stone walls, pierced with small windows, seem to have been the prevailing protection against heat, the Spaniards felt the necessity of ample ventilation. Consequently, the windows, especially in the living quarters of the upper story, are wide and are shaded with protecting eaves and canopies. Sometimes galleries surround the entire building and form a passageway several

feet in width as an insulation, as it were, against the external heat.

Perhaps in no other country in the world are conchas used as a substitute for window-glass. These shells are flat, nearly round, and average 4 in. in diameter. The edges are trimmed off, so as to leave panes about 3 in. square, and these are set in narrow strips of wood. The shells are, of course, translucent rather than transparent, and the result is a soft opalescent light, very agreeable in a country where the glare of the sky would be intolerable if ordinary glass were used. To obtain the maximum window openings, the sashes are made to slide horizontally on wide sills of hard wood in a manner similar to that adopted by the Japanese. By this means, openings as wide as 12 ft. are obtained.

The ceilings of the interiors are high, as is usual in warm climates. The minimum height allowed by the building laws is 3 metres, or about 10 ft. In buildings of the better class, ceilings of from 15 ft. to 20 ft. are not uncommon.

To realise the splendid resources of the forests of the Philippines, one has only to see the hard-wood flooring in the public buildings and the residences of the better class. These consist of large slabs of mahogany, or, to use the local names, molave, narra, tindalo, and acle, these being of various colours and graining. Frequently the pieces, occasionally as much as 40 in. in width and 40 ft. in length, are laid alternately in dark and light shades."

The article then goes on to describe the methods adopted in laying out the surrounding areas, including a spacious square for the proposed Government buildings in juxtaposition to the old walled town, the new hospital, and the Manila Club. Reinforced concrete has been employed in these works, and its various advantages are dealt with in the following terms:—

"It is fortunate that at the time the improvements at Manila were started the value of reinforced concrete had been demonstrated. While the construction of Spanish times, consisting of heavy masonry for the first story and hard wood for the upper story, was rarely injured by earthquake, still, timber construction is subject to decay and to constant attack from white ants, which do their deadly work in the parts of a structure shielded from view. Of the classes of construction considered suitable in countries where seismic disturbances occur, reinforced concrete has the advantage of being incombustible, as well as comparatively light and not subject to injury by white ants or moisture. Unlike structural steel, most of the work involved in reinforced concrete can be done by unskilled labour, a fact of great importance in a comparatively undeveloped country like the Philippine Islands. Moreover, the materials required are easily accessible, gravel and sand being obtainable in most river beds, steel bars and cement alone being imported. Architecturally considered, concrete is well adapted to tropical countries, where simple wall surfaces, serving as backgrounds for masses of brilliantly coloured foliage, and sometimes relieved with columns, pilasters, and other architectural motives, form a successful architectural treatment.

METROPOLITAN ASYLUMS BOARD.

At the usual fortnightly sitting of the Metropolitan Asylums Board last week the following matters were dealt with:—

Quantities.—Messrs. R. L. Curtis & Sons, of Finsbury-square, were appointed to prepare bills of quantities in connexion with the adaptation, fire-resisting, and cleaning and painting works, to be carried out at the shore buildings at Long Reach Hospital at a commission of 2 per cent. on the amount of the accepted tender.

Park Hospital.—Approval was given to a plan prepared by the Engineer-in-Chief for extending the corridors at the above hospital. It was also agreed to carry out certain drainage works at a cost of 3557.

Fountain Hospital.—A report was received from the Medical Superintendent recommending a number of works for the adaptation of the Fountain Hospital for asylum purposes, and as a matter of urgency it was referred to the Works Committee to carry out.

Downs School.—It was decided to carry out improvements in the heating arrangements at the above school at an estimated cost of 922.

METROPOLITAN WATER BOARD.

THE following matters were dealt with at the meeting of the Board on December 11:

Supplies.—The Accountant's statement on the result of the aggregate collection of domestic meter and building supplies for the six months ending September 30 showed that the following revenue was received:—Domestic supplies, 1,051,904.; meter and bulk supplies, 323,324.; and building supplies, 10,087.; total, 1,385,315.

Hampton Court Palace.—The Works Committee reported having authorised the carrying out by the Board's workmen of the work of providing fire mains, etc., at Hampton Court Palace, at a cost of about 1,370., which will be repaid by H.M. Board of Works.

Contract for River Enlargement Work.—The General Purposes Committee made the following report *re* "Mauder's Contract for River Enlargement Work":—"In connexion with this work, which was in progress during the years 1907, 1908, 1909, and 1910, certain statements have been made which have been the subject of our careful investigation for some time back. A memorandum has been sent to each member of the Board, giving the whole of the information which has come to our knowledge, and we are considering bringing up to the Board, at an early date, recommendations designed to obviate the recurrence of similar administrative difficulties in the future. We recommend—'That our action be approved.'"

Mr. Taylor moved, and Mr. Laurence seconded, an amendment that the memorandum should be published on the minutes, and the mover remarked that the Board had no right to whitewash those concerned.

Sir M. Beachcroft said that neither the Board nor the Committee had anything to be ashamed of.

After further discussion the amendment of Mr. Taylor was defeated; but another amendment was carried, referring the matter back to the Committee.

LAW REPORTS.

COURT OF APPEAL.

(Before Lords Justices VAUGHAN WILLIAMS, BUCKLEY, and KENNEDY.)

Action by Contractors on District Surveyor's Certificate:

Thomas Free & Sons, Ltd. v. Urban District Council of Sutton.

THE hearing of this case was concluded last week upon the application of the plaintiffs for judgment or new trial in the action which was tried before Mr. Justice Lawrence and a special jury in the King's Bench Division. It will be remembered that the plaintiffs, a firm of contractors carrying on business at Maidenhead, brought the action to recover 270*l.*, the amount of a certificate given by the then Surveyor to the Council, Mr. Charles Chambers Smith, for work done by the plaintiffs in making-up and laying-out a road called Grenall-road. The amount of the contract for making-up the road was 967*l.*, odd, and the amount sued for was for an instalment due under the Surveyor's certificate. The contract was dated February 2, 1910. Mr. Chambers Smith being appointed the arbitrator under the contract, and the work was commenced in February and completed in the following May. The first certificate was given on March 10, which was for 240*l.*, due to the plaintiffs on account, and later other progress certificates were given, and the amount paid to the plaintiffs by the defendants. At the time the disputed certificate for 270*l.* was given there was, the plaintiffs alleged, 64*l.* 15*s.* for extras, which left due to the plaintiffs in respect of the contract and extras 269*l.* 12*s.* 6*d.*, and it was in respect of that that the 270*l.* certificate was given. The defendants' case was that there had been collusion between the plaintiffs and Mr. Chambers Smith (who had resigned his position on the Council), and that the certificate in question could not, having regard to the terms of the contract, be construed to be a final certificate, because before the Surveyor could grant a final certificate he had got to measure up and value, which defendants said he had not done. Defendants alleged that no event had happened on which the plaintiffs were entitled to a 90 per cent. certificate, which had been given them, the defendants' contention being that the contract provided that 80 per cent. should be paid to the contractors during the progress of the work when certified by the Surveyor, and that when the matter was finally settled then the maintenance period commenced, when 10 per cent. was to be withheld as a security for what

might happen during the period of maintenance. Defendants alleged that that period never happened under the contract, and that no 90 per cent. certificate could be given until the period of maintenance began. At the trial the learned Judge put two questions to the jury—first, whether the 270*l.* was due to the plaintiffs on May 13 under the contract; and, secondly, did the plaintiffs or the Surveyor know that sum was not due; and the jury answered both those questions in the plaintiffs' favour. Mr. Justice Lawrence, however, held that the certificate in question was not a final certificate, the Surveyor at the time not having expressed his approval of the quantity and quality of the work, and that as the certificate was a progress certificate the defendants were entitled to question it, which they would not have been entitled to do if the certificate had been a final certificate. In these circumstances his Lordship entered judgment for the defendants. Hence the present appeal of the plaintiffs.

Mr. Pollock, K.C., and Mr. McCarthy appeared for the appellants; and Mr. Sheurman, K.C., and Mr. Morton Smith for the respondents (defendants).

Lord Justice Vaughan Williams, at the conclusion of the arguments of Counsel, delivered a judgment allowing the appeal upon the ground that the certificate granted on May 13, although not in the nature of a final certificate was yet one, having regard to the terms of the contract, on which the contractors could sue, it having been duly given by the Surveyor for work and labour done. In his Lordship's opinion, in the absence of fraud and collusion, which had been set up inferentially by the defendants, and which had been directly negated by the verdict of the jury, who found that the 270*l.* was due to the contractors at the time of the granting of the certificate, it was competent for the plaintiffs to bring an action for the recovery of the amount, and, therefore, in his opinion, the verdict of the jury was quite right, and the judgment entered for the defendants ought to be set aside and judgment entered for the plaintiffs for the amount claimed with costs. Lord Justice Buckley delivered a dissenting judgment. In his opinion the judgment of Mr. Justice Lawrence was right, and should be affirmed.

Lord Justice Kennedy delivered a judgment agreeing with the conclusion arrived at by Lord Justice Vaughan Williams, and the appeal, therefore, by a majority of the Court, was allowed, and judgment entered for the plaintiffs for the amount claimed, with costs.

Upon the application of Mr. Morton Smith, a stay of execution was granted upon terms till January 31 next, to enable the defendants to consider whether they would appeal to the House of Lords.

KING'S BENCH DIVISION DIVISIONAL COURT.

(Before Mr. Justice COLERIDGE and Mr. Justice BURNETT.)

The Euston-road Building Line: London County Council v. The Metropolitan Railway, the Midland Railway Company, and Others.

THIS matter came before their Lordships on a case stated by the Tribunal of Appeal under the London Building Act, 1894.

Mr. Daldy, for the County Council, said he proposed to ask the Court to remit the case to the Tribunal. It would only be necessary to mention the facts very briefly. The case related to the building line in Euston-road, and raised the same points as in the case of *Fleming v. The Metropolitan Railway* (1911 Appeal Cases, 1), in which it was laid down that the building line was to be settled after taking into account all the circumstances, and not merely the line of the houses or the edge of the pavement. The part of Euston-road between Churchway and Ossulton-street was in question, and the case had stood over for eighteen months, until the decision in *Fleming's* case should be known, and it affected many other parties besides those now before the Court. The Metropolitan Railway wanted to do certain works, and the question arose whether the general line of buildings ought to be taken along the main fronts of the houses or along the edge of the pavement. If it was to be taken along the edge of the pavement, the railway company were really right, but if the line was to be taken along the main front of the houses, they were not entitled to do what they wanted. The case stated that the Tribunal of Appeal were, when the matter first came before them, of opinion that they had simply to open their eyes and see what was on the ground in order to decide the general building line.

Mr. Justice Horridge: The question now is, What is the building line, having regard to the decision of the House of Lords?

Mr. Daldy: Yes. The Tribunal of Appeal thought they were bound by the decision of the Divisional Court in *Fleming's* case; but that was overruled by the Court of Appeal and House of Lords. In these circumstances he (Counsel) asked the Court to make the following order:—"The Court being of opinion, having regard to the decision of the House of Lords in *Fleming v. Metropolitan Railway*, that the Tribunal of Appeal were not right in taking into account all the buildings and additions without regard to the circumstances in which they were erected, the order of the said Tribunal to be set aside, and remit the case to the Tribunal to be further dealt with."

Mr. A. A. Bethune, for the Metropolitan Railway, agreed, and their Lordships made the order accordingly. No order as to costs.

OFFICIAL REFEREE'S COURT. (Before Mr. M. MUR MACKENZIE.) Dispute over Reconstruction Work: Densham v. Banbury.

MR. MUR MACKENZIE, on December 19, delivered a considered judgment in an action of *Densham v. Banbury*, this being a claim by Mrs. Mary Densham, widow and executrix of the late Mr. William Densham, and of 14, Park-street, Devonport, against Mr. Henry Banbury, of Somerset-place, Stoke, Devonport. The claim at the outset was for 238*l.* 12*s.* 9*d.*, balance of an account due for work done and materials supplied at Wisteria-terrace and Montpelier-terrace, in Devonport—in what is known as the District of Penryn-cross.

The hearing of the case lasted several days in London.

Mr. B. Lailey (instructed by Messrs. Cox & Lafone, London agents of Messrs. Rundle & McDonald, solicitors, of Devonport) appeared for the plaintiff, the executrix, and Mr. Mallinson (instructed by Mr. George W. Davey, of John-street) presented the defendant. Mr. Richard Hansford Worth, M.Inst.C.E., a Devonport architect and engineer, and Mr. George Taylor, a local builder and contractor (a witness as to valuation of the deceased's work), were amongst the witnesses called by the plaintiff; Counsel during the hearing, Mr. Arthur Vercoe, A.R.I.B.A., of Messrs. Percival & Vercoe, architects and surveyors, of Plymouth, and Mr. Smith, a contractor, were amongst those giving evidence on behalf of Mr. Banbury.

Mr. Muir Mackenzie, in the course of his judgment, pointed out that the defendant, Mr. Banbury, owned twenty-one houses in Wisteria-terrace, having purchased them for 50*l.* a house each, including the land on which they were built. Mr. Densham, the deceased man, a house painter and decorator, was employed by the defendant to put them in repair, so as to satisfy the local authority. The deceased did also work at some houses on the opposite side—Montpelier-terrace—but there had been a dispute as to what the work was, and it was much less in amount than that done on the other side. Two small sums had been paid by the defendant before the death of Mr. Densham in June, 1902, after the sending in of an account. After that date thirty-six payments had been made during the period from May 22 to July 1, 1903, and the executrix by Mr. Banbury. In 1910 the defendant disputed the account, and said he would pay no more. Subsequently it had been suggested that Mr. Taylor should inspect the buildings to make a valuation, and he did so, accompanied by the defendant and his son. Mr. Taylor's valuation of 460*l.* was not accepted by the defendant, who employed Mr. Smith, who valued it at 241*l.* 2*s.* 1*d.*; but in his valuation he had valued certain things omitted by Mr. Taylor, and the omitted items, when they were afterwards brought to his attention, came to 13*l.*, which would make Mr. Taylor's total estimate about the same as the amount of the account originally sent in to Mr. Banbury by the deceased.

There had been, the Official Referee continued, an extraordinary amount of contradictory evidence, both as to the value of the work and the work that was done. On behalf of the plaintiff reports had been presented concerning the sanitary condition of certain of the houses in question in 1899. As to the surveyors' reports, he (the Referee) found that they were made at the time in matters investigated by persons who made them, and made in pursuance of a sanitary duty imposed on those persons to make those investigations. It had been said in that Court that before this work was done certain of the houses in question were so badly built and dilapidated in 1899 that proceedings were taken under the Act and thorough reconstruction made. The walls had been crumbling down in many cases. Some of the houses had been infested, in 1899, with rats, and altogether they had presented, in 1899, "a condition of ruinous

border which could not be beaten by the oldest of houses in the oldest town." The Official Referee was quoting a sentence from a municipal report of a document of about the period, a document to which Mr. Lailey had referred. Remarking that he had to decide what weight should be attached to the account sent to the defendant by Mr. Denham—he being now dead—the Official Referee said that he must treat that as a *prima facie* fact that it correctly stated the amount of the work. The defendant, who had always challenged the amount, had been absolutely careless in statements, having given conflicting stories on oath, and it would not be right to rely on his evidence. He also regarded the evidence of Mr. Banbury, jun., as unreliable. He found that much more work was done for these houses than Mr. Banbury, sen., or Mr. Banbury, jun., or even Mr. Taylor put down in his notebook. Although less was done on the Montpellier side, the work there went on longer. The result of his conclusions was that sum of 255*l.* 5*s.* 3*d.* should be awarded to plaintiff.

Mr. Lailey: I take it, sir, that judgment or that sum will be filed in the Devonport District Registry?

The Official Referee: That will follow as matter of course.

OBITUARY.

M. P. F. Honoré Daumet.

We regret to announce the death, on December 14, of M. Pierre F. Honoré Daumet, member of the Institut de France and Royal Gold Medalist, 1903, who was born on October 1825. M. Daumet, a pupil of Gilbert and Blot, entered the École des Beaux-Arts in 1845, and won the Grand Prix de Rome. He was attached, in 1861, to an exploratory mission in Macedonia, and drew the report. In the next year he was made Inspector of Works, Prefecture of Police; in 1867 he was appointed Acting-Architect to the Palais de Justice, and in 1877 succeeded Le Duc as Architect-in-Chief. In 1879 M. Daumet became Architect to the second division, Travaux Départementaux; on retiring from that post he was appointed Honorary Architect-in-Chief to the Department of the Seine. He was Honorary Inspector-General, Bâtiments Civils, Vice-President, Commission des Monuments Historiques; Architect to that Commission for the Temple of Augustus, and a restoration of the Church of St. Pierre, Paris, and the Theatre Orange; Vice-President of the Council of Architecture, and Official Architect, Cour d'Appel, Paris. Past-President, Société Centrale des Architectes Français; President of the Committee of the International Congress of Architects, in which capacity he presided at a meeting of the Committee in October last in Rome; and Honorary Corresponding Member of the Royal Institute of British Architects (1885). In 1885 he is elected a member of the Académie des Beaux-Arts; in 1900 he was advanced as a Commander. He was also, from Officer, in 1902. He was also Commander of the Order of Alfonso XII. of Spain, and Knight of the Order of Pius IX.

For a period of twenty years M. Daumet collaborated with the late Duc d'Aumale, for whom, in 1876-81, he restored Chantilly; in respect of his work thereon, the Institut de France awarded to him the Raynaud prize; was nominated as a joint architect, 1865, the Asile des Aliénés de Ste. Anne; he was architect of the Palais des Facultés and the Palais de Justice, Grenoble; to the Dames de Sion, for their chapels and pensions in Paris and Tunis; and of the "Eccle Homo" chapel, Jerusalem. His restoration of theâteau, St. Germain-au-Laye, is commemorated by a tablet, with portrait (illustrated in the *Builder*, August 4, of the current year), presented to him by past students of his atelier upon the fiftieth anniversary of the day its foundation: the tablet is by M. Denys Roch and M. D'Espouy. A portrait of Daumet was published in our issue of 27, 1908.

Colonel Seddon, late R.E.

The death, on December 8, is announced of the late Henry Cooper Seddon, late Royal Engineer, aged seventy-four years. As Assistant Engineer, and Instructor in 1879-85, for Construction at the School of Military Engineering, Chatham, he was the first officer of his age appointed to instruct in measuring, estimating and general builders' work, for which he framed the entire course of instruction. He was chief of the Designing Branch Barracks at the War Office in 1879-82, and of a large number of brigade depôts in

pursuance of the Military Forces Localisation Act, and made the plans for the Household Cavalry Barracks, Knightsbridge, and the Victoria Barracks, Portsmouth. He was Assistant Examiner in Building Construction, Science, and Art Department, in 1870-5, and Examiner in 1875-1900, and Examiner in Engineering Subjects, Civil Service Commission. After his retirement from the Army in 1887 Colonel Seddon practised for a few years in London as an architect and engineer; he was architect to the City of London Electrical Lighting Company, for whom he built their workshops and transforming stations, and he designed and carried out the Ham District Council's sewerage and drainage systems. He became surveyor for Lord Dysart's trustees in Surrey, Leicestershire, and Lincolnshire, eleven years ago. He published "Builders' Work and the Building Trades" and prepared the second and third editions of Colonel Wray's "Instruction in Construction," for use of the Royal Engineers, and the "R.E. Aide-Mémoire."

Mr. W. Griggs.

Mr. William Griggs, who died on December 7, at Worthing, in his eightieth year, was the pioneer of a development of photo-chromolithography for illustrative purposes. In 1851 he entered the service of the Hon. E. I. Company, and in 1855 became Technical Assistant to the Reporter on Indian Products, at the Museum, which, in 1878, was removed from the India Office to South Kensington. He made notable improvements in photo-zinographical processes as first employed by Samuel Cousins, mezzotint engraver, and established his works at Peckham. He brought out reproductions of the Shakespeare folios; a book of "Specimens of Illuminated MSS. in the British Museum" (1903); "Asian Carpet Designs," containing 150 coloured plates, at a cost of about 4,000*l.*; and fifty copies of the Mahabharata, or Patanjali's commentary on the Purnyana standard authority on the Sanskrit grammar, at a cost less by 6,000*l.* than an estimate for tracing the original MS. by hand. Mr. Griggs conducted the *Journal of Indian Art*, begun in 1874, and a serial. "Portfolio of Industrial Art to Illustrate Oriental, Arabian, Italian, and Spanish Decorative Art"; he also illustrated a volume, "The Relics of the Honourable East India Company."

LONDON COUNCILS.

Barnes.—The Surveyor has been directed to prepare a plan, etc., for making-up part of the Shaishab-road, Mortlake. Subject to a contract, the offer of the Roadmaster Company, Ltd., to provide and lay roadmetal in a part of Kook's-lane, at 5*s.* 8*d.* per yard super., and to maintain same for five years, has been accepted. The question of widening Upper Richmond-road and Barnes High-street has been referred to the Highway Committee for consideration. A scheme is to be prepared by the Surveyor for the erection of a swimming-bath with ten slipper baths. Plans have been passed for Mr. A. Harvey for motor garages in Madrid-road.

Bermondsey.—Messrs. B. Finch & Co., Ltd.'s, tender has been accepted at 27*l.* 10*s.* for replacing the urinal at Lavender-bidge.

Hampstead.—A portion of the sewer running northwards from Broadhurst-gardens is to be repaired at an estimated cost of 824*l.* A new sewer is to be constructed in connexion with the Town Hall extension at an estimated cost of 125*l.*

Holborn.—No objection is to be raised to a proposal of Mr. W. Mats to erect buildings on the east side of Baldwin's-place.

Islington.—Part of the wood carriage-way of Highbury-grove is to be repaved at an estimated cost of 310*l.* Repairs are to be carried out to the following roads at the estimated costs mentioned:—Stanley-road, 103*l.*; Beresford-road, 191*l.*; Highbury-place, 188*l.*; Hertsgate-road, 118*l.*

Malden and Coombe.—The Urban District Council have accepted the tender of Messrs. E. & E. Iles, Wimbledon, at 543*l.* 19*s.*, for kerbing, channelling, and paving with tar macadam portion of the roadway of Coombe-road; also the tender of Messrs. J. Wainwright & Co., Ltd., Shepton Mallet, at 97*l.* 14*s.* 4*d.*, for paving the footways with artificial stone slabs and maintenance thereof.

Richmond.—The tender of the Improved Wood Pavement Company, Ltd., has been accepted at 192*l.* 11*s.* for the necessary wood-paving required in connexion with the widening of George-street. The Council have appointed Mr. A. F. Brown, at a fee of 100*l.*, to undertake the whole of the work required in the first stage of the Richmond Town-Planning Scheme. The following plans have been

passed:—Mr. S. D. Gough, five houses, Ennerdale-road extension; Messrs. Brewer, Smith, & Brewer, extensions to music warehouse, Red Lion-street; Mr. W. W. Courtenay, four houses, Leyborne Park.

Tottenham.—Plans have been passed as follows:—Mr. G. E. T. Laurence, school, Downhills, Keston-road; Mr. A. Porter, addition to factory, Tariff-road, for Messrs. Prestwich; Mr. W. J. Burstow, eight houses, Sherringham-avenue.

Westminster.—Consent is to be given to the Army and Navy Co-Operative Society, Ltd., 1, Howick-place, S.W., to erect in Gatliff Wharf, Pimlico, a sawmill and workshops.

PATENTS.

APPLICATIONS PUBLISHED.*

27,250 of 1910.—The Douglas Manufacturing Company, Ltd., and William Meaby: Door bolts and fastenings of a like character.

27,465 of 1910.—Mrs. Ernestine Lefevre, née Bastard, and Lucien Franchement: Portable stone-saw.

28,545 of 1910.—Moses James Adams: Flushing arrangement.

28,996 of 1910.—Robert Thompson and William Affleck Thompson: Walls.

648 of 1911.—William Gilbert: Mixers for Portland cement and the like.

1,893 of 1911.—James Muirhead: Ventilating appliances for buildings.

2,339 of 1911.—Charles Hart: Storage tanks of hot-water systems.

3,665 of 1911.—Edwin Oscar Smith: Anti-rattling device for sliding doors and the like.

2,906 of 1911.—Miroslaw Matgorzewicz and Joseph Krynski: Door locks.

4,902 of 1911.—Thomas Glover: Construction of elbow or bend for metal pipe flues or the like.

7,157 of 1911.—Arthur Wingfield Colenutt: Multiple-bolt fastenings for doors and the like.

8,622 of 1911.—William Henry Rymer: Flexible coverings for roofs, walls, and the like.

10,026 of 1911.—Harry Conklin Trill: Boiler-furnaces, grates, and the like.

11,930 of 1911.—Gunnar Richard Tellander: Ventilation valve.

11,960 of 1911.—George Field: Ventilators.

14,751 of 1911.—George John Money: Fastening devices or latches for doors, windows, or the like.

15,727 of 1911.—Heinrich Bebié: Device for fixing windows, window-shutters, and doors in open position.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointment, xv.; Auction Sales, xx. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary. The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* * It must be understood that the following paragraphs are printed as news, and not as advertisement; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

DECEMBER 29.—**Glasgow.**—DESIGN FOR A BRIDGE.—Designs are invited (Alexander Thomson Travelling Studentship) for a bridge. Premiums of £60, and £20, are offered. See advertisement in issue of December 24, 1910, for further particulars.

DECEMBER 30.—**Armadale.**—Public hall and offices, to cost £2,500. Premiums of 15l. and 10l. Open only to architects who were represented on the site on October 12.

DECEMBER 30.—**Hastings.**—EAST SUSSEX HOSPITAL.—Premiums of 125l., 75l., and 50l. Mr. E. T. Hall, F.R.I.B.A., Assessor.

DECEMBER 30.—**Welsh Litteredford, 1912.**—DESIGN FOR WORKMEN'S DWELLINGS.—Prize, 50l. Particulars from Welsh Housing Association, 9, Temple-chambers, E.C.

JANUARY 1, 1912.—**Rochdale Infirmary.**—EXTENSIONS.—Limited to Rochdale architects. Assessor, Mr. Alex. Graham, F.R.I.B.A.

JANUARY 3.—**Bolton.**—MINERS' FEDERATION HALL AND OFFICES.—Limited to architects within twenty-five miles of Bolton. Premiums, 50l. and 25l. Assessor, Mr. Jonathan Simpson, F.R.I.B.A. Particulars from Messrs. Harding & Fernihough, 7, Fold-street, Bolton.

JANUARY 6.—**Stafford.**—PUBLIC LIBRARY.—The Stafford Corporation invite designs for a Public Library. Mr. Henry T. Hare, F.R.I.B.A., assessor. Second and third premiums of twenty and forty guineas. Deposit, 1l. Particulars from Mr. W. Plank, A.M. Inst. C.E.

JANUARY 8.—**Banbury.**—WORKMEN'S DWELLINGS. The Banbury T.C. invite designs for workmen's dwellings. See advertisement in issue of December 8 for further particulars.

JANUARY 9.—**Magherafelt.**—TECHNICAL SCHOOL.—Particulars from Mr. W. D. Cousins, County Technical Office, Court-house, Coleraine.

JANUARY 9.—**Spennymoor.**—PUBLIC HALL, ETC.—The Spennymoor U.D.C. invite competitive plans and designs for a public hall, market, and offices, etc. Three premiums are offered. See advertisement in issue of December 1 for further particulars.

JANUARY 29.—**Montevideo.**—Government palace (premiums, 2,125l. and 500l.) and town improvement scheme (premiums, 1,060l., 640l., and 425l.). Conditions may be seen at the Board of Trade, 75, Basinghall-street, E.C.

JANUARY 31.—**Australia.**—DESIGNS FOR FEDERAL CAPITAL CITY.—The Government of the Commonwealth of Australia invite competitive designs for the laying out of this Federal capital city. See advertisement in issue of September 1 for further particulars. See also page 598, November 8.

FEBRUARY 3.—**Bolton.**—NURSES' HOME AT THE INFIRMARY.—Premiums of 30l., 20l., and 10l. Assessor, Mr. John B. Gass, F.R.I.B.A.

FEBRUARY 17.—**London, E.C.**—NEW OFFICES.—The Port of London Authority invite preliminary sketch designs for new head offices in Trinity-square, and for laying out remainder of land as a building site. See advertisement in issue of November 24 for further particulars.

MARCH 15.—**Prestatyn, North Wales.**—LAYING-OUT ESTATE.—Lord Aberconway and the Trustees of the Prestatyn Estate invite designs for laying-out of the estate. Three premiums are offered. See advertisement in this issue for further particulars.

MAY 1.—Society of Architects' Travelling Studentship. Design for a Town Hall, 25l. and medal.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and letters read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from hesitation to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100l. unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

Messrs. Moscrop-Young & Glanfield, Architects.

THE ARCHITECT'S CLERK.

WE have already made some brief comments on the papers read at the R.I.B.A. about the responsibilities of architects, pointing out the difficulties these throw in the way of an architect devoting due attention to his functions as a skilled designer and the detrimental influence all these responsibilities must exercise on the quality of his work.

Yet the architect dare not neglect them, being forced in the protection of his livelihood to guard against the liabilities they entail. If his staff is well organised and well chosen some relief will be afforded, but the faculty for carrying organisation to a high pitch is not usually a marked characteristic of the artistic or professional classes; besides, there is the added difficulty of the fluctuating nature of the architect's employment—one year he may have to cope with a large amount of work and the succeeding year with not a quarter the quantity, and his usual method of

dealing with these variations is the employment of a larger or smaller number of assistant in the drawing office, relying on himself for the conduct of the business side of his professional work. Many an architect must have felt that he would be much better off with a capable business assistant than with one or more draughtsmen, whose work he would prefer to do himself had he the time, knowing that he could carry his ideas further with the pencil in his own hand. Some few have been able to put such a system in operation in their offices, but these are in a minority owing to the lack of assistants qualified to undertake this side of office work. Now, as we all know, there is a large surplus in the supply of architects' draughtsmen, and the less skilful find it uphill work to make a living. It does not follow that a lack of the facilities of artistic perception and imaginative design carries with it any disability to appreciate the practical conduct of building operations, and if

attention were concentrated on these there is nothing to prevent many a relatively incompetent assistant becoming a very competent and valuable "architect's clerk." The qualifications demanded are not so exceptional but that with steady and concentrated application many a level-headed youngster could master them; and if he can be induced to realise that he will really be rendering more valuable service than as a designer it would be to the advantage of all concerned.

There is a real need for a supply of competent architects' clerks specially trained for this position. They would not be required to have any artistic skill, but should understand drawings and all matters involving legal responsibility, such as Building Act regulations, London County Council or other similar requirements, building by-laws, party-wall notices and awards, all matters connected with contracts, certificates, dealings with sub-contractors, etc., the

preparation of accounts and numerous other questions not as a rule presenting especial difficulty, but sometimes apt to be handled carelessly amid the pressure of more interesting work. A training as quantity surveyor or as a clerk of works, supplemented by the other studies referred to, would provide the right kind of qualification, but the knowledge of quantities and of materials, though useful in a small office, would not be essential in a large one, where there would be quite enough to tackle without any duties in respect of these.

We feel sure that many architects would welcome the possibility of being able to engage a qualified clerk to relieve him of all the details that are unconnected with the practice of architecture as an art, and to protect him from careless phrasing that has often resulted in serious misunderstandings. Thus, for example, an architect may say to his assistant, "Smithson will do the wrought-iron work at So-and-So's"; and the assistant may write to the builder, "We have instructed Mr. Smithson," etc. The architect's clerk would write, "We have approved Mr. Smithson's estimate for wrought-iron work; please arrange your contract with him for this work, including the necessary guarantees as to time, payment, etc." Comparison need hardly be made between these two forms of letter in regard to the risk of a dispute cropping up in the future.

Again, a knowledge of architects' charges will often save hours of worry in abstracting diaries and making up accounts, work that is rarely within the province of the usual type of architect's assistant, but which can well be undertaken by the confidential clerk.

Probably we have said enough to prove that there is a fair opening for the special type of "architect's clerk" as distinguished from the assistant, and that if a proportion of those interested in building operations qualified for this position they would materially improve their chances of advancement, while the architect in practice would be to some extent relieved of the bugbear entitled "the newer responsibilities."

"THE WOMAN IN THE CASE."

WE have heard much lately of the contemplated attack on the profession of architecture by the educated woman. We, for our part, feel no inclination to discourage such an attempt. Indeed, the more really competent aspirants there are in any profession the more healthy is its condition; it is only the dilettante and inefficient that lowers its status, and the woman who is prepared to bring the full force of her intelligence and ability to bear on the mastery of this art might conceivably take rank as a competent exponent of it. We think the claim that the physical requirements of the active practice of architecture render the profession unsuited to women hardly carries the weight that has sometimes been given to it, and, putting aside the question as to whether the modern tendency towards the suppression of sex differences is a good one, a question too wide to be

argued here, there seems little reason why architecture should not be as open as any other profession to both sexes.

As matters are the woman has indeed exceptional opportunities for proving her ability. There is nothing to prevent her from submitting a competitive design for a town hall or a hospital, and if it obtained the award, what a triumph!—and what purgatory for any unfortunate public body who might be so ill-advised as to put obstacles in the way of her carrying out her design!

However, the woman is as yet but feeling her ground, and has not so far attempted to make good so large a claim; she cautiously and ingeniously points to the long experience she has had in the domestic sphere and to the probability that she is much better qualified than mere man to deal with the problems of the home. Very well, let us take her, for the moment, at her own valuation, and *à propos* of this, imagine a short interview between the accomplished lady and a prospective client.

Omitting the preliminary negotiations between Mr. Brown and Mrs. A., whom he has now decided shall design the house he and his wife propose to build, we will plunge straight into the middle of their first business discussion.

Mr. B.: "Now, by this schedule you will see the accommodation we think we should get for the 2,000*l.* we propose to spend: Two servants'-rooms, day and two night nurseries, with bathroom and nursery pantry attached. Our own bedroom with large dressing-room and bathroom *en suite*, two double guests'-rooms and two single ones, with one or two bathrooms conveniently placed. Dining-room, drawing-room—large enough for dancing—billiard-room, top lighted. Pantry, which would also do for service-room, and a small servants' sitting-room, with all the usual kitchen offices, spacious and not cramped; the coal cellar to hold a truckload."

Mrs. A.: "Do you keep a motor?"

Mr. B.: "Oh, yes, a small run-about! But still, we are thinking of a larger one. We should want a garage about 20 ft. by 10 ft., and I should like a small workshop attached, as I amuse myself with a lathe and other little carpentering jobs."

Mrs. A.: "What was your idea of the sizes for dining-room, drawing-room, and entrance hall?"

Mr. B.: "Well, our present dining-room is 20 ft. by 16 ft.; a little larger than this would do. But our drawing-room is only 17 ft. square; we should like our new one at least 10 ft. more each way. Of course, we should want a hall we could sit in comfortably."

Mrs. A. (after a pause): "3,000*l.* might just cover the cost of your house, but I doubt it. I could promise that north or east of London it could be built for 3,500*l.*—only, of course, in a simple fashion."

Mr. B.: "Oh, but—oh, no! Jones said he thought— You know Robinson's house is quite as big, and he only gave 2,800*l.*, with three acres of ground. I have to live in Surrey, and the ground I want will cost 800*l.*"

Mrs. A. (severely): "I do know Robinson's house. Did you know he is trying to sell it?"

Mr. B.: "Why on earth should he want to sell such a charming old house? The Georgian front was just the kind of thing I was going to suggest for ours."

Mrs. A.: "Yes, delightful, isn't it? But I met Mrs. R. in town the other day and heard all about their troubles. Did you know they had to spend 700*l.* when they went in?"

Mr. B.: "No; he only spoke of a little decoration."

Mrs. A.: "I fear he was not quite candid. But as Mrs. R. was not responsible for the purchase she was very much more explicit. The first snowstorm found out all the weak points in the roof, which, even after an expenditure of 160*l.* still gives trouble at times; the servants' wing had no dampcourse—a wicked way those old Georgians had; and the garden, being clay, was often a swamp until they drained it; two bits of underpinning ran away with 90*l.*, and altogether the first year was a troublesome one. Then the position of the house, so far from anywhere, while ideal for the master and mistress, with their motor, is regarded in a very different light by the domestic staff. A servant can rarely be persuaded to stay for more than six months, and, as they have to employ five as against three at their old place, Mrs. R., with perhaps a little pardonable exaggeration, says that most of her time is occupied looking for new maids. No wonder they got the house for less than half what it must have cost!"

Mr. B.: "Yes, I see. I suppose it is hardly fair to expect to get a new house on quite that scale for the same money. But, of course, as the site I have in view is within half a mile of the station we should not be in quite the same fix as the Robinsons."

Mrs. A.: "Don't be too sure. Didn't you say that it was open common nearly all the way?"

Mr. B.: "Yes, and a large park beyond, so that we should be two miles from the village; but we do nearly all our shopping in town."

Mrs. A.: "You must take the risk. After all, you cannot be expected to make your staff the sole consideration. By-the-bye, what number do you employ?"

Mr. B.: "Cook, house-parlourmaid, and nurse, gardener two days a week. That would do, would it not?"

Mrs. A.: "Yes. I should have a poor opinion of my capacities if I could not devise a 2,000*l.* house to be run by this staff. But, of course, we have not yet settled whether the house you are going in for is to cost 2,000*l.* or 3,500*l.*"

Mr. B.: "Well, 2,500*l.* is the outside limit. I don't know what we can cut out."

Mrs. A.: "If you will leave your schedule with me I will go carefully through it and make my suggestions."

Mr. B.: "Anyway, I suppose the billiard-room would have to go?"

Mrs. A.: "We might get it in the roof, or make the hall big enough; but unless your wife is very keen on it she will probably say 'No' to the latter scheme."

Mr. B.: "Yes, I must talk that over with her."

We will drop the conversation at this point and leave it to our readers to decide how far such a discussion would indicate a special feminine faculty in the practice

of domestic design. The purely architectural side of the question has been intentionally ignored, as it would be going over ground that has been traversed again and again. Whether the feminine mind possesses an imaginative faculty in the fine arts only needing the necessary education to develop it is a matter on which the evidence is too conflicting to justify a definite decision; but as we have not enough really imaginative geniuses to undertake the work of providing comfortable homes for all who are prepared to build them this question may fairly be disregarded in considering the claims of women in domestic work.

It has been argued that the woman who takes up a profession must of necessity do so in the same whole-hearted way as a man to the neglect of any domestic training, and that she would in that case be on exactly the same footing in regard to domestic experience, and therefore her claim to superior capacity in this respect would fall to the ground.

If all our procedure were governed by strictly logical rules this argument is quite sound, as, given a man and a woman of equal ability, they must both, to achieve an equal degree of professional skill, devote the same proportion of their time to professional studies; but as no two persons are of exactly equal ability, and as very few have no interests outside their professional work, the contention we have referred to is inconclusive. It is quite likely that the man is giving part of his energies to some civic duty or some favourite sport, and the woman may recognise to a similar extent the claims of domestic duties. Thus, we may yet see the domesticated woman practising as an architect.

NOTES.

London University.

THE fourth Report of the Royal Commission on University Education in London deals with the question of housing London University. In the opinion of the Commissioners it is essential that no scheme can be put forward unaccompanied by a proposal to provide a site and buildings more convenient than those now occupied. Regarding the University as a great public institution it demands for its headquarters permanent buildings appropriate in design to its dignity and importance, and specially constructed for its purpose. The Imperial Institute does not fulfil these conditions and lies too far west; besides having never been associated with the University in the minds of the public, it possesses no dignified public hall such as the McEwan Hall, in Edinburgh, or the Whitworth Hall, in Manchester, nor has it suitable accommodation for the Senate, for Committees, the principals, and the headquarters staff. Neither does it provide for meetings of Convocation and the graduates and officers attending them. In addition, accommodation is desirable for a Union Club house, headquarters for the Officers' Training Corps, and rooms for professors, graduates, and students. The question as to whether a central library is desirable is left open, but in regard to this and provision for more advanced studies it is felt that

something beyond that provided in the various constituent institutions ought to find a place in the central buildings. Taking all these points into consideration, it is definitely recommended that immediate steps should be taken to find a suitable site of sufficient size to allow a large measure of freedom in determining the nature of the building to be erected, and the production of the Report has been accelerated in view of the limited opportunities for obtaining such a site in a central position. No particular district is indicated; possibly the Surrey side of the river might afford such a site as is foreshadowed in the report.

The Wellington Monument in St. Paul's Cathedral.

THE monument to the Duke of Wellington will shortly be completed by the erection of the bronze equestrian statue which Mr. John Tweed has sculptured from a model he prepared a few years ago, based upon Alfred Stevens' original sketch-model and pen-and-ink drawing preserved in the Victoria and Albert Museum. In our issue of May 28, 1910, we published illustrations of the monument as it then appeared with the trial model in position and contrasted with this a sketch of the original design used by Mr. Rickards in his paper, when comparing the more plastic treatment first intended by Stevens, which was subsequently abandoned in favour of the less satisfactory one with its four pediments that we now see. Our number of January 6, 1894, contains a view of the monument taken just after its removal, mainly at the instance of Lord Leighton, into the second bay of the nave arcade (north) from what is now the Chapel of the Order of St. Michael and St. George.

The Guildhall Improvement Scheme.

PLANS have been prepared by Mr. Sydney Perks, City Surveyor, for rebuilding, at a computed cost of some 50,000*l.*, the offices on the east side of Guildhall-yard, including the Irish Chamber (1826). The intention is to provide better accommodation, upon a site which extends as far as the "Guildhall" Tavern, by means of three galleries, each 70 ft. long, with several smaller rooms, for the Art Gallery in the upper floors of a new block to contain the Lord Mayor's Court, Irish Chamber, and other business departments. The entire scheme embraces the west side of the yard as well, where are now the Guildhall Justice Room and the offices of the Remembrancer and the City Solicitor above. The buildings on the east side occupy the sites of the collegiate church of St. Mary Magdalene and All Saints (north), and the adjoining Blackwell—more correctly Bakewell—Hall (south). With the Hall was incorporated the library—the first free library founded in England—which Richard Whittington's executors built on the south side of the church. Rebuilt in or about 1588 and again, after the Great Fire, Bakewell Hall had a west façade 105 ft. long, with a bold, overhanging cornice and pediment supported by carved modillions. In 1820 the Hall gave place to the (old) Bankruptcy Court, designed by William Fowler. In 1823 William Mountague, City Architect, built

the (old) King's Bench (Lord Mayor's Court) and Common Pleas, the former taking the site of the Guildhall Chapel, between which and the Guildhall lay Cut-throat Alley (see a plan in the *Builder* of June 4, 1910). The chapel was built by the Frowykes as London College, and dedicated to St. Mary Magdalene and All Saints in 1299. It was rebuilt in 1451 as the Church or College of Guildhall; it served latterly as a Court of Requests.

The Architectural Problem.

MR. SYDNEY PERKS, who is responsible for the restoration of Dance's front on the north side of the courtyard, has set himself no easy problem in respect of the treatment of the east and west façades. The existing front has, of course, an historical interest, which excuses much that can hardly be regarded as admirable from any other point of view, and one would scarcely desire to see two more façades of Dance's "Batty Langley" Gothic. At the same time, some sort of harmony should run through and link up the three façades, in order clearly to indicate that they belong to one and the same building. Perhaps this could best be done by keeping the general treatment on broad and simple lines, introducing an echo of Dance's fanciful conception in terminal features at the south-east and south-west corners. We shall look forward with interest to the architect's solution of this exceptionally difficult problem.

The Care of Art Treasures.

MR. EDW. HAMILTON BELL writes to the *Times*, in answer to the customary "outcry" concerning the removal of works of art to the U.S.A., to point out that really from the point of view of civilisation as a whole it is perhaps a good thing, as they are so much more zealously guarded—and, we may add, displayed—in that country. He animadverts on the management of Hertford House, instancing the wiring for electricity of the great chandeliers and the wanton exposure of the Jasper perfume-bearer of Gouthière, known as "La belle coupe." And certainly it seems as though this and other objects of "virtu" might suitably be enclosed in airtight cases to guard them from too appreciative fingering and the corrosive effects of our deplorable atmosphere.

Our Next Issue.

OUR New Year's issue will be, as usual, a special one, and it will be as attractive as its predecessors. Suggestions will be given for an "Imperial London," supplementing to some extent the drawings published in our first number this year. The development of the Surrey side of the Thames will be a feature of the scheme. Otherwise the issue of January 5 will be important. With illustrations by Mr. Henry C. Brewer, Mr. W. Walcot, Mr. Adrian Berrington, and Mr. A. C. Conrade, the pictorial side will be well represented; while reproductions of the work of Signor Angiolo Zanelli, the Italian sculptor, will give further interest to the beginning of our seventieth year.

ARCHITECTURAL SOCIETIES.

Nottingham Architectural Society:
The Law Relating to Building Schemes.

A GENERAL meeting of this Society was held on Tuesday, December 12, at the rooms. Mr. L. Y. Harris was elected an Associate.

Other business being disposed of, Mr. W. H. Taylor, Fellow of the Surveyors' Institution, Licentiate of the Royal Institute of British Architects and Barrister-at-Law, read the following paper, entitled "Some Notes on the Law Relating to Building Schemes":—

"There are several factors at work at the present time which may eventually give an impetus to the development of land for building purposes, namely:—

1. The Finance Acts of recent years.
2. The Housing and Town Planning Act, 1909.
3. The Garden City movement.

In districts where the balance between supply and demand is favourable.

And, although the second and third of these factors will doubtless tend towards the production of more comprehensive schemes in the future than have been projected in the past, owing to certain restrictions being removed which hitherto have retarded the work of development, yet I think architects and surveyors in whose hands the actual organisation of the work of development will lie may possibly be in some danger of overlooking the fact that notwithstanding that the conditions under which development will take place are changing, yet the law relating thereto is in many directions stationary, and more particularly on points which have a deterrent and hampering effect.

The broad general principles of the law affecting development schemes are quite well known and understood. It is when one descends to individual cases that one not infrequently finds these general principles difficult to apply; and also that they are often of a seemingly hampering and vexatious character, restricting the natural rights of the owner and circumscribing the range of the designers' scope; and when one is confronted with such cases one is tempted to a feeling of outraged liberty, forgetting that what appears to be a hardship on the individual is generally for the benefit of the community.

I propose to put before you a few points in relation to development schemes and the erection of buildings which have often been a source of trouble to the architect in the past, and most of which will again and again turn up in the future, despite the trend in modern methods of development and building and in legislation relating thereto.

One is apt to be so obsessed with the general lay-out of the work in hand as to overlook the small points which not infrequently render the whole scheme abortive, or at any rate involve an entire recasting after much work has been done and time spent.

These points may be considered under three heads, viz.:—

1. Laying out new streets.
2. Building lines.
3. Air space.

1.—Laying Out New Streets.

Where land is brought into the market and laid out in plots for building purposes, it may or may not be necessary to form new roadways where never before the public had any right of passage, but it would be safe to say that in every case there exists on or adjoining some part of the land an existing roadway used by the public; such roadway may be a "street," in the common meaning of the term, or a main turnpike road, a narrow country lane or even a mere occupation road; and, generally speaking, any such road affords building frontage of which the owner is not slow to avail himself and is consequently looked upon as an advantage, when in fact it may turn out to be a source of trouble and expense, for when buildings come to be erected abutting on such old roadway, the owner and his architect are often confronted with an objection by the local authority to the intended use of the frontage on the score of turning the old roadway into a "new street," which new street does not comply to the local regulations as to width and construction, etc.

This question as to when an old roadway becomes a "new street" has given rise to a great deal of litigation, all of which seems to me to have ended with no satisfactory results, for one cannot even now say with any degree

of certainty when an old lane becomes a "new street."

Barton v. Eccles Local Board was for a long time the leading case on the point, and seemed to establish the rule that an old highway repairable by the inhabitants at large became a "new street" within the meaning of the Public Health Acts when buildings were erected along it; so that where local by-laws required new streets to be 36 ft. wide, and building operations were commenced along a road, say, 24 ft. wide, the owner must throw sufficient land into the road to make up the width to 36 ft., and form and make up the added portion in accordance with local regulations; but, in effect, this case left the question as one of fact to be decided in each instance by the local bench of magistrates.

Following this, in some cases magistrates convicted owners of not complying with the local by-laws, which convictions in some cases were quashed by the Divisional and Appellate Courts, who sought to draw a distinction between cases where there were buildings on the opposite side of the roadway in question and where there were not.

The case of Devonport Corporation v. Tozer appears to overrule the doctrine enunciated in Barton v. Eccles Local Board, and to decide that the ordinary by-laws as to new streets do not apply to the case of building operations along an existing highway where the latter is not interfered with. It should be noted, however, that this cannot be taken as settled, for this case was really decided against the Corporation because they had omitted to obtain the consent of the Attorney-General to the proceedings.

The case of Smith v. Chorley Rural District Council decided that where a local authority have honestly considered plans submitted to them and they have decided that the proposed works amount to laying-out a new street no action for a mandamus to compel them to alter their decision will lie.

The result of this crop of litigation seems to be that where new buildings are being erected at the side of an old road repairable by the inhabitants at large, and there are no buildings on the opposite side, such building operations do not amount to laying-out a new street; but that if there are already buildings on the opposite side, the reverse may be the case, though this has not been definitely settled. A building owner is, therefore, left somewhat at the mercy of the local authority, for if they decide that what he proposes to do amounts to laying-out a new street, and he is convinced it is not, his only course is to proceed and to allow the authority to take the first step towards what may prove to be an endless piece of litigation, or to fall in with their requirements.

This is eminently a case where the surveyor to the authority could be consulted with advantage as to his views on the point, where there is any doubt, before much progress is made with a scheme, and so avoid waste of time and labour.

Another by-law relating to new streets in force in most districts runs as follows:—"Every person who shall construct a new street shall provide at one end, at least, of such street an entrance of a width equal to the width of such street, and open from the ground upwards."

To the "man in the street" this by-law means that every new street must have at least one end abutting on some other roadway, and that the line of abutment must be of the full width of such new street. And yet this, which is to me a very plain by-law, has been the bone of contention between authorities and owners in several cases, the former having attempted, and not unsuccessfully, to put upon it a strained, and, to my mind, an utterly ridiculous meaning.

The earliest leading case appears to be that of Hendon Local Board v. Pounce—commonly known as Pounce's Case—where the local board contended that by "entrance" was meant "means of access," and that the roadway on to which the new street joined must be also of the by-law width; so that a new street could not be joined on to an old road or street unless the latter was of the width required by the by-laws or was widened to comply with them. Unfortunately the judge in this case adopted this view.

It practically ties up the greater portion of land in country districts served by narrow lanes, if the local authorities so will it.

Fortunately few authorities appear to be taking up an unreasonable attitude on the point, and, in passing, I may remark that the

Corporation of this city have a similar by-law so worded that the absurdity does not arise.

Taken in its liberal and proper meaning I do not suppose there is any reasonably-minded person who would object to it, but even then it may in some cases cause great hardship owing to the change in other requirements as to new streets.

2.—Building Lines.

The next point in connexion with building schemes which almost every architect must run up against at some time or other, and which often requires very careful consideration, is the matter of the building line.

In entirely new districts where no building has yet been done the building line may generally be at the will of the designer, subject to compliance with any special local by-laws in force. But where buildings are already in existence the architect may find that the building line is already fixed for him, and that such line is in his case a particular nuisance, often restricting the general lay-out and sometimes rendering parcels of land more or less waste and valueless.

Most of the cases which occur in this connexion arise under powers conferred upon Corporations or urban authorities to define the building line, or under the Public Health (Buildings in Streets) Act, 1888, which applies only to urban districts.

With respect to the exercise of the former, any person aggrieved by the action of the authority is generally entitled to compensation, and, although in individual cases the prescribed building line may be obnoxious and detrimental to the owner, still he gets a solatium, whereas the powers conferred by the 1888 Act, especially where they are exercised in an arbitrary manner by the withholding of consent to the building line proposed by the owner for no apparent reason, may result in great inconvenience and loss to him; and should he seek to test the legality of the authority's decision, he will probably learn to his sorrow the really peculiar interpretations which can be put upon the provisions of this Act.

It is commonly thought that any question arising under this Act is one of fact to be determined by the magisterial bench; but when one comes to look into cases one finds some very puzzling results.

One point is that the existing buildings and the new one must be "in the same street" within the meaning of the Act, and it has been held in Ravensthorpe Local Board v. Hinchcliffe that for the frontage of two buildings to be in the same street they must be "in some degree of proximity."

This point came up for view in Warren v. Mustard, where the justices decided that the two buildings were in the same street, and convicted, and on appeal the Divisional Court upheld their decision. Mr. Justice A. L. Smith saying that with regard to the "question of the buildings being in the same street that was a matter of fact for the determination of the magistrates, and in this case they had determined that the frontage formed by the line of cottages was in sufficient proximity, and whatever he might think of their decision and however much he might regret it and regret the hardship it might cause to Mr. Warren, the court must (please note the word) adopt it."

Compare this with the case of Leyton Local Board v. Causton, where the magistrates refused to convict, but the Divisional Court reversed their decision.

In the first case it was decided as a *fact*, and being so decided was held not to be open to review, that the building did infringe the Act; whereas in the second case, which would appear to all ordinary persons a clear case of infringement, the magistrates decided as a fact that it was not, and then the High Court interfered with that finding.

In connexion with the question of the building line, I should like to draw attention to a case recently reported in the *Manchester Guardian*, and also in the *Builder*, which touches the architect very closely—in fact, touches him in his tenderest part, viz., his pocket.

Shortly, the facts were these. An architect was suing in the County Court for fees for preparing plans for the erection of some shops. He prepared the usual copies for depositing with the Corporation, who, after keeping them six weeks, intimated they could not pass them, as they intended widening the street by 15 ft. The defendant owner had seen the plans and had approved them.

Owing to the decision of the Corporation as to

the widening the plans were rendered useless, and the defendant refused to pay for them, contending that the building line was one of the most important points an architect had to comply with, and that it was the architect's duty to ascertain definitely where that line was before proceeding to draw the plans, and that if he neglected to do this he proceeded with the plans at his own risk; in the end the judge adopted this view.

At first sight I was tempted to regard the result as unjust, but when it appeared that the architect knew beforehand that a widening was in contemplation but not definitely decided upon, my sense of injustice was lessened, as any careful man would have endeavoured to have arrived at a definite line with the Corporation before proceeding with the complete plans, and would have obtained his client's instructions to negotiate, for which, of course, he could have claimed payment.

3.—Air Space.

Having successfully negotiated the obstruction known as the "building line," an architect may in ninety-nine cases out of a hundred fire away with his building without encountering further obstacles, but on the hundredth occasion may be unlucky enough to be caught in a trap with respect to air space. There is no necessity for me to detail the usual regulations as to air space about buildings, for they are pretty straightforward and seldom give rise to much difficulty. Unfortunately, however, the man who first drafted this rule would appear to have belonged to the fraternity of those who believe the world is flat in the literal sense, and to have been unaware that buildings are at times erected on a hillside.

Some years ago I had to deal with the question of air space in connexion with a building erected on a hillside. The circumstances were as follows:—

Plans of the house were submitted to the local authority, on which a level space of about 7 ft. was to be excavated at the back, and then a retaining wall about 4 ft. high erected to uphold the garden. The authority refused to pass the plans unless the hillside were excavated for 15 ft. from the back wall of the house, the latter being of such a height that an air space of 15 ft. wide was required by the by-laws.

This contention appeared ridiculous, and after considerable delay, filled up by argument with the Council's surveyor, the Council eventually gave way, and I for a long time was under the impression that the Council were legally wrong in their contention. In 1907, however, the case of *Holroyd v. Healy's Breweries* was fought out, where the circumstances were somewhat similar, except that the back wall butted up to the hillside and that the building was a suite of offices.

The magistrates convicted the owners of a breach of the by-laws; on appeal by a majority of the Court this decision was upheld. It is curious to note that all three judges described the result as ridiculous, Mr. Justice Darling remarking that as the by-law stood he did not see any use in the air space at the back, as a privy and ashpit might be erected on it, and there was nothing prohibiting these erections covering the whole space.

I believe the constructions put upon the by-law as to air space I have just described are not generally adopted on the one hand by the Councils, and on the other by owners, and I hope nothing I have said will incite anyone present to attempt to put such construction into practice."

A number of interesting points were brought up in the discussion, in which most of those present took part, and at the close Mr. Heazell proposed, and Mr. Gill seconded, a vote of thanks to Mr. Taylor for his instructive paper. Mr. Maylan supported this on behalf of the visitors, and also thanked the Society for their invitation.

WHITECHAPEL ART GALLERY.

Mr. Gilbert A. Ramsay has been appointed Director of the Art Gallery *vice* Mr. Charles Aitken who was recently appointed as Keeper of the National Gallery of British Art, Millbank. Mr. Ramsay was a pupil of Mr. William Leiper, R.S.A., and of the Glasgow School of Art. He was elected Master of the Junior Art Workers' Guild, 1911-12. In 1910-11 he was assistant to Mr. Aitken, and acted as Director in 1911.

SHOREHAM COTTAGE, KENT.

The design of the alterations and additions now being carried out has been influenced by the existing portion of the house, which was built in the latter part of the XVIIIth century, and is a good example of the quiet and unobtrusive type of house of the period.

The limitations of the site and the accommodation required for the additions necessitated a practically square plan. All the reception-rooms and best bedrooms have been planned to face south-west, with an outlook over the small River Darent (which runs through the grounds) and across to the neighbouring hills.

In order to keep the existing line of roof (a condition stipulated by the client) a large flat, carried out in reinforced concrete, is to be built, supported on 9 in. walls, and cantilevered over to hold the ends of the rafters of the tiled roof.

The hall is to be panelled with some genuine old Jacobean panelling, the property of the client, while the corridor leading from hall to dining-room is to be carried out in a similar manner, with a groined vaulted ceiling. The floor joists over the dining-room are to be of light oak moulded. All the mantelpieces have been designed by the architects in character with the house.

The walls are of stock brick covered with 14-in. cement rendering, while the cornice is of wood painted white; the tiles are partly taken from the old portion of the house which has been pulled down, and partly old hand-made sand-faced tiles. The exterior woodwork of the dormers, cupola, and windows is to be painted white.

The general contractors are Messrs. Holliday & Greenwood, Ltd., of Brixton, the ferro-concrete roof on the Indented Bar System; electric lighting and plant by the Edmundson Electricity Corporation, Ltd.; heating by Messrs. Cannon & Co.; strong-room fittings by the Bramah Lock Company; and lift by Messrs. Waygood.

The architects are Messrs. Moscrop-Young & Glanfield, Licentiate and A.R.I.B.A., of 20, Brook-street, Bond-street, W.

THE ÆSTHETIC TREATMENT OF CONCRETE.

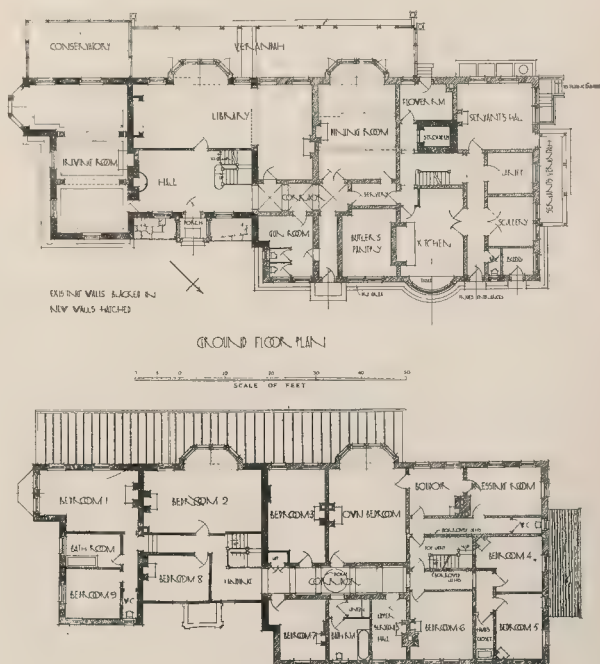

At the seventeenth ordinary general meeting of the Concrete Institute on June 7, in the Lecture Hall, at Denison House, No. 296, Vauxhall Bridge-road, S.W., Professor Beresford Pite read the following paper on "The Æsthetic Treatment of Concrete."

"I suggest, without any intention of humour or hypercriticism, and at the present stage in the study of design for concrete one can only venture to suggest, fearing to dogmatise that the simplest and directest royal road to ultimate artistic and architectural success in this material will be to eschew the process implied by the title of my paper. To this end, which is of course by way of preliminary caveat, I would beg you to endeavour, first, to remain in practical ignorance as to the proper meaning of the word "æsthetic"—this will not be difficult—and then to persuade you, if you possess a glimmering of its implication, together with a fuller comprehension of the almost limitless possibilities of constructive form attainable in reinforced concrete, that to relate so abstract a term as "æsthetic" with anything like "concrete," by means of the process at once mental and physical, which is implied by the word "treatment," had best be avoided, if it is at all possible under the circumstances in which you, as a constructor, may be placed.

That artistic satisfaction and ultimately an architectural development upon settled principles wait upon the honest and direct expression of constructive purposes and forces should not need demonstration. The construction of any direct and serviceable machine or building may be beautifully achieved without invoking consciously, in the slightest degree, the operation which we call æsthetic treatment.

Abundant illustrations have been offered of admirable accomplishments of difficult and novel constructive feats in reinforced concrete which are satisfactory without provoking artistic or critical consideration.

Such sensations of pleasure produced by mechanical skill are closely allied to the presumed æsthetics of beautiful design, though

Shoreham Cottage, Shoreham.

Messrs. Moscrop-Young & Glanfield, Architects.

unconsciously and necessarily free from all academic standards or canons of architectural style.

Surely not far removed from the success of a gigantic reinforced concrete silo or culvert is that of the ancient fireproofing by means of a stone vault on a great scale of our English cathedrals. A small and deeply interesting early example, to which aesthetic purpose cannot legitimately be imputed, is the plainly constructed Norman chapel of St. John in the Tower of London. The constructive steps thus attained are simple but pregnant developments of building skill, which developed without a break in four centuries into the elaborate aesthetic treatment of the vault of Henry VII.'s Chapel at Westminster.

If it were possible we would gladly surrender the necessity of discussing the aesthetic treatment of concrete and rely upon the common practical sense, which is Palestine to the uttermost, and knows only art as the contents of picture-frames and pedestals. If reinforced concrete design could be left to the artistic ignorance of engineers, rather than to their imitative instincts, such a development of concrete design might come to us in as few generations as came through the masters of the mason's craft throughout North Western Europe during the four centuries which succeeded the Norman Conquest.

But we do not live in the past, though upon it; and are necessarily part of the world to which an architectural or æsthetic semblance has importance. Architecture in her styles is a harmonic treatment of form, and whether there is recognisable music in the expression of natural forces or not, the note around us is contagious, and we cannot but echo it, parrot-like, until gifted with a mental perception of the meaning and purpose of the forms we repeat. To the architecture or æsthetic treatment of concrete we must therefore give heed.

For some considerable time the æsthetically minded have desired an original style of architecture. They feel sure that those antiquarian reproductions which by so many are called designs incessantly fetter true artistic inventiveness.

This longing it at once natural and unreasonable, because repeated features and ornaments do become tiresome, and because, do what we will, we cannot be otherwise than ourselves, and that is to say be original.

To the faded architectural imagination the advent of a novel system of construction in a practically new material suggests an opportunity for that freshness of design which will fulfil the hope of seeing an original style spring into being.

Welcome to the new constructional motive and material is at any rate secure amongst these progressive artists. Has not their opportunity at last come?

But the question immediately arises whether the provision of a new material and the application of novel methods of construction are in themselves sufficient to produce original æsthetic design, fresh in any refreshing sense, having attractiveness and elemental beauty.

We will grant at once that the new building will be strictly true to its principles, and unmistakably express itself as having the thinness of reinforced concrete with unaffected realism. It shall be built in truth, but the problem remains to design it with beauty. Truth as to material, by which we have learnt to mean without imitiveness of any other material such as marble or brickwork, and truth as to the structure of its design, by the avoidance of unreal features of constructive import. Both may be present in all simplicity and sincerity, but it may be confidently prophesied that an æsthetically affected and backward-looking generation will refuse to be satisfied with such unadorned veracities, and will repeatedly demand beauty until something sweet, with the taste of which it is thoroughly familiar, has been stirred into this simple fare, like sugar with mortar in winter to prevent freezing.

This sweetness to the eye of the world is the subject for our present consideration. No artist can exist, and the architect as little as the musician, in any other character than that of a public nuisance who does not tune his harmonies for the public approval, and appreciate his unremunerated responsibility to the community when building his personal imaginations for the public gaze and common weal.

The architect, therefore, sets about his task of producing pleasantness of aspect, and, guided

by an instructed instinct, he collects ideas bee-like out of the material of precedents and motives in the world around him. This collecting, observation, and reproductive design are closely connected, for variation of design is related to quality and quantity of observation almost though not quite always.

But before we further consider the most practical aspect of the subjects for students, namely, from what fields can these precedents and motives for the æsthetic treatment of so novel a construction as reinforced concrete be collected, we must briefly state a few conclusions involved. The premise must be first made that over all building which assumes nobility or claims permanence the laws of the mistress of these two qualities of high appeal and of endurance are sacrificed—and it cannot be that any concrete building need be at once mean and temporary—no exception can be pleaded to those laws or principles of architecture which are manifested as imperative from the Great Pyramid onwards through the building history of the world.

This assertion of high aim, coupled with permanence, is perhaps the more necessary to-day to deliver us from the consideration of the fascinating and practical subject of exhibition buildings. It is difficult, extremely so, to judicially settle the claims of a great class of constructions purposely endowed by æsthetic treatment with a wide popular appeal to consideration as works of architecture. This task cannot be enlarged upon now—reasons for judgment on the White City are deferred—but the rule holds for all our constructive work that permanence is a vital quality to real architecture, and that ephemeral building aiming at merely pictorial or historic ends must justify itself on shallower grounds than permanent concrete building.

I. There is no common artistic sense or experience which will enable the educated and cultivated world of to-day to accept the native and naked facts of a reinforced concrete building of ordinary purpose, such as a warehouse or office block, as anything else but barbarous, apart from some harmonious relation to and reflection of traditional architectural forms and proportions which by long usage and historic meaning have established themselves as alphabets and symbols of artistic expression in the building art.

Proportion in the abstract as good or bad is easy to talk about; it may be poetical, but is difficult to embody and unpractical. It would be idle—and this subject is a delightful *corpus vile* for exemplification—to direct an architect that his reinforced concrete building must be simply true to its material and purpose, and rely only on good proportions for success and artistic effect. There is a good deal of professional and critical cant to the tune of efficiency and pre-eminent importance of good proportion. Let us suggest a simply corrective question. What is the canon of proportion that the prescriber specifically has in his mind's eye? If it is an indefinite perceptive sense of fitness please apply it forthwith to this concrete case, wherein the height of every floor and practically the size and shape of every opening in the walls is settled by canons of use and practicability—whether warehouse, hospital ward, or mammoth residences.

Queen Anne's Gate, Mansions, Westminster, may, with all due respect to its inhabitants, be suggested as a sufficient example of proportion settled by practical canons without reliance on architectural style or ornaments.

II. Therefore, in the absence of artistic power to educe beauty out of the utilitarian factors of reinforced concrete building, we are compelled to adopt and adapt those past architectural forms which have canons of proportion and have attained by long acceptance a force of expression. These architectural forms are of age-long growth and development, and though they come to us in stone and brick, and therefore seem unsuitable and unreal if applied to a novel artificial material, we have none other with which to make that public appeal for sympathy which is the basis of the artistic sentiment.

To put it crudely, the classic forms of Greece and Rome, the Gothic forms of England, the Renaissance treatments of Italy are, after all, the staple of the only possible architectural treatment of the reinforced concrete architecture to-day.

III. A third brief conclusion is that the

application of colour, whether in simple tones or various patterns, to the surfaces of concrete buildings, though such treatment may be purely æsthetic, will not suffice as a satisfactory or as an architectural solution of the problem.

The concrete mass necessarily has colour of some sort, whether perhaps the grey of a cement or the pink of an aggregate. This colour quality, which may be said to be native, may be modified for æsthetic purposes, but it really appertains to the texture of the building, and belongs to another branch of this subject. The propriety of securing an even consistency of tone or a clean contrast between applied cement dressings and the general surface of the wall is, however, to be mentioned here. The application of colour implies a direct intellectual exercise in æsthetics of considerable range. It also involves differences of colour material, though essentially between the red and white colour-wash bands of a sunlit Oriental front and the marble veneers of a mediæval Venetian palace there is little difference of æsthetic treatment. Each method is obviously applicable to walls of any core, from Babylonian earth mounds to reinforced concrete partitions.

The æsthetic treatment of concrete would soon be settled and its practitioners assigned positions in schools of painting and decorative art if a superficial treatment were sufficient, whether in economical distemper or costly marble and ceramics. Imagination will soon fly to the Baghdad markets for tile and to Byzantium for mosaic, and neither association nor scope will be lacking.

But how in any scheme of superficial decoration shall we deal with the new problems of plastic form and design? Colour may be a palliative, an enrichment of surface, in that it accepts, and does not control, the forms of the building to which it is applied. Its application does not deal with the greater principles and factors of architectural effect, those of proportion, of light and shade, of grouping, and of ornamental detail.

IV. A fourth conclusion is that in texture alone, that is, in the quality of the surface, lies the ultimate differentiating quality of the æsthetics of any building material, and especially of ferro-concrete. The architectural elements of a style may all be simulated in stucco as if of stone, even to the reproduction of pseudo-constructive jointings and of such originally economic mason-craftiness as rustication. The vital æsthetic difference is that of the texture. The simulation may extend to the superficial elements, but when detected, as it inevitably will be, under the stress of natural forces, the æsthetic value is sensibly lessened, and with the repulsion of artistic sense and sympathy condemnation follows.

The texture of native materials has a special beauty; that of artificial materials, as of brick-work acquired by craftsmanship, both of manufacture and of laying and bonding, also has intellectual interest.

It is to this essential or native character in concrete that we must look for its expression of texture. Though there is a touching interest in the impress of the timbering on the concrete work of the Roman Emperors, modern fancy shattering cannot be suggested, for there will be no lasting result from mere sporadic impulses of imagination. The creation of rusticated joints by sinking moulding fillets, or such like methods of creating a surface design, need not be even proposed, for texture is that element which is solely necessary to, and therefore indispensably connected with, a certain material, and by which you may identify and appraise it. It applies not merely to the detailed description of smooth, joined, or rusticated treatment of a cement surface but to the character of the area, its extent, and the necessary absence or presence of jointings, and other evidences of construction.

The influence of texture is mainly felt in the design and treatment of ornamental detail. The relation of material to design compels attention in such ornamental details which involve consideration of facility or difficulty of execution. A hard and intractable material naturally restrains the mouldings and carvings which are designed for execution in granite, while the surface of a pliant, easily-wrought brick or stone wall suggests enrichment and delicacy of moulding.

The suggestiveness both of modelled or cast mouldings and enrichments in plaster is also of a different character, and this difference is the texture.

Modifications of form in the drawing of detail owing to increased ductility of the material should be welcomed and insisted upon as emphasising a characteristic which it is foolish and timid to disguise.

The absence of building up joints is alone sufficient to afford a fine speciality to concrete design. The jointing of stonework, originally a painful necessity, as the ancient use of monoliths shows, has become an artistic resource of great value, artificially rusticated joints bearing evidence to this fact. The value to scale of such jointings is primary, but their relation to texture is certainly not to be forgotten.

In concrete we have now monolith walls, and this is fact and texture at once. The other quality of scale, lost through the absence of jointing, will have to be recovered by other architectural factors of detail.

The summary of the brief conclusions that we have stated on this subject of unusual magnitude is negatively that:

I. We have found no instinctive guidance towards an unbiased and fresh originality in the æsthetic treatment of both a novel building material and principles of unusual application.

II. That invocations of good proportion or of other abstract principles, though useful as weapons of criticism, are similarly of no assistance in creating a system of design.

III. That superficial colour treatments are insufficient for architectural expression, though valuable in assisting æsthetic effect.

IV. Positively that the texture of concrete surfaces modifies and imparts special character to any forms employed for architectural purposes.

Therefore, while modern considerations of utility and of novel constructional methods determine the proportions and may spontaneously, or subconsciously, if this may be proposed, develop qualities which require an æsthetic character, the only method by which definite progress in an architecture of concrete will be possible to us is by the scholarly and critical employment of the traditional plastic forms of architecture modified by and adapted to execution in concrete; and this is its æsthetic treatment.

We must, therefore, undertake a short review of the development of some of these traditional forms, and note the sources and purposes of their origination.

Encouragement in our researches will await us. There are enough flowers in the world-wide garden of architecture for any collector of æsthetic motive or effect. But to extend the field in any universal way is both needless and unwise. The flowers are around our feet, familiar enough and offering ample material both for imaginative design and popular comprehension. The current architectural detail of stone or brickwork which finds expression in spite of translation from native into artificial building materials is all we need if we will face the problem, really one of the perception of artistic adaptability and of refinement, of texture, that is of the essential relation of the material to the forms into which it is moulded.

Egypt and Greece will furnish us with architectures in stone the æsthetic elements of which are derived indirectly and idealised from other materials. Rome will show us the application of merely architectural forms for æsthetic purposes, while in the mediæval building alone in stone and the kindred crafts shall we find a direct æsthetic development coinciding with constructive progress.

Egypt.

It is of singular interest that one of the earliest known architectures of the world, that of the Nile Valley, has in constructive principle a reinforcement of a weak concrete walling. The original Egyptian dwellings were built of mud strengthened by a systematic reed structure.

The sloping surface of the thin walls, the placed reinforcements at the angles and at the crown of the wall exemplify in a crude form the principles upon which we depend in the design of reinforced concrete.

Then the salient forms of this reed and mud architecture of between five and six thousand years ago in the course of generations crystallised by means of painted representations into an idealised system of design having sacred associations and acquiring an æsthetic quality which was not present to its originators.

These forms are ultimately employed probably after more than a thousand years, frankly to condition the structure and decoration of that most opposite of building material, Egyptian granite, and under structural conditions and by methods which are a subject of wonder and admiration to moderns. In the result of historic action the non-æsthetic reed and mud architecture becomes, in a material foreign to its constructive conditions, the standard and source of a grand architectural style.

A translated future may thus await the unabashed directness of non-æsthetic concrete building, an aspect of the subject excluded by our title.

Greece.

A similar transmigration from a utilitarian construction of wood into an æsthetic architecture of marble evolved itself in the progress of Greek building art. The crude and practical modern post and lintel structure of the pre-Mycenæan age, with its necessary framings, templates, and panels develop, when translated into the more enduring but less ductile marble, into the graceful order of column and entablature, having triglyphs and metopes, abacus and echinus.

The attainment of perfectly artistic craftsmanship spontaneously generated a sense of æsthetic system in the age-long development of the Ionian and Dorian architecture of the Greek world seems to be evident.

The original constructive system becomes idealised in Egyptian architecture, probably through the medium of painted representations of the original types, and in Greek building through the development of a singular and pure power of drawing—that is, of perception of abstract beauty in form. The original method grows crude and barbaric as the refined representation of it develops, and slowly the world becomes possessed of definitely original types of architecture, both having this common element, that they are æsthetic treatments by translation into an alien material of an originally non-æsthetic system of building.

Rome.

Rome seems seemingly nearer to us in her likeness to the general conditions of our own building life. Her genius is expressed in vast works of engineering skill, such as the great Thermae, the Flavian Amphitheatre, and the Pantheon. It is, of course, to the point, though time does not permit for its thorough discussion, to instance the Roman system of reinforced construction of vaults as containing and illustrating the principles of a concrete architecture. The elucidation of the æsthetic quality from this architecture will illustrate the unconscious æstheticism of gigantic masses and of curved lines of great scale; this I would venture to define wholly as engineering. The conscious æsthetic treatment—which we may assign to the artist—is in Roman work of a superficial and unrelated character, and upon the discernment of this the architectural critic exercises his vivid and forked lightning. This superficial treatment consists in the non-functional application to the concrete building of foreign, to wit, a Grecian order of architectural expression. The relation, or want of it, between these æsthetic treatments and the building, both as to mass and material, is exemplified with singular completeness by a state wedding-cake. The internal mass is of concrete, the external adornment of a white cementitious material, sweet to the taste, in which ornamental forms are created, often taking a direct architectural and Roman semblance. Our title as a phrase exactly describes the result both of Roman architecture and of this confectionery as an "æsthetic treatment of concrete."

The development of the Grecian method of covering wrought stonework with a thin coating of plaster into the system of plaster work decoration employed, originally for interior by the Romans, opened the way to the reproduction of architectural forms entirely divorced from constructive obligation; and later on, through the Renaissance of Roman architecture in the XVth and XVIth centuries of our era, this became a popular and economical means of æsthetic treatment.

The Roman reliance on a foreign type of architectural ornament detached from its constructive purport may seem in the light of the "Seven Lamps" to be unworthy and vain, but it continues even to-day to dominate universal civilisation, and the entablature cornice and typical capitals employed by

ancient Rome are still the ensigns of her architectural empire among the northern barbarians throughout the colonies of their descendants and the world which learns from them.

The alienation of material and construction from æsthetic development and use is illustrated by these three national architectures of Egypt, Greece, and Rome; in the first two by an idealised looking backward to ancestral habits, and in the last only by a recognition, almost as unintelligent as it is unrefined, of the need of a popularising element which shall sweeten essential constructive utilitarianism—the confession of this need being both interesting and important to us and our subject.

Gothic.

The development in Gothic architecture of a purely constructive system of design in stone gradually and surely developed its own æsthetic quality. This truth in the last century demanded a recognition denied to it during the generations of the Renaissance art. The attainment of architectural beauty in the mediæval building crafts is a subject fraught with high importance to the modern constructor. The simple ignorance of classic antiquity, and consequently the unaffected confidence in themselves which characterise the Gothic builders, may also generally be said to sum up the relation of the civil engineer and designer of steel structures to-day to æsthetics. So long as these men are blind to the light of antique art, so long, therefore, they are free from error, their ignorance is bliss, and the direct accomplishment of many utilitarian purposes by them has created a Gothic architecture in iron and steel as virile and pregnant with spontaneously æsthetic effects as the early mediæval constructions of stone vaults and flying buttresses. If a sober ornamentation were possible, emphasising in metal, as the mediæval masons did in stone, or the carpenters in half-timbered construction, their artistic pride in the craftsmanship of their material, these would be angels; but they are men after all, and can afford us but little leading in our study of the future treatment of reinforced concrete. We have yet to attain that distant mount of vision from which the Forth Bridge, a gasometer, or a reinforced concrete silo will appear as works either of æsthetic value or intention.

But in each of the mediæval crafts as exercised by men of artistic sense trained only in the manipulation of one material we may find abundant instruction in the adaptation of accepted form to materials of varying texture. Long before any architectural grammar was established upon the orders the pointed Gothic arch and incipient tracery of stonework provided the staple for the only decoration added to woodwork, as a multitude of English church doors and screens will show, and similarly buttresses, pinnacles, and spires, severally constructive features developed in stonework, create a forest of decorative fancies in the wooden canopies of choir stalls. Another remarkable adaptation of prototype design by texture is afforded by the ornamental plastered ceilings which attained such richness, artistic vigour, and naturalness in the later Elizabethan time, being developed from the elaborately ribbed pendant stone vaulting of the latest Tudor period; a movement short enough to be covered by one long life. This æsthetic treatment of a plastered surface might suggest that we have arrived at some final illustration of the possible direction for concrete façades, but though yielding suggestions for ornamental freedom, I would point out that, like colour, it is a method of decoration which has æsthetic qualities and charms under architectural conditions, such as fitting the panel or soffit of a room, and offers no substantial guidance for the establishment of a system of design. But this instance affords a valuable example of the influence of material on practical design in the resulting appreciation of the quality of the texture.

It is in complete grasp of the æsthetic quality of any fine work of architecture in its achievement of satisfactory proportions by traditional standards, in its own movements towards a higher progressive originality in the design and employment of detail, in its essential relation to the purposes of the building which it expresses, and its grasp of the higher qualities of monumental and poetic design that the pathway to an æsthetic treatment of concrete lies. The newness or constructive motive, the wide possibilities of extent and achievement,

Messrs. Marshall E. Walker, A.R.I.B.A., & Arnold W. Harwood, Architects.

the freshness of opportunity in textural adaptation are all incentives of great value to the architect, but not one, two, or all the newer qualities will justify him in neglecting the pursuit of a higher analysis of the true developments of architectural beauty or justify him in expecting that the path to glory in concrete architecture will be gained by any shorter route than that of the most earnest application and appropriation of the message of all the great architecture of the past. Till this has been seriously and perhaps slowly undertaken the path of least resistance, of safety and modesty, has been, and still is, to mask the concrete quality by a surface treatment of stone or brickwork in which only those æsthetic problems arise with which experience has qualified us yet to deal. The effervescence and haste to demonstrate the elastic possibilities of the new method and material of which many examples are provided by our Continental confrères have interest and are characteristic, but I hope, and am sure, that the great and lasting future of the concrete architecture that is now taking root downwards amongst us

will bear fruit of permanent charm, and that being our anticipation it certainly will embody and express a due appreciation of those great principles the fruits of which are offered to us by the historic monuments of architectural art."

HOUSE AT WOKING.

This house was designed by Messrs. Marshall E. Walker, A.R.I.B.A., and Arnold Harwood. The walls are built hollow, and of red bricks of varying shades, with the corners of dark grey brick. The roof is of dark tiles of uneven surface, and the external woodwork is stained; the windows are fitted with iron casements.

The front entrance leads through a small lobby into a square hall with panelled dado and angle fireplace in 2-in. grey bricks and basket fire. The drawing-room is 23 ft. 3 in. by 15 ft. 9 in., with a bay in addition overlooking a small stone-paved garden. A verandah, 12 ft. 6 in. by 9 ft., is approached

from the drawing-room. The dining-room is 18 ft. by 15 ft., with a large bay and angle (the latter in 2-in. varied bricks) in addition; the ceiling has dark-stained beams and the woodwork is in oak. The offices are carefully planned and roomy, and a back staircase is provided. On the first floor are four bedrooms and a dressing-room, the largest bedroom being 18 ft. by 15 ft. without the bay window; this bedroom has a specially-designed fireplace of Dutch bricks and tiles.

On the second floor are three bedrooms, the largest 16 ft. by 13 ft., with box and cistern rooms. Most of the bedrooms have good hanging or store cupboard leading from them.

NATIONAL PORTRAIT GALLERY.

Amongst the most recent acquisitions are the bequests of a portrait in oils, by John Jackson, R.A., of Samuel Prout (1793-1852), water-colour painter, and a portrait in oils, by George Clint, A.R.A., of Thomas Goff Lupton (1791-1873), mezzotint engraver.

THE LONDON ARCHITECT'S PROCEDURE.

MANY a young architect, starting practice in London, must have felt that his training has left a gap in the knowledge required of him. He is presumably well equipped as regards his qualifications for designing and superintending the execution of his conceptions, but he has not, as a rule, had an opportunity of familiarising himself with the numerous questions of procedure that arise both before and during the carrying out of his work. It is with a view to supplying this deficiency that we have decided to give the following notes on London procedure with the District Surveyor.

Responsibilities of Building Owners.

Conditions under the various London Building Acts affecting the interests of building owners grow more complicated as time goes on and fresh legislation is enacted. Every London architect realises the necessity of keeping all such conditions clearly in mind, so as to leave no loophole for any suspicion of negligence on his part as a professional adviser. It is true that in the majority of cases the immediate legal responsibility attaches not to the owner, but to the builder. But, apart from the fact that the builder's responsibilities may, in the event of his bankruptcy, for instance, devolve upon the owner, cases are rare in which the expense consequent upon any infringement of the Acts can be fixed upon the builder; and there are many responsibilities attaching directly to an owner after his building is completed and in occupation.

Acquiring a Building Site.

Amongst various questions affecting the choice of a site are those arising under the Act of 1894. Before advising his client to acquire a site the architect will naturally consider what can be put upon it. He will ascertain if it is situated in a street formed after August 7, 1862, as affecting the height of his building, or if in a street formed after January 1, 1895, as affecting the position of the open space required at the rear; and with regard to these questions he will read especially sects. 41, 47, and 49. If there are old buildings existing on the site, he will probably prepare plans of these to be certified by the District Surveyor.

Such plans need not show the internal arrangements of the old buildings. It should be remembered that the District Surveyor's certificate applies only to the extent of the buildings. It does not, for example, apply to the positions of windows; so that, in the matter of ancient lights, however valuable certified plans may be to establish the rights of a servient owner, they are of little use for purposes of a dominant owner.

The right to rebuild to an old frontage line which is nearer than 20 ft. from the centre of the street must be maintained by means of certified plans; and, although this is not compulsory when the frontage is more than 20 ft. from the centre, the District Surveyor's certificate affords valuable evidence.

Notice to District Surveyor.

The notice which the builder is required to serve upon the District Surveyor should first be perused if not drawn up by the architect. Whether in the case of a new building or of alterations to an existing one the intended use of the building must be stated in the notice, otherwise the District Surveyor will not know how the rules of the Acts are applicable; and, although the architect may feel very sure of having complied with all rules, he should fix due responsibility upon the District Surveyor by making him fully cognisant of the facts of the case.

A prudent architect will obtain from his client written instructions as to the intended use of the proposed building. Sometimes the future use is dependent upon uncertain opportunities of letting or selling the property, and in such cases the building must be so designed that it may lawfully be used for any purpose for which it may be

required. A building, for instance, that may be let either for purposes of wholesale or retail trade must be constructed as a warehouse, and must also have the open space at rear required for domestic buildings. In such cases the alternative user should be stated in the builder's notice to the District Surveyor.

The importance of close attention to all such questions as the above will be realised when it is remembered that an owner is liable to penalties if he allows his building to be used for purposes other than those for which it is legally adapted; and it is extremely desirable that, in the event of a prosecution, an offending owner should not be able to impute negligence to his architect. In the Act of 1894 rules for habitable rooms under sects. 45 and 70, rules for the separation between the trade and dwelling-house portions of a building under sect. 74 (2), rules as to conversion of buildings under sect. 211, and the various penalties provided under sect. 200 may be studied with advantage.

Every building notice is deemed to be evidence as against the builder of the nature of the proposed work; but it is also evidence that the District Surveyor has been duly apprised of certain facts. In order, therefore, to be prepared to prove service of such a notice the architect will insure its being sent by registered letter, and he will, of course, retain a copy of it.

Deposit of Plans with District Surveyor.

In the case of the alteration or erection of a public building, plans showing the proposed construction are required to be deposited with the District Surveyor. They should accompany the building notice, and the latter should contain some reference to them, such as "erection of a public building to be used as a concert hall, in accordance with plans herewith sent," etc.

Except in the case of metal-framed buildings plans of buildings other than public are not required to accompany a notice, though there are cases where it is convenient to illustrate a notice by means of plans.

With metal-framed—usually steel-framed—buildings the architect should supply the plans and copies of calculations of loads and stresses which are required under the London County Council (General Powers) Act, 1909, to be furnished to the District Surveyor. It will be observed that when notice is served in respect of the proposed work a preliminary fee equal to one-fifth of the whole fee chargeable, has to be paid. There is no difficulty in calculating the amount payable upon a new building. Upon additions or alterations, however, the amount has to be calculated upon the portion of the building structurally affected, and this is a matter requiring the architect's attention.

Certificates by District Surveyor.

A builder should not be authorised to cut away any chimney-breast in a party wall unless he can produce the District Surveyor's certificate that this may be done without injury to any building. Such certificate may be of value in the event of complaints by adjoining owners of damage to their property, and the architect should therefore not allow such works to be done upon mere verbal permission of the District Surveyor.

Upon the completion of any public building or of any alterations to one, the architect should obtain the District Surveyor's certificate approving of the construction; and the owner should be warned that, in the absence of such certificate, the building cannot lawfully be used. His attention should be drawn to this rule under sect. 78 of the London Building Act, 1894, and to the penalties for its infringement provided in sect. 200 (11) (j). Of course, in the event of any dispute with the District Surveyor a certificate of approval might be obtained from the Tribunal of Appeal.

Cases of Difference with the District Surveyor.

Preliminary discussions with the District Surveyor upon proposed works are, of course, quite unofficial, but they are often of great assistance to an architect, who learns by them that in different districts different views upon some points prevail. It may happen

that the architect finds himself at variance with the District Surveyor about some particular work which his client wishes carried out. Of course, it is possible to carry out the work in dispute, leaving the District Surveyor to take whatever proceedings he may think necessary. But a prudent architect will hesitate to risk his client's money by carrying out work which may have to be altered or taken down. The best course is for the architect to serve the District Surveyor with a separate notice, clearly specifying the intended work in question. On receipt of this the District Surveyor, if he objects, will serve upon the architect a notice of objection, which he could not do if the matter in dispute did not appear upon the face of the notice, but was only discoverable from the plans. Within fourteen days after service of the notice of objection the architect may appeal to a magistrate to overrule or confirm the decision of the District Surveyor.

If any requirements of the District Surveyor with respect to steel-framed buildings seem to be unreasonable, an appeal to a magistrate may be made within fourteen days from the Surveyor's notice of such requirements.

When a structure is condemned by the District Surveyor as being dangerous, and the owner is served by the London County Council with a notice requiring him to take down or repair the structure, it may happen that he wishes to dispute the necessity of such requisition. When this is so he may, within seven days from receipt of the notice, write to the Council, requiring that the subject be referred to arbitration. It will rarely happen that an architect can advise his client to take this course, but he should warn him of his position before allowing the seven days to elapse.

Altered Conditions in Buildings: District Surveyor to be Notified.

Few building owners are aware of certain responsibilities attaching to them under the Building Acts in circumstances where few would think of consulting a professional adviser.

Rules as to the uniting of buildings formerly contained in sect. 77 of the London Building Act, 1894, were repealed and re-enacted with some modifications in the London County Council (General Powers) Act, 1908. Sect. 18 (3) provides that when buildings which have been united cease to be in one occupation the owner or owners shall forthwith give notice of this fact to the District Surveyor, and shall cause all openings made in walls for the purpose of uniting the buildings to be stopped up and all timber in the walls not in conformity with the Act to be removed. A penalty of 5*l.* attaches to the infringement of these rules, but it may be further remarked that, should loss of life occur by access of fire through openings unlawfully remaining in a wall, a far heavier responsibility would rest with the building owner.

Fees to District Surveyors.

The fees payable by the builder to the District Surveyor upon completion of the work should, of course, be included in the contract sum, but the owner is legally liable to pay them in the builder's default. Hence he might, in certain circumstances, pay them twice over; to avoid which contingency the architect should, before granting his final certificate, demand production of the District Surveyor's receipt.

KING EDWARD VII. MEMORIAL, DELHI.

The full amount, 33,300*l.*, has been subscribed for the All-India Memorial at Delhi. Sir Thomas Brock, R.A., is appointed as sculptor of the equestrian statue, which will be erected on a site between the Alexandra Gate of the Fort and the Jumma Masjid.

SIR WILLIAM Q. ORCHARDSON MEMORIAL.

The memorial to the late Sir W. Q. Orchardson, R.A., will consist of a reproduction of the bust of the artist, which was sculptured by E. Onslow Ford, R.A. Mr. W. Reynolds-Stephens has been asked to make a design for a tablet to be set in the "Artists' Corner" of the crypt of St. Paul's Cathedral.

GENERAL NEWS.

Professional Announcements.

Mr. Thomas Sladdin, F.R.I.B.A., architect, of Salisbury, Rhodesia, has changed his address since 1910 to P.O. Box 103, Salisbury, Rhodesia.

The partnership between Mr. A. E. Cogswell, architect and surveyor, Prudential-buildings, Portsmouth, and Mr. J. E. Rake having been dissolved, Mr. Cogswell has commenced practice on his own account.

Royal Academy of Arts.

The Keepership rendered vacant by the death of Mr. E. Crofts, R.A., has been filled by the election of Mr. A. C. Gow, R.A.,

Lecture Theatre, Royal Institution.

An extensive scheme of improvement and decoration has been carried out, *ex impensis* Sir James Dewar. The scheme comprises the substitution of mahogany for most of the painted deal work, a new plaster-moulded ceiling, the widening of the staircases, and additional electric lighting. The apartment is famed for its acoustical properties—Faraday said it was "almost perfect as a lecture-room." It was constructed in 1800 from the plans and designs of Thomas Webster, Professor of Geology, University College, who was then employed by Sir Joseph Banks and Count Romford as clerk of the works for adapting the premises in Albemarle-street for purposes of the Royal Institution. The Classic façade was added by L. Vulliamy forty years afterwards.

Waterloo Terminus Improvements.

On December 18 was opened to the public the new approach for vehicular traffic which forms part of the extensive scheme which is still in progress at the Waterloo terminus of the London and South-Western Railway. A broad and spacious roadway from Westminster Bridge-road supplants the old steep approach to the main line from York-road. The new road affords a direct access, with an easy gradient rate, to the platform level in front of the enlarged South Station. The former ascent from York-road is now closed, and all vehicles will leave the terminus by a spur-road to the Lower Marsh exit. The new road will ultimately be extended along the entire length of the station frontage now being made in Waterloo Bridge-road.

Cope and Mitre for the Bishop of Chichester.

A presentation has been made to the Bishop of Chichester, by parishioners in the diocese, of a cope and mitre made in the School of Embroidery, St. Margaret's Convent, East Grinstead. The cope was designed by the Rev. F. Geldart, of Woking; it is of cloth of untarnishable Japanese gold upon a white silk ground; the hood is worked upon white damask having a blue border; the orphrey is worked upon blue and green shot silk in elaborated tracery of green, red, and gold. The mitre is on white silk, edged with a blue border, in which is a running design of green and gold leaves with red insets. The mitre and the clasp of the cope are richly jewelled with sapphires, garnets, topazes, amethysts, emeralds, and moonstones.

More Diaries.

We have received from Messrs. Charles Letts & Co., Southwark Bridge-buildings, S.E., a parcel of some of the many excellent diaries which they publish. The reputation of the firm for the variety and suitability of their productions is well established, and it is evident, judging from the diaries before us, that Messrs. Letts can satisfy any ordinary—and often unusual—requirements in diaries. There are the kind of diaries with which most people are familiar, and in addition we notice the "Schoolboy's Diary," which has met with general acceptance, many of the large public and other schools, we are informed, having their own editions. A similar diary, the "Schoolgirl's," is issued for girls. Then there is the "Boy Scout's Diary," a new issue for 1912, and published under the direction of the Chief Scout; the "Gardener's Diary" is another new diary for 1912. The firm's diaries contain as usual the "Self-Opening Tablet," and also the 1,000*l.* insurance. This year the firm have made it possible for the public to register the insurance coupon with the stationer at the time they buy the diary, a convenience

and saving of trouble which the public will no doubt greatly appreciate.

The "City Diary and Almanack, 1912" is a useful work of reference to the City man, for it constitutes an up-to-date and reliable guide to the City in its many ramifications. It contains in particular a complete list of members of the Corporation; the names and addresses of the Clerks of the Guilds; particulars of the City Churches; and full information as to the personnel of the various municipal and parochial organisations of the one square mile. The "Diary" proper gives three days to a page, and is interleaved with blotting paper. The price is 1*s.* It is published at the *City Press* Offices, 148 and 149, Aldersgate-street, E.C.

The Post Office London Directory.

The Post Office London Directory for 1912 (Kelly's Directories, Ltd., 182-4, High Holborn, W.C.) made its appearance as promptly as usual and as much up to date as any previous issue. The remarkable accuracy of such a stupendous work, and the painstaking care which must be taken in its production, are the salient facts relating to a volume which may fairly be called indispensable, and which, it is difficult to realise, our forefathers, prior to some 113 years ago, were without the help of; and while London remains what it is one cannot think of a time when the Directory will cease to be published. In addition to the well known divisions of the streets, commercial, trade, and Court, there are others containing legal, Parliamentary, official, postal, clerical and parochial, conveyance and banking information. The Directory, with London county suburbs, can be obtained in one or two volumes, and it includes two excellent maps. The London Directory may be had in the following forms: Complete Edition, 32*s.*; Small Edition, 18*s.*, containing the Official, Commercial, Court, Parliamentary, Postal, and Banking; Commercial only, 12*s.*; Trades, 12*s.*; Streets, 12*s.*; Court, 5*s.*; Banking, 3*s.*; the London Directory and the County Suburbs Directory may be had, printed on fine paper, bound together in one volume, at the price of 40*s.*, or, printed on the usual paper, in two volumes, price 43*s.* 6d.

COMPETITION NEWS.

Parliament Buildings, Winnipeg.

H.M. Trade Commissioner for Canada (Mr. R. Grigg) reports that the Provincial Government of Manitoba intend to obtain plans at once for new Government buildings at Winnipeg, estimated to cost over 2,000,000 dollars (about 411,000*l.*). It is stated that the Minister of Public Works will invite sketch designs from prominent architects in the United Kingdom. Of these about five will be selected, and the competitors submitting them will be invited to make out full specifications and plans, from which a final choice will be made. The conditions may be seen at the office of the High Commissioner for Canada, 17, Victoria-street, S.W.

BOOKS.

Church Study. By M. M. PENSTONE. (National Society's Depository, Westminster. 4*s.*)

This book is intended for the school teacher and the amateur rather than for the architect, and must be judged from that point of view. It deals with the building, its furniture, and its officers, and does so very thoroughly.

It is one of the most satisfactory signs of the times that teachers are trying more and more to arouse the interest of their pupils in the world in which they live. Only by teaching the children can we hope to raise the artistic feeling of the nation.

As in most modern teaching, the author intends that the parish church should be visited and, if possible, lessons actually given on the spot.

The book deals with the history of the officers and rites of the church, as well as with the architectural details. With the former we have no concern here, except to say that the author is fair, tolerant, and historically accurate.

The book is remarkably thorough, and profusely illustrated with photos and drawings.

The latter are by Mr. John T. Lee, F.R.I.B.A. In the next edition we hope that certain defects will be remedied. Where illustrations of buildings or parts of buildings are given the name of the place should be mentioned. Where types of windows are shown this is not essential, though desirable, but drawings of church towers and a photo of a crypt lose greatly in interest when the name is not given. Illustrations are included of examples of later work, often neglected. Thus the fine view of the XVIIIth-century oak gallery and the fine three-decker pulpit at Whitby is especially interesting. The view of Baker's tomb at St. Bartholomew-the-Great is good, and should interest all Londoners.

The author states that the legs of a Crusader are crossed, and does not make it clear that any great benefactor of the Church might have the same privilege accorded them. There is abundant evidence that many men who never went on a crusade are shown with their legs crossed. Often it will be found that he built or enlarged the church.

The author mentions that in the reign of Edward VI. the Crown confiscated great numbers of chalices and patens, but does not state that Elizabeth ordered that these should be replaced. Though it is probably that the cost of replacing them had to be borne by the parish, yet it shows that the Queen had no sympathy with the plundering propensities of her predecessors. Similarly she dissociated herself from their iconoclasm by ordering the restoration of those monuments which had been damaged.

When modern work is shown it should be stated, and when old the approximate date. In the drawings of lecterns, stained glass, etc., it is not always easy for those who have not made a deep study of the subject to be sure whether the work is copied from old or new work. Of course, those who have studied these subjects much can tell at once, but it is not for them that the book is intended.

In dealing with the church plate some attention should have been given to the XVIIth and XVIIIth century patens, chalices, and flagons which still exist. It is far more likely that the children will see them pre-Reformation ones.

The author points out that church towers were used for defence; the following instances might have been given to help prove the statement. In 1010, after the disastrous rout of the East Angles, the Danes ravaged the countryside. At Balsham, Cambridgeshire, they slaughtered man, woman, and child. One man alone escaped by holding the narrow, winding stairway of the tower. Though these early towers had not the thick walls of the later Norman ones, yet they were strong enough to give some shelter to the inhabitants. The Danes were usually bent on plunder, and so "travelled light." They had no heavy war engines to batter down the walls.

The photo of the tower at Clymping, Sussex, showing one of these fortress towers, is of great interest.

The book is well arranged and accurate. It is based on modern methods of teaching, and should be of the greatest use in spreading a real appreciation of architecture past and present.

The Composition and Strength of Mortars.

By W. J. DIBDIN. (London: The Royal Institute of British Architects. Pp. 54, with forty-five diagrams and many sheets of tables. 5*s.* net.)

This is virtually Mr. Dibdin's report on the series of experiments upon lime mortars which he was commissioned to make in 1907 by the Science Standing Committee of the R.I.B.A., and forms a most valuable contribution to architectural empirical science. The greater part of the book comprises tabulated results of the various tests, together with a comprehensive series of diagrams.

The observations made, over 1,700 in number, deal with the following subjects:—

The tensile and compressive strengths of mortars when composed of white chalk, Dorking greystone, and blue lias limes mixed with five different aggregates in varying proportions.

The adhesive properties of stock and Fletton bricks and of various aggregates.

The composition and durability of ancient mortars.

The experiments under the first of these heads were made one month, three months, twelve months, and two years after mixing, and it is interesting to notice that in many cases both tensile and compressive

strengths sensibly depreciated between the last two tests, this depreciation being most marked in the case of poor mortars containing too large a proportion of aggregate, and being probably due to the loss of capillary attraction with the drying-out of the moisture. Another interesting result of the experiments is the refutation of the theory that in mortars of the same ingredients proportions of one to three may be depended upon to give the best results; as regards both tension and compression, and in one case has nearly three times the crushing strength of a similar mortar in the proportion of one to three. The selection of the best variety of sand for a particular matrix will, in many cases, be greatly facilitated by reference to the results of these tests, and the advantage or otherwise derived from the presence of clay is made clear in respect to the mortars tested.

Exigencies of circumstances forbade the carrying out of the intended tests upon brass, but German Government engineers supplied the necessary information from the extensive experiments which have been made in that country, and a very interesting chapter on the subject is included, which clearly shows that exceedingly powerful mortars result from a proper use of this material.

Tests for adhesion were applied to stock and Fletton bricks and five different aggregates, the lime used being uniform. The Flettons show greatly superior results in each test, their average adhesive strength being double that of the stocks.

In examining ancient mortars, samples were obtained from various localities and of representative periods, and the results of their analysis shows the weathering properties of a given mortar with greater certainty than the most careful laboratory experiments upon recently-made mortars can afford. The examination of these mortars strikingly confirms the deduction already made that the one-to-three rule in mortar making is by no means a reliable one.

One lesson among others this book must impress upon the minds of all who read it—the necessity for very careful reference to previous tests before the ingredients and proportions of a mortar for important works are specified. The wrong aggregate, or the proper aggregate in wrong proportion, may mean a mortar of very inferior quality to one just as easily obtainable.

CORRESPONDENCE.

Decoration of Chelsea Town Hall.

SIR.—The first article in your issue of December 22 has a heading which led me to hope that at last a real "Scheme of Decoration" was under consideration for a public hall.

I find, however, on reading it that the article related solely to the subjects and treatment of pictorial panels, and throughout the article these only are referred to when "a controlling scheme" is spoken of.

It therefore seems worth while to point out that a series of quadrangular panels, even when occupied by masterly paintings, do not by themselves constitute the decoration of an interior. The most passing acquaintance with the decorative works of the great Italian painters would show that in no circumstances could they think of dealing in this way with paintings intended to be decorative. They knew too well that detached pictures, however harmonious with each other, do nothing for the building itself. They knew that if the pictures were to perform a "decorative" function their colours must not stop abruptly at the edge of a panel, but must be also used to express the architectural forms, and extend the harmony beyond the confines of the picture to the building itself—of which it then became a part—possibly the most admirable part.

No artist of note, from Giotto and his school onwards to Michelangelo, or even to Correggio and Pordenone, treated decoration as a question of separate pictures. The pictures were the most interesting and beautiful part of the decoration in which the accessory features played the important part of connecting them with the building which they helped to adorn. This is a fact which the painter of to-day seems to ignore. J. D. CRACE.

The Policy of the R.I.B.A.

SIR.—With reference to my motion for Associates having equal representation on the Council to that of Fellows, I have postponed bringing it forward at the meeting at the Institute on January 8 next, inasmuch as the great pressure of other business at that meeting will prevent its proper discussion and adoption.

I shall, however, bring this motion before the business meeting at the R.I.B.A. on March 4 next, when I still hope that all Associates interested in the subject will attend and support it.

Your correspondent "Swallowite," in his letter published in your last week's issue, is quite wrong when he says that I termed the Licentiates "no class." I have never used such an expression, neither have I ever referred to any "back door" as a means of entrance to the Institute. I have always aimed for far higher ideals than this, nor do I think it advisable to talk about any "line of attack" as he does; but we must all endeavour to strengthen our forces and bind them together, and so obtain our just demands by constitutional and logical methods.

HORACE T. BONNER, A.R.I.B.A.

SIR.—I have read with considerable interest the recent letters of complaint by various Associates, and from the tone of them and from the views expressed by many men in conversation it seems to me there is a deep-rooted feeling of discontent which is not confined to Associates, and it is hoped that a large number of members will attend the business meeting on January 8 and voice their complaints against the suicidal policy of the Council in no uncertain manner. At the same time I wish to offer a protest against the attitude of certain Associates; they seem to wish to join together with common complaint, excluding the Fellows. This dividing of class from class is not only regrettable, but it is quite unnecessary; the object in view is the same for Fellows and Associates—we wish to preserve the status of the Institute and to defend it from attacks from without and within. F.R.I.B.A.

Architectural Assistants and the Office of Works.

SIR.—Mr. Dudley Ward, as representing the First Commissioner, in his answer on the 15th inst. to Mr. Noel Buxton in the House of Commons, when asked to "state the classes and the total number of architects employed in his Department," and "what number of them are Associates or Licentiates of the Royal Institute of British Architects," makes no mention of the class numbering forty termed "Architectural Assistants," of whom nineteen are Associates or Licentiates.

This omission is all the more curious seeing that Mr. Dudley Ward had his attention drawn to this class very distinctly by Mr. Philip Snowden in the House of Commons as recently as the 24th ult., and he then stated he would consider establishment for "a number of professional men engaged in the Office of Works termed 'Architectural Assistants,' who possess their Board's certificate of technical efficiency, some of them being members of the Royal Institute of British Architects, Surveyors' Institute, and allied societies." And, more recently still (on the

7th inst.), he replied to Mr. Philip Snowden in the House that "the desires of each member of the 'Architectural Assistants' class should be ascertained, so that all of the class shall have the opportunity of being placed upon the established list."

Of course, the reply under review was furnished by those in office under the First Commissioner, and upon whom he relies for all his facts, and the list thus supplied to him being incomplete, was incorrect, and, therefore, may we not assume that the cost of the staff in salaries, therein stated to be 534 per cent., to be also equally incomplete, and, in fact, has been so stated to be, to the extent of another 3 per cent., by the President of the Royal Institute of British Architects?

THE WHOLE TRUTH.

The Statue of Achilles.

SIR.—As Mr. E. Swinfen-Harris rightly remembers, the Achilles statue was standing before the Crimean War. The mistake arose from a confusion of military heroes, the statue having been erected to the Duke of Wellington in the year 1822. From a public advertisement soliciting subscriptions from the ladies of England towards erecting a monument to the Duke of Wellington one learns it was intended that this would take the form of "a facsimile of a statue by Phidias, representing Alexander the Great taming Bucephalus." This was a trifle unfortunate, as Phidias must have been dead quite a hundred years before Alexander the Great saw the light. The Committee got out of the difficulty by putting the Duke's head on the statue and introducing him to the public as Achilles. The author is unknown, but Westmacott stuck on the sword and shield. It was cast from cannon taken from the French, but when brought to the Park on June 18, 1822 (the anniversary of Waterloo), it could not pass the gates, and about a month elapsed before it was properly placed. It was uncovered on July 14, and met with the usual outburst from the public; a certain celebrity of the day going so far as to inform the shocked readers of the *Morning Herald* that "if his mother, who was a Newcastle woman, had caught any of her children looking at such an object she would have soundly whipped them." What the ladies who subscribed for the statue thought may be better imagined than described, for it is said that from the day it was uncovered the Wellington Drive was abandoned.

HERBERT SHEPHERD, A.R.I.B.A.

Suburban Gardens.

SIR.—As an artist who for some years has studied with much interest the question of the beautifying of the innumerable small and ugly suburban gardens the monotonous type of which exists in thousands I have been greatly encouraged by the many letters of appreciation I have received of my book, "My Old World Suburb." Since you were kind enough to notice it favourably on its publication last year many of the public have adopted my plan of reform in their small gardens, and I have just received a typical letter from a lady enclosing a photograph of her small town garden which she has reformed (last autumn) on these lines. One point strikes me—that were the garden-owner to consult an expert at the outset the result would undoubtedly be better still.

G. HILLYARD SWINSTEAD, R.I.

Garden in Bedford.

EDITORIAL SUMMARY.

The leading article, "The Architect's Clerk," is suggested by the papers and discussion at the Royal Institute of British Architects on the 18th inst. on the "Newer Responsibilities of Architects."

A second article, entitled "The Woman in the Case," deals with the possibilities of architecture as a profession for women (p. 766).

In "Notes" columns (p. 767) will be found observations on: "The Guildhall Improvement Scheme"; "The Wellington Monument in St. Paul's Cathedral"; "London University"; "The Care of Art Treasures"; "Our Next Issue."

A report of a meeting of the Nottingham Architectural Society appears on p. 768. A paper was read by Mr. W. H. Taylor entitled "Some Notes on the Law Relating to Building Schemes."

At a meeting of the Concrete Institute in June last Professor Beresford Pite read a paper on "The Aesthetic Treatment of Concrete." The paper is printed in full on pp. 769-772.

An article entitled "London Architects' Procedure" appears on p. 773.

Book notices (p. 774) are: "Church Study"; "The Composition and Strength of Mortars."

In Correspondence columns (p. 775) will be found letters on: "The Decoration of Chelsea Town Hall"; "Architectural Assistants and the Office of Works"; "The Policy of the R.I.B.A."; "The Statue of Achilles"; "Suburban Gardens."

The monthly illustrated review of Engineering (p. 777) contains: "The Sitter Viaduct, Switzerland"; "L.C.C. Regulations as to Reinforced Concrete Buildings"; "Foundation Loads"; "Homogeneity of Beton"; "Reinforced Concrete Bridge at Cork"; and "Applying Cement Mortar by Compressed Air."

The Building Trade Section (p. 784) contains: "Factory and Commercial Property Sales, 1911"; "The Employment of a Specialist"; "The Budget and the Building Trade"; "Edinburgh Master Builders' Association"; "Projected New Buildings in the Provinces."

In "Legal Column" (p. 787) will be found some remarks on "Water Charges."

MEETINGS.

FRIDAY, DECEMBER 29.

Junior Institution of Engineers.—Visit to the factory of Messrs. Otto Mondel, Ltd., margarine manufacturers, at Southall. 3 p.m.

WEDNESDAY, JANUARY 3.

Institute of Builders (Koh-i-noor House, W.C.).—Mr. A. W. Gattie on "How to Cheaper Transport," with reference to the Building Trade. 4 p.m.

THURSDAY, JANUARY 5.

Junior Institution of Engineers.—Presidential Address by Commandatore G. Marconi, on "Engineering Considerations in Wireless Telegraphy," has been postponed.

ILLUSTRATIONS.

Royal Academy Schools.

LAST week we illustrated the designs of Mr. Binning and Mr. Bucknell, submitted in the Gold Medal and Travelling Studentship Competition, and this week we reproduce the drawings of Mr. Adrian Berrington and Mr. John C. Rogers. The article in our issue of December 15 should be read in connexion with the work of these and other Royal Academy students.

Since Mr. Berrington's design for an "Open-Air Bath," drawn when he was a student of the Liverpool School of Architecture, was reproduced in the *Builder* (1906) his work has become familiar to our readers. His design for a "Loggia in a Public Garden" obtained for him the Travelling Studentship (60*l.*) of the Royal Academy last year, and his sketches made during his tour in Scotland were much admired when shown recently in the Exhibition of Students' drawings. His unsuccessful design for the Gold Medal, 1909—"A Nobleman's Mansion"—was illustrated in the *Builder*, April 14, 1911.

Last year Mr. John C. Rogers obtained the Silver Medal for his Measured Drawings, "The College at Westminster School"; these were illustrated in the *Builder*, May 19, 1911.

FIFTY YEARS AGO.

From the *Builder* of December 28, 1861.

Metropolitan Improvements Hopeless.

LONG though it be since complaints have been made of the numerous straits and incongruities of the London thoroughfares, but little has been done to remedy the palpable evils which obstruct traffic. Grand things are projected, such as the stupendous sewage scheme and the embankment of the Thames; but great improvements might be made by only attending to small matters; and important easements might be afforded to the incessantly rolling multitude by only opening small straits and removing obstacles from the causeways of ancient intercommunication.

If alterations were turned to improvements

in the old thoroughfares—to abating nuisances where they exist, to widening the choked gorges of such routes as Holborn, Chancery-lane, the Strand, clearing an opening northward, from Clement's Danes, by Russell-square, to Hampstead-road; striking out a leading line from London-bridge, on the south side, to Westminster (giving vent to all the intermediate bridges); then Londoners would acknowledge that some *real regard* was shown for improvements, and that the expense of the Board of Works was not wholly thrown away.

The localities susceptible of improvement within a City range of 50 square miles are very numerous; the means for amendment are without stint: the requirements should not then be thought beneath the care of a minister who could easily find a modern Æmilius to illustrate the office of Ædile.

MONTHLY REVIEW . of . ENGINEERING.

Sitter Viaduct : Erection of Girder Span.

THE SITTER VIADUCT, SWITZERLAND. II.

[Continued from page 578.]

Timber Construction Tower.

AS the girder span, described in our previous article, had to be erected at the height of 98 metres above the bed of the river during the construction of the masonry piers, continuous staging could not be used economically; neither was it economically practicable to erect staging for half the span and to complete the work by building out on the cantilever principle. After having considered various alternatives, Messrs. Theodore Bell & Co. decided to build the large construction tower which drawings are given on page 778, and from this to erect the steelwork in the form of a double-armed cantilever, as represented above.

The tower is a noteworthy example of timber work, 97 metres high, and, including contractors' plant and appliances, weighed 2,500 tons. As the wind pressure, taken at 150 kilograms per square metre, involved a maximum force of 400 tons it was necessary to inquire very carefully into the stability of the structure.

Timber was adopted instead of steel, for the reason that the material could afterwards be utilised more readily in other works. But the designers had to encounter the difficulty that no precise records were available, showing the distribution of forces on a framed structure of such unprecedented dimensions, and, besides, it was very important to keep to the minimum movements of the working platform, in order that the erection of the steelwork could be conducted with the required degree of precision.

With the laudable desire of leaving nothing to chance, the firm constructed large models of the principal elements and tested them under hydraulic pressure. This investigation furnished interesting data on the deformation and the limits of resistance of the framework, and from the results so gained were deduced the fundamental data of the calculations for the tower.

Briefly described, the work comprises a tower 74.80 metres high, surmounted by an enlarged head, carrying at the height of 98 metres a working platform equipped with a travelling crane and other machinery. The eight main uprights of the tower were securely anchored into masonry foundations, four of which were in the bed of the river. As an additional precaution, the summit of the tower was guyed by eight 30-millimetre cables anchored to the foundation of the viaduct piers.

The construction of the tower required 3,500 cubic metres of timber, 42 tons of bolts, and 7.6 tons of steel plate in the form of washers.

At the base of the tower was a platform, 30 by 23 metres, for assembling steelwork and where a lift was installed for raising material to the upper working platform and a second lift for men employed. One lift with the vertical height of 98 metres was capable of hoisting a load of 12 tons, and the other, with the vertical height of 78 metres, was capable of conveying ten to twelve men. The upper and lower platforms were in telephonic communication.

In order to guard against fire risks the tower was provided throughout with water pipes and numerous hydrants, and was watched during the night.

Erection of Steelwork.

The first operation was the assemblage of the middle portion of the span, the lower members of which rested on cast-iron sand boxes. Upon the upper booms a travelling crane, weighing 80 tons, was erected. This crane, with the horizontal overhang of 36 metres, was moved forward as the work of building out the cantilever arms advanced, its weight being counterbalanced by steel bars stacked at the opposite end of the work.

Thanks to the sand boxes employed by the contractors, the ends of the girder span could

readily be adjusted as necessary, and they were particularly useful when the span had been completed and only required to be lowered upon the supports, one of which was 2 metres higher than the other. The four sand boxes with the effective height of 1 metre gave full latitude for this regulation. The only precautions requisite were to keep the sand thoroughly dry and the two parts of each box well lubricated, so as to facilitate their movement when sand was allowed to flow out for lowering the span.

The ends of the girders rest upon four enormous granite seats, each weighing 13,500 kilograms.

The total cost of the viaduct, which has been in service for several months, was 1,513,000 francs, representing 78 francs per square metre of surface.

We are indebted to Messrs. Theodore Bell & Co. for the photograph reproduced above.

L.C.C. REGULATIONS FOR REINFORCED CONCRETE BUILDINGS.

IN pursuance of the powers conferred by Parliament in 1909, the London County Council are about to make regulations with respect to the construction of buildings wholly or partly of reinforced concrete, and with respect to the use and composition of reinforced concrete in such construction.

At present the position of the matter is that the Building Acts Committee have prepared a draft code, embodying some of the alterations proposed by the Surveyors' Institution, the Institution of Civil Engineers, the Royal Institute of British Architects, and the Concrete Institute. This amended draft was brought before the Council on November 13 last, but was not then passed.

Sitter Viaduct: Timber Construction Tower for Steel Girder Span.

(From *Génie Civil*.)

After having come before the Council again for approval, the proposed regulations will have to be sanctioned by the Local Government Board and the four institutions mentioned above will have a second opportunity of putting forward any amendments they may consider to be necessary.

Unlike the purely optional recommendations of the Royal Institute of British Architects' Committee, the London County Council regulations will be rigidly enforced by law, for by the London County Council (General Powers) Act of 1909 they will become equivalent to an Act of Parliament.

Hence it is of the utmost importance to architects, building contractors, and the public that the nature and effect of the regulations should be very carefully examined and considered before the new code is brought before the Local Government Board for sanction.

Experience shows, especially at the present time, that it is not always an easy thing to make laws; but it shows that the amendment of existing laws is very much more difficult.

Two examples of the second case will serve our purpose. One is that of the unfortunate and short-sighted law which forbade any mechanically-propelled vehicle to be driven on the public highway at more than walking pace and without the attendance of a man in front waving a red flag to warn the public of possible disaster. For a generation this absurd law was in force, much to the delight of foreign nations and the injury of British industry.

The other example is that of the Building Regulations made at the instance of the Metropolitan Board of Works and perpetuated almost without alteration by the London Building Act of 1894, an enactment which has continued its harmful influence by prohibiting improved methods of building, until the

present year, and still bars the way of reinforced concrete construction.

All credit is due to the London County Council for their various efforts to remove obsolete and vexatious restrictions, and for their obvious desire to place steel-frame and reinforced concrete building construction upon a sound and reasonable basis.

So far as the latter method is concerned, it is particularly desirable that the draft regulations now awaiting approval should be of scope sufficiently wide to permit the introduction of improved materials and improved methods without involving the tedious delays invariably accompanying any effort to amend existing laws and regulations.

As we show later, there are some clauses in the new regulations proposed by the County Council which indicate an undesirable lack of foresight and elasticity, and we hope that the instances mentioned will receive attention not only by the technical advisers of the Council, but also by the professional societies cited in the Act.

In the subjoined notes we follow the order of the draft regulations as printed for consideration by the County Council.

Part I.—General.

The definition of reinforced concrete in paragraph (1) states that the reinforcing metal shall

(a) Be sufficient to take up all the direct tensile stresses;

(b) Assist in the resistance to shear;

(c) Assist in the resistance to compression where necessary."

Line (a) should be amended by omission of the word "direct," for direct tensile stress is rarely contemplated in reinforced concrete design, and the Council should provide for all tensile stresses, and not merely one very unusual variety, to be taken up by the

reinforcement. Our amendment would make the definition cover tensile stresses due to direct pull, to flexure, and to the combination of flexure and shear.

Line (b) suggests that the Council have fallen into the common error of confusing shear with tension on diagonal planes in beams. Whether they have done so or not is not perfectly clear.

Paragraph (3) states that "all floors and staircases (together with their enclosing walls) shall be constructed throughout of fire-resisting materials, and be carried upon supports of fire-resisting materials." This paragraph appears to have been transferred from the regulations for steel-frame buildings, where also it is stipulated that the construction shall be "throughout of fire-resisting materials," the phraseology clearly forbidding the use of structural steel or reinforcing steel in floors, staircases, staircase walls, and their supports. This cannot be intended, and the paragraph ought to be worded properly so as to convey the true meaning of the Council. Why not simply say that the structural details in question shall be of fire-resisting construction?

Part II.—Data.

The paragraphs applying to floor and roof loads are similar to those in the regulations for steel-frame buildings and require no comment, and the same remark applies to the paragraphs concerning wind pressure, but in paragraphs (19) to (46) we have various rules affecting computations for reinforced concrete structures.

Weights.—An opportune reminder is given to the effect that the dead weight of material must not be forgotten, the weight of reinforced concrete being stated at the reasonable average of 150 lb. per square foot.

Ratio of Span to Depth of a Beam.—Three paragraphs under this head amount to the somewhat ineffective stipulation that the ratio shall not exceed 24, but may exceed that value if the calculated deflection is less than $\frac{1}{250}$ of the span. Since the limitation of the ratio cannot in itself assume stiffness, it would be better to omit the point and to adopt instead a minimum proportionate deflection in terms of the span.

Bending Moments.—A clearly-expressed statement of formulae for the bending moments of beams under different load and other conditions will be found very convenient to all making use of the regulations. Another excellent feature is constituted by the simple and reasonable rules proposed for computing the bending moments in slabs differently reinforced and supported or fixed. The treatment of this section is far more practical and helpful in every way than the corresponding recommendations of the Royal Institute of British Architects' Report.

As an instance we may point out that while the latter says the bending moments in slabs are not to be taken at less than $Wl/12$, unless determined by exact calculation, the London County Council regulations allow values up to $Wl/24$, according to circumstances.

We do not overlook the fact that the rules given are necessarily quite empirical, for the simple reason that there is no reliable theory for the calculation of bending moments in reinforced concrete slabs, supported or fixed along all the edges.

Working Stresses.—This is an important section, the values applying to all structural members, with the exceptions provided for under the subsequent head of pillars. The working stresses allowed are as given in the tables which appear in full on the next page.

There are several points in these demanding comment. First, by "Direct compressive stress" we presume the reader is to understand what the word "direct" actually means, namely, the stress due to a direct push, and not what the same word is wrongly used to denote in Part I., line (a), in connexion with tensile stress.

Second, the expression "Extreme fibre stress" is loose, and should read *extreme fibre stress in compression*.

Third, the shearing stress of 60 lb. per square inch is absurdly low for simple shear, since it is now well known that concrete is quite capable of withstanding shearing stress intensity up to about half the permissible working stress in compression. But shearing stress is usually taken as the measure of indeterminable tensile stress on diagonal planes, and the fact is, as we have previously stated, that it is not safe to allow more than 25-30 lb. per square inch,

Stresses on Concrete.	Proportion by Volume.			Stress in pounds per square inch.		
	Cement. 1	Sand. 2	Coarse Material. 4	Cement. 1	Sand. 1½	Coarse Material. 3
Stress in pounds per square inch.						
Direct compressive stress.		600			700	
Extreme fibre stress.		600			700	
Frictional stress between concrete and steel.		100			100	
Shearing stress on plane section.		60			60	
Tensile stress.		Nil			Nil	
Stresses on Mild Steel Complying with the British Standard Specification.						
				Pounds per square inch.		
Direct compressive stress = mc , where m = modular ratio and c = safe working compressive stress (in pounds per square inch) on concrete surrounding the steel.				mc		
Direct tensile stress on mild steel in longitudinal members.				17,000		
Tensile stress in web-reinforcement.				12,000		
Shearing stress on mild steel.				12,000		

expressed in terms of shearing stress, as the working stress for diagonal tension. A still safer and more logical provision is to allow something for the tensile resistance of the concrete by demanding that the calculated shearing stress (representing tension on diagonal planes) shall be taken up by suitable web reinforcement. If the Council are wise they will make clear that the next line, "Tensile stress . . . nil," is to cover both longitudinal and diagonal tension by inserting the requisite words.

Fourth, it is not made clear whether the stress for mild steel denoted by the expression, "Direct compressive stress = mc ," is intended to apply solely to pillars and struts or to pillars and struts and beams, the uncertainty being due to the previously-mentioned misunderstanding on the part of the Council as to the proper use of the word "direct."

So far as pillars and struts are concerned, the values given by mc would be in accord with the elastic theory as accepted by many authorities in all parts of the world. But the values will not apply to the compressive stress c , on steel in beams until they have been qualified by a factor representing the relative levels of the neutral axis and the axis of the steel employed as compressive reinforcement; or unless the value for c has previously been qualified in a similar manner. For example, assuming the axis of the steel to be coincident with the compressed surface of the concrete, we should have: $c_s = mc \times 1$; while, assuming the axis of the steel to be coincident with the neutral axis, we should have: $c_s = mc \times 0$.

Fifth, the limitation of tensile stress in web reinforcement to 12,000 lb. per square inch is a matter requiring explanation in view of the admitted capacity of mild steel to withstand the safe working stress of 17,000 lb. per square inch. If proper methods of calculation are adopted there is absolutely no justification for this anomalous restriction.

In paragraphs (36) to (38), following the tables, there is further uncertainty following the ambiguous use of the word "direct." It is very desirable for this to be cleared up.

Grip Length.—With the exception of the points stated below, this section is judicious, particularly in requiring that "additional security shall be provided by fish-tailing the ends of the bars or by bending the ends of the bars into a J form or by mechanical bond."

The points against which an emphatic protest must be entered occur in the following sentences:—

"In the case of a bar having mechanical bond the least diameter of the bar may be measured from outside to outside of the transverse projections, provided—

(a) That the transverse projections are not further apart centre to centre than twice the normal diameter of the bar;

(b) That the height of such projections above the normal surface of the bar shall be at least $\frac{1}{4}$ in. on all bars exceeding $\frac{1}{2}$ in. in diameter, and $\frac{3}{8}$ in. on all bars not exceeding $\frac{1}{2}$ in. in diameter."

While (a) limits the spacing of projections, it does not say whether the limits are to be applied longitudinally or transversely, or both

longitudinally and transversely. Assuming the last alternative to be a correct interpretation, it would be quite open for anyone to employ a circular bar with three continuous ribs of any desired thickness projecting from the main body of the bar, and if the bar were of $\frac{1}{2}$ in. diameter the ribs could be made according to (b) to project to any distance exceeding $\frac{1}{16}$ in. Thus, taking the case of a $\frac{1}{2}$ -in. diameter bar with three ribs $\frac{1}{16}$ in. thick each, projecting $\frac{1}{2}$ in. from the body of the bar, the least diameter according to (a) could be measured at $1\frac{1}{8}$ in. We cannot see why the regulations should suggest so misleading a method of measurement. It serves no useful purpose and can only lead to confusion.

Moreover, the case we have assumed of a very undesirable kind of bar, complying with the terms of paragraphs (a) and (b), shows that, in addition to specifying minimum heights of projections, the regulations should also state minimum thicknesses and maximum heights for projections. They should also make clear the meaning of paragraph (a) and denote the main body of the bar by words more expressive than the somewhat inappropriate word "normal."

Modular Ratio.—In this section the ratio (m) of the elastic modulus of steel to the elastic modulus of concrete is arbitrarily specified at the value of 15, on the assumptions that the elastic modulus for all kinds of steel will always be approximately 30,000,000 lb. per square inch, and that the elastic modulus for all varieties of concrete will always be approximately 2,000,000 lb. per square inch.

There is no doubt whatever that for mild steel complying with the British Standard Specification, and for concrete made in accordance with the provisions of the proposed regulations, the value $m = 15$ is a very fair average. But in view of the fact that the alteration of existing laws is a very difficult and tedious operation, we should like to have some provision for altering the arbitrary ratio, $m = 15$, to suit any special qualities of steel that may hereafter be introduced, and to comply with any well-authenticated data that may be forthcoming to justify the acceptance of higher or lower values for the elastic modulus of ordinary or special qualities of concrete. By reserving power to exercise a little elasticity the Council will be able to avoid possible harm to an important branch of building construction, and will be placed in the position of being able to keep their regulations up to date in respect of this far-reaching ratio, to which the value now assigned with general consent is nothing more than an approximation, sometimes far below and sometimes far above the value obtaining in actual practice.

Part III.—Beams.

Paragraphs (48) and (49), demanding that "The least diameter or thickness of the longitudinal bars in beams shall not be less than $\frac{1}{4}$ in.," and that all other reinforcements in beams "shall be at least $\frac{1}{4}$ in. in diameter or thickness," are in direct violation of the fundamental principles of reinforced concrete design,

and their tendency will be in the direction of barring the way to improved forms of construction.

In order that the concrete in tension may be enabled to develop its full extensibility so as to make the elongation under stress (even though resulting in part from very minute and uniformly distributed hair cracks) very much greater than that of plain concrete, the steel employed as reinforcement must be in bars, rods, or wires of small section—the smaller the better from the theoretical standpoint. This being the case, it is clearly unwise to make any regulation calculated to shut out some methods and forms of reinforcement already in existence, or that may hereafter be devised to ensure closer adherence to theoretical principles. The same remarks apply also to the subsequent section on "SLABS."

Compressive Reinforcement.—As in the R.I.B.A. Report, no formulae are given for the design of beams with reinforcement in compression. The only guidance afforded is the statement that "the sectional area of the beam in the plane of the reinforcement may be assumed to be increased by fourteen times the cross-sectional area of the steel in compression."

This method of computation by the aid of what is termed an "equivalent section" may be understood by experts, but we are sure it will not be found useful to the average designer. There is far too much left to the imagination and to be ascertained by a special course of study, and a series of readily understood formulae is much to be desired.

Shear Reinforcement.—We have already commented on the misunderstanding repeated in the regulations with regard to shearing stress and tension on diagonal planes, and need only refer the reader to our remarks under the head of "Working Stresses."

Resistance Movements.—Paragraph (64) states the customary assumptions on which are based the formulae afterwards given for the design of beams. The basis is the same as that implied in the R.I.B.A. Report, but the assumptions are more fully stated.

Notation.—Following the example of the R.I.B.A. Committee, the Council have adopted the code of Standard Notation proposed by the Concrete Institute. This is a welcome development, and if the Institution of Civil Engineers also fall into line it may be taken for granted that use of the notation will become universal in this country.

Formulae.—Paragraphs (66) to (78) give equations for rectangular and tee-beams, virtually identical with the formulae of the R.I.B.A. Committee, but differently and more conveniently arranged. A point of considerable importance is the definite and exclusive adoption of this particular series of formulae by the Council. We agree that the straight-line theory, thus legalised to the exclusion of all other theories, is one that has found general favour on the Continent and in America. It gives safe results, and the formulae can be written in and reduced to very simple terms for everyday practice. Still, it must not be forgotten that other theories are in existence, some based on theory and substantiated by careful investigation, and others based on the results of long experience. Consequently, there is some reason in the argument that well-tried formulae should be officially recognised, and we must not lose sight of the possibility that powerful reasons may be forthcoming at a later date for the adoption of formulae interpreting more faithfully than those of the straight-line theory the actual behaviour of reinforced concrete beams. We adopt no partisan view in this matter, and simply propose that the adoption of the straight-line theory and resulting formulae should be qualified by words empowering the Council to accept other theories and formulae which they may approve from time to time. Such a loophole would act as a safeguard against any undesirable obstacle being built up in the way of future progress in design.

Part IV.—Pillars.

In the first paragraph of this section it is said:—"The term 'pillar,' when used in these regulations, shall be deemed to include any pillar, pier, post, column, detached support, or any other vertical compression member." This comprehensive and satisfactory definition covers all vertical compression members, but has no reference to compression members placed diagonally or horizontally. Therefore, the scope of Part IV. ought to be enlarged so

as to cover pillars and struts, no provision being made anywhere else in the regulations for diagonal or horizontal compression members. It is singular that the omission should have escaped the notice of the County Council and the four professional societies to whom the draft regulations were submitted. Our readers will remember that the R.I.B.A. Report is free from the same criticism for the reason that the corresponding section is entitled "Pillars and Pieces under Direct Thrust."

A good provision in paragraph (86) is one specifying a progressive diminution of the working stress with the increase of the ratio of length to the effective diameter, beyond the value $l/d = 18$.

Paragraph (87) determines the proportion of the maximum permissible pressure on pillars fixed in different ways, another useful statement.

The remainder of the section on pillars is very similar to the corresponding section in the R.I.B.A. Report except that it affords no guidance to the design of pillars under eccentric loading. In other respects it is preferable as allowing rather more latitude to designers and being more definite on points of practical detail. It is very much open to question, however, whether the Council have not been premature in adopting the distinctions drawn by the R.I.B.A. Committee as to the relative values of helical, circular, and rectangular, lateral reinforcement. At the present time there are no authoritative independent data which conclusively prove the attitude assumed. We are quite aware of all that can be said in favour of helical reinforcement, and equally aware of practical objections advanced against its theoretical advantages, and prefer to reserve our judgment. If the new regulations are sanctioned as they stand, the effect will obviously be to make all firms who submit competitive designs adopt helical reinforcement. Whether such a result is likely to improve reinforced concrete design is a controversial point. It seems clear to us that the County Council ought to proceed cautiously in accepting theories that are not unequivocally established.

Part V.—Walls.

This is a very welcome section permitting enclosing curtain walls of reinforced concrete to be built not less than 4 in. thick providing they are adequately designed, and enclosing curtain walls of brick in reinforced concrete framework to be not less than 8½ in. thick for the topmost 20 ft. and 13 in. for the remainder of their height. The section includes some necessary stipulations as required to ensure safety and proper construction.

Part VI.—Foundations.

Comment on this section is unnecessary, as it merely repeats the limits of pressure on earth and plain concrete which were given in the regulations for steel-frame buildings.

Part VII.—Protection.

The stipulations here made as to the protection of reinforcement from fire are the same as those of the R.I.B.A. Report, on which we commented favourably a short time ago.

Part VIII.—Materials.

Cement.—The adoption of slow-setting Portland cement in accordance with present and future British Standard Specifications will satisfy all concerned, but the arbitrary establishment of 90 lb. per cubic foot as the weight of cement is both unnecessary and inadvisable for reasons given on a previous occasion.

Sand.—There is nothing objectionable in the three paragraphs here included.

Coarse Material.—Under this head we are glad to find that coal residues, slags, and stone liable to disintegration are rigorously excluded. Another good point is the stipulation that aggregate shall be varied in size as much as possible within the permissible limits.

Concrete.—Although the section entitled "Working Stresses" provides for only two mixtures of concrete, we have a third mixture here in the proportions of 1:1:2, the working stress on which is 900 lb. per square inch if we take the safety factor stated under the head of "Pillars." It would be very inconvenient for users of the regulations to be obliged to search through three distinct sections before finding the information that ought to be collected together in one place, and we hope this clerical defect will be set right.

Paragraph (133), stating that "all three materials should be thoroughly mixed dry and then thoroughly mixed again after wetting," can only be intended to apply to hand-mixing. Nothing is said about the superiority of machine-mixed concrete, the quality of water, and the consistency of concrete.

Despite the statement in paragraph (119) that "the quantity of cement shall be determined by weight," the regulations deal throughout with proportions by volume. It would be far better to adhere to actual weight for cement and volume for sand and aggregate, with due regard to the proportion of voids in the two latter materials.

Steel.—Paragraph (135) says that all steel shall comply with present and future British Standard Specifications for structural steel, or shall be any other structural steel which may hereafter be standardised by the Engineering Standards Committee. This is excellent as far as it goes, but it must be remembered that the object of the Committee is to promote uniformity among similar materials and products in general use, and not to put an official seal upon any new and improved materials and products that may be introduced. Consequently if one or a few steel-makers should succeed in producing metal possessing qualities making it specially valuable for reinforced concrete work, it could not be expected that the Engineering Standards Committee would immediately standardise such metal, and the County Council, being bound by the wording of this paragraph, would be debarred from allowing the employment of the metal even if they believed such a course to be in the public interest. For these considerations we propose that the words "or which may hereafter be sanctioned by the Council" should be added to paragraph (135).

Paragraph (136) supplements the table of working stresses previously given, by stating that "the working tensile stress on such other structural steel which may hereafter be standardised shall not exceed:—

- (a) One-fourth of its ultimate resistance;
- (b) One-half the stress at the yield point;
- (c) Twenty thousand pounds per square inch, whichever is the least."

Regarding (a), we may point out that the ultimate resistance of steel is not a reliable factor in reinforced concrete construction, because for all practical purposes the limit of resistance coincides with the yield point of the reinforcement. Therefore it is more satisfactory to base the working stress on the stress at the yield point, as in (b).

The proposed limit of 20,000 lb. per square inch, stated in (c), is quite reasonable, but if anything somewhat excessive for steel with the elastic modulus of about 30,000,000 lb. per square inch, and for such steel provides an assurance that minute hair cracks in concrete, arising from the inability of that material to stretch to the extent demanded by the stretching of steel under stresses exceeding a few thousands of pounds, shall not develop into cracks of undesirable width.

But as the stipulation refers to future qualities of structural steel, it is impossible at the present time to fix 20,000 lb. per square inch, or any other limit of working tensile stress. For instance, if steel were produced with the yield point of, say, 60,000 lb. per square inch, and the elastic modulus of, say, 40,000,000 lb. per square inch, the working tensile stress of 30,000 lb. per square inch might reasonably be permitted, and we should like to see the County Council in the position of being able to act suitably, instead of tying their own hands by prophetic limitations.

The two sentences (a) and (b) in paragraph (137) refer to the dimensions of transverse projections on mechanical bond bars, and require amendment as indicated under the head of "Grip Length," where the same sentences occur in the regulations.

It should also be stipulated that the sectional area of steel in deformed bars shall be measured on the core, or main body of the bar, and nothing allowed for projections unless the latter are continuous from end to end of the bar.

Part IX.—Tests and Testing.

We are fully in accord with the provisions of this section, the effect of which will be beneficial in every way. There is only one suggestion to be made, namely, that tests should be conducted at the request of the District Surveyor on selected beams or floor bays, even in the absence "of any sign of weakness or faulty work"—see paragraph (143).

Part X.—Centering.

Apart from the American form of spelling here adopted, no comment is needed on the brief but explicit general directions here given.

Part XI.—Workmanship.

Although short, this concluding section conveys a number of useful hints to building contractors on the execution of work in reinforced concrete. It should be noted that paragraph (157) specifies circumstances in which tests, not mentioned in Part IX., must be conducted. This paragraph might conveniently be printed under the special heading devoted to "Tests and Testing."

Conclusion.

Supplementing the foregoing comments, we wish to say that the draft regulations bear evidence of having been compiled with much care and an obvious wish to provide safeguards for the public without placing unreasonable obstacles in the way of designers and contractors. Limits of space have debarred us from mentioning specially all the good points of the code, and we take this opportunity of saying that our suggestions have been made solely with the object of conducting to the further improvement of a draft which reflects much credit upon all who have been concerned in its production.

FOUNDATION LOADS.—III.

THE need for accurate determination of the safe bearing power of soil concerning whose resistance any doubt may exist could be illustrated by numerous examples of subsidence and other movements. We will here refer to only two or three typical cases, showing the undesirable developments which may take place if not prevented by measures dictated by ample information obtained before the commencement of building operations.

One of these is that of a massive structure covering a considerable area and having masonry walls, with footings of ample dimensions for soil of average quality. The site is on sloping ground, the back portion being a few feet higher than the level of the street in front. After completion of the building a crack appeared in one of the main walls, and continued to open until it extended through the full height of the wall and into the roof. This evidence of unequal settlement naturally suggested the desirability of investigation into the nature of the subsoil, as a result of which it was found that below the superficial layer of earth a bed of hard blue shale existed beneath a part of the site, and that the remaining part was supported by decomposed shale absorbing water readily and incapable of carrying considerable loads.

Another case is that of additions to a large church founded on alluvial soil of great depth. The old foundations had gradually settled down and come to rest many years before—a process which was repeated in connexion with the new works. The consequences were the development of various ugly cracks and much anxiety to the eminent architect commissioned by the authorities. The new foundations were doubtless perfectly safe in themselves, and there might have been no trouble if they had not been connected with older work. If careful tests had been made in advance it would have been quite possible to adopt measures for the consolidation of the soil and the distribution of the load so as to reduce settlement to insignificant proportions.

Again, we have in the history of a recent bridge founded on London clay one more proof of the necessity for the investigation of bearing capacity. The structure to which we refer was originally intended to have masonry arches, but after the abutments and river piers had been partly completed some doubt arose as to the advisability of imposing upon the soil the loads at first contemplated. Experiments were then made by the consulting engineer, and the final upshot was the abandonment of masonry in favour of steel arches. Had the tests been made at an earlier stage considerable outlay would have been saved, and the design of the structure would have been at once more graceful and better adapted to navigation.

Nothing elaborate in the way of apparatus is required for testing the bearing power of soil. The first thing to be done is to lay bare, at selected points on the building site, small areas of the bed upon which the

proposed foundations are to be constructed. This means the digging of small test pits, at the bottom of which a bearing surface should be prepared and levelled. The surface can then be loaded in any convenient manner, and careful observations taken of the settlement.

Speaking in general terms, the results given by a very small test area are apt to be misleading unless the operator possesses considerable experience in work of the kind. For instance, while a very heavy proportionate load might be sustained by a small area for a short time without appreciable result it does not follow that a large area would be capable of supporting the same unit load permanently.

We mention this point because load tests are sometimes made on a rather microscopic scale. In the case of the State Capitol of South Dakota, U.S.A., the soil was tested by excavating pits to the depth required by footings at a number of places on the building site. The bearing surface was prepared at the bottom of each pit under the supervision of the architect, great care being taken to dress and scrape the ground to a smooth horizontal surface. The testing apparatus consisted of a 12-in. square post, 6 ft. long, whose ends were cut perfectly square, and at the upper end of which was fixed a horizontal platform 6 ft. square, suitably braced by cleats and struts. Before loading the platform the foot of the apparatus was accurately seated, and levels were taken to ascertain the exact height of the platform. After application of the load observations were made to show the time when the settlement commenced and the extent of the movement. As the computed foundation load was $\frac{1}{2}$ tons per square foot the testing apparatus was loaded up to 3 tons, and the general result was a settlement of 3-16 in., but nothing more after about twelve hours had elapsed.

Even after the tests had shown the ample bearing power of the soil precautions were taken by no means at an end, for during excavation of the foundation trenches the ground was carefully examined with the object of discovering whether any soft places existed requiring special treatment. It was found that in some points the material was not so solid as could be desired, and to guard against any tendency to unequal settlement the footings were made continuous through the main walls, and in addition were reinforced by steel bars.

Another interesting illustration of careful investigation into the actual nature of the subsoil is furnished by the case of a bank building in Toronto, the architects having been informed that the site was on a thick bed of hard clay with almost unlimited bearing power. This estimate of resistance was based on the behaviour of adjacent buildings of no great height, and although these were perfectly safe and free from settlement, it was found that higher buildings with deeper foundations could not be erected with confidence unless special provision was made against settlement. At some remote period the site had formed part of a lake bottom, and consisted of clay hardened near the top to form a very hard crust, below which the clay was quite soft, resembling putty in consistency. In order to obtain reliable data tests were made with simple apparatus of the kind described above. No movement occurred until the load of $\frac{1}{2}$ tons had been imposed on the area of 1 sq. ft., when the measured settlement of $\frac{1}{8}$ in. rapidly occurred, and on the following morning had increased to $\frac{1}{4}$ in. while still under the same load. Nevertheless, the results so obtained were not considered to be conclusive as to the actual capacity of the soil, because the isolated area tested was not under the same conditions as an equal area beneath a large footing. Consequently, a supplementary test was made under conditions reproducing more closely those foreseen in the projected building. The apparatus used this time consisted of a 6-in. diameter pipe with a cutting edge driven about 8 in. into the clay. Inside the pipe an oak piston was inserted, its lower end being squared, the upper end projecting from the pipe was provided with a loading platform guided between pieces of timber. Pig-iron was placed on this platform, and no settlement occurred under the load of 5 tons per square foot. Therefore 4 tons per square foot was taken as the safe uniform load. The foundations were designed on this basis, and since the completion of the building in

the middle of the year 1907 no movement has been detected.

Having ascertained the safe bearing power of the soil in any given place where building operations are intended it will be necessary to take account of local and individual conditions before commencing the work of foundation design. The safe load per square foot for a church tower or factory chimney should obviously be much less than that for a lower structure.

HOMOGENEITY AND IMPERVIOUSNESS OF BETON.

THERE is only one way to make beton impervious, and that is to ensure that the amount of cement used exactly fills all the voids in the aggregates; and this can be attained only by proper calculation of these voids, and by ensuring homogeneity by means of thorough mixing.

Calculation alone will not ensure this result: for if the mixing be not thorough, voids unfilled with cement will remain, as shown by a proportionate excess of the obtained over the calculated volume of beton. Thorough mixing alone may ensure homogeneity, but if there be not sufficient cement to fill the voids empty spaces will result, which will lessen the imperviousness of the completed mass. If some portions of the mass contain too much cement and the others too little, as the result of improper mixing (and as often occurs with continuous mixing machines, with hasty mixing with batch machines or with careless hand-mixing), there will be in the mass spots or stripes which will be pervious to water.

The problem is usually to secure a high degree of resistance to pressure with maximum imperviousness; in beams it is also desirable to attain a good resistance to tensile stresses. Where imperviousness is the main object, this should be secured by a minimum amount of bond; but as usually attempted this desired result is not attained, simply from ignorance of or neglect of the proper proportioning of aggregates.

It is easy to see that if we have a number of incompressible spheres of the same diameter the voids between them will be of the same size, and that the proportion of each void to the volume of the spheres is independent of the diameter of these latter. It is equally easy to see that if we can calculate the size of the voids, we can fill a large portion of each one by a sphere, and that, by calculation or otherwise, we can find out what diameter of sphere will largely take up the smaller and more numerous voids between the two second larger spheres and the larger ones, and with each other.

What is true of spheres is equally true, although to a lesser extent, or to a less practically applicable extent, of all other regular forms, symmetrical about all three axes. It is also true, but in lesser degree, of less symmetrical forms, or of those which are symmetrical about only two axes.

This being the case, we can see that, while calculation of the voids between irregular masses, such as are used as aggregates in beton mixing, would be impossible, we can still obtain the most thorough filling of the voids between the larger pieces of stone by means of a much cheaper material than cement—namely, by smaller pieces of the same material, or by gravel or sand, by separating the various kinds of material and the sizes of each material, and making tests of various proportions of the different sizes and kinds. That particular mixture or proportion which results in the least increase of volume per weight, or in the greatest weight per unit of volume, is the one which leaves the least space to be filled with cement. It is also evident that up to a certain point (to be determined by experiment) the longer the various components are mixed the less the resultant volume will be.

In making these experiments the prices of the various aggregates should be taken into consideration.

An exact test of the voids in each kind of aggregate alone, or of each successive mixture, may be made by determining the volume of water required to fill all the voids in a measured vessel, full of the aggregates in question, but this will underestimate the amount of smaller aggregates or of cement necessary.

It will pay every contractor who has much to do with beton to measure out a cubic foot or a cubic yard of each material which he employs as

aggregate, and to determine, by the water test, the amount of smaller aggregate requisite to fill the voids therein. These tests should include not only each kind of aggregate and each size thereof by itself, but various combinations of different sizes of the same aggregate, and of two or more different materials of different sizes.

From the data thus tabulated (and which will, of course, be in volumes only) there should be made one of weights only, and of percentages of volumes and of weights, and these should enable the contractor to effect the most economical and the most satisfactory mixtures.

APPLYING CEMENT MORTAR BY COMPRESSED AIR.

WHEN concrete or cement mortar is applied as a protective covering to structural steelwork, the ordinary method is to surround the steel members with wooden forms and pour the wet mixture into place, some form of wire mesh or metal lath being employed as an anchorage; but a radically different arrangement is adopted in covering the steel work which forms an important feature of the reconstruction of the Grand Central Terminal yards of the New York Central and Hudson River Railroad in New York City. The essential parts of the "cement gun" there used consist of superimposed steel tanks forming two compartments, from the bottom of which a dry mixture of sand and cement, entirely under the control of the operator, is ejected by compressed air through a hose line carrying a nozzle at its discharge end. To this nozzle a second and smaller hose delivers a supply of water under pressure. The mixture of sand, cement, and water shoots out of the nozzle orifice with considerable force and impinges upon the surface of the steel work at which it is pointed. The mortar issuing in the form of a spray adheres to the surface of the steel and forms a coating which may be made as thick as desired. The discharge of the cement and the sand is regulated by varying the speed of a large feed wheel at the bottom of the lower compartment, which has deep notches around its entire circumference. This wheel is revolved by a small compressed air motor, and the small charges of the sand and cement mixture collected in the notches or pockets around the periphery of the wheel are fed successively into the rapidly-moving stream of air which issues from the inlet connexion. The material is blown through a curved outlet and passes thence into the hose line supplying the discharge outlet of the gun. The quantity of air required for working the gun depends upon the conditions under which it operates and the nature of the work to be done, and this is also true of the water used to hydrate the cement. The nozzle through which the mixture is discharged is designed to secure the thorough hydration of the cement, and that portion of it which is exposed to the abrasive action of the sand is lined with a composition that can be readily replaced as wear takes place. The water comes in contact with the mixture of cement and sand just as it passes through the nozzle, which is furnished with an annular chamber from which the water is sprayed under pressure from a series of carefully-proportioned orifices, and the hydration is begun there and continues until the surface to be covered is reached. The mixture issues from the gun nozzle at a velocity of about 350 ft. a second, and when it strikes the steel surface the large and coarse grains of sand rebound until the thin film of fine cement mortar which immediately adheres to the steel offers a plastic base in which the coarse particles become embedded; the mixture then builds up to any desired thickness upon this film. It is apparent, therefore, that when the swift moving stream of material hits the steel surface, and between that time and the instant when the mortar cover begins to build up, there is a tendency for the sand grains to clean off any rust after the manner of an ordinary sand blast. The deposition of the thin film of cement against the steel is advantageous as it secures an excellent bond and makes an efficient protective covering over the metal. As the cement is literally shot upon the steel a coating of great density is secured, while the force of the impact drives out all superfluous water and the concrete takes its initial set in a very short time, all possibility of voids or air pockets being avoided.—*The Times*.

REINFORCED CONCRETE BRIDGE AT UNIVERSITY COLLEGE, CORK.

SPANNING a branch of the River Le passing through the grounds of University College, Cork, a reinforced concrete bridge has lately been built from the designs of Mr. J. H. de Warrenne Waller, an old student of

the college now occupying a responsible position on the construction of the new bridge at Waterford. The new bridge is 72 ft. long over all, 68 ft. between abutments, and provides for a roadway 16 ft. wide.

The work is interesting, not because of the size or importance of the undertaking, but rather for the reason that its construction presented a problem commonly encountered

in practice—the construction of a bridge at moderate cost and of pleasing appearance.

The question of economy is answered by the statement of Professor C. W. L. Alexander to the effect that tenders had shown the cost of a steel bridge to be much greater than one of reinforced concrete, and to this there was to be added the cost of painting—probably 6*l.* or 8*l.* a year.

The aesthetic question is best answered by the view reproduced at the head of this article, where it will be seen that the bridge is of the girder type, with panelled sides and simple but effective latticed parapets. An arch would certainly have been more effective, but was impracticable owing to the low level of the ground at either side and the necessity for allowing ample clearance for the flow of water under the bridge.

The former structure on the site was constructed of Oregon pine and had been in service about twenty-seven years. Frequent repairs were necessary, the cost of maintenance having been 17*l.* a year, and finally the bridge became so decayed as to be beyond repair. The governors of the college then invited tenders from four steel firms, and alternative tenders to the design prepared by Mr. J. H. de W. Waller.

The subjoined particulars relative to the latter are taken from a paper read by the designer to the Institution of Civil Engineers of Ireland, to which body we are indebted for the illustrations reproduced in the present article.

Of the four steel firms invited, two sent in designs, one for a single span at the cost of 452*l.*, erected on foundations to be prepared by the owners and exclusive of masonry and road work, and one for two spans at the cost of 283*l.*, excluding cartage from the quay, foundations, centre pier, and road work. The reinforced concrete bridge cost 235*l.* 12*s.*, exclusive of the items omitted from the tenders for steel, thus effecting an initial economy of about 12½ per cent. and an annual saving of at least 6*l.* for maintenance.

System.—In this bridge the design and construction do not follow the lines of any patented system, but are based upon what the designer believed to be the most desirable features in several systems. Figs. 1 to 3 are an elevation, half-section, and half-plan, respectively, of the bridge.

The reinforcement consists of plain round steel bars, most of them bent and some straight, the ends of all being crooked for anchorage. Special bars were introduced over the centre support to provide resistance to stresses caused by continuous beam action. The bottom layer of bars are made to overlap 6 ft. at the support, to provide against tensile stresses that may arise if settlement of the central pier should take place.

The vertical spacing of the main bars, as shown in Fig. 2, is worthy of attention. The two sets of bars are not placed close together, as is sometimes done, but are kept separate by one inch of concrete to make provision for the transference of stress from the steel to the concrete, in accordance with the recommendations of many independent authorities.

The form of stirrup used in the main beams is one adopted by Mr. A. L. Johnson, a well-known reinforced concrete specialist in the United States. The stirrups are made from ¾-in. round steel rods, the upper ends being bent down so as to rest upon the upper edge of the beam mould (see Fig. 2) during the deposition of concrete, and therefore not only receiving support itself, but affording excellent means of holding the main bars in position.

The stirrups in the outer beams are a modification of those in the two inner beams of the bridge. In these only one side of the stirrup rested on the beam mould, and the other side was supported by means of a plank fixed temporarily, so that the cranked end of the stirrup hooked over it.

Both varieties of stirrup have the

FIG. 1. ELEVATION. FIG. 2. HALF-SECTION. FIG. 3. HALF-PLAN.

A Reinforced Concrete Bridge, University College, Cork. (From the Transactions of the Institution of Civil Engineers of Ireland.)

disadvantage that the ends penetrate through the outer surface of the concrete, thus leading to the creation of rust spots and affording loopholes for the entrance of moisture to the interior of the construction. These drawbacks are sufficiently serious to make the form of stirrup in question undesirable for adoption.

The last matter for mention under the present head is the question of the formation of joints between concrete already set and fresh concrete laid after the temporary suspension of work. The specification required the concreting of the deck slab to be done with only one vertical joint over the centre pier, but before the work was commenced the contractor undertook to concrete the whole in one operation, so as to avoid the joint altogether. In a small bridge such as that at Cork the alteration offered no difficulty.

Calculations.—After the bending moments had been accurately determined, the beams and connecting-slabs were computed by formulae based on the straight-line theory, and therefore essentially the same as those adopted by the R.I.B.A. Committee.

Considerably more web reinforcement was provided than the amount required by the formulae in order to bind the upper and lower parts thoroughly together. As the total cost of the stirrups was under 3*l.*, it is evident that little is to be gained by attempts at economy in web reinforcement, the proper course, in our opinion, being to allow nothing for the resistance of the concrete to web stresses, because the most important of these is tension on diagonal planes.

The bending up of the main bars was effected as near to the ends as was permitted by the reduction of bending moment towards the middle of the span, the angle of the inclined portions being 30 deg. to the horizontal.

Ornamentation.—The decorative treatment of the bridge is found mainly in the panelled sides of the outer beams and in the balustrade. The diamond-shaped lattice panels might certainly have been improved upon, although, as may be judged by the photograph, they have a rustic appearance by no means inappropriate to the surroundings of the bridge. On the middle pier of the parapet are placed the arms of University College, which were modelled in clay by Mr. J. J. O'Brien, of the Cork School of Art, and cast in neat Portland cement.

Concrete.—Subject to modifications governed by the actual percentage of voids in the aggregate, the concrete was mixed in the proportions of 1:2:4. The aggregate consisted of one part stone broken to 1 in. gauge, and two parts river gravel, from $\frac{1}{2}$ -in. to $\frac{3}{4}$ -in. gauge. Sand was supplied from the Ballinacree pits near Middleton, and cement was supplied capable of passing the standard tests, and in addition a tensile test on briquettes at the end of three days, and the usual pat tests for soundness.

By the addition of sufficient water the concrete was mixed so that it would flow slowly when agitated. It was poured into the moulds and worked into place with pieces of batten sharpened to a chisel point at one end.

In the central pier the concrete under water was deposited by the aid of a 6-in. square timber shoot. The concrete was put in dry at the top, the lower end of the shoot was then gently lifted off the bottom, allowing the concrete to flow into place, the shoot being kept well filled so that no concrete could fall directly into the water.

The lattice panels of the parapets were cast separately and afterwards fixed in position. They were formed in moulds made in halves, each half having a bevel of $\frac{1}{4}$ in.

towards the middle, so as to permit of ready withdrawal. The concrete for the panels consisted of crushed limestone and sand in equal proportions, and the reinforcement consists of $\frac{1}{4}$ -in. round rods placed near both faces of the work.

Each of the balustrades was cast in one operation, the lattices and ornamental shield were placed in position, the moulds for the piers, posts, and top rail were fitted closely around them, and the whole concreted up.

Foundations.—The two end supports of the old bridge were quite capable of carrying the vertical load of the present bridge, and needed little alteration. The river supports were cast-iron columns and unsuitable for the new design, but, being well founded, were left in place and incorporated in the central concrete pier. Between the cast-iron columns were driven ten 10-in. square pitch-pine piles, as shown in Fig. 8.

Road Surface.—Before laying the road bed the top of the deck slab was covered with three coats of coal-tar, thinned with petroleum. Then was added a layer of coke-breeze concrete, and over this paving of blue Staffordshire brick.

Cost.—The total cost of the structure was as follows, including fees for the design:—

Central pier, including 10 piles and 3 cubic yds. of concrete	£33 0 0
Bridge beams and decking concrete at 50s. per cubic yard	114 0 0
Reinforcement (total) at 14 <i>l.</i> per ton, including labour	55 0 0
Balustrade, 144-ft. run, excluding ornamental shields	42 8 0
Road filling and paving	52 0 0
Other items	84 17 0
Total cost	£401 6 0

The contractor was Mr. Antony Gaul, of Cork, who carried out the works to the satisfaction of all concerned.

Reinforced Concrete Bridge, University College, Cork.

THE BUILDING TRADE.

THE BUDGET AND THE BUILDING TRADE.

IN the recent debate on the Finance Bill the Chancellor of the Exchequer conceded that "sooner or later" there would have to be an inquiry into the system of land valuation. This is a course the necessity of which we advocated in a recent article on "Increment Value" (the *Builder*, September 8 last), and we can only hope that the inquiry may be granted sooner rather than later. In our article on the original Budget resolutions, May 1, 1909, we pointed out that it was the small householder who would be the chief sufferer under the new departure in taxation, and now that the taxes have been in operation for nearly two years abundant evidence is forthcoming that our opinion was justified. Increment value duty is levied upon an uncertain basis, and those who can ill afford to contest the Government valuations are those who have to bear the heaviest burden of taxation. Building development is also seriously hindered. The expressed intention of the promoters of the new taxes was that the increment value duty should only represent an improvement in the value of property apart from the enhancement by any act on the part of the owner. Even if this principle were strictly adhered to the assessment of the tax involves an expensive and vexatious inquiry where a building estate has been laid out, and thus not only is the demand for house property lessened, but building development is hindered. The attitude of the Chancellor of the Exchequer towards the building trade does not appear to be wholly consistent. When he introduced the new taxation he assured his hearers that it would stimulate the building trade and throw open land which was being "held up." In his speech in the House, however, on December 13 last, he is reported as having said that "he had great hopes of the increase in the valuation of land. The House was told that the Government were ruining the building trade, that nothing was being done in the trade, that speculative building was at an end, and there was no building of houses except on demand. He was not so sure that it was altogether a bad thing that they should only make the supply fit the demand." We have italicised this passage not only because it seems to contradict one of the intentions with which the new taxation was expressed to be introduced, but because it loses sight of the point which we have endeavoured to make clear above, that the demand itself has been checked, and checked severely, by the imposition of the new taxes.

In fairness we must add that Mr. Lloyd George himself denies that the building trade has been injuriously affected. In his Budget statement last May he contended that the figures relating to unemployment showed steady improvement (see the *Builder*, May 26), and again in the House he repeated the assertion. He relies, as we have frequently pointed out, on the figures contained in the *Board of Trade Labour Gazette*. These returns, however (as we showed in our issue for May 26), are only partial, referring to trade union carpenters, joiners, and plumbers, and, as was recognised in the actuarial report on Unemployment Insurance, taking no account of bricklayers, plasterers, painters' labourers, etc., to whom no unemployed benefit is paid.

If an inquiry is granted into the methods of valuation it is important that the position of various industries should be perfectly comprehended, and we have made the above observations because some misapprehension appears to exist as to the actual effect of the taxes on the building trade.

THE WEBB ORPHANAGE, CREWE

This orphanage has been erected in connexion with a bequest made by the late Mr. F. W. Webb, who was for many years the chief mechanical engineer to the London and North Western Railway Company. The building was designed by Mr. J. Brocke, F.R.I.B.A., and the contract carried out by Messrs. Normanton, of Manchester.

THE EMPLOYMENT OF A SPECIALIST.

THOSE who supply electrical and other equipment for new buildings in the course of erection are generally known to the lawyer who draws a building contract as "specialists." So long as his money is safe, the question who employs him is a matter of indifference to the specialist. He may be employed by the architect and paid by the builder without knowing or caring who the building owner is. A cheque for 100*l.*, drawn on the banking account of a solvent builder, is as good as the cheque of any building owner—perhaps better.

But, alas, solvency is not always met with in commercial affairs! Although he may have been solvent at the time he took the job on, the builder sometimes finds that he has grossly under-estimated. In the result, when the specialist sends in his modest bill he is met with the reply: "The builder filed his petition yesterday week." The specialist then casts round to find out whether he cannot pursue a remedy against someone who is solvent; and before doing so he must be able to show that he was employed either expressly or impliedly by that person. What, then, is the relationship created between the specialist and the building owner by the terms of an ordinary contract?

This matter was discussed very clearly and decided very definitely in a recent case tried by Mr. Justice Coleridge in the King's Bench Division. We refer to *Young & Co. v. White* (28 T. L. R. 87), where specialists for the supply of steelwork for a building were held entitled to sue the building owner as the real principal in respect of goods supplied through the building contractor. The facts were briefly these. The plaintiffs, who are specialists in steelwork, were asked by certain architects to tender for the steelwork on a building in the course of erection in Chelsea. The tender, which was to do the work for 229*l.*, was sent in. Subsequently, the architects informed the plaintiffs that they were going to ask the builders to send the order for the steelwork; and on the same day the building contract was signed between the builder and the defendant, who was the building owner. Subsequently, the builder gave an order to the plaintiffs to carry out the steelwork "in accordance with your estimate and drawing sent to the architects dated July 20, 1910." Before the plaintiffs could obtain from the builders the sum of 150*l.*, being the balance due on a certificate, the builder went into liquidation. Consequently, the specialists brought an action to recover the sum of 150*l.* from the building owner. Clause 20 of the contract provided that:—

"All specialists . . . executing any work or supplying any goods for which prime cost, prices or provisional sums are included in the specification, who may at any time be nominated, selected, or approved by the architect, are hereby declared to be sub-contractors employed by the contractor; but no such sub-contractor shall be employed upon the works against whom the contractor shall make what the architect considers reasonable objection, or who will not enter into a contract with the contractor upon terms and conditions consistent with those in this contract, and securing the due performance and maintenance of the work supplied or executed by such sub-contractor."

It was contended on the part of the plaintiffs that when they contracted with the builder he was really the agent of the building owner, and this was agreed to by the court. Mr. Justice Coleridge said:—

"Generally, if the specialist supplies the goods or does the work for less money than the provisional sum allowed for prime cost, the owners get the benefit, and are entitled to a deduction on the whole contract accordingly. If the specialist charges more, the extra amount is added by the builder, and is an extra on the contract. This shows that the owner gets the benefit or suffers the loss of any lesser or greater amount payable in respect of prime cost. This does not affect

the right of the contractor to his profit on the whole contract, which would probably include this item. Here the owner selects the specialist, obtains the tender, fixes the price, and has the real, if not the only, interest in the work that is done. The builder is not interested. If he unreasonably objects to the selection, he may be over-ruled. He may make no discount for himself, and if the owner chooses to pay the specialist direct he can do so. The form of the contract here and there may discover the builder apparently contracting as principal. The substance is that he contracts as agent where specialists are concerned."

It is difficult to overrate the importance of this decision having regard to the enormous amount of work which is done by sub-contractors and specialists in various parts of the country. For a thousand reasons the contractor may find it impossible to carry out the work which he has undertaken for the price named in the tenders and the specialist may be the first to suffer.

Nor does this decision of Mr. Justice Coleridge stand alone. He adopted the reasoning of Mr. Justice Channell in *Crittall v. London County Council* (75 J. P. 203). In that case the County Council contracted with building contractors for the erection of a building, for the purposes of which certain specialities were to be ordered from stated firms. Amongst the specialities were certain casements. Many months after the head contract was entered into, the building owners invited the plaintiffs to quote for the casements according to a specification, which provided that the amount of the accepted quotation would be inserted as "a prime cost item" in building contract; that the plaintiffs would enter into an agreement with the building contractor to execute and complete the casements within a given time under penalty; that the architect of the building owner would have power to vary the work; and that payment for the work should only be made on the certificate of that architect. The plaintiffs having quoted according to this specification, the building owners forwarded the quotation to the building contractors with a request that they should place the order with the plaintiffs. Subsequently, the building contractors informed the plaintiffs that they (the building contractors) had instructions to accept the plaintiffs' estimate for the casements. In an action by the plaintiffs to recover the balance of the price of these casements from the building owners, it was held that, while the contract for the casements was *prima facie* a contract with the building contractors, it was also a contract made, in fact, by the building contractors acting as agents on behalf of the building owners as real principals, because it was to procure something for their benefit, and that on the facts of the case the plaintiffs were entitled to judgment (*Hobbs v. Turner*, 1902, 15 T. L. R. 235, followed).

Of course, it is to be said that these decisions may be overruled by the Court of Appeal. If they are upset, every specialist and sub-contractor will probably endeavour to ensure that when he enters into his contract he has a right both against the builder and the building owner.

LABOUR IN THE BUILDING TRADE.

A JOINT movement for improving conditions of labour in the London district in the wood-working and furnishing trades has been inaugurated as the outcome of private conferences between the following trade unions:—

- Amalgamated and Associated Societies of Carpenters and Joiners.
- General Union of Carpenters and Joiners.
- National Amalgamated Furnishing Trades Association.
- Amalgamated Union of Cabinet Makers.
- Old West-End Cabinet Makers' Society.
- Progressive Union of Cabinet Makers (London).
- Perserverance Cabinet Makers' Association (London).
- Independent Cabinet Makers' Association (London).

A proposed list of new working conditions has been drawn up and presented to the London building trade employers. Although it is hoped to carry through the negotiations without a strike, the societies concerned have decided on a levy of 5s. per member to form a fighting fund. The new proposals include the substitution of a 47-hour week for a 50-hour week during thirty-nine weeks of the summer; the raising of the minimum rate of wages from 10s. per hour to 1s. per hour; the payment of time and a quarter for night work; and the payment of double rates for all overtime. The present practice is to pay time and a quarter for first two hours. It is also proposed that 1d. per hour extra be paid to men employed in fixing joinery which has been prepared outside the district, and that subletting for labour only be prohibited.

The bricklayers, plumbers, painters, and labourers employed within twelve miles of Charing Cross are also preparing programmes of new demands.—*Daily Chronicle*.

EDINBURGH MASTER BUILDERS' ASSOCIATION.

In the Royal British Hotel, Princes-street, Edinburgh, the annual dinner of the Edinburgh, Leith, and District Building Trades' Association was held on the 14th inst. About seventy gentlemen were present, and Mr. David Wilson, J.P., occupied the chair.

After the loyal toasts had been honoured, Mr. Robert Gilchrist, President of the Glasgow Masters' Association, proposed the toast of 'The Edinburgh, Leith, and District Building Trades' Association.' He said there was a great deal of depression in the building trade in the West. He appealed to masters to have regard to the fact that they must work together if they were to protect their interests.

In his reply, the Chairman said they had had during the year no serious trouble with any of the operative's societies. Any small differences which had been brought under their notice had been adjusted by conferences in a most friendly way. It was a matter for regret that they were unable to employ as many men as they should like to employ. The ranks of the unemployed contained many of the building trade employees, and they saw little prospect of improving matters in the near future.

Reports from the different Building Trades Federation showed that the building trade throughout the country was in a worse position than it was in Edinburgh, where they had had a number of public buildings to help them, although some of these contracts, owing to keen competition, were not very remunerative. 'Too many builders in Edinburgh the year had seen the worst of a succession of bad years.

In December last year, and in the following month, property was changing hands freely, and they all thought property was returning. The scheme in the air, House of Commons Bill, Insurance, &c., and the effect of the increment duty, confidence in property as an investment was again checked for a time. It was time the Legislature gave the building trade a rest and let them have a chance of securing a return of confidence and restored security in property. In regard to lost property, they were told that builders were to blame for over-building. That was a mistake. The cause was not over-building; the condition they complained of was the effect of depopulation. The flower of their tradesmen had been driven from their homes abroad to get their daily bread. The effects of the Insurance Bill would be felt by the building trade in a greater degree than by most of the other trades. With regard to the unemployment part of the Bill, he said that section had been inadequately discussed. When framing the Bill the Chancellor of the Exchequer had consulted the employees' organisations, but no organised body of employers had been consulted. Their Committee had urged that workmen's compensation should have been included in the Bill as a contributory measure.

Along with the English Federation an endeavour was being made to get the Government to make an inquiry into the working of the Workmen's Compensation Act. That inquiry had been increased fourfold since the introduction of the Act, and it was a very heavy item in the cost of production. Malingering was responsible for much of the increase, and only by a contributory scheme would that be avoided.

Mr. J. B. Forrester, in proposing 'Kindred Societies,' said the building trade was suffering more from lightning-speed legislation on any other trade. He thought they were at the end of their tether, and they were and assert themselves. He appealed to the building and allied trades to unite together as to form one huge federation.

Replies were made by Mr. James A. Baxter, President of the Glasgow Master Wrights' Association; Mr. Arch. Watson, Vice-President of the Glasgow Master Plumbers' Association; and Mr. R. J. Henderson, Vice-President of the Edinburgh, Leith, and District House Factors' Association.

FACTORY AND COMMERCIAL PROPERTY SALES, 1911.

MESSRS. LEOPOLD FARMER & SONS, factory specialists and surveyors, of Gresham-street, E.C., report that the year under review has shown better results than was the case in 1910 in the disposal of factory property, wharves, land, etc. Values have been maintained and sales transacted at good times prices. The prices realised would not convey to the reader that the standard of values has been kept up, as hardly two factory properties are alike. The tendency, however, is for the price to rise consequent on the improvement by development in certain manufacturing districts, which have special advantages in rail, waterside, and other facilities. There is a migratory movement amongst manufacturers to districts outside large towns where the lowest possible cost of manufacture can be obtained. The Budget taxation of 1909 has not to any great degree affected the values of industrial properties, but as regards other securities, landed property a shrinkage is noticeable. There are many inducements affecting industrial operations, and the development of commercial enterprise.

It is difficult to say which branch of any particular manufacture more than any other has progressed in the year 1911: one, however, perhaps, being very noticeable is the manufacture of electric filament lamps, and several companies interested in the business have acquired factories and are carrying on large businesses.

Acquiring of factories, etc., and building of works, consequent on reorganisation and extension in many trades, are always in progress; those in the engineering, milling, chemical, and spinning trades having been well to the front in development in the year under review.

The effects of the Patents and Designs Act are still well to the front; foreign holders of English patents still being on the look-out for factory property to comply with its requirements.

In looking ahead to further deals, Messrs. Farmer & Sons are confident of good sales, as there is every likelihood of a great amount of prosperous activity in the industrial world.

GENERAL BUILDING NEWS.

PROPOSED CHURCH, CHESTER-LE-STREET.

Plans for proposed Congregational Church have been prepared by Mr. Albert H. Fennell, architect, Chester-le-Street, Co. Durham. The front facade will be of stone in late Gothic style. The scheme is to cost about 3,250l., exclusive of site and manse. Church seating 510, schoolroom seating 250, vestries, cloak-rooms, cellars, etc.

NEW CHURCH, STEPPS.

The Building Committee of Steps United Free Church has decided upon erecting a new church, and plans have been prepared by Mr. Andrew Balfour, F.R.I.B.A., architect, of Glasgow. The estimated cost of the work is 5,000l., and the seating accommodation is for 650 people.

NEW CHURCH SCHOOLS, HESLE.

The extensions to these schools are being erected by Mr. M. Harper, contractor, at an estimated cost of 1,500l. The extensions include three new classrooms, besides considerable internal alterations. The architect for the work is Mr. J. Bilson.

NEW BUILDINGS IN LONDON.

Laboratory buildings at University of London. Strand, W.C. (5,000l.); Professor F. M. Simpson, architect, 63, Gower-street, W.C. Block of office buildings, Aldwych, W.C.; Mr. A. Burr, architect, 85, Gower-street, W.C. Additions to offices of the City of London Board of Guardians; Mr. A. E. Pridmore, architect, 2, Broad-street Buildings, E.C.

NEW MILL, BELFAST.

Mr. Samuel Stevenson is the architect for the new spinning mill which is being erected for Messrs. Jaffe Brothers. The contractors are Messrs. M'Laughlin & Harvey, Ltd.

MONEYRA MASONIC HALL.

Messrs. Watt, Tulloch, & Fitzsimons are the architects for this new hall, the founda-

tion-stone of which was laid last week. The contract is being carried out by Mr. W. J. McClurg.

WORTHINGTON HOSPITAL.

The new outpatients' department of this hospital has been erected at a cost of 2,620l., from the designs of Mr. A. Morris Butler, architect. The contractor for the work is Mr. George Baker, jun., and the building will probably be opened in February.

TRADE NEWS.

Messrs. Hayward Brothers & Eckstein, Ltd., engineers and ironfounders, 187 to 201, Union-street, Borough, S.E., supplied sixteen large circular glazed terrace lights for lighting the rooms of the Museum below, in the King Victor Emanuel Memorial, Rome.

Under the direction of Mr. Arthur C. Bloomfield, M.A., Boyle's latest patent 'air-pump' ventilators have been applied at the Bank of England, Threadneedle-street, E.C.

Woodseats (Sheffield).—Church; Messrs. Geo. Baines & Son, architects, 5, Clement's Inn, W.C.

Wortley (Leeds).—Factory and laundry; Mr. F. D. McKay, architect, The Lodge, Bramley, Yorks.

Yeaddon.—School; Vicar, Parish Church, Yeaddon.

Yeovil.—Fifty houses; Mr. A. Oddy, Surveyor, Yeovil Town Council.

shops, and farming. In the Orange Free State a demand for builders exists at Bethlehem. In *The Cape* there are openings at Cape Town for a few masons in the stone-dressing industry. *Panama Canal*.—The employment by the Isthmian Canal Commission of skilled labourers is now restricted to American citizens, except in cases in which American labour of the character required is not available. There is a surplus of skilled and unskilled labour on the Isthmus, and as the Canal Works are now within measurable time of being completed it will soon be necessary to reduce the number of men employed.

Labour in Cape Town.

We take the following from the Government Labour Bureau, Cape Town, for the month of October:—

Stone-dressing.—Very busy. Seventy-seven masons are employed at the new Law Courts and about twenty-five others in connexion with other undertakings in various parts of the town.

Plumbing.—Much brighter. The greater portion of the work in progress is in connexion with repairs, but a few contracts for new work are now being dealt with, and it is quite possible that a slight shortage of men may occur in the near future.

Painting and Decorating.—Improving. There is an increase in the number of premises in course of redecoration, and only three painters were registered for employment at the Bureau.

Fibroplaster and Cement Working.—Fair, but with no increase in the demand for labour.

Bricklaying.—This trade now shows signs of a definite improvement, and employment is made personally at the rate of about one man at any time during the past six months.

Shopfitting.—As anticipated in September, an increase has occurred in the amount of work in hand.

Joinery and Woodworking Trades.—This industry has improved to a considerable extent since September. Applications by competent joiners to fill prospective vacancies should be made personally at the Labour Bureau or through the medium of the magistrate in whose district the applicant resides.

Furniture Manufacture and Cabinet-making.—Very busy.

Building Work, Ceylon.

The Principal Collector of Customs of Ceylon (Mr. C. D. Vigors), in his report for the year ended June 30, 1911, states that proposals are before the Government for the erection of export warehouses at Colombo on the old coaling grounds, and also for the provision of a steam or petrol launch for Customs use in the harbour. It has been decided to obtain an electric crane for loading material into trucks, and also an additional crane for Government goods. The passenger jetty at the port is to be lengthened by 120 ft. A scheme is being prepared for the deepening of Colombo harbour, a large part of which has a depth of less than 30 ft. This work will be necessary if the Suez Canal is deepened to 36 ft. by 1914.

Hospital, Freetown, Sierra Leone.

The *Sierra Leone Royal Gazette* of November 11 contains the text of the Governor's address on the introduction of the annual estimates, from which it appears that a new hospital is to be built at Freetown.

Building and Road-making, etc., Works, Argentine Republic.

The *Boletín Oficial* of November 10 publishes a decree (No. 8,573), issued by the Ministry of Public Works, earmarking a sum of 20,846,000 pesos currency (about 122,500*l.*) for the carrying out of extensive public works throughout the Republic. Of this sum 1,390,000 pesos (about 121,600*l.*) is allocated to Buenos Aires City, and a similar sum to each of the following provinces: Buenos Aires, Santa Fé, Córdoba, Entre Ríos, Corrientes, San Luis, Jujuy, San Juan, Santiago del Estero, Men doza, Salta, Tucumán, Rioja; and 1,356,000 pesos to Catamarca. The principal works to be carried out consist of the building and enlarging of schools, colleges, hospitals, and libraries; the making of roads; dredging, irrigation, and canal works; and bridge building.

Theatre at Yurief, Russia.

H.M. Consul at Riga (Mr. V. H. C. Bosanquet) reports that, according to the local Press, a project is on foot to construct a stone theatre at Yurief (Dorpat), in the province of Livonia. A sum of 110,000 roubles (about 11,600*l.*) is required for the enterprise.

School Houses, Cuba.

The *Gaceta Oficial* publishes a law earmarking a sum of 150,000 pesos (about 31,000*l.*) for the erection of 150 new school houses in various parts of the Republic.

FOREIGN AND COLONIAL.

Labour in the Colonies.

From the Supplement to Circulars of Emigrants' Information Office, 34, Broadway, Westminster, S.W., we take the following: *New South Wales*.—In Sydney and suburbs the building and iron trades and factory workers have been well employed, and stone-masons, bricklayers, plasterers, carpenters, joiners, able-bodied labourers, are in great demand. The strike of iron workers at Lithgow continues.—In *Victoria* employment continues to be very good, and assisted passages are now being granted to mechanics. There is a large demand for bricklayers, carpenters, plasterers, boiler-makers, blacksmiths, moulders, engine fitters, plumbers, turners, and furniture makers. *South Australia*.—Work of nearly all kinds is plentiful, and there is a good demand for bricklayers, masons, plasterers, carpenters, first-class painters, plumbers, boiler-makers, ironworkers, moulders, and cooper-smiths. *Queensland*.—There is a good demand for labour generally, both in towns and factory. *New Zealand*.—The demand for mechanics is not general, but skilled men, such as plumbers, have little difficulty in finding work. *Union of South Africa*.—Employment in the building trades in Johannesburg continues brisk. In Pretoria the state of trade is fair in building,

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointment, xvi.; Auction Sales, xx. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

Contracts.

BUILDING.

DECEMBER 29. — **Glasgow.** — DESIGN FOR A BRIDGE. — Designs are invited (Alexander Thomson Travelling Studentship) for a bridge. Premiums of 500, and 200, are offered. See advertisement in issue of December 24, 1910, for further particulars.

DECEMBER 30. — **Armadale.** — Public hall and offices, to cost 250,000. From Messrs. 1234, 70, and 101. Open only to architects who were represented on the site on October 12.

DECEMBER 30. — **Hastings.** — EAST SUSSEX HOSPITAL. — Plans for 1234, 70, and 101. Mr. E. P. Hall, R.I.B.A., Assessor.

DECEMBER 30. — **Welsh Eisteddfod, 1912.** — DESIGNS FOR WORKMEN'S DWELLINGS. — Prize, 500. Particulars from Welsh Housing Association, 9, Temple-chambers, E.C.

JANUARY 1, 1912. — **Rochdale Infirmary.** — EXTENSIONS. — Limited to Rochdale architects. Assessor, Mr. Alex. Graham, F.R.I.B.A.

JANUARY 6. — **Bolton.** — Miners' Federation Hall and Offices. Limited to architects within twenty-five miles of Bolton. Premiums, 600, and 250. Assessor, Mr. Jonathan Simpson, F.R.I.B.A. Particulars from Messrs. Fielding & Fernihough, 7, Fold-street, Bolton.

* JANUARY 10. — **Hammersmith.** — ALTERATIONS, etc. — The Hammersmith E.C. invite tenders for alterations and repairs to premises, No. 120, King-street. See advertisement in this issue for further particulars.

JANUARY 10. — **Catherham.** — SCHOOL. — Erection of Roman Catholic school. Mr. W. Bevan, F.R.I.B.A., architect, 65, Lansdowne-road, Croydon. Quantities on deposit of 10.

* JANUARY 11. — **London, N.** — ALTERATIONS, etc. — The St. Mary Islington Guardians invite tenders for certain alterations, etc., at Receiving Houses, Hornsey-rise, N. See advertisement in this issue for further particulars.

JANUARY 11. — **Radstock.** — COTTAGES. — Erection of twenty-eight cottages. Specifications from the Surveyor, Mr. G. H. Gibson, Radstock, near Bath. Deposit of 10.

JANUARY 11. — **Southampton.** — WORKS. — For construction of economiser flues and buildings, and supply and erection of a fuel economiser, at waterworks pumping station at Otterbourne; also for construction of a meter recorder house conditions seen, and quantities and forms of tender from the Waterworks Engineer, 35 and 35, French-street, Southampton, on deposit of 10.

* JANUARY 12. — **Knockly.** — EXTENSION OF POST-OFFICE. — The Commissioners of H.M. Works and Public Buildings invite tenders for extension of office. See advertisement in this issue for further particulars.

JANUARY 12. — **Korton-in-Ribblesdale.** — SCHOOL. — For erection of Helwith Bridge new school. Plans seen, and specifications, with quantities, from the Education Architect, County Hall, Wakefield. Deposit of 10.

JANUARY 13. — **Naas.** — WATER WORKS. — Erection of a new pump-house, the supplying and fixing of pumps, gas-engine, and other works. Plans and specification prepared by Mr. Francis Bergin, B.E., 56, Westmoreland-street, Dublin. Deposit of 10 for quantities.

JANUARY 12. — **Owston.** — SCHOOL. — For erection of a new school at Owston, Carroft. Plans seen, and specifications, with quantities, from the Education Architect, County Hall, Wakefield. Deposit of 10.

JANUARY 12. — **Silkstone.** — SCHOOL. — For erection of a new school. Plans seen, and specifications, with quantities, from the Education Architect, County Hall, Wakefield. Deposit of 10.

JANUARY 12. — **Workington.** — POST-OFFICE. — The Commissioners of H.M. Works and Public Buildings invite tenders for new post-office. See advertisement in this issue for further particulars.

JANUARY 13. — **Cirencester.** — HOUSES. — Erection of twenty-four houses in Siddington-road. Drawings and specification seen, and quantities, on deposit of 20, 25, from Mr. V. A. Lawson, A.M.Inst.C.E., Council Buildings, Cirencester.

JANUARY 13. — **Honley.** — SEWER. — Construction of 9-in. sewer in Gynn-lane, near Honley Station. Plans seen, and quantities and form of tender from the Engineer, Mr. W. H. Radford, C.E., Albion-chambers, King-street, Nottingham, on deposit of 10.

* JANUARY 15. — **Chatham.** — HOSPITAL EXTENSION. — The Secretary of State for War invites tenders for demolition of water tower and erection of new administrative, operation, and ward blocks and boiler-house at Military Hospital, Fort Pitt. See advertisement in this issue for further particulars.

* JANUARY 15. — **Coventry.** — CLASSROOMS. — The Governors of Bablake School, Coventry, invite tenders for additional classrooms, gymnasium, etc. See advertisement in this issue for further particulars.

JANUARY 16. — **Gwanfaren.** — VILLAS. — Erection of ten pairs of semi-detached villas, for the Marlborough Building Club. Plans and specifications with the architect, Mr. J. Mann, June, 27, Lancaster-villas, Merthyr Tydfil.

* JANUARY 17. — **St. Albans.** — COTTAGES. — Tenders are invited for the erection of six cottages in Catherine-street, St. Albans. See advertisement in this issue for further particulars.

JANUARY 23. — **Ilford.** — SCHOOL. — Erection of elementary school. Plans and specifications seen, and quantities and forms of tender from the architect, Mr. C. J. Dawson, F.R.I.B.A., 11, Cranbrook-road, Ilford, on deposit of 50 s.

JANUARY 31. — **Prescot.** — ADDITIONS. — For additions to the Council school. Plans seen, and quantities from the County Architect, Mr. H. Little, 16, Ribblesdale-place, Preston. Deposit of 20.

FEBRUARY 13. — **Whalley.** — ASYLUM. — For the completion of the erection of the asylum. Specification, general conditions, and quantities from Mr. Henry Little, architect, 16, Ribblesdale-place, Preston, on deposit of 100.

NO DATE. — **Barnsley.** — PREMISES. — Erection of new business premises for Messrs. Hunters, Ltd. Mr. W. W. Wray, A.R.I.B.A., architect, 2, King-street, Wakefield.

NO DATE. — **St. Albans.** — COTTAGES. — Erection of six new cottages, Catherine-street. Particulars from Mr. H. F. Mence, architect, 11, St. Peter's-street, St. Albans.

of Messrs. D. R. Paterson, Ltd., has been accepted for the construction of a sewer in Neasden-lane; as has also the tender of Mr. G. W. Riley, at 13s. 10s., for the provision of a bandstand in Roundwood Park.

Wood Green.—The Surveyor is to be instructed to prepare plans and estimates of the cost of levelling and laying-out the land at the rear of the Town Hall. Tenders are to be invited for cuiverting, etc., a portion of Moselle Brook. A plan has been lodged by Mr. S. W. Cranfield for the conversion of a shop into a cinematograph hall, Myddleton-road, Bowes Park.

Woolwich.—Plans have been lodged with the London County Council by Mr. Bruce Dawson, 6, Old Queen-street, Westminster, S.W., for the erection of a new factory in Green-lane, North Woolwich.

OBITUARY.

Sir James C. Inglis, M.Inst.C.E.

Sir James Charles Inglis, member of the Council, 1907, and President, 1908 and 1909, of the Institution of Civil Engineers, and General Manager of the Great Western Railway Company, died at Rottingdean on December 19, aged sixty years. He was member of the Prussian Order of the Red Eagle (Third Class) and the Order of the Crown of Italy; a member of the Royal Commission upon Canals and Inland Navigation, and an arbitrator for the Federated Malay States Government in the matter of the purchase of the Tanjong Pagar Docks, Singapore, 1906. A native of Aberdeen, he received his earlier education in the Grammar School and University there; he entered Messrs. Norman, Copeland, & Co.'s engineering works in Glasgow, and then, 1872-5, was employed as James Abernethy's pupil upon the Alexandria railways and docks. Under Mr. P. J. Margary he worked upon the construction of the Great Western docks at Millbay, Plymouth, for the South Devon and Cornwall Railways. Having started in practice as a civil engineer at Plymouth, Sir James Inglis constructed Mount Batten breakwater for the Cattewater Harbour Commissioners, together with railway, harbour, and similar undertakings in South Devon and Cornwall. In 1892 he was appointed Assistant-Engineer, and within a few months Engineer-in-Chief to the Great Western Railway Company; in 1903 he became General Manager and Consulting Engineer, and thus was associated with their extension schemes for Fishguard Harbour, their South Wales lines, and the joint line with the Great Central to Wolverhampton and Birmingham. It is stated that he was the first student of the Institution of Civil Engineers and the first railway General Manager who became President of the Institution. The funeral took place on December 23 at Kensington Cemetery.

PATENTS.

APPLICATIONS PUBLISHED.*

27,653 of 1910.—Jean Jacques Pousset: Apparatus for the display of sectional building models.

27,805 of 1910.—Charles Ervin Reitz: Ventilators.

28,216 of 1910.—Thomas Downie: Furnace fronts and doors.

28,224 of 1910.—Henry William Hemingway: Process for preserving or treating stone and like building materials, and for producing cement.

1,008 of 1911.—Charles Clayton Shaw: Flushing apparatus.

1,560 of 1911.—John Thomas Henthorne: Joint for pipes or conduits.

3,153 of 1911.—Fedor Silber: Roofing tiles.

6,576 of 1911.—John Howard Cartland and Archibald Henry Collins: Apparatus for closing doors and the like.

9,839 of 1911.—Max Seyferth: Floor cleaning machines.

11,513 of 1911.—Isidor Garcia Lastra, Guillermo Bernstein and Cipriano Salvatierra: Manufacture of reinforced cement column.

12,002 of 1911.—Arthur Johnson: Means for moulding bricks, tiles, and similar articles.

12,856 of 1911.—Charles Back and Rudolf Wakik: Process and device for manufacturing marble slabs with inscriptions, ornamentations, and the like in imitation marble.

15,511 of 1911.—Henry Arthur Goddard: Box cores that are used in building hollow concrete walls.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

16,506 of 1911.—George Baxter Upham: Processes for manufacturing bituminous paving blocks.

16,531 of 1911.—Robert Hudson: Fasteners suitable for windows, doors, gates, shutters, box-lids, and the like.

19,508 of 1911.—Paul Schwenzow: Machines for stamping plastic material into moulds in the manufacture of pipes, tubes, and like bodies.

18,856 of 1911.—Edouard Benedictus: Strengthened glass.

20,104 of 1911.—Frank Hiff: Chimney-pots or cowls.

22,135 of 1911.—Henri Marliere: Safety-chains for doors, windows, or the like.

SELECTED PATENTS.

19,313 of 1910.—Robert MacLaurin: Stoves.

This relates to a kitchen stove having a charging-hopper *A* with a gastight cover *F*, and a shoot *D*, at the rear of a cooking-range, and wherein the primary and secondary air supplies may be regulated by doors. The upper door *K*, and the ashpit *Q* are tight-fitting, and a door *P*, with a hit-and-miss or other regulator, controls the primary air

19,313 of 1910.

supply and also the secondary air supply, which passes from the ashpit through a hollow cheek. The bottom grate-bars may be curved up at the front without additional front bars, or front bars with a lifting bottom grate may be provided. Flues are provided beneath and above a side boiler *L*, and continue above or around the oven, a damper being provided to direct the hot gas.

18,250 of 1910.—Edward Charles Robert Marks (Soc. Anom. Beer, Belgium): Transporters.

This relates to an apparatus for removing material from a heap which comprises a crane-like structure, from the crab of which depends a rigid frame carrying the shovel. In one arrangement the crab 4 is driven by a pinion engaging a rack 18 on the bridge 1, and carries a vertically-adjustable frame 5, at the lower end of which the shovel 7 is pivotally mounted at 6. The shovel is formed symmetrically so as to be capable of working in either

direction, and is provided with small rollers 14 to run upon the ground. The shovel is swung about its axis by cords operated from a winding machine controlled from the driver's cabin. In the other arrangement the shovel has only one cutting-face, and one side of the frame 4 is extended downwards, at 15, to form an abutment for the frame 5. The shovel is discharged over the rear edge down a shoot 16 leading to a hopper.

18,142 of 1910.—William Larmer: Chimney-tops.

This relates to a chimney-top which consists of an inner tube, having its bore equal in diameter to the chimney opening, with a canopy over, and an outer tube, which is of about twice the height of the inner tube, and is formed at its base as a chamber of four or more sides, in which are air-holes.

18,929 of 1910.—Edward Charles Robert Marks (Ideal Machinery Company, U.S.A.): Moulding concrete blocks.

This relates to moulding machines for concrete blocks of the type described in Specification No. 12,452-1907, which are fitted with a device for removing the surplus moulding-material after the tamping operation, and consists in the provision of a scraper 34 carried by a frame 22, sliding on guide-bars 18 mounted on vertically adjustable brackets bolted to plates 16 fixed to arms on the machine frame 1. The scraper frame also carries a spring-supported plate 38, which is depressed by a blow from a heavy tool or tamping-hammer after the passage of the

18,929 of 1910.

scraper to smooth and flatten the upper surface of the block. The forward movement of the scraper frame is effected by a foot-lever 29 fixed to a yoke 23, which is revolvably mounted on the shaft 11 of the core-actuating yoke 12, and operates through a lever 27 and link 26. The return movement is effected by the engagement of the yoke 12 with the lever 27 when the lever 10 is operated to withdraw the cores.

SELECTED PATENTS.—Continued on page 790.

LEGAL COLUMN.

Water Charges.

Another conundrum has come up for decision by the Courts under the Metropolitan Water Board (Charges) Act, 1907, in the case Metropolitan Water Board v. Phillips, the question being what was the rateable value of certain premises upon which the water rate was to be calculated.

The premises in question were the Brown Bear, Aldersgate. The claim of the Water Board related to two quarters, viz., October 1 to December 31, 1910, and January 1 to March 31, 1911. By a supplementary list, which came into force April 6, 1909, the rateable value had been assessed at 400l., but on June 2, 1910, the overseers had sent to the Assessment Committee a provisional list, placing the value at 399l. On objection the Assessment Committee reduced the rateable value to 234l., and that list was dated October 3, 1910, and came into force on that day.

The defendants contended that the water rate should be based for both quarters on this lower valuation, but the Water Board claimed 5l. being 5 per cent. on 400l., the former assessment for the first of the two quarters and 5 per cent. on the lower assessment for the second of the two quarters' water rate.

The Court decided the question in favour of the Water Board, but agreed that the case involved difficult questions, and that the decision involved some hardship on the defendant. Very shortly stated, the reasoning of the decision was as follows:—Sect. 13, sub-sect. 1, of the Metropolitan Water Board (Charges) Act, 1907, provides that the rateable value "shall be determined by the valuation list in force at the commencement of the quarter for which the water rate accrues." This Act incorporates the Waterworks Clauses Act, 1847, sect. 70 of which made the water rates payable in advance on the ordinary quarter days, but the Charges Act, by sect. 15, makes the quarterly dates of payment April 1, July 1, October 1, and January 1. After a careful examination of the various Acts relating to valuation the Court came to the conclusion that under sect. 13 of the Charges Act the valuation list in force at the commencement of the quarter for which the water rate accrued was the original list, placing the rateable value at 400l., the provisional list not being in force until after the objection had been heard and determined by the Assessment Committee, which, it will be seen in this case, was October 3, or three days after, under the Charges Act, the water rate accrued became due.

The Act which regulates the supply of water by the Metropolitan Water Board is a private Act, and therefore the public have less facilities for becoming acquainted with its provisions than is the case with public statutes, but it has altered and modified many public statutes and has been the cause of considerable litigation which has involved questions the Courts have expressed difficulty in solving. With reference to the changes of dates in the quarter days upon which the water rate is payable we may remind our readers of a decision reported in *The Builder*, September 5, 1903, in which it was held that the Water Board were under no statutory obligation to give any notice to consumers.

LONDON COUNCILS.

Barking.—Application is to be made to the Local Government Board for sanction to a loan of 505l., the estimated cost of widening Ripple-road, between Cobham-road and Westbury-road. The plans of the Architect for the erection of four cottages on a portion of the hospital site have been referred to a sub-committee for consideration and report.

Battersea.—Repairs to granite macadam are to be carried out in six roads at an estimated cost of 618l. Electricity mains are to be extended at an estimated cost of 107l. No objection is to be raised to the proposals of Mr. L. A. White to erect a new chapel on the site of the old chapel at the Salestan Schools, Surrey-lane, and of Messrs. Edwin Evans & Sons, for six houses in Sudbrooke-road.

Camberwell.—Alterations are to be carried out to the Camberwell Baths, Church-street, to comply with the conditions of the London County Council, at an estimated cost of 1,100l. **County of London.**—A meeting of Metropolitan Borough Engineers has been held to consider the following letter from Mr. W. E. Kiley, Superintending Architect to the London County Council:—"The Building Acts Committee of the Council has had under further consideration the question as to an arrangement being agreed between the Council and the Metropolitan Borough Councils with regard to buildings and structures to be dealt

with by the respective authorities under Part VII. of the London Building Act, 1894. Experience since the subject was last discussed has confirmed the Committee in the opinion that it would be to the public advantage if an arrangement could be arrived at to define which buildings and structures could be dealt with by the Council and Borough Councils. I am, therefore, authorised by the Committee to inquire whether you would be prepared to recommend your Council to agree to an arrangement under which your Council would deal, under sect. 84 of the London Building Act, 1894, with buildings within the following limits, buildings not complying with these conditions being dealt with by this Council:—Summer-houses, tool sheds, coals or wood sheds, fowl houses, and ruins, pigeon houses, dog kennels, perambulator sheds, cycle sheds, motor-car sheds, and other similar structures:—(a) Not exceeding in area 64 sq. ft.; (b) Not exceeding in height 7 ft. in any part measured from the level of the ground to the underside of the eaves or roof-plate; (c) Situated at least 5 ft.; (1) from any street; (2) from any other building or structure, unless there be a non-perforated wall separating the proposed structure for the whole of its length and height from such other building or structure; (d) Not having therein any stove, fire, fireplace, hot-air pipe, hot-water pipe, or other apparatus for warming or ventilating the same; (e) Not extending in an part thereof within the prescribed distance from the centre of the roadway, in any street or way; and (f) Not projecting in any part thereof beyond the general line of buildings in any street or way." The following resolutions were agreed to at the conference:—(a) That with reference to Mr. Riley's letter of the 11th inst., after carefully considering, in conference, the suggestion of the Superintending Architect, the Metropolitan Borough Surveyors are not prepared to acquiesce in Mr. Riley's proposals. (b) That this conference would willingly take into consideration some alternative scheme for equitable distribution of the statutory duties of Part VII. of the London Building Act, 1894.

Deptford.—The Public Health Committee have put forward the following recommendations at the conclusion of their report on infantile mortality:—(1) That the Baths and Washhouses Committee consider the desirability of converting two or more houses in one of the wards in the central district of the borough as slipper baths; (2) That the Works Committee take into consideration the paving of streets in congested areas with a surface of jointless and impervious material. Plans have been passed for Mr. J. Adams for additions to a building at the rear of Nos. 41-3, Clifton-hill, and for the erection of a building at the rear of Nos. 45-7, Clifton-hill.

Kensington.—The kerb and footway paving in portions of Ossington-street, Pembridge-road, Hite-street, King's Hill-gate, Ladbrooke-road, and Cornhill-road is to be raised and made good where necessary at a total estimated cost of 272l. The tender of Messrs. A. Roberts & Co., Ltd., at 126l., has been accepted for carrying out alterations and other works in adapting No. 21, Drayton-mews for use as a tool-house, store, etc. The Works Committee report that in connexion with a report submitted to the Council in October last on the subject of the advisability of a scheme being adopted providing for street name tablets in London being of a uniform character, they stated that they had had before them a suggestion that it might be of considerable assistance to pedestrians if the names of streets were also let in the paving of the footways at street corners, particularly in more important thoroughfares. They had had before them a footway tablet in mosaic which had been prepared by the directions of the Borough Engineer, and he suggested that footway tablets of this material, which gives a good foothold, should be laid on each side of Kensington High-street, indicating that thoroughfares, in close proximity to the eastern and western boundaries of the street. As regards the proposal put forward, the Committee wish to point out that whilst tablets let in footways may be of some advantage to pedestrians, they would be found to be of little, if any assistance to vehicular traffic, and looking to the number of pedestrians in busy thoroughfares, such as Kensington High-street, and to other conditions, they consider that plainly lettered street name tablets fixed on buildings and tablets fixed on lamps would be found more useful than footway tablets, particularly as the latter, if fixed in such thoroughfares, would very frequently be wholly or partially covered up by persons making use of the footways. The Committee have, therefore, given directions for special attention to be given to the fixing of name tablets at a lesser height upon buildings than has been the practice in the past, and to the fixing of a greater number of tablets on street lamps.

Lambeth.—The tenders of Messrs. Thomas Wood & Sons, Ltd., Messrs. Briantow & Co., Ltd., and Messrs. Johnson Brothers have been accepted at 1,500l., 250l., and 250l. respectively for tar-spraying works during the year 1912-13. The following plans have been passed:—Mr. Walter Nightingale, on behalf of the Duchy of Cornwall, drainage of ten houses proposed to be erected in Aquinas-street, Stamford-street; Mr. J. Parsons, on behalf of the Duchy of Cornwall, drainage of twenty houses proposed to be erected in Denny-street; Messrs. Stringer Brothers, drainage of three houses proposed to be erected in Claverdale-road, Upper Tulse-hill.

Lewisham.—Tenders are to be invited for paving Phœbeth-street, Francemary-street, and a portion of George-lane, as soon as 75 per cent. of the estimated cost of the works have been received. A 16-in. strip of pavement in front of 218-244, Brownhill-road is to be paved at an estimated cost of 95l. The tender of the Improved Wood Pavement Company, Ltd., has been accepted for laying wood-paving in Catford-road at the following costs:—340 yards super. wood-paving 9-in. concrete, 12s. 11d. per super. yard; 70 yards super. wood-paving, 8s. 2d. per yard; 50 yards super. 12-in. concrete, 12s. 11d. per yard. The footpaths on the north side of Rosenthal-road are to be repaired with artificial stone in lieu of tar-paving, at an estimated cost of 102l. The tender of Mr. G. J. Howick has been accepted for replastering the ceilings in the Central and Forest Hill Libraries in sirapite, at 37l. 17s. and 38l. 17s. 6d. respectively. The following plans have been passed:—Royal Arsenal Co-operative Society, Ltd., additional rear of Nos. 50 and 52, Rushey-green; Mr. J. Randall Vining, shops, London-road; Mr. E. H. Harrison, five shops, Fernbrook road; Mr. G. A. Lansdown, forming and laying-out street in continuation of Newstead-road, also new street out of St. Mildred's-road.

Middlesex County Council.—The City Engineer and Surveyor has been authorised to substitute Lancashire or Yorkshire grit stone sets for the existing granite sets over Cobham County Bridge, Yiewsley, at an estimated cost of 100l. A new carriageway of mild steel decking and wood blocks in lieu of the existing plank decking and macadam is to be constructed over the Middlesex half of Hampton Court County Bridge, at an estimated cost of 1,750l.

Poplar.—The electrolytic disinfecting shed is to be removed from the site adjoining the electricity works to the opposite side of Violet-road, where it is to be enlarged and reconstructed at an estimated cost of 240l., including the provision of concrete foundations, drainage, refilling apparatus, electric installation, etc. During the quarter to end March 31 next repairs are to be carried out to the wood-paving of five roads at an estimated cost of 1,800l.; the macadam paving of ten roads at an estimated cost of 662l. and repaving of two roads at an estimated cost of 300l. The application has been approved of Mr. C. Dunch, on behalf of Messrs. Howard Brothers, for the erection of buildings in Portico-street.

St. Pancras.—The Council have decided to lease Oak House and Wellington House to Mr. Samuel Pulham, Victoria-parade, Muswell Hill. The tenant proposes to expend nearly 1,000l. on improving the property.

Shoreditch.—Laburnum-street is to be repaved with 2-in. compressed asphalt, and Union-walk with redressed granite sets, at an estimated cost of 2,115l. Electricity mains are to be extended in the Bethnal Green area at an estimated cost of 350l.

Southwark.—The tender of St. Pancras Iron-works Company, Ltd., has been accepted at 128l. for supplying and fixing stall divisions on the first-floor stables at Greenmoor Wharf. Plans submitted by Messrs. Henry Langston & Co., 1, 2, 3, and 30, The Exchange, Southwark-street, S.E., have been approved for the erection of a building on the site of Nos. 266-282, Waterloo-road.

Walthamstow.—The tender of the Trinidad Lake Asphalt Paving Company, Ltd., has been accepted for a supply of Trinidad asphalt macadam and bitumen, at 14. 6s. per ton for the macadam and 5l. 5s. per ton for the pure natural Trinidad Lake bitumen (for grout). Plans are to be prepared by the Engineer for making-up the footpath in front of Nos. 113-149, Blackhorse-lane. Tenders are to be invited for carrying out the work of doubling the tramway track at the "Bell" corner in Forest-road. Plans have been passed for Messrs. F. H. Heath, Ltd., for an electric theatre in Wood-street. Mr. F. W. Willmott and Mr. F. Clayton have lodged plans for an electric theatre in Hoe-street, and three houses, Byron-road, respectively.

Willesden.—The work of repaving the pathways in Cavendish-road is to be proceeded with at an estimated cost of 830l. The tender

BUILDING—continued.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

NO DATE.—Waverton.—VICARAGE.—Erection of new vicarage. Quantities and form of tender from Mr. J. H. Martindale, F.R.I.B.A., architect, Eaglesfield Abbey-rooms, Castle-street, Carlisle.

ENGINEERING, IRON, AND STEEL.

* **JANUARY 16, 1912.—Truro.**—IRON GATES, RAILINGS, ETC.—The Cornwall C.C. invite tenders for wrought-iron gates and railings, etc., upon boundary walls at new County Offices. See advertisement in this issue for further particulars.

FURNITURE, PAINTING, MATERIALS, ETC.

DECEMBER 29.—Rhonda.—TOOLS.—For supply of tools, etc., for the metalwork and woodwork classes at the new Centre Handicraft Centre. Forms of tender from Mr. T. W. Berry, Director of Education, Council Offices, Pentre, Rhonda.

JANUARY 1, 1912.—Leeds.—PAINTING.—For painting, etc., to be done at the Central Home and Superintendent's house, Street-lane, Round-bay, and the Receiving Home, Leopold-street, Leeds. Specifications and forms of tender from Mr. James H. Ford, Clerk to the Guardians, Poor Law Office, South-park, Leeds.

JANUARY 1.—North Uist.—FENCE.—Erection of a six-wire corromony fence. Particulars from Mr. H. H. Mackenzie, Factor, Balone, Lochmaddy.

* **JANUARY 11.—Hampstead.**—WORKS, MATERIALS, OR SERVICES.—The Hampstead B.C. invite tenders for works, materials, or services for one or three years from April 1 next. See advertisement in this issue for further particulars.

JANUARY 13.—Leeds.—REPORTS, ETC.—For the supply of freelay reports, fire bricks, fire-brick lumps, and freelay. Specification and form of tender from Mr. R. H. Townsley, General Manager, Gas Offices, East-parade, Leeds.

* **JANUARY 16.—Truro.**—SCREENS, PLATFORMS, AND FURNITURE.—The Cornwall C.C. invite tenders for supplying screens, platforms, and furniture for Council-chamber of new offices. See advertisement in this issue for further particulars.

ROADS, SANITARY AND WATER WORKS.

DECEMBER 29.—Northwood.—SEWER.—For the construction of six lengths of sewers. Plans and specifications seen, and quantities and forms of tender from Mr. W. L. Carr, Surveyor, Council Offices, on deposit of 1l.

DECEMBER 30.—Eastbourne.—ROADS.—For private improvement works. Plan and specification seen, and form of tender from Mr. A. E. Prescott, Borough Surveyor, Town Hall, Eastbourne.

JANUARY 1, 1912.—Edmonton.—KERB.—Supply and delivery of kerb on edge. Forms of tender and particulars from Mr. Cuthbert Brown, A.M.Inst.C.E., Engineer and Surveyor to the Council, Town Hall, Edmonton.

JANUARY 1.—Gildersome.—GRANITE.—For supply of granite. Mr. W. Wilby, Surveyor, Council Offices, Gildersome, Yorks.

JANUARY 5.—Chesterfield.—SEWAGE, ETC.—For laying a new sewer and surface-water drains, and construction of new approach road to the new burial ground. Plans and specifications seen, and quantities from the Borough Surveyor. Deposit of 1l. 1s.

JANUARY 6.—Penarth.—SEWER.—For extension of the Kymyn outfall sewer. Plans and specifications seen, and quantities from Mr. Edgar J. Evans, A.M.Inst.C.E., Surveyor, District Council Offices, Penarth.

JANUARY 9.—Aldershot.—PLINTS.—For supply of Hungry Hill flints. Forms of tender from Mr. F. C. Uren, Surveyor, Municipal Buildings, Aldershot.

JANUARY 9.—Meriden.—GRANITE.—For supply of granite. Mr. A. W. Liggins, Clerk, 11, Priory-street, Coventry.

JANUARY 10.—Didcot.—ROAD.—For making a new road, for the Wallingford R.D.C. Plans and specifications from Mr. G. F. Slade, Clerk, Wallingford.

JANUARY 13.—Bexley Heath.—MATERIALS.—For materials. Specifications and forms of tender from Mr. W. T. Howse, Surveyor, Council Offices, Bexley Heath.

JANUARY 15.—Hitchin.—GRANITE.—For supply of broken granite. Mr. Wm. O. Times, Clerk, Council Offices, Town Hall, Hitchin.

JANUARY 15.—London.—ROADS.—For the formation of two short connecting roads near the Recreation Ground, Freemasons-road, Custom House, E. Mr. William Jacques, A.R.I.B.A., 2, Fen-court, Fenchurch-street, E.C. Deposit of 1l.

JANUARY 20.—Norfolk.—GRANITE.—For supply of granite. Specification and tender forms from Mr. T. H. B. Heslop, M.Inst.C.E., County Surveyor, the Shirehouse, Norwich.

SELECTED PATENTS—Continued from page 788.

18,694 of 1910.—Henry Osmond Barnard: Ventilating shaft tops.

This relates to a ventilating shaft top, wherein the top is formed of a number of curved plates having narrow unobstructed openings between them. A cap closes the upper end altogether or in part, and the coupling shaft is of less cross-section than the top; the top may be fixed or wind-directed.

18,694 of 1910.

The plates *v* are of parabolic cross-section and openings *s* are formed at the angular points. The cross-section of the shaft is gradually enlarged to that of the top, and the cap *t* may be a flat plate or be made up of curved plates completely closing the end. The lower part of the coupling shaft *k* may be enlarged, be fixed to, and stand off from, the shaft *p*, to which it is applied, so that rain may escape between them; or the top may have a windvane *g*, and be mounted on a central spindle *x* with rollers *r* between the shafts.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiered Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TRADE CATALOGUES.

We have received from the Wilson Rolling Shutter Company, of St. John's House, 124-127, Minorie, London, E., a booklet descriptive of their improved rolling doors and shutters. These are of the interlocking slat type, and are designed as an improvement upon the various other types of shutters which have been hitherto in use, particularly with regard to the corrugated form of shutter made out of also to overcome the difficulties arising from the use of shutters composed of steel slats, which are constantly liable to break away. The slats are so shaped at the edges as to form a continuous hinge running the whole length of the shutter. The shutters can be supplied for fixing to any class of opening and for attachment to buildings of brick, stone, cement, or iron or steel structures.

Messrs. Henry Hope & Sons, Ltd., of 55, Lionel-street, Birmingham, and 39, Victoria-street, Westminster, S.W., forward us a leaflet illustrating their new wedge mortise lock. The special wedge shape of the lock, it is claimed, saves time in fixing, preserves the strength of the door, less being cut away from the tenon of the lock rail than is necessary for a square-cased lock, and ensures better fixing, at least two screws in each case entering the solid wood. A great number of these locks have been used by the Royal Liver Buildings, Liverpool. The firm also call attention to Hope's two-point casement handle, designed to hold a casement open one inch or one-quarter of an inch, a feat impossible with the common quadrant casement stay in gusty weather without the most irritating rattling.

Messrs. Lacey-Hulbert & Co., Ltd., pneumatic engineers, of 31, Victoria-street, London, S.W., send us leaflets of some of their latest designs for air compressors. A neat portable pattern, particularly adapted for blowing out dust from generators, motors, switch-gear, and electrical machinery of all kinds, is mounted on one base-plate with a substantial electric motor, and fitted with comparatively large wheels to facilitate ready transference from place to place, where the condition of the floor is unsuitable for wheels of small diameter, which can also be fitted without extra charge, if preferred. The base-plate itself forms an air receiver of considerable volume, which permits of the air being cooled and drained before passing through the base. The firm are also the manufacturers of the well-known "Boreas" rotary pumps. Driven by petrol engines or electric motors, mounted on one bed plate, they make excellent sets for country houses and factories requiring water to be forced into tanks.

The Genest-Stoessel Insulating Company, of 47, Victoria-street, Westminster, forward us a pamphlet dealing with their Korfund foundation plates for deadening and absorbing the noise and vibration of machinery. Our readers need hardly be told that the question of efficient foundation for machinery is an exceedingly important one with regard to the building in which the plant is erected, whose stability is likely to be seriously endangered by excessive vibration. Korfund is made of cork strips, protected by iron framing from losing its elasticity by compression, and is made to order for the actual area of the
